Education is an aspect that contributes to build the human in the good quality. Improving the quality of education is absolutely the responsibility of all parties. The government through the Directorate General of Higher Education (DIKTI) always works to improve the quality of education in Indonesia. One of the efforts made by DIKTI is to provide Lesson Study (LS) grants on some LPTK under its ministry. One of LPTK's of LS grantee is Ahmad Dahlan University (UAD) for the period 2011-2014 with the executing is department of math and science education that includes math education, biology education, and physics education.

In the mathematics education study program of UAD, lesson study activity in odd semester in the academic year of 2013/2014 applied to discrete mathematics subject which is a compulsory subject with 2 credits. The problem that will be solved in the implementation of LS on discrete mathematics subjects was the lack of students' activeness in the lectures activities. Based on observations and discussions with colleague who teach discrete mathematics subject, the problem should be sought immediately the solution were (1) a lack of interaction between students and students to lecturer, (2) lack of student courage to express their opinions, (3) the passive students during lectures, (4) most of the

students silent and did not respond to lecturer's question, (5) students were not active to ask to either the lecturer or their friends if there were material that has not been well understood. Through lesson study in discrete mathematics subject was expected there would be improvement in the quality of learning, including the student activeness and their learning outcomes as in the research of Triandani et al (2013). Since LS is a good momentum for lecturers to discuss making improvements of learning.

Beginning from those problems then the lecturers of mathematics education through lesson study activity tried to make the active learning with students as a learning center. It was chosen Problem-based learning approach because this approach is in accordance with both of the conditions of the students and the material of the subject. Problem-based learning according to the Vernon and Blake in Sockalingam (2010) propose that PBL is an instructional approach that uses problems as a context for the student to acquire both problem-solving skills and knowledge. Meanwhile, according to Graff and Kolmos (2003) Problem-based learning is an educational approach whereby the problem is the starting point of the learning process. Thus the problem-based learning can be understood as a learning approach that is characterized by the giving of the problems as a stimulus for students to practice critical thinking and problem solving skills. Problems

that used can be raised either from students or lecturers. The characteristics of problem-based learning are: (1) learning begins with a problem, (2) ensure that the problems are related to the student's real world, (3) organize lessons around each problem, not around each discipline, (4) gives a great responsibility to the learners in forming and running their own learning process directly, (5) use of small groups, and (6) requires learners to demonstrate what they have learned in the form of a product or performance.

Lesson study (LS), in Japanese called the *jyugyou kenkyuu*, is an approach to make improvements of learning in Japanese. The improvements of learning are done through processes of collaboration among teachers (Santayasa, 2009). The implementation of lesson study in the lecture can develop the professionalism of lecturers. This is because the continuous of LS will provide eight opportunities for lecturers (model and observer) which relate closely to the lecturer's professional development, namely (1) determining learning objectives that match the needs of the student, (2) reviewing and enhancing learning that are beneficial to students, (3) deepening the knowledge of the learning material presented by the lecturer, (4) determining the long-term goals to be achieved by students, (5) planning collaborative learning, (6) analyzing both of the learning process and student behavior carefully, (7) developing a reliable knowledge of learning, and (8) reflecting on their learning implementation based on the development of both students and colleagues. There are three phases of the lesson study. They are planning (plan), implementation (do) and reflection (see).

Activeness according to Asnawi (2011) is in the process of learning occurs atmosphere so that students actively asking a questions and expressing an opinions. Meanwhile, according to Sriyono (1992), activeness is at the time a teachers teach, they must manage so that their students be active physically and spiritually. Learning is an active process of students to form the knowledge. According to some experts quoted Sardiman (2012,) about learning definition such as; 1) Cronbach provided a definition: Learning is shown by the change in behaviors as the result of experience, 2) Harold Spears said Learning is to is observed to read, to imitate, to try something themselves, to listen, to follow direction, 3) Geoch said learning is a change in performance as a result of practice. Also according Sardiman (2012) learning is a changing in behavior or appearance, with a series of activities for example by reading, watching, listening, imitating etc. So learning can be understood as a change in the behavior of individuals towards a better life. Activeness of learning occurs in all learning activities are incarnated in the form of listening, discussion, solving a problem and giving an opinion.

Thus it can be understood that the student learning activeness is a learning activity in which students engaged actively in discussions, ask a questions, answer a questions and express opinions.

Active learning is a learning that provides learning opportunities itself or doing their own activities. Active learning activities according to Asnawi (2011), among others, are: experience, interaction, communication and reflection. Student activeness during the learning can be seen from: (a) The enthusiasm of students in the joining of learning (b). Student interaction with lecturer, (c) the interaction among students (d) Collaboration of group (e) Activities of students in the group, and (f) Students' participation in the concluding the result of discussion.

## 2 METHODS

Lesson Study activity in order to enhance the learning activeness of students in discrete mathematics subject with a problem-based learning approach in the Mathematics Education Program Study involved 18 lecturers in the mathematics education program study who acted as one model and 17 observers. Therefore special on Tuesday have agreed no mathematics education's lecturer who teach except a lecturer who appointed a lecturer models, so that all lecturers can participate actively in the implementation of Lesson Study. Lesson study participants were students of Mathematics Education 7th semester grade D with number 56 students. Activity of lesson study was carried out 4 times of meeting where at each meeting includes plan, do, see phase.

In the plan phase, all the lecturers involved in the lesson study discussed to identify learning problems, design a learning device that includes lesson plan, student worksheet and the observation sheet. The observation sheet was used to observe the student learning activeness. The next phase was the do phase do. At this phase, the lecturer models did her learning while observers observed learning process, especially the student learning activeness. The last phase is see phase, at this phase all of the lecturers involved in the lesson study gathered to reflect on the implementation of learning and the observation of the students that took place during the do phase. The result at this phase was used as a material of improvement in the planning of plan phase for the next meeting.

The data of student activeness obtained using the observation sheet then analyzed by quantitative descriptive method to determine a criteria of the student learning activeness level after implementation of LS. Observation sheet that prepared Guttamen scale form by category options "yes" and "no" with the meaning of percentage for good categories if the score is more than 50, enough categories if the score equal

to 50 and the less category if the score is less than 50 (Sugiyono, 2012) Before the implementation of lesson study, students were informed about the implementation of lesson study so they were ready for learning during learning of discrete mathematics subject in the implementation of lesson study.

### 3 RESULTS AND DISCUSSION

During learning process of discrete mathematics subject using problem-based learning approach in the implementation of LS students was grouped into 10 groups which each group consisted of 5-6 students. The forming of a group was done randomly by considering the force and gender. Students are given a student worksheet which contained the problems to be solved along with the group then presented in front of the class.

During the learning activity, each observer used the observation sheet to observe student learning activeness, especially for monitor the student learning activeness. The results of these observations were used as the data of student learning activeness during the lesson study implementation. Furthermore, the data were analyzed descriptively quantitatively to determine whether or not an enhancing of the student learning activeness in the discrete mathematics subject using problem-based learning approach in the implementation of lesson study. The results of the data analysis of student learning activeness were shown in the following table.

Table 1. Percentage of student learning activeness

Indicator	Meeting			
	I	II	III	IV
The enthusiasm of students in the joining of learning	89.41%	79.50%	82.93%	89.30%
Student's interaction with lecturer	35.29%	44.50%	43.41%	57.67%
The interaction among students	45.29%	56.00%	49.76%	53.49%
Collaboration of group	64.12%	64.00%	62.44%	71.63%
Activities of students in the group	70.59%	75.50%	68.29%	75.35%
Students' participation in the concluding the result of discussion.	39.41%	55.50%	52.68%	59.07%
Percentage of activeness	57.35%	61.67%	59.92%	67.75%

Figure 1. percentage of student learning activeness in each cycle.

Table 2. Enhancing of the student learning activeness

No	Indicator	Enhancing of each indicator of activeness		
		1 <sup>st</sup> cyle to 2 <sup>nd</sup> cyle	2 <sup>nd</sup> cycle to 3 <sup>rd</sup> cycle	3 <sup>rd</sup> cycle to 4 <sup>st</sup> cycle
1	The enthusiasm of students in the joining of learning	-9.91%	3.43%	6.37%
2	Student's interaction with lecturer	9.21%	-1.09%	14.26%
3	The interaction among students	10.71%	-6.24%	3.73%
4	Collaboration of group	-0.12%	-1.56%	9.19%
5	Activities of students in the group	4.91%	-7.21%	7.06%
6	Students' participation in the concluding the result of discussion.	16.09%	-2.82%	6.39%
Enhancing of activeness		4.32%	-1.75%	7.83%

Table 1 shown that the score of student learning activeness enhanced during implementation of lesson study using the PBL approach which taken place for 4 meetings/cycles with student learning activeness criteria in good category. In the first cycle of the LS, the indicators 1,4,5 of learning activeness were indicators that has a high scores. In the indicator 1, related to the enthusiasm of students in the joining of learning was better than before LS activity as possible learning approaches applied by lecturer was a relatively new in the classroom so that the students were very enthusiastic to join the learning. Setting of learning by a group and giving problems in the student worksheet to be solved by group member provided opportunities for students to collaborate and discuss with the group in order to solve the existing problems.

While student interaction with lecturer and among students were still lacking by looking at the acquisition of those indicators was in the not good category. Based on fact in the classroom in the classroom it shown that students still look shy to ask the lecturer, students prefer to keep silent or ask to their friends if there was material that was poorly understood. Students were less brave in asking to

lecturer directly, they prefer to ask their friends who considered smart or brave to inquire into lecturer. Students were only interacting with the friends who seat closest. This was possible also because during the learning in the LS activity, there are many observers in the classroom who caused students felt a little awkward and ashamed to ask or answer questions of lecturers because they worried if the question was too easy or if the answer was wrong then they will be laughed in the class. This fact also triggered the reluctance of students to participate in the conclusion of the results of discussion. It may be seen from the low scores on the 6<sup>th</sup> indicators. These habits should not be preserved during the learning activity. Overall percentage of student learning activeness in cycle 1 was in good category. Although there were score of three indicators of the student learning activeness were still not good.

Based on table 2, in the second meeting of the LS activity occurred enhancing of student learning activeness of 4.31%. Score of 4 indicators of learning activeness increased significantly, while score of the indicator 1 and 4 of the learning activeness decreased. At this second meeting, there were some students who first attended the lectures of discrete mathematics because they still followed the field experience practice in the school. So they did not know enough about the learning that was used by lecturers. As a result, when they worked with their group they were unfamiliar and a little awkward to interact. Moreover most of these students did not know each other because of different batch. This case possible caused the score of 1<sup>st</sup> indicator about enthusiastic students in the joining of learning was decline of 9.91%. Likewise for the decline in the score of 4<sup>th</sup> indicator which associated with collaboration of group. Students precisely formed two internal groups that discuss different issues of the existing problems in the student worksheet. This indicated a lack of group coordination so that each student was busy working on worksheet with a friend who was sitting nearby. Therefore, in the third cycle was planned to assess the activeness of the group by providing a reward in the form of praise to motivate students during the learning process in order to be more active.

The student learning activeness precisely decreased in cycle 3. While it still in the good category and decline only 1.75%. This can be seen from score of student activeness of 5 indicators decreased. Although the 1<sup>st</sup> indicator increased by 3.43%. The decrease of activeness was possible be caused of the saturation and boredom of students towards learning are used as the research that has been done by Aprilia et al (2012). In the learning when lecturer uses learning method many times monotonously, students will feel bored and saturated. Based on the results of reflection with observers was obtained the finding that although turnover of seating position has been done so

uniformly of each group have felt sitting in the front and rear, the group that seat in front of class was still not active. They did not come forward to take a presentation. In addition, there were students from the beginning to the end of the learning process were not active at all. Students were only silent and passive during group discussion.

The finding from reflection of the 3<sup>rd</sup> cycle became concerning in 4<sup>th</sup> cycle, that was the students who have not been active since the first cycle be pursued actively by ask them to read and explain the material in front of the class. At the end of LS activity, student learning activeness increased of 7.83%. Overall score of indicators of student learning activeness have increased significantly and in a good category. In general, the student learning activeness has started to rise. The more students who want to take presentation in front of the class and respond to their friend's presentation. Some groups have already taken a discussion group, but discussions between the groups still appeared invisible. Some groups worked individual or just a discussion with his friends nearby. This was possible because there were no objects together in a group, e.g. a small blackboard in each group which made each member to focus on one object only. In addition, other possibilities were also due to the number of members of the group of 5-6 students. Perhaps if the number of members of the group was only 3 students then group discussions will go smoothly. But if this was done there would be a lot of groups and it obviously required extensive classroom. Students already used the existing handbook. This facilitated the learning process. Problem-solving skills of students were increasing.

In the figure 1, overall it shows that percentage of student learning activeness enhance during LS implementation by using PBL approach in the discreet mathematics subject although there were also declining at cycle 3. Base on table 2, the enhancing of 4.32% was at 1<sup>st</sup> cycle to 2<sup>nd</sup> cycle, 7.83% was at 3<sup>rd</sup> cycle to 4<sup>th</sup> cycle and the declining of 1.75% was at 2<sup>nd</sup> cycle to 3<sup>rd</sup> cycle.

From the implementation of LS for 4 cycles, the student was still rare to ask. Generally, students who asked at each cycle were the same person. While the other students tend to be quiet, waited for their friends asked or requested other friends to ask. It becomes a task for the lecture to think how to raise the asking ability of the students in the learning. The lecturer's efforts to activate students during the learning influenced many factors including: the number of students in a classroom, learning time, classroom atmosphere, support facilities and infrastructure. The findings for lesson study with 4 meetings can be used as considerations related to matters that affect the student learning activeness are: (1) Placement of students in the group. (2) The students' seating position. (3) Attention lecturer

during the learning process takes place. (4) The existence of reward. (5) The proportion of repeater. From those findings at least it can be consideration for the lecturers to planning their learning. Meanwhile, for the effective implementation of lesson study should involve small observer so that they do not disturb the concentration and psychological of both the students and lecturer.

#### 4 CONCLUSIONS

Lesson study activities using problem-based learning approach in discrete mathematics subject have been able to enhance the student learning activeness at class D of semester VII which totaling 56 students. The enhancing was particularly helpful in the context of academic and character formation of the students in the community. Student learning activeness in the discrete mathematics subject using PBL in the LS activity was in the good cariteria for each meeting.

#### 4 ACKNOWLEDGEMENTS

This study was supported by the Lesson Study Expansion Grant for Teacher Training Institution from The Directorate General of Higher Education, Ministry of Education and Culture Indonesia.

## Reflection Quality Determines The Quality and Sustainability of Lesson Study In Smk Negeri 1 Subang

Deden Suryanto<sup>1</sup>

<sup>1</sup>Lesson Study Facilitator SMK Negeri 1 Subang

**Abstract:** Lesson Study has been running since 2010 at SMK Negeri 1 Subang. During the implementation of lesson study, there are positive impacts and it's so significant to improve the teacher professionalization, increasing and improvement of pedagogical presentation of the learning process in the classroom. Some of the positive influence that : the teachers (100%) stated that the Lesson study was a concrete efforts to made some improving the teaching and learning quality, Lesson study has provided many benefits for an increase in teachers' creativity in managing teaching and learning in the classroom, 100% of teachers stated that Lesson study has provided increased knowledge about the learning that can be used by teachers in teaching and 100% of teachers stated that lesson study has provided an increase in the quality of teachers prepared lesson plans before teaching.

### 1 INTRODUCTION

For the learning process in the classroom, the positive effect are : Lesson study is a fun activity for the students was 96.67%, materials 87% can be easily to understood, observer presence of teachers in the classroom does not interfere as much as 56%, the rest was disturbed 44 % and the teacher is able to motivate the students to learn 92%

In addition to the positive effect above, there are also negative influences or constraints encountered in the implementation of Lesson Study. These constraints include: the teacher Time to teach was interrupted with the Lesson Study activities (100%), meaning and value in order of Lesson Study activities have not touched on aspects of the activities that are meaningful and important to the development of teacher professionalization. Even teachers eventually get bored with the lesson study activities.

There are several factors causing bottlenecks in the implementation of Lesson Study and the emergence of boredom for teachers in its implementation. These factors include the technical implementation of lesson study is conducted on the same day and hour, so that teachers feel aggrieved because their teaching hours uninterrupted. Another factor is the quality factor of an observer who is always focused on the same thing every observing in open class, the teacher eventually get bored because that was found was the same thing every activity in open class.

Solutions for improving the quality and sustainability of lesson study is the presence of a teacher giving an understanding to the observer on the level of reflection that is consistently delivered every implementation of lesson study. If the observer continuously reminded of their duties and functions as well as given the challenges associated with the quality levels of reflection, then the result will be increased (meeting 1 the result of level 4 show : 0,00, meeting 2 ; its increase to 2,86 and meeting 3 : its increase to 14,29). So the implementations of lesson study more qualified and meaningful to teachers. In the end, the

teacher felt the need for the implementation of lesson study. With the increase in the assumed implementation of lesson study will continue getting quality and continuity will be maintained, given the observer teacher already discovered the benefits and values in order of execution of lesson study. For the learning process in the classroom, the positive effect are : Lesson study is a fun activity for the students was 96.67%, materials 87% can be easily to understood, observer presence of teachers in the classroom does not interfere as much as 56%, the rest was disturbed 44 % and the teacher is able to motivate the students to learn 92%

In addition to the positive effect above, there are also negative influences or constraints encountered in the implementation of Lesson Study. These constraints include: the teacher Time to teach was interrupted with the Lesson Study activities (100%), meaning and value in order of Lesson Study activities have not touched on aspects of the activities that are meaningful and important to the development of teacher professionalization. Even teachers eventually get bored with the lesson study activities.

There are several factors causing bottlenecks in the implementation of Lesson Study and the emergence of boredom for teachers in its implementation. ## 2 CONTENT

Lesson Study in SMK Negeri 1 Subang has been running since 2010 up to now. In the course of these 4 years, gained a lot of lesson study both the influence is positive or negative influence. Some positive effects of lesson study on teachers and learning process in the classroom include:

- a. For the teacher:
  1. 100% of teachers stated that Lesson study is one of the instruments made in improving the quality of teachers teaching presented in the classroom.
  2. 100% of teachers stated that Lesson study has provided many benefits for the improvement of teachers' creativity in managing teaching and learning in the classroom.
  3. 100% of teachers stated that Lesson study has provided improved knowledge of learning that can be used by teachers in teaching and learning.
  4. 100% of teachers stated that Lesson study has provided an increase in the quality of teachers prepared lesson plans before teaching.
- b. Those learning processes in the classroom:
  1. Teaching activities is a fun activity for students at 96.67%
  2. The material can be easily understood 87%.
  3. The existence of an observer in the classroom teacher does not interfere as much as 56%, the remaining 44% being distracted
  4. Teachers can motivate students to learn 92%

Negative influence of Lesson Study include:

1. Teacher teaching time disturbed by the Lesson Study activities (100%).
2. Meaning and values in order of Lesson Study activities have not touched on aspects of the activities that are meaningful and important to the development of teacher professionalization. Even teachers eventually get bored with lesson study activities.

3. Teachers (mainly) senior assume Lesson Study is an activity budget spent alone, when there are all running budget until frenetic, but when the budget is not there also no activity.

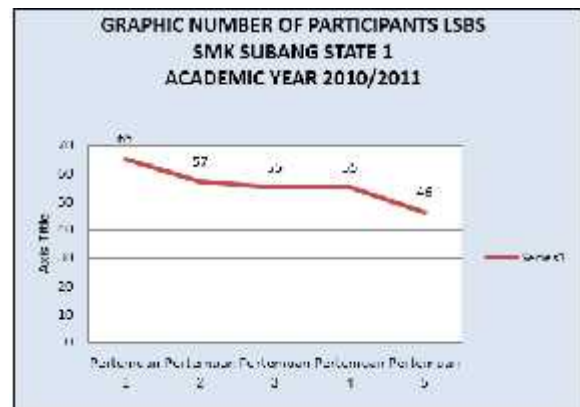

Based on the positive and negative influences on the above, there is a fundamental question that is trying described in this paper. Why teacher lesson study considers an activity that is not meaningful to teachers, so feel bored with the lesson study? Even there were positive effect resulting from the lesson study and it's so significant for increasing professionalization of teachers in implementing the learning in the classroom.

There are several factors that the author tried to lift role in this paper as the answer to the above question. Some of these factors are:

### 1. Techniques Lesson Study implementation.

Lesson study implementation techniques is seen as an answer to the fundamental in assessing the success of lesson study. His understanding is due to the technical implementation of lesson study was conducted in a school are designated only by time (day and hour), giving rise to a sense that the same objections of teachers appointed to participate in lesson study. The reason they convey because of their teaching time in the classroom is interrupted.

Note the level of participant lesson study in SMK Negeri 1 Subang, from the period 2010 to

2012.

Based on the graph above, it can be concluded that the technical implementation LSBS in SMK Negeri 1 Subang with same day and hour, has become one of the causes of the more berkurangnya number of participants Lesson Study.

**2.1 Observer Quality**

One of the activities in the Lesson Study is the Do. This activity is carried out by the teacher in the classroom models and observed by the other participants. At the beginning of Lesson Study activities many findings and the benefits derived from the activity do this. Teachers feel and find some gaps between the plans drafted by the implementation in the classroom. Although the level of observer still struggling about what teachers do in the classroom learning activities.

The next meeting of the findings of the observer

<p><b>LEVEL 1:</b></p> <ul style="list-style-type: none"> <li>1. Judge the Model teacher / teacher Modelless.</li> <li>2. Remarks tends to be partial to good to teachers, rather than on concept-learned / students.</li> <li>3. Without a solution to the way student learning.</li> </ul>	<p><b>LEVEL 2:</b></p> <ul style="list-style-type: none"> <li>1. Has led to student comments and suggests result.</li> <li>2. Brief low accuracy rate course (what students do or the concept only).</li> <li>3. Not one comment related to other comments.</li> </ul>
<p><b>LEVEL 3:</b></p> <ul style="list-style-type: none"> <li>1. Comments combining students, the concept being taught and better solution or a wider audience.</li> <li>2. Comment discusses the ways how students learn it.</li> <li>3. Shows model because what the teacher models do, but tell the what we should do in order to learn the students.</li> </ul>	<p><b>LEVEL 4:</b></p> <ul style="list-style-type: none"> <li>1. Focusing on cognitive experienced by students.</li> <li>2. Focusing on the process of establishing a way of thinking / cognitive experienced by one of the students / ideas.</li> <li>3. Suggestion begins with learning objectives.</li> <li>4. Suggestion leads to the way of the student's learning from the beginning to the end, or at least until the finish in cognitive achievement of learning objectives.</li> </ul>

still revolve around teacher and learning activities, so that the problems that arise and have found similarities between the open lesson with each other. This has led to boredom for teachers to continue to follow the observer lesson study because they tend to think of the problems found with the same or a similar solution called it-that too. Ultimately observer even chatting in class and disrupt the learning situations in the classroom.

At the beginning of the school year 2012/2013, UPI PHKI provide training how to be a good

observer to be a reflection of the level of quality and meaningful to the improvement of teacher professionalization. There are several levels of reflection that determine the quality of lesson study. These levels include:

Levels mentioned above, presented in an effort to improve the quality of reflection by providing a challenge to the observer to improve the quality of the class based on your observations at these levels.

The results obtained after the exposure levels of reflection are as follows:

1. Meeting dated 24 September 2012. At this meeting presented on reflection levels to

participants Lesson Study. The results obtained are:

- a. The graph of level reflection was show :

The following observations focus participants in the open lesson:

2. Meeting dated October 8, 2012
  - a. Level Reflection chart is as follows:

The graph of the above table is presented as follows:

Based on the above data it is concluded that: If the observer continuously reminded of their duties and functions as well as given the challenges associated with the quality levels of reflection, then the result will be increased. So the implementations of lesson study more qualified and meaningful to teachers. In the end, the teacher felt the need for the implementation of lesson study

b. Participant observation chart Focus Lesson study:

### 3 CONCLUSIONS

1. Lesson Study has been running since 2010 at SMK Negeri 1 Subang. During implementation impact of much positive and significant increase in both increased teacher professionalization and improvement of pedagogical presentation of the learning process in the classroom. Some of the positive influence that teachers include 100 % of teachers stated that Lesson study is one concrete efforts made in improving the quality of teaching and learning , Lesson study has provided many benefits for an increase in teachers' creativity in managing teaching and learning in the classroom , 100 % of teachers stated that Lesson study has provided increased knowledge about the learning that can be used by teachers in teaching and 100 % of teachers stated that lesson study has provided an increase in the quality of teachers prepared lesson plans before teaching .

For the learning process in the classroom, the positive effect is produced by KBM Activity Lesson study is a fun activity for the students was 96.67 % , materials 87 % can be easily understood, observer presence of teachers in the classroom does not interfere as much as 56 % , the rest was disturbed 44 % and the teacher is able to motivate the students to learn 92 %

2. Besides the positive effect of the above, there are also negative influences or constraints

3. Meeting dated October 22, 2012

a. Graph Level Reflection:

4. Focus Charts Lesson Study Participant Observation

Based on the results of Lesson Study for 3 meetings over generalizing the results obtained as the table below:

Meeting
Meeting 1
Meeting 2
Meeting 3

encountered in the implementation of Lesson Study. These constraints include: Time to teach the teacher interrupted the Lesson Study activities (100%), meaning and value in order of Lesson Study activities have not touched on aspects of the activities that are meaningful and important to the development of teacher professionalization. Even teachers eventually get bored with lesson study activities.

3. There are several factors causing bottlenecks in the implementation of Lesson Study and the emergence of boredom for teachers in its implementation. These factors include the technical implementation of lesson study is conducted on the same day and hour, so that teachers feel aggrieved because their teaching hours uninterrupted. Another factor is the quality factor of an observer who is always focused on the same thing every observing open class, the teacher eventually get bored because that was found was the same thing every activity open class.
4. Solutions for improving the quality and sustainability of lesson study is the presence of a teacher giving an understanding to the observer on the level of reflection that is consistently delivered every implementation of lesson study. The results showed that there were increased levels of reflection every lesson study activity and an increased focus on observations every open class implementation. With the increase in the assumed implementation of lesson study will continue getting quality and continuity will be maintained, given the observer teacher already discovered the benefits and values in order of execution of lesson study.

## The Implementation of Pair Work Method in Teaching Grammar iii Through Lesson Study Activity at STKIP PGRI Pasuruan

Diah Anita Pusparini <sup>1</sup>

<sup>1</sup> English Education Department, STKIP PGRI Pasuruan, East Java, Indonesia  
diah\_anita\_48@yahoo.com

**Abstract:** Among the various numbers of English learning components, Grammar or language structure is considered important component in communicating. This is proven by many students still in doubt and scared in communicating by using English due to, other than lack of vocabulary, their fright in making mistakes of the appropriate grammar. It looks like this students' problem in communicating will still going on considering most Grammar classes nowadays are tend to have a full-tense and quiet atmosphere. Thus, one of the ways which can be used to arouse the students' interest in Grammar lesson is by creating as lively and motivating as possible atmosphere to study longer. In order to manage a supportive situation for students to comprehend Grammar material deeper, pair work method can be used where students are able to have a friend/partner to practice their well-structured grammar in communicating or to ask language structure problem they have not fully understood. In fact, understanding concept in a Grammar lecture is not as easy as it looks. Especially if the class has a heterogeneous students, since every student does not have the same ability in understanding a material. There will be students who belong to the low ability zone in understanding a material. Through this consideration, in this research based article, the researcher would like to know whether the pair work method can help the students in understanding the grammar concept easier. This research was done through the Lesson Study activity of the English Education Department at STKIP PGRI Pasuruan especially for the third semester students

**Keywords:** Pair work, grammar

### 1 INTRODUCTION

Grammar is one of a tertiary level subject which must be taken by the college students in STKIP PGRI Pasuruan. There are four levels in Grammar subject, which are Grammar I, Grammar II, Grammar III, and Grammar IV. Grammar cannot be said as an easy subject for the students. Based on the researcher's experience in teaching, the students are still having problems in understanding the structure concept which must be understood in producing appropriate sentences based on a particular rule. This condition might be due to the burden that the students must take by themselves in understanding and doing the tasks given by the teacher/lecturer. Therefore, the researcher would like to implement the pair work method in Grammar III learning process for the third semester students at STKIP PGRI Pasuruan.

In implementing the pair work method, the students are able discuss and work together in solving a problem. According to Case (2008), there are a few good reasons to use pair work method in learning English, they are: there are more time to talk, able to train the students to speak, decreasing embarrassment, fun, students get more attention, a reflection toward mistakes, smoothness, exercises,

and a more dynamic class. Ber íková (2007) also added that pair work gives the chance for students to talk in a comfortable atmosphere, it also increases cooperation among students due to the students centered character, so that pair work gives the chance for teachers to keep their eyes on the students when they are having a discussion or when they are doing the exercises and able to know their difficulties and development.

There are some studies and articles that had been done related to pair work, one of them is Ber íková (2007) which concluded that students are likely and tend to work in pair with a friend though not always having the same partner all the time. However, she also added that students are likely to have a self-paired partner though they might be paired with someone they do not feel comfort with. A pair-work activity is considered helpful for weak students if the pairing arrangement done by pairing them with other brighter students so that they can help each other. The second idea was proposed by Sert (2005), he concluded that giving a pair-work task showed a positive contribution in an academic or social level.

Based on the explanation above, this research is intended to know whether pair-work method can be used to improve the students' ability in understanding the grammar concept which was done through the lesson study activity of the English

Education Department at STKIP PGRI Pasuruan especially for the third semester students. During this activity, the researcher also used some teaching aids as a media such as worksheet and movie clip videos. Those media were used to minimize the time in explaining the material or lecturing so that there were more time used by the students to interact in pair.

## 2 METHOD

This research based article used the Lesson Study steps/procedure in doing the activity; among others are plan, do, and see. The researcher did the “Plan” together with the other teachers who are also teaching in STKIP PGRI Pasuruan. We did the plan a week prior to the open class activity as well as choosing the appropriate material and the teaching media.

After dealing with the plan, the researcher did the open class and being seen by the other members of the team as observers. This “Do” step was done for 4 meetings. Here, the observers examined whether the plan was done well and how it affected the students. Then, the last was doing the “See” step after the open class. The researcher and the observers discussed the findings they found in the classroom and planned a better design for the following open class.

The open class was done to the third semester students of Grammar 3 class which consisted of 30 students. While the materials taken were Perfect aspects for the first meeting, Future forms for the second and third meetings, and Passive voice for the fourth meeting. The materials were taken from Grammar book and the internet.

## 3 FINDINGS AND DISCUSSIONS

In the first open class, the students were able to concentrate well though some students who were sitting on the back row seemed lack of focus. The pair work activity was not running well entirely. Some students tend to rely on their partner rather than doing the task together as a group. This was shown when the students have to answer a certain question; instead of being confidence in answering the question, they asked their partner for the answer. Brown (2007:228) stated that this condition might happen due to the individuality of some students since not all students are willing to share their ideas and prefer to work alone.

Reflecting from the previous open class, in this second open class, the researcher as well as the

Lesson Study Team tried to take control on the students’ focus by giving random questions to each student individually after they did the worksheet. Pair work activity was done quite well and showing a positive result since the students were pairing themselves with a partner they wished. This way, they can do better cooperation though some students were still tend to rely on their partner in doing the task. This condition supported by Ber íková (2007) who stated that students are likely to have a self-paired partner though they might be paired with someone they do not feel comfort with.

As well as the second open class, in this third open class, the researcher and the Lesson Study Team kept on giving random questions to each student individually after they did the worksheet to take control on their focus. Although they still did grammatical mistakes in doing their worksheet, but they seemed reluctant in confirming them to the teacher. As Brown (2007:228) said that students’ errors will be reinforced in small group where students will simply reinforce each other’s errors and the teacher will not get a chance to correct them.

Concerning to the conditions happened in meeting 1 until meeting 3, the researcher and the Lesson Study Team decided to use a Movie Segment Videos to keep the students on the track of paying their attention during the course. They still did the task in a pair work after watching the movie segment videos. The pair work activity was running well since they were able to discuss the task more attractively and the task given was based on the movie segment videos, too. Watching the movie segment videos seemed creating a more comfortable environment since the students were able to communicate well with the pair and becoming more open to deliver their answers. According to Ber íková (2007), pair work gives the chance for students to talk in a comfortable atmosphere. Brown (2007:225) also added that group work offers an embracing affective climate where each individual is not so starkly on public display, vulnerable to what the student may perceive as criticism and rejection.

Below is the table of the students’ score during the open class activity:

Table 1. Students’ Grammar Score

Score	Total				Category
	Open class I	Open class II	Open class III	Open class IV	
91-100	-	-	-	2	Excellent
84-90	5	4	6	7	Very Good
77-83	8	6	9	5	Good

71-76	6	4	7	5	Average
66-70	7	10	6	8	Below Average
61-65	4	3	2	2	Poor
55-60	2	5	2	1	Very Poor
0-54	1	1	1	-	Fail
N	33	33	33	30	
Total Score	2343	2178	2343	2310	
Mean	71	66	71	77	

The table showed an increasing score got by the students during the Grammar III course by using pair work method through Lesson Study Activity. Though there is a decreasing score in open class 2, the students were able to gain more score in open class 3 and open class 4.

In order to have a more in depth figure about the above table (Table 1), below is the figure showing the same data about the students' Grammar score during the open classes: ability; second, students are being paired with someone they feel comfortable with; third, teachers are able to control the students' activity during the pair work in order to minimize grammatical mistakes; and fourth, using an attractive teaching aid which can pull the students' attention together.

Considering those circumstances, there are some suggestions which might be useful for other Grammar teachers in applying this pair work method: first, knowing each student's ability will be much helpful for the teacher to arrange the pair work group; second, it is okay to have students pairing with someone they feel comfortable with, but this cannot happen all the time, so teachers may switch between one and another pair so that in the end, they would feel comfortable to be paired with everyone in the class; and third, use an attractive teaching aid to replace the teacher's explanation which the students thought it might be a bit boring to have only listening to a lecturing activity.

Figure 1. Students' Grammar Score

## 4 CONCLUSIONS

After finishing the open classes for four meetings in Grammar III course, it can be concluded that the implementation of pair work method can be used to improve the students' ability in understanding the Grammar concept since they got more chance to ask and gain more information from their partner/pair intensively during the pair work activity. However, this condition may happen in a certain circumstances: first, students of better ability are willing to share their knowledge with students of lower ability; second, students are being paired with someone they feel comfortable with; third, teachers are able to control the students' activity during the pair work in order to minimize grammatical mistakes; and fourth, one and another pair so that in the end, they would feel comfortable to be paired with everyone in the class; and third, use an attractive teaching aid to replace the teacher's explanation which the students thought it might be a bit boring to have only listening to a lecturing activity.

## Improving Students’ Scientific Ability through Lesson Study-Based Mathematics Learning

Dian Kurniati

*Faculty of Teacher Training and Education, Jember University, JL. Kalimantan No 37 Jember, East Java, Indonesia  
dian.kurniati82@gmail.com*

**Abstract:** Students’ scientific ability is the main concern of every lesson carried out by teachers in Indonesia nowadays. Learning process based on students’ scientific ability was designed such that the students may construct the concept through observation step (to identify or find the problem), design the problem, give the hypothesis, collect the data, analysis the data, make the conclusion and communicate the funded concept. Therefore, improving students’ scientific ability will students’ ability in problem solving and develop students’ positive characters. In this study, three students from 7<sup>th</sup> grades SMP Negeri 1 Jember were randomly selected to observe their scientific ability. The observation was focused on how they were observing, questioning, associating, experimenting, and networking to solve some problems related to mathematics. Periodic observations were conducted during the open classes, one of the stages in the lesson study procedure, in each cycle conducted by the lesson study team members consisting of one teacher and three observers. There was an improvement in scientific ability from three selected students during the third open class compared to the first and the second open classes after reviewed collaboratively by the lesson study team members. In the first open class, two students couldn’t solve the problems correctly because they didn’t comprehend what was the given and which was asked in the problems. In the second open class, three students were able to solve the problems correctly but they couldn’t make the conclusion and communicate that result. However, in the third open class, three students could solve the problems by observing, questioning, associating, experimenting, and networking correctly. Therefore, it can be concluded that there was an improvement in students’ scientific ability after participating in the lesson study-based mathematics learning.

**Keywords:** Students’ Scientific Ability, Periodic observations, Mathematics Learning, Lesson Study.

### 1 INTRODUCTION

The curriculum in Indonesia has been changing and developing overtime and currently Indonesia has changed its curriculum from School Based Curriculum (SBC) to the 2013 curriculum. The government must have obtained a particular reason in changing the curriculum. Ministry of Education and Culture, Muhammad Nuh, stated that Indonesian education system should fit the demand of era. The currently used 2013 curriculum is expected to be a solution to improve human resources quality in Indonesia.

One of the fundamental changes in the 2013 curriculum is the approach used in the Teaching and Learning Process (TLP). The approach used in this new curriculum is scientific approach with five teaching and learning process steps. This approach is focused on how students are observing, questioning, associating, experimenting, and networking the learning material.

Scientific approach is intended to provide insight to students in recognizing and understanding various materials using a scientific approach that information can come from anywhere, anytime and does not always depend on the teacher’s information (Teacher

Centred Learning). Therefore, it is necessary to develop the students’ scientific ability, so that students are able to understand the learning material perfectly. However, many teachers find it difficult to design a study that can enhance students’ scientific ability. One of the teachers’ difficulties is that the teachers’ incapability in understanding the difficulties experienced by students in conducting scientific activity, especially in finding a mathematics concept. In this case, the teachers need the help of observers to help monitor the students’ scientific ability. The observer activity can be developed through lesson study.

Lesson study is a potent embedded peer-to-peer professional learning strategy. It requires teachers and other educators to work collaboratively and continuously based on the collegiality principles and mutual learning (Sumar Hendaya, et al: 2006). Through lesson study, teaching and learning process is developed by the community which then selecting one of the teachers to carry out the study, while other teachers observe students’ learning activities during the teaching and learning process. At the end of the activity, the teacher regroup and conduct a discussion to discuss the result of the teaching and learning process, revise and develop the next learning

program based on the result of the discussion. It is done to help the teacher to find a solution about the problems faced in the TLP. Based on the previous explanation, it is necessary to find a way to enhance the students' scientific abilities, especially in mathematics. Hence, students' scientific ability is the main concern of every lesson carried out by teachers in Indonesia nowadays. Learning process based on students' scientific ability was designed such that the students may construct the concept through observation step (to identify or find the problem), design the problem, give the hypothesis, collect the data, analysis the data, make the conclusion and communicate the funded concept. Therefore, improving students' scientific ability will students' ability in problem solving and develop students' positive characters.

## 2 RESEARCH METHODOLOGY

The three stages of the design implementation of lesson study in mathematics to improve students' scientific ability broadly refers to the Lesson Study cycle according to Lewis, they are Plan, Do and See. The lesson study is carried out for three cycles, with each cycle is focused on observing the students' scientific ability to solve some problems related to mathematics. The learning model designed in the first cycle refers to the students' learning outcomes at the previous meeting, while the learning model used in the second cycle refers to the observers' result in observing the students' scientific ability in the first cycle. The third cycle is also designed based on the result of the observers' observation on the students' scientific ability. Therefore, through these steps, it is expected that problems or difficulties experienced by students can be solved.

In this lesson study, three students from 7<sup>th</sup> grades SMP Negeri 1 Jember were randomly selected to observe their scientific ability. The observation was focused on how they were observing, questioning, associating, experimenting, and networking to solve some problems related to mathematics. Observation made for the first, second and third lessons were recorded for three students, namely student A, B, and C.

According to Wragg (1999), observations can be regarded as a method of gathering classroom evidence because it embeds student's actions and active learning process that describes and record what the students are doing. In this case, periodic observations were made on three students' participation in scientific ability at predetermined time intervals of ten minutes during the lesson from 07.00 am to 08.20 am. Periodic observations were conducted during the open classes, one of the stages

in the lesson study procedure, in each cycle conducted by the lesson study team members consisting of one teacher and three observers. There was an improvement in scientific ability from three selected students during the third open class compared to the first and the second open classes after reviewed collaboratively by the lesson study team members.

## 3 RESULT AND DISCUSSION

Learning material used in the first cycle was “sample and population” and the learning material used in the second cycle was “Probability” while in the third cycle, the application of probability in everyday life was determined as the discussion material.

After reviewing the first and the second lesson, the lesson study team and the teachers involved discussed collaboratively the lesson content and learning activities as well as the classroom discussions. A new lesson plan that comprised of agreed lesson content and learning activities as well as the classroom discussions was determined and implemented.

### The first meeting

1. Student A was able to identify what was given and which was asked in the problem. Sometimes he was able to identify what was given and which was asked in the problem after a seconds. Furthermore, he had been able to make a plan to solve the problem and communicate the reason for choosing the plan fluently and correctly. However, there were several steps of plan whereby he was able to give a reason for choosing such right after a seconds. Furthermore, he was able to do the calculations properly to obtain the proper solution of the problem.
2. Student B had not understood the whole sentences on the questions. Furthermore, he was able identify what was given and which was asked in the problem. Sometimes he was able to identify what was given and which was asked in the problem right after a seconds. Furthermore, he had been able to make a plan to solve the problems well. However, he sometimes could give reasons for choosing a plan, but the solution of the problem cannot be resolved correctly.
3. Student C had not understood the whole sentences on the questions. Furthermore, he was able to identify what was given and which was asked in the problem. Sometimes he was able to identify what was given and which was asked in the problem right after a seconds. However, he had been able to make a plan to solve the problem and communicate the reason for

choosing the plan fluently and correctly. He had also been able to do the calculations correctly, but the solution of the problem cannot be resolved well.

### The second meeting

On the second problem, Student A was able to identify what was given and which was asked in the problem. Sometimes he was able to identify what was given and which was asked in the problem right after a seconds and with a less precise answer. Furthermore, he had been able to make a plan to solve and reason the problems fluently and correctly. Student A was also able to determine the solution of problems in the second meeting properly. However, he could not make the conclusion and communicate that result to his group, so could not Student B and Student C.

### The third meeting

Student A said that he was able to understand the problems well. Furthermore, he was able to identify what was given and which was asked in the problem fluently and correctly. Sometimes he was able to identify what was given and which was asked in the problem right after a seconds. Furthermore, he had been able to make a plan to solve the problem and communicate the reason for choosing the plan fluently and correctly. In addition, he also changed the problem solving steps because he thought that the steps he set earlier was incorrect. Furthermore, he was able to do the calculation correctly to obtain the solution of the problem. After finding the solution of the problem, the student made the conclusion related to the problem and communicate that result to his group, so did Student B and Student C. However, Student B and Student C did feel so embarrassed that they were not able to communicate the conclusion of the problems well. It was caused by their uncertainty on their solutions.

Based on the analysis above, it is badly needed to have a change in teaching and learning process that

teachers should be more facilitating students to be more open when they experience problems. It must be done to improve students' confidence in delivering something.

## 4 CONCLUSIONS

There was an improvement in scientific ability from three selected students during the third open class compared to the first and the second open classes after reviewed collaboratively by the lesson study team members. In the first open class, two students couldn't solve the problems correctly because they didn't comprehend what was the given and which was asked in the problems. In the second open class, three students were able to solve the problems correctly but they couldn't make the conclusion and communicate that result. However, in the third open class, three students could solve the problems by observing, questioning, associating, experimenting, and networking correctly. Therefore, it can be concluded that there was an improvement in students' scientific ability after participating in the lesson study-based mathematics learning.

## 5 ACKNOWLEDGEMENTS

The author gratefully acknowledge the support of The Jember University and Mathematics Education Study Program. The author also deeply thanks to the Mathematics teacher and students of SMP Negeri 1 Jember and all lecturers in the author's department for their support.

**Abstract:** In the newest education curriculum namely curriculum 2013, Indonesian government focuses on building good character for citizen in several aspects which covers religion, social, knowledge, and skill. In order to succeed the government mission to build a good character for the citizen, teachers and lecturers should integrate character building through learning process in the classroom. It can be done by creating a good atmosphere through teacher’s behavior change in the classroom so that the students can enjoy studying so that their good character can be developed. During the team conducted lesson study, self-confidence was chosen to be the main character which was developed. This study proposed to find out how students’ self-confidence can be enhanced through teacher’s behavior change on lesson study program for TEYL 1. The result of the study showed that the students’ self-confidence were enhancing due to the teacher’s behavior change.

**Keywords:** enhance, student’s self-confidence, teacher’s behavior change, lesson study

### 1. INTRODUCTION

Nowdays there are many Indonesian people get moral and attitude crisis. Drug abuse, hostility, plagiarism, cheating, corruption, and social unrest are the examples of negative phenomena that happen in Indonesia. Unfortunately, the doers of negative phenomena are not only ordinary people but also educated people in government system. It is also done by young people to mature people. Furthermore, it also happens not only in a big city but also in rural area. This condition can be solved through education system. Due to solve the problem on moral and attitude crisis, Indonesian government realize Curriculum 2013 as the solution to build good character for Indonesian people through education. Curriculum 2013 aimed at preparing and facilitating Indonesian people to have life skill as an individual with good faith in religion, productive, creative, innovative, affective, and enable give valuable contribution for society, nation, and world civilization (Regulation of Education and Culture Minister No.69, 2013).

The core concept of curriculum 2013 is to prepare graduates to have good and strong faith in religion, social, knowledge, and life skill. Curriculum 2013 views that the balance of knowledge, skill, and attitude is the main foundation in building soft and hard skill for life (Setiyawan, 2014). Hopefully, graduates of curriculum 2013 will survive and are successful in

their life so that they can hinder the moral and attitude crisis in Indonesia.

Concerning on the concept of curriculum 2013, character building can be implemented in all level of education that it covers elementary school, junior and senior high school and university level. In university level, character building can be implemented in the classroom during teaching and learning process. During teaching and learning in the classroom lectures are addressed to build good character to the students by giving a model as lecturer with good character, learning activity, giving assignment, etc.

English department at University of Nusantara PGRI Kediri provides English pre-service teacher program has mission to graduate the English teachers who have a good English skill and entrepreneurship skill, enable to produce qualified English work, and participate in social life actively. In order to reach this mission, English Department provides the students with various subjects to fulfill their competence as a skillful and professional English teacher. Teaching English to Young Learners 1 (TEYL 1) is one of the subjects that it is given to the students that discuss about how to teach English to young learners theoretically and practically.

In line with the English department mission, ideally, students should have good characteristics such as high self-confidence, innovative, active and creative. On the other hand, the fact showed that

only a small part of students in classroom who participate actively during teaching learning process in TEYL 1 (9 students = 25% from 36 students). The students are categorized as active students if they (1) actively pay attention when lecturer delivers materials; (2) actively ask question deals with the material that they do not understand yet; (3) actively answer the lecturer’s question that its aim is to clarify the students understanding; (4) actively give a comment and suggestion for others presentation and performance. The rest of the students showed that they had low self-confidence so that they could not fulfill the requirement of active students. According to the result of the observation, it could be reported that when the lecturer gave a chance to the students to ask question about material – some students made a note about her/his question then gave it to her/his friend, some students did discussion with their friend then when the lecturer came to their seat and asked about the problem they nodded their head, then the rest of them were silent, played their mobile phone, or chatted with their pair.

To solve the problem in the classroom, the writers decided to change their behavior in teaching TEYL 1. The decision is considered the result of self-correction during *Lesson Study* (LS) program. Before join LS, the lecturer rarely did self-reflection on the way she taught students. When she did self-correction and changed the teaching process, she only focused on herself. The result, when the leaning process was not as successful as what she expected, she blamed the students. In addition, before joined LS, learning process tend to teacher center approach.

Having LS program, the writers get more experience and suggestion from the other lecturers who become a member of LS team. According to the results of discussion conducted by the LS team, it was suggested that the writers should change her behavior in teaching TEYL to enhance the students’ self confidence. The teacher’s behavior change covers the model of interaction, the way of giving reward to the students who are actively and confidently participate in the classroom, and the way of giving feedback.

Considering to the problems happen in the classroom and the suggestion from LS teams and their experience in teaching, the writers believe that teacher’s behavior change can enhance the students’ self confidence for TEYL 1 class. This study aims at finding the answer 1) Can teacher’s behavior change enhance the students’ self-confidence? 2) How is the class climate when the teacher change her behavior in the class.

## 2. THEORETICAL REVIEWS

### 2.1 Self –Confidence

Self-confidence can be separated with our life. Having self-confidence whether it is low or high, it gives an effect to our life. Self-confidence is essentially an attitude which allows us to have a positive and realistic perception of ourselves and our abilities (Goel & Aggarwal, 2012). Someone who can be categorized as self confidence person if she/he has attributive personal such as assertiveness, optimism, enthusiasm, affection, pride, independence, trust, the ability to handle criticism and emotional maturity. Furthermore, a self confident person perceives himself to be socially competent, emotionally mature, intellectually adequate, successful, satisfied, decisive, optimistic, independent, self-reliant, self-assured, forward moving, fairly assertive and having leadership qualities.

In addition, Basavanna in Goel & Aggarwal (2012), “Self Confidence refers to an individual’s perceived ability to act effectively in a situation to overcome obstacles and to get things go all right.” It can said that self confidence is a positive personal perception our self to solve any kinds of obstacles and to think that everything can be done perfectly. Having self confidence, it does not mean that a person always can reach what she/ he want, enable to solve all problems but she/he enable to look at what is happening in a positive point of view. In sum, the value of Self Confidence plays an important position in human behavior and personality and is regarded as a basic condition of human existence in modern day world by many thinkers.

### 2.2 Teacher’s Behavior Change

Change is considered as the result of self correction and self reflection due to reach better result. Teachers are used to change how they teach to get better learning outcomes for their students. This change tends referring to the positive change. Pennington (1990) in Richard, Gallo, & Renandya (2001: 47) stated that positive change is a central to the professional life of a teacher. It means that to become a professional teacher, a teacher should do any kind of changes in teaching and learning process. It cannot be limited in time but it is done based on the condition and situation in the class. In addition, Freeman (1989) in Richard, Gallo, & Renandya (2001: 47) describes a number the notions of change:

- 1) Change does not necessarily mean doing something differently; it can mean a change in

awareness. Change can be an affirmation of current practice..

- 2) Change is not necessarily immediate or complete. Indeed change occur over time, with the collaborator serving only to initiate the process.
- 3) Some changes are directly accessible by the collaborator and thereafter quantifiable, whereas others are not.
- 4) Some types of change can come to closure and others are open-ended.

Barley (1992) reported a number of changes that are usually done by the teaching during teaching practices. These changes cover sixteen separate changes as follow:

- 1) Teacher-centered classes were made more students-centered
- 2) Use of more varied, authentic materials
- 3) Earlier focus on accuracy changed to communicative competence
- 4) Decrease the explicit teaching of rules in grammar instruction
- 5) Change in attitude
- 6) Use of group work begun or improved
- 7) Increased use of tasks and students-generated projects
- 8) Changes in procedures for teaching children

Furthermore, the source of teacher change can shaped from several conditions and activities. Vonk (1991) in Richard, Gallo, & Renandya (2001: 50) identified that complex interaction as the moment that promotes teacher change. Complex interaction can assumed as the interaction which involves teacher, colleagues, teacher trainers, and it is possible, a group of students. Having discussion, formal and informal feedback from collaborators, and the interactions with the colleagues, the ideas of change the teaching practice begun to appear. In addition Baley (1992) identifies six other sources for teaching change.

- 1) Dissatisfaction with the current situation
- 2) The connection of a new idea with the teacher's own situation
- 3) A change in the teaching context
- 4) Life changes and personal growth which led to professional development
- 5) A realization of something based on his or her experiences as a learner
- 6) A conflict between the teachers' new beliefs and their practices

Based on the explanation about change, the writers identifies that her change in teaching practice are teacher centered class to students centered, change in attitude and change in

assessment. Change in teacher centered class to student centered class means the teacher activity will not be very dominant in classroom. The activities in the class are design to encourage student's participation. Then, change in attitude can be described as the change of giving feedback. Teacher uses positive feedback whether the students' answer is correct or wrong. By doing so, the students don't feel being blamed by the teacher. Moreover, the change in assessment deals with the change that it is done by the teacher on giving score only focuses on formal assessment to combining formal and informal assessment.

### 2.3 Lesson Study

Lesson study (LS) is an activity in which aimed at enhancing the learning outcomes and teaching process continuously through teacher group collaboration (Sudrajat, 2010). LS commonly consists of model teacher and its collaborator. Model teacher is selected teacher in which his/her teaching process will be improved. Then, collaborator is a teacher as team which help model teacher to improve her/his teaching through planning activity, observing teaching process, then giving reflection.

LS is conducted through several steps: design, implementation, testing, and improvement (Rock and Wilson, 2005: 78). Moreover, Carbin and Kopp in Sudrajat (2010) propose six steps LS include:

- 1) Form a team: select the team which covers model teacher and collaborators. It may consist of 3-6 teachers with good understanding and competence in LS program.
- 2) Develop student learning goals: team discuss the learning material for students as the result of LS.
- 3) Plan the research lesson: model teacher and its collaborator design teaching model to reach the teaching objectives.
- 4) Gather evidence of student learning: model teacher practice the teaching plan, then collaborators observe the teaching process and collect the data as the material for analyze teaching process.
- 5) Analyze evidence of learning: team discusses the result of teaching practice then analyzes its progress whether it reaches teaching objectives or not.
- 6) Repeat the process: team revises the teaching model based on the result of discussion and finding evidence in teaching practice. Then, team do the previous steps, it may be conducted 2-5 times.

### 3. METHODOLOGY

The method used by the model teacher was LS. It was conducted through six steps. According to Carbin and Kopp in Sudrajat (2010) the steps of LS cover 1) form a team; 2) develop student learning goals; 3) plan the research lesson; 4) gather evidence of student learning; 5) analyze evidence of learning; 6) repeat the process

**In forms a team,** the teacher selected the team as collaborator in LS. The team consisted of three lecturers, one lecturer as model teacher, whereas rest of them was collaborators. The lecturer of TEYL 1 was selected as the model teacher. Then the others were collaborators. After the team was settled, they divided the job descriptions for each member. Model teacher was a doer of teaching practice in which her/ his teaching process would be optimized through doing LS collaboratively. Then, the duties of collaborators were work together with model teacher to do LS that it was started with plan activity and it would be finished by analyzing the teaching process as the result of plan activity.

**Develop student learning goals.** In this stage, the model teacher and collaborators formulated the learning goals especially for TEYL 1. Standard competence for TEYL 1 was enable the students to understand the principle of Teaching English for young learners, enable to construct lesson plan based on curriculum and the characteristic of young learners. Besides, preparing the students with knowledge and skills to teach young learners, TEYL 1 aimed at building a good character for the students. According to the results of observation before LS, it showed that the students had low self confidence in the classroom. It could be seen from the fact that when the lecturer gave a chance to the students to ask question about material, some students made a note about her/his question then gave it to her/his friend, some students did discussion with their friend then when the lecturer came to their seat and asked about the problem they nodded their head, then the rest of them were silent, played their mobile phone, or chatted with their pair. The main focus of LS for TEYL 1 was to enhance the students' self-confidence.

**Plan the research lesson.** In plan the research lesson, the teacher model and collaborators identified the problem in TEYL 1, especially on students' self-confidence. The model teacher worked together with the collaborators to analyze the teaching material, constructed teaching material, composed the steps of learning and the assessment. In order to reach the learning goals that focused on enhancing students' self-confidence, they also worked together to find the strategies to overcome the problems. The result of discussion

proposed that the teacher model should change her behavior in teaching process. The teacher's behavior change covered change in teacher centered class into student centered class. It means the teacher was not dominant did the teaching and learning activities in classroom. The activities in the class were design to encourage student's participation, e.g. creating group work activities. Then, change in attitude could be described as the change of giving feedback. She used positive feedback whether the students' answer was correct or wrong. By doing so, the students did not feel discouraged. Moreover, she changed the assessment system. Before LS she give the final scores based on formal assessment, but she changed it by combining formal and informal assessment.

**Collect evidence of student learning.** The teaching practice and observation were done to collect evidence of student learning stage. The teacher model in this stage taught the students based on the lesson plan that had been made in plan stage. A the same time, the collaborators played a role as observers. While she taught the students, the observers recorded the data through observation the students' behavior and monitored the teaching process whether the teacher model did as the plan or not.

To record the progress of students' confidence, the team created a form as follows:

Table 1. The group of TEYL 1- Class 3D English Department of University of Nusantara PGRI Kediri

Group	No.	Name	1	2		16
1	1	Arief Tristian				
	2	Imanuella L.				
	3	Tri Setiyo N.				
2						

The collaborators gave a check (V) to the column if students participated actively in the class.

Besides the observation form, the team also decided to give questionnaires to the students to know their opinion after LS was conducted, e.g. the change of learning activity, their feeling when they have to participate, the advantages of LS for the students.

**Analyze evidence of learning.** This was an important stage. In this stage team analyzed the evidence during teaching process. The observers reported their results during doing observation. It covered the observation for teaching practice and the students' self-confident progress. The weaknesses of the teaching practice were analyzed then team found the solution to overcome them so that it would be happen in the teaching practice.

**Repeat the process.** Based on the result of previous stage, the team repeated the process LS which started with plan.

#### 4. DISCUSSION

After conducting LS, the writers report that changing teacher’s behavior can enhance students’ self-confidence. This can be seen from the data in the table below.

Table 2. The improvement of students’ participation

Meeting	The number of students who participate actively in the class	Presentage (%)
I	7	18,91
II	9	24,32
III	10	27,02
IV	14	37,83
V	22	59,45

From the table above, it can be seen that students’ participation in the learning activity in TEYL class encrease. In the first meeting only seven students participated by answering the teacher’ questions. In the following meetings more students took part in the learning activities. They not only answered the questions, but also initiated to give presentation and to give feedback to other students. They are also confidence to deliver ideas although their ideas sometimes were different from other students.

The following quotations were taken from the answer of the questionnaires.

Student A: *After we have agreement, I feel confident to say when there is a question from the teacher. If I have problem, I can ask the teacher freely without feeling guilty.*

Student B: *There is a big change for me. I feel more confidence when the teacher asks questions. I can express myself freely as the teacher give reward.*

Student C : *Yes, I feel more confident after LS, as my friends and teacher appreciate my ideas in the class.*

The statements above were quoted from the students’ answer written in the questionnaire. At the beginning of the meeting the model teacher made agreement with the students. The agreement was that students who participate actively during the teaching and learning process would be awarded by the teacher. The teacher noted the active students and took certain score from the participation. The

participation includes answering questions, initiating ideas to give presentation, giving judgement on students’ ideas, and responding other students’ ideas. In other words, from the students’ answer it can be concluded that they feel more confident during the teaching and learning process.

#### 5. CONCLUSION

LS can improve the process and outcome of learning. After implementing LS program that is changing the teacher’s behavior in teaching, the writers conclude that class participation and students’ self-confidence were increase in learning TEYL 1. Through LS program either teacher model or collaborators get more experiences on working together on preparing teaching material (plan), observing the teaching and learning process (do), and reflecting the process (see). Problems in teaching learning process can be solved collaboratively through LS. Finally, LS opens teacher’s thoughts and gives solution among colleagues from different point of view.

#### 6. ACKNOWLEDGMENT

It is a great experience for us to carry out Lesson Study both as a teacher model and as an observer. There are a lot of benefits by sharing ideas with colleges therefore we would like to express our gratitude to LS team from the university, English department, colleges, and all the students for the bst cooperation.

## USING COOPERATIVE LEARNING AND PEER ASSESSMENT TO ENHANCE STUDENTS' ABILITY IN PUBLIC SPEAKING AND TO ACTIVATE LEARNING IN SPEAKING IV CLASS

Gusti Nur Hafifah, Pramudana Ihsan, Linda Mayasari, Waode Hamsia  
English Department, Faculty of Teacher Training and Education, Muhammadiyah University Surabaya,  
Jl. Sutorejo 59, Surabaya, Indonesia.  
[gustihafifah@yahoo.com](mailto:gustihafifah@yahoo.com)

**Abstract:** This study is aimed to determine the appropriate learning methods used in the teaching learning process in Speaking IV Course. Through Lesson study activities, Lecturer can examine whether the lesson plans made were appropriately applied in class or not. Speaking IV is the final level of Speaking Course in University for English Department Students. At this level, students are targeted to be a skillful public speaker in real public environment. Students must be able to master and practice the 12 topics in public speaking, in which they had to be 12 kinds of public speakers. Implementing the lesson plan and syllabus in teaching and learning process in the classroom is not easy regarding the limited time and place allocation and also students' speaking abilities. From the Action Research done, it is found that applying Cooperative Learning Methods was able to accommodate and give students more opportunity to perform their skills in Public Speaking Practice in the classroom. This method of teaching also enhances students speaking activity, creativity and confidence to speak in public. Teaching and learning process is also considered more effective and efficient with this method application. Lesson study activities facilitate lecturer to observe the effectiveness of the application of the method used in the class. Through 4 cycles that have been implemented, including (plan, do, and see), The KBK team consisting of Lecturer models, the observers, as well as the KBK Supervisors concluded that Cooperative Learning is suitable to be applied in the Speaking IV Course. In addition to cooperative learning, Peer assessment method (by distributing the assessment instruments to students) was considered succeed in helping the students to do assessment toward their friends' performances and also evaluate their own ability in public speaking. Students can comment on each performance of each topic based on the assessment rubric that has been discussed in advanced by the lecturer at the beginning of the learning in the classroom. Besides that, Project Assignment also considered to be efficient and effective in motivating students' creativity.

**Keywords:** Lesson Study, Public Speaking, Cooperative Learning, Peer Assessment.

### A. INTRODUCTION

Lesson Study is defined as a model of professional development of educators through collaborative and sustainable teaching implementation and review among the teachers, based on the principles of collegiality to build a learning community (Herawati: 2012). Senior lecturer are demanded to work cooperatively and supportively with junior lecturers in an effort to improve the quality of teaching and learning in class. Moreover, embodied collegiality can help senior lecturers to prepare the junior lecturers to fulfill the regeneration of the expertise of teaching.

The Implementation of Lesson Study that includes three stages: plan, do, and see has given positive impacts toward the lecturers and the teaching environment in the faculty. Lesson study creates conducive teaching atmosphere

among lecturers. Lecturers become more honest and respective in giving and accepting critics and suggestions from other lecturers. They also become more reflective and sportive regarding to support the process of teaching quality improvement in the classroom. All the lecturers in KBK (kelompok bidang keahlian) team need these attitudes to enhance effective teaching and learning process as well.

*Speaking IV* course taught in English Department, Faculty of Teacher Training and Education, Muhammadiyah University is a final level of speaking course after *Speaking I, II, and III*. It is expected that at this level the student already has an advanced speaking ability. Therefore students were targeted to be a public speaker after accomplishing this course. It is also expected of students able to master public speaking skills performance in various events and places. The Model Lecturers in this research

teach and apply the syllabus that has been created by the team of Speaking Course. Students are targeted to be 12 kinds of public speakers such as; story teller, public relations officer, sales promoter, motivational speaker, political orator, master of ceremonies, TV anchor, host, etc.

The teaching learning process that has been done is individual presentation performed by the students in the classroom. This kind of learning model is considered ineffective because of the limited time of only 100 minutes lecture for each meeting and in every. While the course has 12 topics to be done in one semester, so each topic must be mastered by students in each meeting. Practically only half of students (17 students) in the class could do the presentation in each meeting (2 x 50 minutes). Each student needs at least 10 minutes for the presentation and the preparation. Beside that by having this method of individual presentation, students become passive and less interactive audience in the classroom. Students still have to be motivated by a variety of ways to become actively engaged in criticizing their friend's performances of each topic. Students tend to be passive and busy with their own activities in class and did not pay attention to their friend's presentation in class. Based on the problems stated above, it is expected that through lesson study program lecturers are able to find a solution of the problem to find appropriate learning method that can be applied in the Speaking IV course in order to improve public speaking skills of the students.

## B. REVIEW OF RELATED LITERATURE

### *Lesson Study*

*Lesson Study* is a model of learning that has meaning "study of learning." *Lesson Study* is a model of professional development of educators through collaborative and sustainable teaching learning process based on the principles of collegiality and *mutual learning* to build a *learning community* (Lewis, 2002). *Lesson Study* is not a method of learning or a learning strategy, but in *Lesson Study* activities can select and apply various methods / learning strategies appropriate to the situation, and the problems faced by teachers. *Lesson Study* can be a learning activity of a number of teachers and experts learning which includes three (3) phases of

activities, including planning (*planning*), implementation (action) learning and observation and reflection (*reflection*) of the planning and implementation of learning, in order to improve the quality of learning. In addition, according to Hendayana (2007: 10) *Lesson Study* is done continuously through three stages, namely *Plan* (Plan), *Do* (Implementation), and *See* (Reflection).

### **Phase One: Plan (Planning)**

In this phase teacher can identify the existing problems in the classroom that will be used for *Lesson Study* activities and planning for solution. Identify the problem in the framework of solving the planning problem is related to the subject (each lesson) that are relevant to the class and the class schedule, student characteristics and classroom atmosphere, method / approach to learning, media, teaching aids, and evaluation of processes and learning outcomes. Based on the results of the problem identification and solution planning discussions, then compiled and packaged in teaching equipment which includes ; Lesson Plan (RPP), Implementation Guidelines for Learning (Teaching Guide), Student Worksheet (LKS), the media or learning aids, instruments of process and product assessment, and classroom observation sheet. The making of the teaching equipment can be done by a teacher or several teachers on the basis of agreement on aspects of learning that is planned as a result of the discussion. The result of the preparation of the learning equipment needs to be consulted with a professor or teacher who is deemed an expert in the group to be refined.

### **Phase Two: Do (Implementation)**

In this phase, a teacher who has been designated (approved) by the group, implements lesson plans (RPP) which have been prepared in the classroom. Experts and other teachers made observations using the observation sheet that has been prepared and other necessary devices. The observer noted the positive and negative in the learning process, especially in terms of student behavior. In addition (if possible), made video recordings (audio-visual) that attentively captured special events made by the teacher or student during the implementation of teaching and learning process in the classroom. These recordings will be useful as authentic evidence of events that need to be discussed in the reflection stage or in seminars *Lesson Study* results, besides

it can be used as a dissemination material to a wider audience.

**Phase Three: See (Reflection)**

After the implementation of teaching (Do) teacher should do immediate reflection. At this stage of reflection, the model teacher, observers and other experts have a discussion about the process of teaching and learning that has been done in implementation process. This discussion is led by the Principal, Coordinator of the group, or teacher designated by the group. First, model teacher is given the opportunity to express his/her impressions during the performance of the teaching and tell the problems faced by his/her self and by the students during the class. Then, the observer (other teachers and experts) present the results of their observations, especially concerning the activities of students during the learning takes place, along with playback of the recorded teaching video. Furthermore, teachers who perform these implementations will provide feedback on the comments of the observer. It is important that the reflection phase reconsider lesson plan that has been prepared as a basis for improvement to the next lesson plan. Whether, the lesson plan is appropriate and can enhance the activity of the students' learning performance or not. If it does not match and support effective learning, then it needs to be considered the revision of teaching and learning methods, students worksheet, teaching aids or media, etc. this consideration are used to improve plans for further learning.

**Cooperative Learning**

According to Jacob (1999) *Cooperative Learning* is learning method, in which a group of students work together and help each other in completing academic tasks. As'ari (2001) states that in *cooperative learning*, students are not only required for individual attempt to achieve success or try to beat their friends, but students are demanded to be able to work together to achieve results together. The social aspect is very prominent and students are required to take responsibility for the success of the group. Nur & Wikandari (2000) said that students more easily find and understand the concepts that are difficult if they discuss the issue with other students. Lonning (1993) states that group discussions, involved the group members' participation is much more effective to change the attitudes and behavior of individuals in a

persuasive discourse. So with *Cooperative Learning*, students who are having problems with the lesson can ask questions to the group without any shames, compared if they should ask directly to the teacher. This will enhance the student's motivation to learn in order to gain a better understanding about lesson material which is learned by searching, finding and developing the concept of a group basis. Thus *Cooperative Learning* is established as student-centered learning (*student centered*) and is not centered on the lecturer (*teacher centered*) as an educator.,

**Public Speaking**

Public speaking can be defined as the process of speaking to a group of people with the aim to inform, influence (persuade) and / or entertain the audience. Many people called public speaking as a "presentation". Like all forms of communication, public speaking has some basic elements that parallel with the communication model proposed by Laswell; communicator (speaker), message (content of the presentation), the communicant (listener / audience), medium, and effects (impact on audience presentation). The purpose of public speaking is diverse, ranging from transmitting information, motivating people or just telling a story. Whatever the goal of the speaking is, a good speaker can affect both the thoughts and feelings of the audience. Nowadays, public speaking is very much needed in a variety of contexts, including in leadership, as a motivator, in the context of religious, educational, business, customer service, to the mass communication such as talking on television or radio listeners.

**Peer Assessment**

Assessment is usually done by the lecturer to the students. There are two kinds of assessment; result results and process assessment. Both result and process assessments are conducted in public speaking course. Process is judged the students activity and participation during the discussions in class, whether they engage actively and critically in response to the issue being discussed or just sit passively. Result assessment can be seen from the product achieved or student generated. In this case, the result of the assessment for the course is overall students' presentation and performance on the various topics that they have assigned to design. The assessment of speaking performance is not only done by the lecturers but can also be done by a fellow student, this is called peer

assessment. Peer assessment between students can be done by filling the assessment rubric that has been set by the lecturer, so students will make an assessment based on the assessment guidelines that has been given and explained by the lecturer. This method is considered effective not only for improving student reflection abilities, but also for enhancing students' active and interactive classroom discussion. Students will be easier to provide comments and suggestions about the appearance of the theme, based on the existing assessment. In addition, students will also be more focused and attentive on their friend's performance. By doing this students can take lesson on their friends strength and weaknesses to improve their own performance.

### C. RESEARCH METHODOLOGY

#### 1. The subject of the research

Students of English Department who are taking course *Speaking IV*, *Class A and Class B*, in the 5th semester of the 2011/2012 academic year and 2 Models Lecturer of Speaking Course.

#### 2. Setting of the research

The research is conducted in English Department, Faculty of Teacher Training and Education, Muhammadiyah University Surabaya. The research is done at the odd semester of the academic year 2013/2014.

#### 3. Research Procedure

Instructional systems development method applied in this research is Lesson Study model by Lewis (2012). Implementation of Lesson Study through three stages: plan, do, and see.

#### 4. Data collection Techniques

During the accomplishment of the three stages of the lesson study *plan*, *do* and *see*, the data were

taken through observation and digital recording (audio-visual)

### 5. Research Instruments

Basically, this study is an effort to build collegiality among teachers in transferring knowledge to students through *lesson study* models. However, the impact of the application of the coaching profession is the *lesson study* to the student is the primary focus of research. Thus the research instruments can be divided into:

- a. Observation sheet (Plan, Do, and see)
- b. Recording
- c. Student Questionnaire

### 6. Data Analysis

The data were analyzed descriptively.

## D. RESULTS

### Implementation of Lesson Study In Four Cycle

#### • Cycle I

Before planning the lesson, all members and team leaders discuss the condition of students, availability of means of support, characteristics of the subject teaching and others. After conducting an analysis of the conditions and circumstances we drafted the lesson plan (RPP), starting from setting the competencies, the competence indicators, and learning objectives, selecting methods of approach and appropriate strategies, formulate scenarios or steps - learning step by considering a variety of possible student response as well as alternative assistance provided by the lecturers, preparing equipment and instructional media needed and also the method of evaluation.

During the implementation phase in the cycle of a Do, Model lecturer did not apply the teaching strategies based on the lesson plan that has been agreed previously (stage plan), due to the limited time available. Not all students, only half numbers of the students have the opportunity in presenting the story telling ability. The lecturer has taught the class very well and mastered the lesson being taught, but she was not able to make the students be active in discussion. The lecturer had difficulty in encouraging students to think critically and to comment on the

other students performances presented in front of the class. Students tend to be passive during the discussion. There are only few students who gave criticism or suggestions about the storytelling that brought by their friends. Most of students were being ignorant and busy preparing for each own presentation and did not focus or pay attention to the story telling being presented in front of the class. Although the lecturer has given instruction that students should observe carefully observe their friends' performance, so that they could learn lesson from others.

Having completed the implementation plan and direct observation the lecturers and observers conducted reflection (see). The model Lecturer was given time to convey the impressions and other things regarding her teaching and the application of the lesson plan that had developed before. Then the observers were given the opportunity to provide feedback and suggestions for improvements that need to be done in the next cycle. Critics and suggestions that were delivered by observers during reflection should be based on the analysis of observation during the learning process. From the results of the first cycle of reflection, it can be concluded that the method of presentation of individual students is not efficient to be implemented in the course of speaking the next topic.

- **Cycle II**

Learning from the experience of the first cycle in which students are not very active and interactive in the classroom, then the KBK team began to prepare better lesson plans using cooperative learning and self - assessing, students are given the description of the assessment rubric and course regulations of the performance this time. In the implementation (do), lecturer divided the class into 3 groups and set the position of the letter U in the sitting room. One group consisted of five students and each student was given 3 minutes to present its product. Other students in the group were asked to pay attention and be given time to assess the performance based on the topic (promoting product). The Implementation of open lesson on the second cycle is considered successful in improving the interaction and activity of students in the class. In addition, the time available for 2 credits of courses, which is 2 times 50 minutes was fairly enough in accordance with the teaching and learning process duration. At the end of the lesson lecturer still had time to give

review about students' overall performance in general and then end the lesson very well.

On reflection cycle to 2 is considered effective to enhance students speaking ability and to activate learning. It was also efficient in terms of time. But this method was suitable to be applied to the topic / subject of 'promoting product' in which the level of competence of the lesson was not so difficult and required only a short time for the presentation. Difficulty level of the language used was also quite easy because it used every day language conversation in the classroom.

- **Cycle III**

In this third cycle Plan CBC team planned to use the same method applied to the second cycle. But not all methods could be applied in cycle 2 could be applied in cycle 3, considering the topics that should be presented to students in the third cycle was quite difficult and required more time for individual presentations. So the model lecturer planned not to use cooperative learning, but would still continue to apply the model of peer assessment in the classroom.

In an open lesson of cycle 3 students still showed interactive activity in the classroom, although the cooperative learning method was not used. The Model lecturer has given students motivation before the class began, the lecturer said to the students that students participation during the discussion , include giving critics and asking questions would be awarded with points or score of students participation. So students must be active during the discussion. Students were given assessment rubric as their guidelines to assess students' performance in doing peer assessment. Nevertheless, the class can fulfill the provided time, the topic being presented in this cycle was “becoming motivator”. Each student had presented his/her motivational speech in 10 minutes and followed by interactive discussion with the audiences. Because of the limited time, not all 16 students could do their presentation in one meeting. However students were more active than the previous cycle. Inspirational topics being presented by some students were able to motivate the audience and make them involved directly and emotionally. The peer assessment itself made the students more focus on the presentation and they were not busy preparing their own presentation , since they were busy judging their friends performance based on the assessment rubric, given by the lecturer.

- **Cycle IV**

The fourth topic of speaking IV being observed was 'Political Campaign'. Lecturers planned to use cooperative learning models and peer-assessment. In addition lecturers slightly adapted the system of debate in the parliament. Tailored to the topic of public speaking this time as a political campaign, the lecture tried to create a conducive and critical atmosphere for parliamentary debate. Like in cycle 2, students were divided into 3 major groups and each student from each group was given the opportunity to present their political campaigns in a group. The time given is a maximum of 4 minutes for each speech and debates or 5 minutes for questions and answers (Q & A) in group and 1 minute for peer assessment. So each student had 10 minutes. Since each group consisted of not more than 6 students then the time allocation needed was sufficient for 100 minutes (2 credits)/ meeting. At this cycle, most of the students looked active and critical in debate session. To have an effective and interactive campaign, debate and question and answers session, students need to be given direction of the campaign mechanism in the classroom. The rules and techniques of the campaign and debate were delivered before the class start to create regular and well managed campaign and debate atmosphere. But this session required a large classroom so that the noise of each group debate did not distract the noise of the other group.

#### E. CONCLUSION

Lesson study provides opportunities for Lecturers to examine and observe learning process in the classroom. It also gives students benefit in terms of improving the quality of education in the classroom. The result of this lesson study found that cooperative learning could be the most appropriate method to use in the course of speaking, where students are required to present oral English skills with a predetermined time. Cooperative learning encourages the activity of students in the classroom because they can communicate actively and critically in commenting on their friends' performance. In addition, this method also increases students' confidence, where each is given same opportunity to present themselves

in the classroom. Peer assessment is also considered to be very useful in drawing students focus and attention toward the presentation in class. In addition, by knowing the assessment rubric at the beginning of learning, the students are better prepared and anticipated in designing and developing the material of the presentation based on given topics each week. With the clear assessment rubric, students know what to do and what will be evaluated on their public speaking performance. Finally, cooperative learning and peer-assessment are recommended methods that can be applied in speaking class, which has limited time and large number of students, to enhance students' ability in speaking skills and to activate learning in class.

**Abstract:** Lesson study is collaborative activity lecturers to enhance the quality of learning. In the lesson study activity, lecturers in same concentration collaboratively plan, do and evaluate (see) learning obviously. This research aims to know affectivity of the graph theory learning on lesson study-based by using problem based learning (PBL) approach toward student learning outcome in mathematics education department of Ahmad Dahlan University compared with learning without lesson study-based and PBL. This research is experimental research. The population is students of mathematics education department at 7<sup>th</sup> semester, sample is taken randomly. Method of collecting data is documentation to obtain data of initial capability; test technique is to obtain data of learning outcome. Instrument that used is a test. Instrument test used construct validity test, which was with validated by expert. The result of the research is the graph theory learning on lesson study-based is not more effective than learning without lesson study-based. This case was indicated with obtained  $t_{hitung} = 1.161$  on the significant level 0.05 and degree of freedom 119 and  $t_{table} = -2.2$  such that  $1.161 > -2.2$ . This case may be caused by observer too much in a class so that concentration of students and model lecturer during learning process was disturbed.

**Keywords:** Lesson Study, Comparison Study, Graph Theory

### 1 INTRODUCTION

Mathematics is a science that is considered to be difficult for most people. In mathematics learning at both the elementary education, secondary education and higher education still much an activity learning, reasoning ability and communication skills are still lacking. It is characterized by the lack of mathematics learning outcomes. Based on empirical data of the student learning outcomes against several subjects in mathematics education study program FKIP UAD obtained that student learning outcomes in general is still low. It is characterized by the number of students take remedial at each semester and there are many students who earn a low GPA. Related to the above, an attempt to improve the efficiency and quality of learning is cultivated concentrations increase by mathematics education study program.

Discrete mathematics are compulsory subjects in mathematics education study program is given in semester 7 with 2 credit. This subject is one applied subject that does not require a lot of prerequisites so that it can be classed as an easy subject. Therefore, based on the observation of discrete mathematics learning for several semesters found that this course is in great demand by students of the semester 5. Although relatively easy subject but still found many students who did not pass and take remedial.

Based on these problems, this study is limited to a comparative study of graph theory learning based on lesson study using PBL on student learning outcomes in mathematics education study program Ahmad

Dahlan University in academic year 2013/2014. The purpose of this study was to determine the effectiveness of graph theory learning based on Lesson study using PBL on the students learning outcomes of mathematics education at the University of Ahmad Dahlan with learning-based without lesson study.

Lesson study is a collaboration activity of lecturers to improve the quality of learning. In lesson study activities, all lecturers collaboratively plan, implement and evaluate learning in a real. Lesson Study emerges as one of the alternatives to address the problem of learning practices that have been seen as less effective (Lewis, 2002). The implementation of lesson study in lectures to develop the professionalism of lecturers. This is because the continuous of LS will provide eight opportunities for lecturers (model and observer) which relate closely to the lecturer's professional development, namely (1) determining learning objectives that match the needs of the student, (2) reviewing and enhancing learning that are beneficial to students, (3) deepening the knowledge of the learning material presented by the lecturer, (4) determining the long-term goals to be achieved by students, (5) planning collaborative learning, (6) analyzing both of the learning process and student behavior carefully, (7) developing a reliable knowledge of learning, and (8) reflecting on their learning implementation based on the development of both students and colleagues. There are three phases of the lesson study. They are planning (plan), implementation (do) and reflection (see).

Problem-based learning according to the Vernon and Blake in Sockalingam (2010) propose that PBL is an instructional approach that uses problems as a context for the student to acquire both problem-solving skills and knowledge. Meanwhile, according to Graff and Kolmos (2003) Problem-based learning is an educational approach whereby the problem is the starting point of the learning process. Thus the problem-based learning can be understood as a learning approach that is characterized by the giving of the problems as a stimulus for students to practice critical thinking and problem solving skills. Problems that used can be raised either from students or lecturers.

Problem-based learning was developed based on the concepts proposed by Jerome Bruner. Features according to the problem-based learning according to Arends in Suprijono (2011) that authentic assessment, interdisciplinary focus, authentic investigations, product, collaboration. The characteristics of problem-based learning are: (1) learning begins with a problem, (2) ensure that the problems are related to the student’s real world, (3) organize lessons around each problem, not around each discipline, (4) gives a great responsibility to the learners in forming and running their own learning process directly, (5) use of small groups, and (6) requires learners to demonstrate what they have learned in the form of a product or performance.

According to some experts quoted Sardiman (2012,) about learning definition such as; 1) Cronbach provided a definition: Learning is shown by the change in behaviors as the result of experience, 2) Harold Spears said Learning is to is observed to read, to imitate, to try something themselves, to listen, to follow direction, 3) Geoch said learning is a change in performance as a result of practice. Also according Sardiman (2012) learning is a changing in behavior or appearance, with a series of activities for example by reading, watching, listening, imitating etc. So learning can be understood as a change in the behavior of individuals towards a better life. Sudjana (2005) define student learning outcomes is essentially a change in behavior as a result of learning in a broader sense includes the areas of cognitive, affective, and psychomotor. Dimiyati and Mudjiono (2006) also mentioned learning outcomes are the result of an interaction act of learning and teaching acts. According to Gagne that mathematics learning outcomes are the abilities of the students after he received his math learning experience or it can be said that the results of learning mathematics is a change in behavior in students, who observed and measured in terms of changes in knowledge, behavior, attitudes and skills after studying mathematics. The changes are interpreted as the improvement and development direction is better than ever. Therefore, the results of study can be interpreted as the result of a learning

activity that determines the success of the learning process.

## 2 METHODS

The implementation of lesson study of discrete mathematics subject involved one lecturer as a model and 17 observers. The topic of matterial was graph theory. This type of research is experimental research. Experimental research is research done deliberately to cultivate the emergence of the variables, in this case generated variables that learning through lesson study and learning through lesson study of other variables are discrete math learning outcomes. The study involved two classes: one class of experiments and a control class. Both of these classes have the same relative ability (homogeneous). The design of this study used a posttest-only design control design, can be seen in table 1.

Table 1. experiment design

	Treatment	Student learning outcomes
Eksperimen	X	O <sub>1</sub>
control		O <sub>2</sub>

Remarks:

X : Learning through lesson study  
O<sub>1</sub> : The learning outcomes through lesson study  
O : The learning outcomes without lesson study without

(Sugiyono, 2008)

The population in this research was students at semester VII of mathematics education study program in Ahmad Dahlan University which consisting of 5 classes. In this research, the sampling of the classes are conducted using random sampling techniques, class D as experiment and class C as a control class.

Data collection techniques used test. The data collection instruments used in this research was test of student learning outcomes. Instrument was essay test. The instrument before used validated at first. The purpose of validation was to determine whether the instrument has been qualified to use the research or not.

The data analysis technique was a method used to analyze data obtained through research. Data analysis techniques are: (1) Test Requirements Analysis: Normality with Chi Square test and Fisher's test of homogeneity of the test, (2) Hypothesis Testing with t test.

## 3 RESULTS AND DISCUSSION

Based on calculations of data, the average of student learning outcomes of discrete mathematics

which graph theory topic at class control was 61.715 and 56.448 of experimental class. For more details are presented in table 2 below.

Table 2. Summary Description of Mathematics Learning Outcomes

Variable	Treatment	
	LS	Without LS
Number of student	63	58
Highest score	100	100
Lowest score	0	10
average	61.715	56.448
Deviation standar	28.115	21.603
variance	790.465	466.673

Based on the results of normality test with chi squared test, learning outcomes data from the control class and the experimental class were normally distributed. For more details can be seen in table 3 below.

Table 3. Summary test for normality

Learning outcomes	$\chi^2_{count}$	$\chi^2_{table}$	Conclusion
Control	10.729	12.592	Normal
Eksperiment	2.421	9.488	Normal

Based on the results of homogeneity test with Fisher's exact test was obtained of  $F = 1,694$ ,  $F_{(0.025,62,57)} = 1.676$  and  $F_{(0.975,62,57)} = 0.6$  so that  $1.693 > 1.675$  then  $H_0$  was rejected, so the data were not homogeneous.

Based on table 3 and 4, the analysis of hypothesis testing using t-test with variances not homogeneous. The steps of hypothesis test as follow:

1. Hypothesis

$$H_0 : \mu_1 = \mu_2$$

$$H_1 : \mu_1 < \mu_2$$

2.  $\alpha = 0.05$

3. Test Statistics

$$t_{hit} = \frac{(\bar{x}_1 - \bar{x}_2)}{\sqrt{\left(\frac{S_1^2}{n_1}\right) + \left(\frac{S_2^2}{n_2}\right)}}$$

4. Area of rejection

$$t < -t_{(\alpha, v)} \text{ with}$$

$$v = \frac{(S_1^2/n_1 + S_2^2/n_2)}{\left(\frac{(S_1^2/n_1)^2}{n_1-1} + \frac{(S_2^2/n_2)^2}{n_2-1}\right)}$$

5. Calculation

Based on the results of the data analyze obtained that  $t = 1.161$  and  $t_{(0.05, 11)} = 2.2$  then  $1.161 > -2.2$ , so  $H_0$  was accepted.

Thus learning the lesson study in discrete mathematics learning was no more effective than discrete mathematics learning without learning the lesson study.

#### 4 DISCUSSION

Lesson Study aimed to improve the learning through processes of collaboration among the lecturers. If the quality of learning was better cause the student's understanding of material related to discrete mathematics increased. However, based on the analysis of the data shown that the discrete mathematics learning through lesson study was not more effective than learning without lesson study.

Based on information from several students, during learning students felt strained. This happened because at the time of the lecture, students were observed not only from his teachers but some other lecturers who served as an observer. They sit spread in the classroom. However, because the number of observers was quite a lot, in the classroom during learning process student was shy to ask. There are some observers who talk behind so unsettle the class. This case can disturbing concentration of students. Based on information from the lecturer models, during lectures felt less comfortable because observed by 17 observers. This caused less of the delivery of content. Many students who took discrete mathematics subject was repeaters and they still took field experience practice in the school, so they joined the learning at 2<sup>nd</sup> meeting of LS. This caused there was difference in the level of understanding of the material.

In addition to the above possibilities, the other possibility of discrete mathematics learning using LS ineffective can be identified: 1). Small class which size was 9 x 8 m<sup>2</sup> with a group of 58 students and 17 observers. 2) the seating arrangement was not optimal because there were some empty seats in the classroom. 3) The repeater student has not been entered at 3 first meetings. 4) the role of observer was not maximal.

Another research stated that the learning through LS was not more effective than the learning non-LS was the research conducted by Khasanah, U. et al (2013). With the same conditions, namely the large number of observers, small class sizes with a large number of students, number of students repeater. This is in contrast with studies and theories existing LS in Indonesia, Japan, or any other State which said that learning based LS was better. (Sanders, 2009). Therefore, the implementation of LS in the mathematics education study program of UAD need to be evaluated.

#### 3 CONCLUSION

Based on the wording that has been described above it can be concluded that discrete mathematics learning using PBL in lesson study activities are no more effective than discrete mathematics without

learning the lesson study activities. Some of the factors that lead-based learning activities suboptimal lesson study is the role of the observer is not optimal, the number of many observers, the size of the room and the seating arrangement of the students.

**Abstract:** An effective attempt to improve learning quality is creating good and solid learning community which is also willing to do continuous improvement. This attempt is implemented in lesson study, which covers three main activities, i.e. plan, do and see. The lesson study involves all lecturers belong to the same subject group to work collaboratively based on mutual learning. It has been discovered a root problem of students’ learning in animal physiology I course which required prioritized solution. This problem was the students’ learning achievement in cognitive domain. Learning strategy implemented in this lesson study activity was problem-based learning (PBL) combined with LOVE (*Lembar Observasi Video/Video Observation Sheet*). This approach aimed to improve students’ learning result. Four cycles of lesson study activities was conducted in animal physiology I course in Biology Department, Faculty of Teacher Training and Education, Universitas Ahmad Dahlan, Yogyakarta. The implementation of this lesson study involved a lecturer as a model with 9 observers and 48 students in a class, on March-April, academic year 2012/2013. Data showed that implementation of PBL combined with LOVE improved students’ learning result with the average score of 48,64; 52; 71,9 and 71,7 in each cycle respectively.

**Keywords:** problem-based learning, love, lesson study, learning result

### 1 INTRODUCTION

Biology Education Department in Faculty of Teacher Training and Education, Universitas Ahmad Dahlan is one of the Teacher Training Institution that has responsibility for educating professional biology teacher candidates. The major challenge for biology education department was to improve students’ knowledge, competences and skills to comply with national education system. Curriculum analysis was continuously implemented to evaluate the needs of external stakeholders, which includes the Senior High Schools. Teacher candidates have always been familiarized with schools’ curriculum to better understand the dynamic requirements of those schools. Knowledge and skills are major consideration to be continuously improved. In order to conduct the improvement in learning process, lesson study has been implemented.

In lesson study, lecturers belong to the same group evaluated the learning process in the class collaboratively. This activity was based on collegiality and mutual learning principles among the lecturers themselves to create learning community. Lesson study also serves as a tool to aid lecturers in creating high quality of lesson plan as well as a guidance to implement this lesson plan in the class. Lewis et al.

(2006) stated that teachers or lecturers should produce high quality of lesson plan, observe and analyze the actual learning experienced in the class. In that way, teachers will make better implication for the learning design and actual learning process continuously.

Teachers in Japan have implemented lesson study model for decades to evaluate how they manage learning design in the class. Furthermore, teachers in United States of America also found the fact that students’ good score in mathematics subject was related with lesson study that has been implemented previously (Lenski & Caskey, 2009). As reported by Lewis et al. (2006) Lesson study implementation in USA has been the fastest-growing model of teacher professionalism development program. Since 2000, many elementary schools have developed lesson study model for their teachers. This approach helped teachers to create learning community in planning and implementing the lesson plan for their students.

Animal Physiology I is one of the core courses for 4<sup>th</sup> semester students of biology education department. This course is a pre-requisite for animal physiology II which is offered in 5<sup>th</sup> semester. Basic competence for this course is to understand physiology concepts in animal’s system and correlation between each system and its application in the real life. Based on the basic competence

formulation, characteristic of this course is in cognitive level C2 and C3 dominantly. However, high order thinking skills have always been a consideration in the learning process.

It has been identified the root problem of students' learning in animal physiology 1 course was learning achievement in cognitive domain. Learning result of this course in the past depicted the students had problem in understanding basic concept and theories of the topic. The difficulties were in extracting information from the textbook or any other learning source which described the topic. Several indicators had been observed to support this conclusion. They were the student's ability to rewrite the concept that has been previously explained was inaccurate, the student's ability to answer short question regarding the concept was low, and the student's presentation of the concepts before their friends was also incorrect. Eventually, their achievements in mid semester examination and or final examination were unsatisfied. However, during the course, some students have shown their best effort to understand the materials by any means, including intensive discussion within student's group. This condition was also observed and considered as the potential answer on the root problem.

Lecturer group discussion as part of the lesson study activity found that Problem-based Learning (PBL) has been considered as a successful and innovative method to assist students in their learning process. This model has opened a new engineering education in accordance with many other learning models with the objective to improve learning quality. Many efforts have been done to clearly define the concept 'problem-based learning'. Howard Barrows, one of the person involved in the development of this model at Mc Master University, Canada, explained the concept in terms of specific attributes as being student-centered, taking place in small groups with the teacher acting as facilitator and being organized around problems (Barrows, 1984 in De Graaff and Kolmos, 2003).

Furthermore, as explained by Hmelo-Silver (2004) that problem-based approach to learning asks the student to experience problem solving so they can learn both content and thinking strategies. PBL is an instructional method in which students learn through facilitated problem solving. They learn complex problem that sometimes does not have single correct answer. They also need to work in group collaboratively to identify what they need to learn in order to solve the problem. Students are engaged in self-directed learning (SDL) and then apply their new knowledge on the problem and the effectiveness of the strategies employed. Teachers role in this method are as facilitator rather than providing knowledge directly to the students.

Ernst & Colthorpe (2008) explained that learning is an active process which involves all learners in many activities to enable them explore and

discover ideas to solve the problems. In this case, problem-based learning approach plays its role in the learning process where learners are exposed to the problem first so they would learn to find to solution.

This kind of active learning was proved to be effective in biology learning process as reported previously (Udovic et al., 2002) to develop students' comprehension on essential biology concepts as well as improve scientific discoveries and critical thinking skills.

In addition, students also needed to improve their understanding on the topic. Due to characteristic of animal physiology course which contains many definition and mechanisms of animal system organs, a full pictures and diagrams explanation solely was not sufficient. At this point, video played important role in complementing learning media for the students. As a treatment to encourage students in extracting information regarding the topic independently, student worksheets were given. This worksheet required students to observe video related to the topic to enhance their understanding on the concept. This worksheet was specially named LOVE (Lembar Observasi Video/ Video Observation Sheet). Implementation of PBL combined with LOVE in lesson study activity on animal physiology 1 course was expected to improve students' learning result.

## 2 METHODS

Basically, lesson study was conducted in three main activities, i.e. plan, do, and see (reflection). Several previous studies have described the practice of those activities in the class which involves the teachers or lecturers belong to a group. Nahadi (2007) reported the implementation of school-based lesson study with one teacher as a model accompanied by the other teachers in collaboration with lecturers who served as observers. Similar study has also been conducted by Sriyati (2007) who involved high school teachers to be observers in the lesson study activities in accordance with the implementation of classroom action research.

In this study, lesson study activities to improve students' learning result on animal physiology 1 course was conducted in Class B of 2<sup>nd</sup> year (4<sup>th</sup> semester) student academic year 2012/2013 with the total number of students was 48. There were one lecturer appointed as a model, 8 observers and one cameraman/photographer to record the whole activities in lesson study. Implementation of the lesson study was from March 11, 2013 to April 3, 2013 divided into 4 cycles of *plan*, *do* and *see* activities. In plan session, all lecturers involved tried to identify the learning problem. They also designed the lesson plan, student worksheet and observation sheet afterward. The observation sheet was used to collect data regarding the student activities during the lesson. In

addition, all student progress and their achievements were also recorded to be analyzed.

The next step was *do*, which means the implementation of lesson study in the class. Also known as open class, a lecturer appointed as model conducted the learning process in the class while at the same time the observers observed the students activities during the lesson. In this session, the role of cameraman/photographer was very important in capturing anything happened in the class as an evident of students responses to the learning model implemented by lecturer.

After the class was over, all observers, a model and cameraman assembled together in lecturer’s room to discuss whatever happened during the open class. This session is known as ‘see’ or reflection. A model was given the first opportunity to express his feeling and thoughts regarding the learning model that had just been implemented previously. The observers gave their opinions and facts they found regarding the student responses, supported by the data they wrote on observation sheets and the video recorded in the class. The discussion in this session produced suggestions for the improvement in learning process on the next cycle.

In this paper, all data were obtained from post-test on each cycle. The test was conducted after the student presentation session so all materials had been delivered and discussed previously within the groups of the students. In order to objectively assess student’s comprehension on the topic, all tests were designed as short essays. The Minimum Completeness Criteria (MCC) was defined at score 70. This was based on the average students score on animal physiology I course in the previous year. The MCC described the student ability to fulfill the basic competences on the course.

On the other hand, observation sheet filled by all observers were also taken into consideration. This described the student responses during the learning model implementation in the class. All observer suggestions were also considered carefully to support the problem solving in animal physiology I course. The data were then analyzed using quantitative description.

### 3 Results and Discussion

Four cycles of lesson study activities which cover plan, do and see have been conducted. The implementation of Problem-based Learning (PBL) in combination with LOVE (Lembar observasi Video/Video Observation Sheet) have shown an increase both in student learning results and the number of student who pass Minimum Completeness Criteria (MMC) as seen in Figure 1.

Figure 1. Post-test average score and number of student passing minimum completeness criteria (MCC) on each cycle during lesson study activities in animal physiology 1 course.

Overall, there was an increase in the score average of the students in animal physiology 1 course of 48,64; 52; 71,91; and 71,70 in cycle 1 to cycle 4, respectively. There was also an increase of student number who passed MCC from 10 students in cycle 1 to 25 students in cycle 4.

Figure 2. Students score proportion (%) in cycle 1 of lesson study activity.

Post-test average score obtained by students in cycle 1 was the lowest (48,64) with only 10 students pass MCC. This reflected the general capability of the students to understand the materials was low.

In fig.2, score proportion showed that more than 77 percent of the students have not passed the MCC which was set at score 70. Only 15,91 percent of the students got average score in range of 70-80, while only approximately 6 percent of the students had the highest average score of more than 80.

Topic delivered in cycle 1 was about human digestive system. Based on the lecturers discussion in plan activity, it was decided to give the student general overview of the material first, followed by distributing students worksheets to each group. Focus group discussion (FGD) was undergone intensively under the supervision of lecturer. In this session lecturer acted as facilitator to guide the students working on

their assignments. Video material contained brief explanation of the topic was also distributed to each group to help the students answering related questions in their worksheets. It was observed clearly that students' response to this approach was not very satisfied. They seemed to be unfamiliar to learn in such environment that required them to extract information from many learning sources and then discussed it in the group. Conventional learning model that was usually conducted in the class made the students acted passively. This contributed to the lowest achievements of the average scores and number of students achieving MCC in the first cycle.

Reflection discussion on the first cycle found that this approach should be continued in the next cycle. What needed to be improved was the general explanation from the lecturer which should cover details on the topic prior to ask the students extracting information from the video. Post-test was also needed to be more specific to the topic so that students would have less difficult in answering the questions.

Figure 3. Students score proportion (%) in cycle 2 of lesson study activity.

The second cycle showed an increase in the post-test average score. This depicted that students understanding to the topic was generally improved. They started to be familiar with the PBL approach in learning process. In this way, PBL could serve as an advancement tool in learning as previously reported by Hillman (2003). Video materials were also helpful in supporting the students' comprehension on the topic. However, the student number passing MCC was slightly decline to 9 from 10 in the previous cycle. Only 20 percent of the students completely fulfill the basic competence of the course (fig. 3). Despite the decline, there was an increase in the percentage of the students obtained the highest average score of more than 80. Topic of this session was about human respiratory mechanism. Complexity of the topic could also contribute to the students difficulties in understanding it.

Reflection discussion of the lecturer and observers recommended the use of more diagram and pictures to assist the students. It was concluded that in explaining mechanisms, video played important role to enhance students' comprehension. Therefore, the next cycle should also deliver the material in the form of video. The LOVE worksheet also described the students' improvement in extracting concepts and theories of the topic more accurately. A group of students was also identified as having difficulties more than any other group. This group showed sluggishness in the process. It turned out the member of this group was the repeater students, who did not successfully pass this course last year. This group needed more concern and guidance from the lecturer that served as facilitator.

Figure 4. Students score proportion (%) in cycle 3 of lesson study activity.

In cycle 3, as depicted from fig. 1 and 4, students average score reached the highest point at 71,91. Number of students achieved MMC also increased sharply from 9 in cycle 2 to 25 in cycle 3. Students' score proportion described the number of students passed MMC was almost 60 percent compared to the previous cycle which was only 20 percent.

Implementation of PBL seemed to increase not only students' comprehension on the materials, but also the students' independence in learning process. They were no longer entirely depended on lecturer, instead, they experienced the way of extracting information directly from various learning sources, including video. They were also trained on how to express the ideas in the group and combining the concepts they found to understand the topic. At the end of FGD, a representative of each group presented the concept before his/her friends in order to get feedback. This session was also useful for the lecturer to monitor the students' comprehension and to make any revision when misconception occurred. In this cycle, students seemed to be more prepared in discussing the materials with group members. Topic delivered in this cycle was still about respiratory

system, with subtopic lung volume and respiratory regulation. The problem in the worksheet was related to the daily life. In this case, students could get real example of the topic to support their comprehension. There were no substantial misconception or difficulties experienced by the students suggested that this cycle was better than the previous cycles.

PBL approach was helpful for the students in their learning process. However, when setting the students on a problem solving course, they don't know what to do at first. In this case, lecturer needs to provide facilities so they can find out information to solve the problems (Johnston, 1997 in Hillman, 2003). Video served as the best facility to support the explanation of mechanisms or process rather than just images or pictures alone. The video observation sheet (LOVE) was proved to assist students in understanding the topic.

Figure 5. Students score proportion (%) in cycle 4 of lesson study activity.

The fourth cycle of lesson study activity was conducted in the topic cardiovascular physiology. This topic was known to be intricate due to many concepts that required detail observation and thinking from the students. The use of video in explaining the cardio cycle was very substantial. It was found that students' post-test average score was slightly reduced compare to the third cycle (fig. 1). However, the number of students passed MCC was equal to the previous cycle. Score proportion (fig. 5) depicted the increase number of students who obtained the score above 80. The students' number percentage in cycle 4 was decrease in MCC compared to cycle 3 due to the unequal number of total students' presence in those cycles. In last cycle, there were 47 students compared to 43 in third cycle.

In the reflection session, all lecturers evaluated the PBL implementation with the use of LOVE to assist the students achieving the best result. They concluded this approach was significant in improving students' learning result. In accordance to this conclusion, Hmelo-silver (2004) explained that as

a matter of fact, PBL can help students develop: flexible knowledge, effective problem-solving skills, self-directed learning skills, effective collaboration skills, and intrinsic motivation.

In order the students to be successfully learn in PBL environment, there are 7 steps that were suggested, i.e.:

1. Students need to clarify the concepts
2. Students need to define the problem clearly
3. Students analysis on the problem
4. Students find the explanation
5. Students formulation of the learning objective
6. Students need to search further information
7. Students need to report and test new information accurately.

Eventually, using PBL, students become lifelong learners who have learned to take responsibility for their own learning process (De graaf and Kolmos, 2003).

In addition to that, determining MCC should be more comprehensive to get the most objective point. Nasirullah (2013) stated that deciding the MCC was complex. Many things should be taken into considerations, such as complexity of the course, facilities that support the learning process and the individual capability of the student. In this case, through lesson study, lecturers have the opportunity to learn and discuss more about setting up the MCC objectively.

At the end, lesson study activity was a significant attempt not only to improve professionalism of lecturers, but also to increase the students' learning quality. As previously explained by Lenski and Caskey (2009), lesson study activity was very helpful to improve lecturers'/teacher's professionalism by constructing, organizing, sharing, and sharpening their knowledge in learning process. Therefore, plan, do and see need to be implemented appropriately to solve students' learning problems and at the same time, help them achieving the expected competences.

## 4 CONCLUSIONS

Combination of PBL with LOVE implemented in lesson study activity improved the students' learning result. PBL approach in learning has opened up students' mind to significantly develop their knowledge, self-directed learning skill, collaboration skill and also problem-solving skill that made them a lifelong learners. Moreover, lecturers' professionalism through working collaboratively in plan, do and see activities was also improved. In lesson study, there was wide opportunity for the lecturers to develop skills in planning, implementing

and evaluating the learning strategies to improve learning quality.

## 5 ACKNOWLEDGEMENTS

This study was supported by the Lesson Study Expansion Grant for Teacher Training Institution from The Directorate General of Higher Education, Ministry of Education and Culture Indonesia.

## Lesson Study Makes Contextual Learning More Directed in English Learning for 4<sup>th</sup> Graders in SD GagasCeria

Irna Irianti paraswati, S.S

[Irna\\_paraswati@yahoo.com](mailto:Irna_paraswati@yahoo.com)

**Abstract:** Contextual learning is a learning that associates contents with students' daily life. It is also the characteristic of learning in SD GagasCeria. Teachers give the experiences to the students so that the lessons become meaningful. Lesson study is one of the learning tools for the teachers which one of its aims is to improve learning quality. In SD GagasCeria , Lesson study already done since 2009 and it affects the contextual learning in SD GagasCeria. Through Lesson study, the contextual learning develops. Learning in the class more directed then before. In lesson study process, teachers design the lesson together. Here, discussion processes which make learning idea more creative begin. The lesson focus is not only for the teachers but also for the students and the contents. In English lesson in grade 4 of SD GagasCeria , contextual learning already done. For instance, when we learned about "hobbies" we made the activity in a theme called "Gagas Got Talent". In this theme students learned many kinds of hobbies. At the end of the theme, they had to present their hobby in the audition called Gagas Got Talent. In the Gagas Got Talent lesson planning, English teachers and I discussed many kinds of activities which could make students more enthusiastic and active in the class. We discussed about the activities, contents and also about the materials that will be used. However the thing that made the lesson more directed is not only the plan but also the discussion after the lesson. It is called post lesson discussion. It gave many influences for the lesson. Through post lesson discussion, we found that learning stages take important role so that students can understand the contents. Learning stages about hobbies became clearer and more directed. Students were able to reach the learning goal nicely with the exciting process as well

### 1. INTRODUCTION

Contextual learning is the characteristic learning in SD GagasCeria. Teachers give the experiences to the students so that the lessons become meaningful.

As defined by Elaine Johnson in her book *Contextual Teaching and Learning*, contextual teaching and learning (CTL) is "a system of instruction based on the philosophy that students learn when they see meaning in academic material, and they see meaning in schoolwork when they can connect new information with prior knowledge and their own experience" (Johnson, 2002. p. vii).

In other words, contextual learning helps the student to see the meaning of material by connecting it with their personal knowledge, experiences and interest so that the children will feel easy to recognize and learn the subject. It also happens in the lesson of SD GagasCeria.

Apparently, in English learning for 4 grade of SD gagasCeria, contextual learning become more directed through lesson study.

Ozawa (2009) said that lesson study is a teacher's activity to increase their lesson through their collaboration. Lesson study is a cycle that involves plan, do and see. With the teachers

collaboration in planning, doing and reflection so that the contextual learning will be more directed. Through planning and reflection process, the teachers can discuss the stages of the lesson.

Through Lesson study, the contextual learning develops. Learning in the class more directed then before. In lesson study process, teachers design the lesson together. Here, discussion processes which make learning stages become directed begin. Beside that through the discussion there will be a lot of creative idea appear for the lesson. The lesson focus is not only for the teachers but also for the students and the contents.

In English lesson of 4th grade in SD GagasCeria, contextual learning has been done. We bind up the lesson with the theme that makes children interested to learn. Then through lesson study we indicate that English lesson become more directed than before.

### Content

#### 1. The aim

The aim of this article is to indicate that lesson study can make contextual learning in English learning of 4 grade in SD GagasCeria become more directed.

## 2. Design/ Methodology/ Approach

The report from the process of lesson study taken from the answers that were given to the students before and after lesson study.

## 3. Findings

The learning subject is “hobby” and it is familiar for the students. Before the lesson done in a theme (conventional learning), students only can answer the question with the short answer. After the lesson done by the contextual learning with also the lesson study, students seem enthusiastic to learn and they not only can answer the question but they can explain it as well.

**4. Originality/ value :** Data from the answers of the students

**5. Keywords :** Contextual learning and lesson study.

## 2 LITERARY REVIEW

### 2.1 Contextual learning

Contextual teaching and learning (CTL) is “a system of instruction based on the philosophy that students learn when they see meaning in academic material, and they see meaning in schoolwork when they can connect new information with prior knowledge and their own experience” (Johnson, 2002. p. vii).

### 2.2 Lesson study

Ozawa (2009) said that lesson study is a teacher’s activity to increase their lesson through their collaboration. Lesson study is a cycle that involves plan, do and see. With the teachers’ collaboration in planning, doing and reflection so that the contextual learning will be more directed. Through planning and reflection process, the teachers can discuss the stages of the lesson.

Lesson Study has been implemented by the Japanese education system since 1900’s. However, Stigler and Hiebert described Lesson Study extensively in 1999 in their book “The Teaching Gap” (Hock & Sam, 2010). Lesson Study is an approach used to conduct the research on teaching in the classroom. This approach is able to explore the development of more meaningful teaching because it emphasizes the teaching process. The exploration of the teaching process is in the form of inquiry investigation (Chassels & Melville, 2009) and systematically through the observation of teaching (Fernandez, 2002).

Lesson Study is a continuation of collaborative teaching methods and has its own characteristics

(Daipi, 2009). Lesson Study can enhance teachers’ learning experience as well as improve their teaching. Teacher learning experiences include teachers’ knowledge of the content of the lesson (content knowledge) and knowledge of teaching methods (pedagogical knowledge), which should be built and derived from observation and reflection activities of teaching practices (Dotger et al., 2012; Lewis, 2008; Post & Varoz, 2008). It also does not marginalize the importance of students’ learning in the teaching process. The evaluation and reflection of each lesson is not only on teachers but also focuses on the development of student learning. Teachers observe learning ability and intelligence of students (Cheng & Yee, 2012; Lewis, 2008).

This helps teachers plan lessons carefully and meet the students’ needs. In addition, the Lesson Study approach enhance creativity and critical thinking of trainee teachers (Ong et al., 2010), particularly when analyzing in-depth lessons, stimulating innovation, and reforming teaching and learning to find solutions to a problem and to expand understanding skills as well as the ability of teachers and students. Lesson Study can be implemented in various ways to suit the teachers, students, and the environment while meeting the criteria in Lesson Study cycle, as shown in Figure 1.

Figure 2. Cycle of lesson study

Lesson Study implementation involves several teachers teaching sessions. Uniquely, the teachers work together to determine the objective of each teaching session. The first step in the Lesson Study involves teachers’ discussion to determine appropriate learning objectives with targeted students. The teaching objective should be reasonable as students need to understand the concept and teach effectively. In the second step, teachers are asked to build a complete Lesson Plan for teaching together (Lewis, 2008; Post & Varoz, 2008; Teacher Education Division of the Ministry of Education, 2011) based on long-term judgments about student learning. Lesson Plan contains detailed information about different aspects of each lesson to be carried out (Fernandez, 2002).

Cooperation in the preparation of this Lesson Plan is expected to generate more thoughtful ideas. In the third step, a teacher will implement teaching in a simulation classroom based on the proposed

Lesson Plan. Another teacher will monitor and evaluate the teaching (Lewis, 2008; Post & Varoz, 2008). Both are expected to understand the subject matter taught, as they will develop a Lesson Plan.

Therefore, the observation of the students responses is based on observations protocol then the results is recorded (Fernandez & Robinson, 2006). Deep observations will provide detailed feedback to stimulate the teacher to understand their students' learning better (Cheng & Yee, 2012). After completing the lesson, the teacher will reflect on the teaching and learning and discuss the strengths and weaknesses of teaching during the process of teaching (Teacher Education Division of the Ministry of Education, 2011).

As such, the Lesson Plan can be improved based on the reflections, which can be used to identify weaknesses in the operation of learning (Marble, 2007). Next, the second lesson can follow the improved Lesson Plans. Indeed, during the second lesson, the teacher can try to modify the thoughts of students who previously adopted the wrong concept of learning (Cheng & Yee, 2012).

### 3 RESULT

We did the research in English of 4 graders in SD GagasCeria with "hobby" as the material.

Before using the theme, I did the conventional lesson. I discussed with the children about the hobbies in the class. In the class discussion, I asked several questions to the children. They are :

1. What is your hobby?
2. Why do you like it?
3. Where do you usually do it?
4. How do you do/play it?

From the questions above, students only could answer 2 questions. They are 'What' and "why" questions. This is one of the example of the student answer before lesson study.

This is belong to Bema, one of the 4 grade students. When I asked about hobby as we can see above, he only could answer "My hobby is playing soccer because I like kicking".

After that, we began the lesson study. In lesson study, we did three things, plan do and see as can we see in this table below.

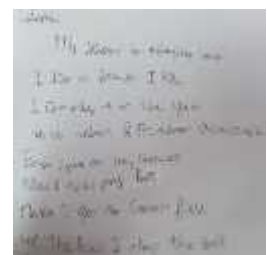

Figure 2. Cycle of lesson study

First we did the plan. In this activity we discussed the preparation and also discussed about the lesson. If we see from the table, plan including determine the aim of lesson and creating the lesson. We determined the aim of the lesson together. The aim of the lesson was the audition. So that at the end of the lesson they have to do demonstrate, describe and write (DDW) their hobby. We created the lesson became the audition called "Gagas Got Talent". We used this as the theme because, we were inspired one of the TV program and students seem interest with this program. They talked a lot about this program. In doing the plan, we also prepared the materials such as video and slide.

After that, we did the second activity. I taught and other teachers observed my lesson. Here we did teaching and then evaluating. We did evaluating after I finished with the class.

In evaluating process, we discussed students response, activity and the lesson itself whether student could understand the lesson or not. Beside that in this process we also discussed about the next stages of lesson or how the students can reach the aims of the lesson. Here I see that the contextual learning began to be directed through the discussion. In order to the students can reach the lesson aim so that we made the check point for each lesson.

Then after we do the lesson study and started to apply the reflection result. Here are one of student's articles.

From the picture above we can see that Bema can answer the question completely. When I ask him, he explained the answer:

" my hobby is playing soccer. I like it because I like sport. I can play it in the yard. It is indoor and outdoor activity. First I put on my costume, then I take my ball, next I go to soccer field and the last I play the ball."

#### 4 CONCLUSION

1. Contextual learning is the characteristic learning in SD GagasCeria. Teachers connect the material with students interest or student daily life so the students will feel enthusiastic to learn.
2. Lesson study makes contextual learning more directed. Through the activity of lesson study learning stages directed in collaboration of the teachers in a team.
3. English lesson in 4 grade of SD GagasCeria also use the contextual learning method. Through English lesson this research indicates that contextual learning can be more directed through lesson study.
4. Students already know the material. It relates with their interest. It is about hobby.
5. Before the lesson done by a theme, students learning outcomes were no so good. From 4 questions, they only can answer two questions with the short answers.
6. After the lesson bind with a theme, students became enthusiastic to learn. Beside that their learning outcomes are better than before. They do not only can answer the questions but also can explain the answer as well.

## Enhancement Learning Activities and Students Understanding by Way of Lesson Study in Taxonomy of Vascular Plants at Biology Education Department Universitas Muhammadiyah Bengkulu

Irwandi and Santoso

*Lecturer of Biology Education Unmuh Bengkulu*

*E-mail : [tabawu@yahoo.com](mailto:tabawu@yahoo.com)*

**Abstract:** The Purpose of this research is to determine whether there is an increasing in the activity of learning and Student understanding by lesson study in Taxonomy of Vascular Plants course at Biology Education Department Universitas Muhammadiyah Bengkulu. Lectures by applying lesson study, namely : *plan, do, and see*. It has been conducted as much as 4 times open lesson at the class. Data are collected by observation paper and test. Results of this research show that the improvement Student learning activity is occurred from open lesson 1 to open lesson 4. Student learning Comprehension in Taxonomy of Vascular Plants increase, namely from open lesson 1 to open lesson 4 the average is 61.43 , 67.03 , 71.03 , 76.37 consecutively.

**Keywords:** Lesson Study, Learning activity, Comprehension, Taxonomy of Vascular Plants

### FOREWORD

#### Background

Student tend to assume that study in college to get much lecturing material and high score. The essence of learning in university is to build mindset and cognitive structure and develop thinking skill which has been ignored, whereas by thinking skills, student is expected to integrate their knowledges and experiences to solve the problem facing on study and life problem generally (Nurhayati, 2011)

This is due to, one of them is the weakness problem on learning process, especially on Science study, is more teacher-centered (Lecturer only gives science as product and students memorize factual information) (Depdiknas, 2008). Learning has been less innovative so far and less encouraging students to build competition desire. Most of Learning is conducting only by giving lecture.

Innovation has been done is only limited on using media, namely sometimes using LCD to show presentation on power point. This is still teacher centered (Sugiharto, 2011). One of learning which can improve a learning process is by problem oriented learning, because problem oriented learning opinion from Ibrahim and Nur (2000:2) is trying to help students become independents and autonomous.

One way to help lecturer so that they can improve their skill in lecture activity is by Lesson Study activity. Lesson study can provide sharing experience among lecturers in order to create a learning community that is programmed. With

lesson study activity assesment of colaborative learning and sustainable based on the principles of collegiality and mutual learning can build learning community, performance of the student in learning is the most important part in learning process, interaction among students, students and their lectures, students and their study material, and students and their environment, are concern matters. On reflection stage (see) lecturer obtain inputs from various competent side, about learning which is directed on how student learns. Therefore, it is possible to improve the quality of learning.

Spermatophyte Systematic course is a group course on group expertise course which is taught on odd semester at Biology Education department Universitas Muhammadiyah Bengkulu. In this course, student is still difficult to understand the systematics content consequently the interest of students are less interested in the subject of systematic.

#### Research Questions

This research question is whether the adoption of Proble Based Learning (PBL) through lesson study activity on Spermatophyte course can increase activity and learning outcomes of student in Biologi education Faculty, Universitas Muhammadiyah Bengkulu?

#### Relevant Research

Research result by Yeni (2012) states that PBL model is better than conventional model and has effect on improving student learning outcomes. Happy N (2011), also stated the implementation of

can enhance the ability of students to think critically and creatively. According to Nopriyeni (2013) stated that there are difference in creative thinking ability of students using PBL learning model, inquiry and conventional. According to Mas'ud (2012) through his research stated that PPL Model lesson study based can enhance the activity, understanding, as well as student motivation in carrying out the teaching and learning process in the classroom. (Mas'ud, 2012) another research result show that there are differences in critical thinking ability of students through PBL learning, GI and conventional, with the highest critical thinking skills acquired through PBL (Apriza, 2013)

**Study of Theory**

**Problems based learning in Spermatophyte systematic course**

Problems based learning (PBL), is one of innovative learning model which can provide an active learning conditions for students. PBL is learning model that involves students to solve a problem through the stages of scientific methods so that students can learn knowledge related to its problem and also have skills to solve the problem. (Ward, 2002; Stepien, dkk, 1993 inside Dasna & Sutrisno, 2010).

According to Arends (1997) problem based learning model is very useful to develop thinking level higher in problem oriented situations, including how a good learning is. In order for a teaching is meaningful, teacher can help the students to learn on solving the problem by giving related tasks with real life, improve process skills to solve problems, and train students to be independent as an autonomous learner.

The role of lecturer in problem based teaching is to present a problem, ask questions and provide the necessary student facilities. Broadly speaking problem based teaching consists of presenting to students the authentic problem situations and meaningful problem that can make it easier for them to conduct an investigation and inquiry.

Table 1 Stages of problem based learning

Stages	Lecturer Behaviour
Stage 1 : Student orientation to the problem	Lecturer explained the purpose of learning, motivate students to engage in problem solving activities chosen.
Stage 2 : Organizing students to learn	Lecturer helps student to define and organize study task related to the problem.

Stage 3 : Guiding the investigation of individual and group	Lecturer encourages students to collect appropriate information, carry out experiments, to get an explanation and problem solving.
Stage 4 : Developing and presenting the work	Lecturers help students to plan and prepare appropriate work such as reports, videos, and models as well as helping them to share the tasks with their friends.
Stage 5 : Analyze and evaluate the problem solving process	Lecturers help student to reflect or evaluate on their investigation and the processes used.

**Implementation of lesson study activity systematic study of spermatophyte.**

Lesson study activity through open lesson and reflection in lecture of Spermatophyte systematic course in Biology education department Universitas Muhammadiyah Bengkulu which includes 3 steps : Planning, do (implementation), and see (reflection) in learning at real classroom during 4 open lesson that has been conducted in October-Novembre 2013. Open lesson is done by 3 step, namely : planning, do (implementation), and see (reflection) with details of the activities for each stage as follows :

(1) Planning

In planning stage, the things are done is as follows :

- a. Analyzing the teaching materials which include : the depth of the material, compliance with demands of curriculum and degree of difficulty.
- b. Determining of learning strategy, such as :
  - b.1 foreward: Motivating students
  - b.2 Core Activity
    - Expected study activity
    - Design student interaction with learning materials
    - Design student interaction with student
    - Design interaction student with lecturer
  - b.3 closing
    - Determining student activity which is expected to conclude the lessons
- c. Creating a learning device
  - c.1 Chapter Design
  - c.2 Lesson Design

- c.3 Student worksheet
  - c.4 Assessment
  - d. Determining observer
    - d.1 Chairman of the program
    - d.2 Lecturer appropriate field
  - e. Determining Lecturers models who will implement the learning in the classroom.
- (2) Do (implentation)
- Do steps is done include the following stages :
- a. Brief meeting (briefing) guided by facilitator in this case Biology education program chairman.
  - b. Lecturer models suggests short plan (lesson plans,objectives,position of teaching materials in the curriculum,the prediction of student response.
  - c. The facilitator reminds the observer to not intervene in the learning process
  - d. Observer may choose a strategic place in accordance with observations plan.
  - e. Lecturer model implements the learning process
- (3) See (reflection)
- On see or reflection stage,the activities done as follows :
- a. Facilitator presents the agenda of reflection.
  - b. Facilitator presents the rules
    - b.1 speak orderly ( be a good listener)
    - b.2 speak politely which is constructive not to prosecute lecturer model
  - c. Each participant was given a chance to speak,speak based on findings observatios.
  - d. 4 inputs is to be focus on " how students learn"
  - e. Lecturer Model presents :
    - e.1 condition are not appropriate and in line with expectations.
    - e.2 Something that changed from planned.
  - f. facilitator gives observer a chance to comment
  - g. Facilitator lets the "notulen" to summarize the discussion
  - h. Facilitattor says at thank and announce the next lesson study activities.

### The Experience that has been done

As chairman grant of higher education lesson study 2013-2014 in Education department Universitas Muhammadiyah Bengkulu,has conducted mortality research of lesson study Biology education programe Universitas

Muhammadiyah Bengkulu. On odd semester 2013/2014 is done 2 groups course of lesson study research,namely plant physiology course and vertebrate systematic. On even semester 2013/2014 2 more course,that is human anatomy physiology and spermatophyte systematic. On odd semester 2014/2015 in animal ecology course whereas on even semester 2014/2014 in Microbiology course.

### Research Methods

This study used a qualitative approach with a case study (Yin,2006). Research question is focused on "how " and "why" aspect to implementation of lesson study in Spermatophyte Systematic course through problem based learning (PBL) in Biology education department Universitas Muhammadiyah Bengkulu. Data obtained by implementing documentation, observation sheets, test sheets, and student work during the implementation of lesson studi in Biology education department Universitas Muhammadiyah Bengkulu in October-November 2013.

### Collecting data Tehniques

The data collection techniques in this study are as follows :

1. Student learning activity  
Students' activity data obtained through observation sheets filled by observer during lecture in classroom.
2. Students Understanding  
Students' understanding data againts spermatophyte systematic course obtained by giving cognitive test to students after learning process.

### Reflection

Reflection is held by having reflection on discussion after the lecture takes place. Discussion participants are lecturer model and observer.

### Research Results

#### A. Research Result

Lesson study activity has been done in Biology education department in august to november 2013,in spermatophyte systematic cours,with the results as follows :

The main agenda from this activity is implementation of open lessso in spermatophyte systematic course with lecturer model Drs.Santoso,M.Si and observer 1. Dr. Irwandi, M.Pd, 2. Dr. Rusdi, M.Si, 3. Drs. C. Darwin, M.Pd,4. Drs. Nasral, M.Pd, 5. Paryanto, M.Pd, 6. Tomi Hidayat, M. Pd and technicians Paryanto, M.Pd. There are 35 Students

involved who take spermatophyte systematic course in 5th Semester. Implementaion of this open lesson consists of 4 cycles. Each cycle is hel discussion plan (plan),implementation in the classroom (do) and reflection from each end of activity (see).

1.Student Learning Activity

Cycle I

Media and learning device is still not complete,as there is no laptop, only one reference book,many specimens were wrong,and the lack of student understanding,the need for clarity in the division of time each learning steps. Students are less active discussion to respond and explain to other groups,and less daring to ask the lecturer about things that have not been understood. Students are still paying less attention to other group in listening to presentation. Group discussion is still less interactive and dominated only by certain people. Interaction in group discussions are a little better.

Cycle II

General observation has improved to a better direction,but there are somethings that need to be improved. During class discussions are still lacking students give arguments,only able to read reference. Student understanding of the course material is still lacking when associated with the original media. The presentation has been balance among sources theory or media with the examples of existing specimens,the working group has been good,and has been utilizing information technology.

Cycle III

Students have observed to native biological media as the leaves of plants in learning process.Gropu discussion of existing student interaction between students and other students. Existing argumentation among students. Contextual material has been started to be understood. Feedback discussions, behaviour,internet facilities have been already good.

Cycle IV

Students have been serious in group discussion, be able to explain in the discussion and are familiar with the group discussion in class learning. Discussion activity in the group has been good by utilizing existing media with internet connection on their laptop. Active role in responding to the presentation of other groups in the class discussion. Debate argument has been increasing and each group involved actively responding to questions.

2. Student learning result

In open lesson 1 activity with gymnospermae topic obtained the average lesson result 61.43, open lesson 2 with agiospermae topic the average learning result 67.03, open lesson 3 with monocotyl topic obatined the average student learning result 71.03, and open lesson 4 with dicotyl topic obtained 76.37 the average student learning result. This means,there is an increase in student results from open lesson 1 to open lesson 4. (see table 2)

Table 2 student learning result in spermatophyte systematic plant course

No	Student Name	OP I	OP II	OP III	OP IV
1	ANGI AL QORANA	50	55	55	65
2	ANIS NURIFA	60	65	70	73
3	AYANG SARI	65	70	78	82
4	AYU PERMATA SARI	65	70	70	83
5	DECKI PURNAMANSYAH	60	75	78	86

### Discussion

From the reflection implementation of problem based learning as implementation of lesson study in spermatophyte systematic plant in Biology education department Universitas Muhammadiyah Bengkulu can be seen that there is an increase in the

activity of the lecture on students seen from reflection result open lesson 1 to 4. Learning interaction between students and students, discussion process, as well as students understanding of the lecture material has increased significantly.

Table 3 Reflection results open lesson I-IV

OPEN LESSON I REFLECTION	OPEN LESSON II REFLECTION	OPEN LESSON III REFLECTION	OPEN LESSON IV REFLECTION
(1) Specimens were taken still incomplete or even wrong (2) Less Spirit in describing the discussion results (3) Less active and coomunicative in giving opinion	(1) Less passionate so that discussion process is not optimal (2) Lack of understanding due to lack of preparation (3) In the discussions are still reading by reference to, and are not able to develop with their own language or words.	(1) there are arguments between students already. (2) Contextual material that has been begun to be understood (3) Feedback discussion has been good (4) There is increasing interaction between group members (5) Mutual argumentation between groups has existed	(1) The discussion accustomed so good enough (2) generally good Overall (3) there is still a group who are less active (4) Arguments between groups is quite good (5) group discussion is good enough.

Student learning results, that is from open lesson 1 :61.43, open lesson 2 : 67.03, open lesson 3: 71.03, and open lesson 4 : 76.37. this is consistent with the advantages of PBL among others: (a) become easier to remember and increased understanding of teaching materials, (b) focus on relevant knowledge, (c) Encourages to think (d) build teamwork, leadership and social skills, (e) build learning skills, (f) Motivate students (Amir, 2009). Lesson study conducted in the classroom with the aim to better understand students and conducted jointly with other lecturer (Rahayu, 2005)

Lesson study is a model of professional development of educators through collaborative learning assessment and sustainable based on the principles of collegiality and mutual learning to build a learning community (Sumar Hendayana, dkk :2006). Lesson study is a comprehensive approach toward professional learning and sustain lecturer become lifelong learners in developing and improve the quality of learning in the classroom. Lesson study is not a method or learning strategy but lesson study activities can apply various methods or learning strategies appropriate to the circumstances, conditions and problems faced by lecturer. Susilo (2006) also stated that through

lesson study, teachers/lectures can assess and develop the learning which can be developed.

In addition to the above, lesson study also can improve the quality of learning and has been conducted in Japan. Lesson study is considered as the secret of Japan's success in improving the quality of education. Stigler and Hiebert (1999) identified several factors which made lesson study can improve the quality of Japan's education : Lesson study is based on a model of learning that are continually increased. Although improvement is achieved through the lesson study activities only slightly, but because of the activities carried out constantly then it becomes great. Lesson study is always focused on how to make students learn. The purpose of education is to make student learn, therefore, any education program should be directed to help the student improve and success in learning. Lesson study focusing on the improvement that can be directly utilized in the existing context. Each learning activity is a unit that must be analyzed and improved so that improvement can be applied directly. Lesson study is a collaboration. By collaborating teachers can exchange ideas directly each other and give feedback for improving the quality of learning.

## Conclusions and Recommendations

### 1. Conclusions

The conclusions obtained from application of problem based learning (PBL) as the implementation of lesson study in spermatophyte systematic plant course in Biology education department Universitas Muhammadiyah Bengkulu, are as follows :

- a. There is an increase in students learning activities in both the original media observation of learning activities and in class activities and group discussions.
- b. There is an increase in student learning, ie, Open Lesson 1: 61.43, Open Lesson 2: 67.03, Open Lesson 3: 71.03, dan Open Lesson 4 : 76.37.

### 2. Recommendations

Recommendations from this activity, namely:

- a. It should be followed up for the next stage that is each lecture always implement lesson study in Biology Education Department Universitas Muhammadiyah Bengkulu, by entering that program as one of requirements for lecturer to get a promotion
- b. Before open lesson activity is conducted, need to discuss with lecturer team first, so that activities can be carried out smoothly.

## Challenges to the Improvement of Teaching and Learning Practices through Action Research *Group work Activity in Senegal*

Kensuke Saito

*Expert, Japan International Cooperation Agency (JICA), 30 Rue de Docteur Calmette, Dakar, Senegal  
saiken0220@gmail.com*

**Abstract:** This paper reports on an action research that attempted to improve teaching and learning practices in Senegal by focusing on group work activities. Group work has been regarded as an important teaching method since the introduction of a new competency-based curriculum in 2009. Despite the effort over the last couple of years, significant changes in the students’ learning experiences have not yet occurred. Concerned about the situation, a project, called *Projet de Renforcement de l’Enseignement des Mathématiques, des Sciences et de la Technologie* (PREMST) supported by the Japan International Cooperation Agency’s (JICA) conducted lesson observations and identified that teachers rarely questioned the actual functioning of group work activities. To address that issue, the project team organized an action research that aims at activating and functionalizing group work activities by using lesson study model. Fourteen schools were selected as the sites of this action research and thirty five teachers were observed. As a result of this research, the teachers focused more on each student’s learning process, and they started to give instructions to students who had difficulties. Moreover, there was a definite improvement in the students’ communication capacities, and the majority of students actively participated in group activities, whereas before the research group work had been dominated by certain leaders. Also, this research implies that lesson study is a mechanism in which both teaching and learning practices are continuously changing.

**Keywords:** Lesson study, Action research, In-service teacher training, Primary education, Education in Africa

### 1 INTRODUCTION

This paper reports on an action research that attempted to improve teaching and learning practices in Senegal by focusing on group work activities. Group work has been adopted in several countries (Cohen, D. K. 1990, Kutnick et al. 2005). The active exchange of ideas within groups gives students an opportunity to engage in discussion, take responsibility for their own learning, and thus become critical thinkers (Totten, Sills, Digby, and Russ 1991). Similar educational challenges have been occurred in under-resourced countries, including Sub-Saharan African countries (see for example O’Sullivan 2004). Although group work is widely accepted and practiced in the classroom, it is also reported that teachers rarely questioned how to utilize such pedagogical method to attain lesson objectives (Barrett 2007). Senegal confronts with a similar problem. Group work has been regarded as an important teaching method since the introduction of a new competency-based curriculum in 2009. Despite the effort over the last couple of years, significant changes in the students’ learning experiences have not yet occurred. Concerned about

the situation, a project, called *Projet de Renforcement de l’Enseignement des Mathématiques, des Sciences et de la Technologie* (PREMST) supported by the Japan International Cooperation Agency’s (JICA) conducted lesson observation and identified that teachers rarely questioned the actual functioning of group work activities. By monitoring lesson study at clustered in-service teacher training, *Cellule d’Animation Pédagogique* (CAP), the national trainers of the project realized that teachers regarded group work as a “panacea” of teaching and it would automatically improve learning in the classroom. Although group work is regarded as one of the important teaching methods, many teachers have not paid attention to student discussions and only conducted a “surveillance” of the classroom. Furthermore, when developing group work assignments, teachers rarely gave assignments which promoted open thinking. Therefore, to address those issues, PREMST organized, as a part of its activities, the action research that aims at activating and functionalizing group work activities by using lesson study model. This paper reports on the results as well as the lessons learned from the action research conducted in 2014.

In this paper, first, I present an overview of primary education in Senegal, focusing on the teacher training system and JICA's approach. Then, in the third section, the action research implementation processes, such as the sample school selection method and details of the intervention conducted by the project team, are explained. In the fourth section, the results of the pre-test and post-test on the teachers' teaching practices and the students' learning experience are analysed. The perceptions of the teachers and school principals, which were collected via questionnaires, are used to support the analysis of the progress in teaching and learning practices. Finally, this paper concludes by providing some implications for future studies and project activities.

## 2 TEACHER EDUCATION AT THE PRIMARY LEVEL IN SENEGAL

The Senegalese government started an educational development program called *Programme d'Amélioration de la Qualité, de l'Équité, et de la Transparence* (PAQUET) in 2013. The PAQUET aims to develop human resources to contribute to sustainable development. In this program, the Government gives a priority to education and training in mathematics and sciences (République du Sénégal 2013). Therefore, sciences and mathematics teacher training is high government priority. In Senegal, teacher training can be divided into two categories. One is the initial training at the teacher training center *Centre Régionaux de Formation Personnels de l'Éducation* (CRFPE). Teacher training at CRFPE, however, is only 9 months; therefore, a program of initial training did not correspond with such a short period. The second type of teacher training is the clustered in-service teacher training, *Cellule d'Animation Pédagogique* (CAP). The CAP is conducted monthly at the cluster level and is separated from the ad-hoc-type training supported by the Ministry of National Education (MEN) and other donors. All teachers have to participate in the CAP without any per-diems. Since 2007, PREMST has used this in-service teacher training system to improve the quality of cluster training.

MEN appointed eleven national trainers from different departments of the Ministry as well as the regional offices. They take charge of all aspects of training from the development of training content, the implementation of training to the monitoring of all levels of training.

During the phase 1 of the project, PREMST has reorganized the CAP and introduced modules on science, mathematics and teaching methods to improve the teaching capacity of teachers (JICA 2010). Based on these results, JICA and MEN decided to continue the project and introduced "Lesson Study" to Senegal in order to establish a continuous in-service training model and to improve the teaching practices at a classroom level. Senegalese lesson study is conducted at CAP whereby teachers from several schools observe lessons and discuss them with their classmates. This lesson study model was officially adopted by MEN and is expected to be introduced to all 14 regions by 2015. The lesson study will be conducted in 8,800 primary schools, targeting all teachers.

## 3 RESEARCH METHOD

This research involved four steps: 1. a pre-test, 2. training that introduces new concept of group work, 3. the implementation, and 4. a post-test. During the implementation phase, teachers strived to improve practices in a classroom using a lesson study model, such as the preparation of lessons by teachers, the implementation of lessons, the analysis of lessons and the feedbacks from colleagues, and the reflection of suggestions to next lessons. Fourteen schools were selected as the sites and thirty five teachers participated in this action research. The project team asked the Academy Inspectorate (*Inspection d'Académie*: IA) in the three regions to select one school per department. The criteria of the selection were that the school principal and teachers should be motivated and talented and that the school should be close to the department's inspection office. For the support at school level, fifteen school principals, eight national trainers, and two Japanese experts were involved into the research. School principals were asked to examine all lesson plans and provide feedbacks to teachers before conducting the lessons. They also observed those lessons and discussed the lesson afterward. The national trainers and Japanese experts also visited schools to provide support to teachers and school principals at school level. Personally, I visited three schools and observed three lessons during the implementation period. And I visited two schools and observed four lessons at the post-test.

## 4 IMPLEMENTATION OF THE ACTION RESEARCH

### 4.1 Result of the pre-test

For the pre-test, the lessons of thirty five teachers were observed to collect the baseline data. During the pre-test, teachers were evaluated by national trainers using a lesson observation sheet, which consisted of two main aspects; students and teachers. Each item was given a score between 0 and 3; 0 (unsatisfactory), 1 (moderately satisfactory), 2 (satisfactory), 3 (very satisfactory). For the students' evaluation items, students were scored based on their understanding and degree of group work participation through lesson observations. For the teacher evaluation items, teachers were evaluated based on their attitude toward the students and their aptitude for teaching. The results of the pre-test revealed that students had difficulties in expressing their ideas, during group work activities. For teachers, it was observed that they did not give suitable tasks for group discussions and did not provide sufficient support to students during group work (See Annex 1).

### 4.2 Training to introduce new concept of group work and tools

Based on the results of this pre-test, the national trainers developed a module and organized a training to strengthen the teachers' knowledge and techniques with regard to group work. Since the group work activities had not fully functioned at classroom level, concepts and techniques which can be applied in practice were explained. Concretely, national trainers explained, by using a module, the reasons why teachers were encouraged to conduct group work in the lessons, the timing of group work activities, and techniques of which teachers could utilize for better communication among students.

Teachers had had difficulties in using group work as an efficient teaching method. They had been satisfied if students discussed something with group members. The module emphasized that group work was just a teaching method, and it has to be utilized to attain lesson objectives. In addition, the module explained the importance of the process of learning. Teachers tended to focus on the result of group work by which only a few students contributed in each group. Teachers rarely paid attention to the answer of individual group members. During the training, national trainers encouraged teachers to focus on ideas of individual students.

In order to apply these new concepts and techniques at the practice, three tools were introduced, one of which was an introductory tool that allowed students to understand how to talk and how to listen during group work. As students were not accustomed to discussions with their classmates, to facilitate these discussions, the project team introduced group work guidelines. The second tool used was a formative evaluation tool for teachers. One of the difficulties observed by the national trainers was that teachers were not effectively observing the discussions. Teachers were observing each group but were not listening to the discussions. To promote more focused listening, this tool was introduced to encourage teachers to take a note of students' ideas. The third tool used was a work sheet for students. It allowed the teachers to understand the learning progress and each student's difficulties, and it allowed students to visualize and understand the steps in the lessons.

### 4.3 The implementation phase

From the end of April to the beginning of June 2014, teachers were asked to conduct at least five lessons that adopt the modality of group work. Figure 1 shows the number of lessons conducted by teachers and the number of monitoring sessions conducted by the school principals and national trainers during that period.

Figure 1: Number of lessons and number of monitoring sessions conducted by school principals and national trainers (N = 35)

Source: PREMST 2 (2014b)

Through the monitoring, national trainers and Japanese experts witnessed that many teachers tried to use tools. For example, many teachers tried to install introductory tools by using posters. Those posters showed how to listen and how to speak during group discussion. Furthermore, several

teachers reminded those rules of discussion during group work. Also, teachers challenged to use work sheet in their lessons. In almost all lessons, teachers prepared work sheets and tried to improve the quality of learning. National trainers and Japanese experts observed that teachers repeatedly explained how to use work sheet since it was new for students. Sometimes, teachers carefully observed the utilization of work sheet during individual work and group work. In regard to the formative evaluation tool, it was not necessarily utilized by teachers. They had difficulties in using this tool during their lessons. Especially, teachers mentioned that they did not have enough time to write down students learning process on the tool. However, teachers tried to understand students' learning process in a different manner, as I will explain afterward.

Although, there were many efforts for the utilization of tools, through the monitoring, national trainers and Japanese experts realized that there were misunderstanding of its utilization. Especially, teachers had difficulties in developing work sheets. The module showed only one example each of work sheet for mathematics and science. Teachers simply copied the model of those work sheets regardless the contents of each lesson. Because of the insufficient understanding about work sheet, some teachers misunderstood that they always had to conduct experimentations, or students had to formulate hypothesis in all lessons, even when conducting experimentations is not suitable for attain lesson objectives. Another difficulty was that some teachers understood work sheet as a kind of evaluation tool at the end of the lesson. National trainers intended to use work sheet to visualize the process of learning. However, several teachers distributed work sheet at the conclusion of lesson and asked students to fill in. One of the lessons which I observed was a lesson of mathematics. It was an introduction of the lesson of decimal number and a teacher set an objective as students could explain the decimal number. In this lesson, the teacher used the work sheet as the evaluation of the lesson. It means that students had to fill in work sheet after long explanation of teachers. This lesson took three hours and students had to endure the painful lesson without break. After this lesson, a national trainer, a school principal, and the teacher talked about her lesson. In this discussion, the school principal suggested that she should use work sheet during her lesson to help them learn better. He explained how to use it as an efficient tool considering lesson contents and lesson objective. The school principal also encouraged her to prepare a plan of next lesson especially focusing of the utilization of work sheet.

## 4.4 Results of the post-test

After the implementation period, the national trainers observed the lessons of each teacher as a post-test using the same lesson observation sheet and the same questionnaire as in the pre-test. The project team conducted a questionnaire for the school principals to collect their perceptions of the activity. This section analyses the results of the post-test, by comparing the scores of the pre- and post-test and the qualitative data.

### 4.4.1 Comparison of the lesson observation scores in the pre-test and post-test

The results from the post-test showed that both the students' and teachers' practices improved, as shown below. Figure 2 shows the progress from the pre- to the post-test. As can be observed, the students improved from 0.92 to 1.49, whereas the teachers progressed from 1.10 to 1.39.

Figure 2: Comparison of the lesson observation scores in the pre- and post-test (N = 35)

Source: PREMST 2 (2014b)

A paired two samples t-test was conducted to compare the score in pre-test with the score in post-test for student aspect. There was a significant difference in the score for the student aspect score in pre-test and post-test ( $M=-0.57$ ,  $SD=0.091$ );  $t(34)=6.19$ , two-tail  $p <=0.001$ . (See Annex 2).

For teacher aspect also, a paired two samples t-test was conducted to compare the score in pre-test and the score in post-test. There was a significant difference in the score for the teacher aspect score in pre-test and post-test ( $M=-0.30$ ,  $SD=0.46$ ,  $N=35$ );  $t(34)=3.83$ , two-tail  $p <=0.001$ . (See Annex 3).

For the comparison result between the pre- and post-test, while students and teachers did

achieve a satisfactory score in several items, some other items needed more improvement. From these post-test results, it can be seen that students still have difficulties in the elaboration of the experimentation protocol for hypothesis verification, participation during practical activities, and the formulation of conclusions from the activity. However, the students had a relatively satisfactory score for commitment of group work activities, the capacity to listen, the capacity to express their own ideas, and the capacity to elaborate production with group members.

Students demonstrated significant improvement in how to use the work sheets. Students also improved their listening capacity and the capacity to express their own ideas which are the main communication requirements for students. As regards the items that showed little improvement, students still demonstrated difficulties in elaborating the experimentation protocol for hypothesis verification, and they were also not good at participation during practical activities, such as experimenting, with their classmates. Regarding the commitment in group work activities, as students get committed in the group work activity in the pre-test, there was a relatively high score in the post-test, but the gain was considered unsatisfactory (See Annex 4).

Also, the post-test results showed that teachers still needed to focus more on the creation of the condition for finding problems, assistance in hypothesis formulation, and support for the elaboration of the verification protocol. However, the post-test scores for teachers were relatively satisfactory for the development of group work, the monitoring of task execution, and the implications for students on the elaboration of the concept and theorem.

For those items that showed a superior gain, it seems that while teachers improved their assistance in hypothesis formulation, the post-test score was still relatively low. Further, from these results, the teachers appeared to have focused on the support of the group activities and inviting their students to elaborate the concepts and theorems at the end of their lesson. For those items that had inferior gains, the teachers appear to have had difficulty in elaborating the verification protocol with the students since the pre-test. About the clarity of instruction, while the score was higher than the pre-test, the gain was not significant. For the remind of security instructions, even though there was a -0.35 gain on the pre-test, the national trainers considered this item to be inapplicable because almost no lessons conducted dangerous experimentation. Therefore, scored this as N.A in the post. That is the

reason why the score of the post-test is inferior to that of the pre-test (See Annex 5).

#### 4.4.2 Questionnaires

In addition to the post-test results, qualitative research was conducted, by applying questionnaires on the teachers and school principals, in which they gave their perceptions on the improvements in the students' and teachers' attitudes, as shown below.

- ✚ Improvement in students' attitudes through the action research
  - High motivation for group work
  - Active participation of all students (Leader is not always the one who dominates the discussion)
  - Emulation among groups
  - Better communication and mutual support among students
  - Understanding the scientific approach concept
- ✚ Improvement of teachers' attitudes through the action research
  - Better supports and analysis of student progress by the teacher
  - Active communication between teachers and students
  - Giving responsibility to students
  - Frequent communication among teachers
  - Practice of “student centered” lessons
  - Preparation of more objective lesson plan because of discussions with colleagues
  - Understanding the importance of preparation of lessons and conducting research by teachers
  - Realization of the diversity of students and their answers
  - Paying attention to both students' answers and students' competences

These answers show that teacher and school principals felt that the students became more motivated to work together. In addition, through this action research, the teachers and school principals felt that the students were being trained to be independent learners and to functionalize their group work with their classmates. In terms of teacher improvement, both school principals and teachers felt that they focused more on each student's learning process. In addition, teachers realized the importance of preparation of lessons and conducting researches. They also frequently communicated with their students to support and facilitate the group work activities.

#### 4.4.3 Description of lesson observation

As shown in the previous section, the scores in the lesson observation are improved. Both students and teachers changed their practices in the classroom. This section shows, using descriptions of lesson observations of one class, how one teacher and his students have changed their practices. The project team filmed three lessons, one is the lesson of pre-test, another is the lesson observed during the implementation period and the other is the lesson of post-test. This class received the visit of national trainers and the project team twice during the implementation phase.

From these descriptions, the students of this class seemed to have improved their attitudes to learning. At the beginning, they had difficulties in formulating their own ideas and group work had not functioned at all. Almost all students did not understand assignments of group work and discussions have been dominated by certain students. Apparently, they were not accustomed to formulating their own ideas and they hesitated to work with their group members. However, through this research, students learned to explain their ideas and discuss with their classmates by following rules of group work such as how to organize group discussions, how to speak own ideas and how to listen ideas of others. In addition to the communication among students, students also actively communicated with their teacher to require him to clarify his instructions.

For the teacher aspects, the teacher improved his practices step by step. At the beginning, he did not pay attention to learning process of each student. What he have done was just a “surveillance” in which he checked whether students worked hard or not. However, at the end, he provided supports more than before and he gave several instructions to students who had difficulties. Apparently, the introduction of work sheet made a confusion among students at the beginning. However, in order to solve the problems, the teacher carefully observed learning process of each students at the end (See Annex 6).

The questionnaire also confirms the change of his perception. During the pre-test, we asked the reason why the teacher had conducted group work activities in his lesson. Then, he vaguely answered that group work was conducted to exchange ideas among group members. However, when the same question was asked at the post-test, his answer became a lot more concrete. He mentioned that he conducted the group work because it was a tool to involve all students in his lesson and to induce their interest in participating in the lesson of germination and agriculture related subjects. His remark confirms that he adopted group work, by considering the

contents and topics of the lesson. In addition, we asked him the satisfaction of lessons. At the pre-test, he was satisfied if students participated in the group work. He was satisfied if children had discussed something with group members regardless the contents of discussion. In addition, he did not pay attention to the discussion contents. Group work itself did not have any meaning for the lesson conclusion. But, at the post-test, he was satisfied because students had been able to draw the conclusion from the discussion with their group members. It means that he started to utilize group work as a teaching method. Thus, through this research, he has learned to use group work as an efficient tool to achieve the lesson objectives, whereas before this research, he had conducted the group work not paying attention to its consistency with the lesson objective.

Apparently, several improvements of teaching practices were observed. However, his practices left much room for improvements. For example, his attitudes to students were not always supportive as shown in the description. He did not give sufficient time for thinking and discussing during individual work and group works. He gave a higher priority to the management of lesson time and he, sometimes, paid less attention to students’ learning progress.

#### 4.4.4 Summary of results

As shown above, through this research, students are accustomed to use work sheet and to improve their communication capacity. Especially, the discussion during the group work is more democratized. Also, as teachers and school principals confirmed, students actively participate in discussions and they are motivated to conduct group work. However, students may need more effort to conduct better group work. For example, they have a difficulty in elaborating the experimentation protocol for hypothesis verification and they sometime hesitated to participate in practical activities, such as experimentation.

Teachers also improved their teaching practices. They started supporting the development of group work. They frequently observed students’ task execution and they gave instructions if needed. These changes are also reported by school principals. Also, teachers may start reflecting their practices and changed their practices based on their reflection. For example, teachers tried to remind the rules of discussion to fictionalize group work since they realized that their supports were not enough. However, their practices left much room for improvements. They have to focus more on the

creation of the condition for finding problems, assistance in hypothesis formulation, and support for the elaboration of the verification protocol.

## 5. DISCUSSION

### 5.1 Improvement cycle of teaching and learning practices

As shown in the previous section, both students and teachers improved their practices through this action research. Especially, students improved their communication capacity, which can lead to better discussions in group. Such improvements in the communication capacity of students were also confirmed by the answers of questionnaires. Both teachers and school principals perceived that the majority of students actively participated in group activities, whereas before this research, group work tended to be dominated by certain leaders. As the students became accustomed to working with their classmates, the discussion within the group gradually opened to everybody. Also, the lesson observations showed improvements of students' practices. They could express their own ideas and discussed with their colleagues. Then, they could formulate interesting ideas by collaborating with their group members. In addition, teachers and school principals perceived that students began to develop a mechanism of collaboration among themselves. For example, they observed that students support their classmates who have difficulties.

Such a demonstration of student maturity did not occur without the maturity of teaching practices. It might be a result of the improved instructions given by the teachers. As confirmed by the post-test results, teachers circulated around groups to understand each student's progress, and then they gave instructions for group work activities. Teachers had to circulate around the classroom because students were unaccustomed to the utilization of work sheet, and many groups could not write anything without the support of teachers. It appears that the fact that students had difficulties in using work sheets encouraged teachers to observe the learning process of each student. The case of the earlier example of the teacher whose lessons were analysed illustrates this point. In his class, the introduction of work sheet made a confusion among students at the beginning. But, this situation forced him to observe carefully the learning process of each students. He gradually changed a function of monitoring. At the beginning, he had simply conducted “surveillance” in the classroom. By the

end, however, his monitoring was meant to support the students, by checking the answers of students and giving instructions to students who had difficulties. In fact, similar changes were reported at least in some of the teachers observed by national trainers and another Japanese expert. One of the significant impacts of this research is that the teachers have started realizing to what extent the students understood or did not understand the lessons, and teachers started focusing on each student's learning process. Also, through the process of lesson study, some teachers seemed to realize the importance of exchange of ideas with their colleagues. And they pointed at the necessity of the preparation of lesson plans and conducting small scale studies for their lesson preparations.

As mentioned above, the learning practices of students are improved by the change of teaching practices. It is also true that the change of teaching practices is influenced by the self-reflection of teachers. This process is a part of lesson study cycle. The teachers found problems of their own lessons through the observation of their students, or sometimes feedbacks from their colleagues. And they tried to improve their teaching practices for a better functionalized group work. As the result of the reflection of teachers' efforts, students also gradually changed their practices. Following the instructions of teachers, students started to discuss with their group members and they expressed their own ideas. This research demonstrates that lesson study can be a mechanism in which both teaching and learning practices are continuously changing.

### 5.2 Challenges for a better functioning of group work

Although both students and teachers began changing their practices, there are still several challenges. For example, teachers themselves seemed to have little understanding about how to formulate hypothesis or elaborate experimentation protocols. In other words, they hardly understood the procedure of the lessons with experimentations or how to practice it in the classroom. This insufficiency in the teachers' understanding strongly influenced the students' learning. As explained, students had difficulties in elaborating the protocol for hypothesis verification and practicing experimentation. The same tendency is observed on the inferior scores in the teachers' items for creating conditions for finding problems, assisting in hypothesis formulation, and supporting the elaboration of the verification protocol. In fact, during the post-test lesson observation, we found that some teachers and even some school principals

failed to understand the meaning of hypothesis and how to elaborate it. One of the reasons why teachers did not understand the experimental approach may be a lack of experience. They might have not experienced such a lesson during their childhood, or they may not have conducted such lessons to their students before. In addition, teachers have no supporting materials to conduct this type of lesson. Obviously, if they are unaccustomed to conduct experimentations, they may hesitate to practice it in front of their students.

Another challenge might be coherence of lesson. As explained, the students need more efforts to formulate conclusions from group work activities. The students had difficulties in drawing conclusion of lesson from their activities. However, it is not necessarily a problem of students. Through this research, teachers learned to adopt group work in their lessons. But, unfortunately, the objective of group work was not always consistent with the objective of the lesson. Even though the students showed interesting opinions during their group works, teachers did not fully utilize these answers to deepen their understanding. The lesson observation of the post-test reported the difficulties of formulating conclusion because of the diversity of students' answers. Teachers need a capacity to understand and respond to students' unexpected answers in order to achieve the objective of lesson.

As mentioned in the previous section, lesson study is a mechanism in which both teaching and learning practices are continuously changed. In order to functionalize this learning mechanism, teachers needs more efforts as shown above. This research indicates the importance of conducting studies by teachers. In this research, the project decided to conduct lesson study in schools, and teachers analysed their practices concerning the learning practices of own students. Teachers should be encouraged to conduct small scale studies in the schools to make functionalize the continuous improvement process. The improvement of learning practices does not occur without the development of teaching practices. Teachers need to continue their studies to offer better lessons to students.

## 6. CONCLUSION AND FUTURE IMPLICATIONS

In this paper, the results of an action research that attempted to improve the teaching practices of teachers as well as the learning experiences of students were explained. As shown in the section of post-test result, the teachers focused more on each

student's learning process, and they started to give instructions to students who had difficulties, within the short implementation period. Moreover, there was a definite improvement in the students' communication capacities, and the majority of students actively participated in group activities, whereas before the research, group work had been dominated by certain leaders. Also, as discussed, this research implies that lesson study is a mechanism in which both teaching and learning practices are continuously changing. While this research resulted in some progress, there are still many challenges remaining. Some teachers did not understand the lessons with the experimental approach or how to put them into practice. This lack of understanding by the teacher strongly impacts student learning.

One of the possibilities for the future is the development of a package of lesson plans and a teacher's guidebook. As discussed, teachers seemed to have little understanding about how to use the experimental approach in the lessons. The package of lesson plans and the teacher's guidebook may allow teachers to understand the important points of the lessons more clearly and how they can be explained in the classroom.

Another implication is the need to develop effective teacher monitoring systems at the school level. For this action research, the project selected schools with motivated and talented school principals, who already played important roles in monitoring at the school level. Because of their efforts, this action research has managed to bring some progress in the learning and teaching practices. To implement this group work model in other schools, the capacity building of school principals is essential; therefore, the project needs to develop a monitoring system with the involvement of the talented school principals.

For the new phase of this action research, the project team intends to revise the guide and redesign the implementation structure based on lessons learned from this research. With regards to the problem of insufficient understanding of experimental approaches, national trainers added several examples of lesson plan and work sheet to encourage teachers to individualize their sheets. Also, for the monitoring by school principals, national trainers developed a tool for school principals to conduct effective monitoring. To confirm the effect of these approaches, the project team will continue with another cycle until the end of July 2015.

Annex 6: Description of lesson observation

	Summary of lesson	Description	
Pre-test	<p><b>Topic: Teeth</b></p> <p>The objective of this lesson was to discover types of teeth and their functions. As an assignment, teacher asked their students to answer three questions such as, 1. What are roles of teeth?, 2. How many types of teeth are there?, 3. Give names of each type. Students started their individual work then conducted a group work. After presentations of 2 groups, the teacher started an explanation of functionality of teeth using a piece of bread and cloth. Some students demonstrated to tear a piece of cloth and bite a piece of bread. After these experimentations, the teacher wrote names of each type of teeth and their functions on a blackboard as a conclusion of the lesson.</p>	<b>Student Aspect: 0.75</b>	<b>Teacher Aspect: 1.00</b>
		<p><i>Student:</i></p> <ul style="list-style-type: none"> <li>• During individual work, many students didn't write their answers</li> <li>• During group work, students continued their individual work. Some group didn't discuss because they haven't finished individual work. Some students simply copied answers of the other students.</li> <li>• Students seemed to be interested in experimentations more than discussions without materials.</li> </ul> <p><i>Teacher :</i></p> <ul style="list-style-type: none"> <li>• The teacher didn't observe students' answers during individual work. He had to prepare an assignment of group work.</li> <li>• One student had difficulty in reading. What the teacher said was "You are too late!"</li> <li>• Insufficient time for assignments. The teacher said 5 minutes for the individual work but he gave 3 minutes. For the group work, he said 30 minutes but he gave 5 minutes.</li> <li>• The teacher looked around to conduct the surveillance of his students during group work</li> <li>• The conclusion of lesson was drawn from neither group work nor students' answers</li> </ul>	
Monitoring	<p><b>Topic: Reproduction of animals</b></p> <p>The objective of this lesson was to learn reproduction of animals. The teacher gave one question such as "How to reproduce these animals?: horses, cocks, birds, and man". First of all, in order to answer this question, individual work and group work were conducted. The represents of each group presented their productions. After those presentations, teacher asked to verify their answers. He distributed textbook and students conducted literature analysis. He concluded this lesson by filling a work sheet.</p>	<p><i>Student:</i></p> <ul style="list-style-type: none"> <li>• Some students asked their teacher to clarify his instructions.</li> <li>• For the first assignment, during individual work, students wrote their own answers. During group work, students followed rules of group discussion and each student showed and shared their own ideas</li> <li>• For the second assignment, they were not always independent learners. They didn't have enough time to think and share ideas with group members. What they had done was just reading the page of which teacher indicated.</li> </ul> <p><i>Teacher :</i></p> <ul style="list-style-type: none"> <li>• At the beginning of the lesson, teacher frequently changed his instructions. It made students confusions.</li> <li>• For the first assignment, the teacher looked around to conduct the surveillance of his students but he didn't check their answers during individual work. At the beginning of group work, he recalled rules of group work. Then he tried to check answer of each group using the monitoring tool and explained how to fill in work sheet. But he didn't have enough time to check all of them.</li> <li>• When teacher conducted his observation, what he said was "Hurry up! You are too late."</li> </ul>	

		<ul style="list-style-type: none"> <li>For the second assignment, teachers indicated pages of which the explication of reproduction was written. He didn't pay attention to progress of each student.</li> <li>To fill in the work sheet, he gave advices to students who had difficulties. He explained meaning of questions in French and Wolof, then he urged his students to elaborate their ideas.</li> </ul>
<b>Post-test</b>	<p><b>Topic: Germination</b></p> <p>The objective of this lesson was to learn conditions of germination. Before this lesson, in order to verify such conditions, students had prepared some pots. In this lesson, as a first assignment, students compared two pots; one was a pot which was watered and another was not watered. This first assignment was done by individual work and group work. For the second assignment, students observed the other pots which were prepared by students under different conditions. After observations, as a conclusion, the teacher explained conditions of germination by using the results of experimentation of pots.</p>	<p><b>Student Aspect: 1.67</b></p> <p><b>Teacher Aspect: 1.67</b></p> <p><i>Student:</i></p> <ul style="list-style-type: none"> <li>Students tried to observe pots in various ways. Some of them checked condition of soil and others checked seeds.</li> <li>Each student wrote down their own opinions during individual work</li> <li>For the second assignment, students actively discussed more than before since they had settled conditions of experimentation by themselves. They discussed results of experimentations and why their experimentations were failed or succeeded.</li> </ul> <p><i>Teacher :</i></p> <ul style="list-style-type: none"> <li>Instructions to students were clearer than before. The teacher explained what students have to do during individual work and group work. He also reminded how to use work sheet.</li> <li>At the beginning of group work, the teacher recalled rules of group work. He visited at each group to check whether students followed rules or not.</li> <li>He didn't give enough time for the second assignment. Students didn't have sufficient time to exchange their opinions.</li> <li>After the second assignment, students gave their interesting opinions about conditions of germination. But he couldn't utilize those answers to draw the conclusion since they were diverse.</li> </ul>

## Building Blocks, Stumbling Blocks -Student Responses In Understanding The Point, Line And Plane Through Dialogue

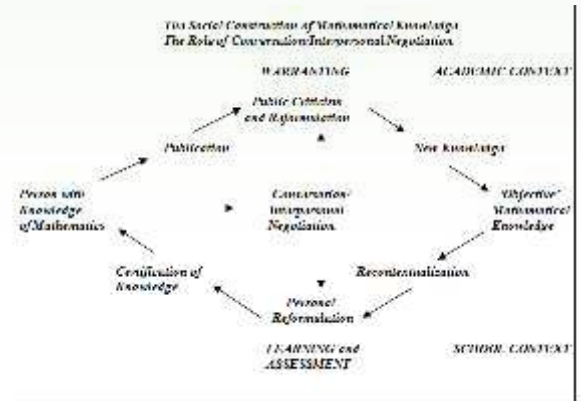

Luis allan b. Melosantos  
Quezon city, philippines

### 1. STATEMENT OF THE PROBLEM

How do students participate through dialogue in their construction of knowledge about the undefined terms point, line and plane ?

### 2. BACKGROUND / REVIEW OF RELATED LITERATURE

This action research is a follow-up to my work in M.A. Basic Education, Major in Mathematics at the Ateneo de Manila University, finished in 2010, investigating the power of enhancing dialogue in the study of Geometry. The work is based on frameworks formulated by Paul Ernest under the social constructivist theories of learning. It also touches on philosophies related to how a pool of knowledge is always context bound and can never be looked at under the microscope of pure isolation. Interest in the work is specially spurred by almost two decades of dealing and always struggling with the geometric trinity of point, line, and plane in the classroom. For any true starting point in the study of how Euclidian Geometry is taught, it is this paper’s stand that there is always a call to go back to the undefined terms. Taken from said masteral work, Ernest’s framework is summarized in the following figure:

The Creative/Reproductive Cycle of Mathematics  
Source: Ernest, 1996

It cannot be overemphasized that students need to fully grasp the concepts point, line and plane to do well in Geometry and in any high school for that matter. The irony of it is that these concepts, called the building blocks of Geometry, are undefined terms! It is the position of this writer/researcher that this irony of ironies is taken lightly, ignored, or is not well researched enough. After all, how do we undertake a research on things we cannot even define? The gloss over on the problem is very unfortunate.

The primary literature for this action research is, of course, the masteral work submitted to the Principal’s Office in 2010: Enhancing Conversation and Dialogue in Geometry. The work is a compilation of worksheets supplementing a textbook in Geometry I was fortunate to have co-authored. The students can answer worksheets on particular topics. The worksheets emphasize the dialogue responses of acceptance, reaction, elaboration, criticism, and correction which Ernest defines as follows:

**Criticism:** In doing ‘criticism’, the student is called on to evaluate a mathematical concept or solution in terms of its strengths and weaknesses, with greater emphasis on the

latter. Rather than doing error-spotting, weakness-hunting is the core of doing criticism. The student can then offer alternative ways by which the concept, solution or process can be improved.

**Correction:** It is possible to make a student correct a concept or solution to a problem which is given to be erroneous. How the student identifies the error is sometimes the more important aspect of the task than finding the error itself. By correcting a given mathematical text, the student also demonstrates how he analyzes, synthesizes and evaluates using any tools he knows.

**Acceptance:** Acceptance refers to a student's agreeing to the truth proposed by a mathematical concept. It also demands that the student lays the basis for his acceptance of the concept.

**Elaboration:** In elaboration, a student is made to extend or expound on something already known. By extension, he/she can enumerate other relationships which come out as consequences of a given mathematical concept. He can also pick up the same concept and look at it from other perspectives or points of emphases.

**Reaction:** To react to a mathematical concept would mean that one or two particular details forcefully grab the attention of the student. This might be due to the novelty, strangeness, ingenuity, or controversy inherent in the concept.

It is through these levels of responses that students, by Ernest's framework, are thought to contribute to the social construction of knowledge.

### 3. RESEARCH METHOD

For data collection, the designed worksheet for the Building Blocks of Geometry are given to five Regular Geometry classes, each handled by a different teacher. This is in keeping with the aim of casting the net of dialogue as wide as possible. The students are given the first weekend after taking Long Test #1 to answer the worksheet as candidly and as honestly as possible.

It is the aim of the data gathering to gather varied and significant samples to each of the five possible responses. It is possible that only one of the five responses is taken from a

particular student. It is also possible that all five responses are that of a single student.

### WORKSHEET

Name \_\_\_\_\_ Section \_\_\_\_\_  
Due Jun 21, 2013

#### The Building Blocks of Geometry

1. What problems arise in your mind concerning the over-all framework/concept of the undefined terms? What weaknesses do you think can be addressed?
2. Which definition do you think can be simplified? What problems are you addressing by these simplifications? In what way do the concepts become better?
3. Does it make sense to talk about things which we cannot ever pin down to a definition we can all agree on? Why? Why not?
4. What is the best representation paper that we use for "space"? Why?
5. What is your reaction to the following statement? -- 'The Undefined Terms are the basic terms in Geometry.'

The questions above, correspondingly, elicit the following responses:

1 – criticism, 2 – correction, 3 – acceptance, 4 – elaboration, and 5 – reaction. The students are not made aware of the response types they are to make to avoid pre-empting their answers.

### 4. PRESENTATION OF DATA / INTERPRETATION OF DATA

It is deemed by this researcher that the presentation and interpretation of data are best put together in one section for ease of reading. The data gathered are put in boxes. Every box is followed accordingly by the interpretations.

1. What problems arise in your mind concerning the over-all framework/concept of the undefined terms? What weaknesses do you think can be

addressed ?

**RESPONSES:**

- a. I find the problem of the undefined terms is that they would be unclear per situation.
- b. It is hard to differentiate the meaning and definitions used to separate undefined terms and defined terms.
- c. I think that the undefined terms are too broad.
- d. A problem and a weakness is there could be various definitions given by different people.
- e. They are hard to measure and analyze.

Question #1 is a criticism item. It allows the students to focus on the weaknesses of a concept and to possibly offer alternatives. Response 'a' ties up this weakness to the reality of the different contexts in which the concept is understood. It is a recognition already of the student that knowledge is not produced out of pure and isolated contexts. Unconsciously, response 'a' is cognizant already of the social dimensions of learning. Responses 'c' and 'd' follow basically the same line of thought as that of response 'a'. Response 'd' goes deeper into the matter by identifying people as responsible for the social construction of knowledge and not simply inanimate entities varying from situation to situation. Response 'c' is also possibly a call to narrow down the parameters for the concept. It is already a voice calling out and participating in the dialogue, inviting responses, challenging norms.

Response 'b' looks into the structure of the field of knowledge. It is an analysis of the structural weaknesses propping concepts and definitions. It is a participation in the dialogue asking for consistency and the erasure of overlapping concepts. On a deeper level, and maybe tangentially, it might be looking already into how the power of language comes into play as it mentions in one breath *meaning* and *definitions*.

Response 'e' proves to be a real curiosity. It is the 3<sup>rd</sup> year student asking for that which is measurable. It is the 3<sup>rd</sup> year student still bound by the shackles of Algebra. At the same time, however, it is also putting a long-term dialogue about the concepts on the table. It is already raising potential difficulties that might

arise should the undefined terms be subjected to the rule of numbers. Response 'e' also surfaces, in criticism, the usual fears about mathematics

2. Which definition do you think can be simplified ? What problems are you addressing by these simplifications ? In what way do the concepts become better ?

**RESPONSES:**

- a. None. It's all pretty simple.
- b. The definition of the measure of an angle needs to be simplified. It can be simplified by removing "from one ray to the other". This makes it easier to understand.
- c. The concepts become better if they are written more specifically.
- d. Coplanar. I don't get some parts. There are a lot of lines and points outside and inside the plane.
- e. I think line segments should be defined as lines that end. It addresses the problem of them having points in between the endpoints.

Question #2 is a correction item. This allows the students to correct possible errors. It proves to be a heavier question since it is not that easy correcting undefined terms. Response 'a' easily proves the point. Resignation and hubris are both rolled up in response 'a'. Response 'b' is very clear as to what it needs to correct and, at the same time, offers a solution. The student is saying that he understands what an angle is and that he does not need to know that it happens "from one ray to the other". The correction in the response can also be read as a caution on the use of language. Language, being powerfully loaded, does not always help in clarifying things !

Response 'c' is very akin to response 'b'. In its social ramifications, response 'c' sees the written text as contributing to the pool of knowledge. The student here is more like having a dialogue with the written text. A response like this might be fairly commonly expected of good readers.

Response 'd' demands a correction and does not really correct per se. It attempts to analyze parts and components and sees that any correction must happen through these. It

recognizes that sometimes only parts need corrections leaving the general concept standing. Response 'e' attempts to make a correction by abbreviation. The simpler it is said, the better. In the process, it demonstrates confidence that all other grounds are covered already.

3. Does it make sense to talk about things which we cannot ever pin down to a definition we can all agree on? Why? Why not?

**RESPONSES:**

- Yes because life is like that.
- Yes because it improves our way of thinking and the range of our imagination.
- Yes. At least we have a definition.
- It does because it can be understood.
- No. If we can't even know the definition how can we truly understand?

Question #3 checks on acceptance. Response 'a' takes us all to the cosmic level and demands of us a moment of silence. It sees mathematics as an inevitable fact and part of life. Any resignation to mathematics is a resignation to life and vice versa. Response 'b' accepts because it is good. Its acceptance is premised on the philosophy that man is a thinking being and that any improvement to how man thinks is always something to take positively.

Response 'c' is an acceptance based on a more utilitarian attitude to life. It is able to accept since it recognizes that with a solid starting point we can eventually work out things small and big.

Response 'd' justifies its own acceptance and it is difficult to argue with its self-evident truth. It demands a social dialogue that can be understood. Anything less ultimately fails the test of social acceptability. Response 'e' is very related to the former. It tests acceptability in the crucible of knowability. It invites dialogue that is founded on known things or things that can truly be defined.

The responses for question #3 generally take the context of the collective entity. It demonstrates strong social awareness in the teaching-learning process and in the progress of the dialogue.

4. What is the best representation on paper that we use for "space"? Why?

**RESPONSES:**

- A Cartesian Plane since it is unlimited
- None since paper is 2-dimensional but space is 3-dimensional.
- Cube. Space could easily be inside a cube.
- I believe there is no best representation because it is the set of all points, everything, the universal set.
- the blankness of paper itself ...

Question #4 is an elaboration item. Response 'a' elaborates by invoking previous knowledge. It shows how dialogue is also time-bound. Dialogue happens not only between individuals or between groups but also across time. The student making the response is like conversing with himself as he was in the past. It also demonstrates elaboration by analogy. The Cartesian Plane is infinite as is space. Response 'b' makes a concrete elaboration. It is also an elaboration by showing a counter-example. Responses 'a' and 'b' highlight in the dialogue that which are familiar.

Response 'c' elaborates by what proves to be convenient. The student knows he can draw a cube and propounds on the fact that it contains space inside. Response 'd' elaborates by showing impossibility. That space is everything means it cannot be given a best representation. By downplaying representations it seeks to produce a better elaboration of what space covers.

Response 'e' takes us all to a more philosophical level. It takes us all to a realm higher than mathematics itself. It is such constructs that move forward dialogue and contribute to bigger developments in the field of study. It is an elaboration that is both concrete and metaphysical. Such a response can only enrich the dialogue contributing to the pool of knowledge. The shift in perspective exhibited in response 'e' opens up further possibilities for a more creative and imaginative dialogue.

5. What is your reaction to the following statement ? -- ‘The Undefined Terms are the basic terms in Geometry.’

**RESPONSES:**

- a. I was shocked that a very hard topic would dwell on undefined terms.
- b. This is true and I have no doubts about it.
- c. It is weird.
- d. I was scared. How can I learn advanced stuff if the basic stuff is undefinable ?
- e. Why undefined ? We get them !

The responses to question #5, a reaction item, profiles the possible dispositions of the students at the point of participating in dialogue. Responses ‘a’, ‘c’, and ‘d’ pose potentials for resistance and are veritable stumbling blocks to further dialogue and thus, to learning. The worksheet saved the reaction item for last to highlight, for the teacher, the importance of hurdling such blocks first to effect learning. It is these initial reactions that set the tone for the ensuing dialogue.

Responses ‘b’ and ‘e’ certainly do not lack for the element of courage. It is said that the world belongs to the brave, to those who plod on, to those who take on challenges defined and undefined.

#### 4. CONCLUSION/REFLECTION

The responses presented in this paper cover only a very small fraction of the dialogue that actually happens inside the classroom. Much communication is lost and gets leaked out of the creative/reproductive cycle of knowledge construction. It is the over-riding challenge for the teacher to be aware and to be able to detect these responses, in their varied kinds, when they arise. The task is not easy but is of paramount importance. Understanding the building blocks / undefined terms of Geometry determines and dictates a whole year’s student performance in the course.

The move to have less quizzes and to have more teaching time for the Regular Geometry course is perfectly on the right track. Dialogue

should be emphasized and even more enhanced.

In the framework of social construction of knowledge, everybody gets a chance to participate and to have a stake in the outcomes of the dialogue. An awareness of their own contribution can spur students to perform better.

Belatedly, this research was even more inspired by a reading of Edwin A. Abbott’s literary-mathematical 19<sup>th</sup>-century classic *FLATLAND - A Romance of Many Dimensions*. In it, the main protagonist, aptly named Square, states

Yet I exist in the hope that these memoirs, in some manner, I know not how, may find their way to the minds of humanity in Some Dimension, and may stir up a race of rebels who shall refuse to be confined to limited Dimensionality(p.117).

It is hoped that through dialogue and enhancing student responses, the point, the line, and the plane take us all to higher and higher dimensions.

#### 5. ACKNOWLEDGEMENTS

This is the second humble action research finished in the name of the Geometry Regular Team 2013-14. It is indebted to Mr. Kevin Cordoviz, Mr. Mark Lao, Ms. Jody Lim and Mr. Zoel Masangkay who gave up precious minutes of their class time that could have been used for dialogue to be able to administer the research worksheets. Their classes in Geometry, 3C to 3M, made this paper possible. Ms. Janice Antonio, Mathematics Subject Area Coordinator, is thanked for her support.

**Abstract:** In Gagasceria Elementary School, lesson study in Bahasa subjects routinely conducted in our school. However, this year we experienced a fairly significant changes in planning of lesson study. The focus previously was a teacher, turned into a student, what the stages of learning that must be passed so that the student could learn objectives achieved? At first, we only discussed about lesson plan that will be held in open lesson. But it was changed as we follow many lesson study that we join at Gagasceria. It affects the way we think for planning our lesson study this semester. If the student has thoroughly studied the content and skill, what new things are learned and will this skill can be used in the future? One of the things that we discussed are steps that need to be passed by the student in order to achieve the goal of learning. The possibility of what will emerge when teachers choose specific teaching materials and skill. This year, we feel that lesson study can make student feel more familiar with the subject learned in the learning process. Language skills of children also have increased quite good. And the teacher also learn how to understand the way of student's mind in order to achieve the learning objectives. We also discuss the possibilities that will occur when teachers choose one method. Lesson study is our event, one of which, the same perception in understanding the purpose of learning with a fun process.

**Keywords:** bahasa; language; skill; series of activities; planning; lesson study

### 1. INTRODUCTION

Lesson study in Gagasceria Elementary school begin in 2009. This is the initiative from the school management to make community learning in school. When we had open lesson, we can share the classroom teaching methodology. But, at first time lesson study focused on the teachers. From there, we learned that lesson study is not merely develop teachers but also improve the quality of learning. We also doubt, was it the way we do already called lesson study. Because of that, we learn from other school about lesson study. This journey directing us to met with many experts in lesson study, so that the quality of lesson in Gagasceria Elementary increased. Lesson study is held in all subjects, one of them is in Bahasa subjects. One of the reason why teacher do lesson study is because the result of assessment discussion at the end of the academic year. We found data that most student still had difficulty in understanding instruction either spoken or written. They unconfident to express their feeling. They also had difficulty to understand others feeling in daily life. This finding could see that children did

not understand about the expression and body gesture from theirs teachers and friends. They only knew if teacher or friend saying their feeling directly.

Before lesson study, we do planning to conduct discussions with the teacher model. This discussion discuss the matter will be delivered as well as a method of teaching. This discussion more toward the form of activities to be done in class. We discussed among other:

- what activities will be conducted by the student
- how teachers assess student
- how the student worksheets form

Doing planning with the former method, actually have not give a positive result. From the post lesson discussion it is also found that student still have difficulty to understand teacher instruction, difficulty understanding about math problem solving text, and text in science subjects.

Then we see method used in the Japanesse lesson study. The method used in that lesson study more focused on the learning, not only focus on the teacher. Since that time, the planning discussion on lesson study in Gagasceria Elementary School transformed. We have to look at the basic

competence from government and than we discussed among others:

- why do they have to achieve the basic competence
- what capability that student has been achieved related to the basic competence
- what capability will the student gain if they has been achieved the basic competence

This is accordance with Tyler theory of lesson study planning whose work is published by John 2006 cited from Lenski & Caskey (2009) on Using the Lesson Study Approach to Plan for Student Learning journal. The research on lesson study can be contextualized in the larger body of lesson planning research. The current thinking that lesson planning is a linear path that begins with a teaching objective is based on Tyler's work, which was published in 1949 (John, 2006). Tyler (1949) proposed that lesson planning should consist of four essential elements: educational purposes or objectives, classroom experiences to attain these purposes, effective organization of the experiences, and determining whether the purposes are attained.

We are concern about planning stages on lesson study to improve teacher competencies and the quality of student achievement. The topic that has been choosen in lesson study not only in literacy aspects but also all aspects of the language. We are trying to develop together through this activity. Lesson study it was not only impact on class who performs open lesson, but also affect school policy related to the use of language. Those policy for instance: the application of cursive writing for all teachers and child (begin from 2nd grade), the application of good and correct bahasa in learning activities to all teachers, and the application of striped sheets of 3 and 5 for a child grade 1 and 2.

Language skills or experience can be trained through habituation during the process of teaching and learning activities. This is accordance with the Uno theory (2010: 22) who explained that learning is a process of efforts by the individual to obtain a change of behavior as the overall experience of individual interact with its environment. Policy regarding the use of language school also in accordance with the Good and Brophy theory (Uno, 2010: 15) it seemed to change patterns on children achievement on new skills in response to its environment, the habit, the attitude of, the ability, knowledge, understanding, emotion, appreciation, physical, ethics, as well as social relationships.

On this paper, we will discuss about the impact of planning stage on lesson study in bahasa class. Focused on 3rd grade in 2012-2013 compared with 2013-2014 academic year. The topic is about imitated dialogue with appropriate expression of the text drama child heard. In this paper, we also discussed about teacher paradigm that change several aspects on teaching learning.

## 2. LESSON STUDY IN BAHASA CLASS

We tried to solve the problem, which has been mentioned before by doing lesson study. The lesson study is not a new thing for us, but we feel there is change by doing lesson study in this year. This happens because there are teachers who are observing lesson study in Japan and experts who are coming to our school.

Through a lesson study, we learned that the planning is very important in the learning preparation. We see the results of the discussion of lesson design another subjects that enforcement succeed in the purpose of learning affected preparation and discussion of planning. Planning of other subjects team, mapped ability that had been owned students in the earlier class or on an activity before. Afterwards, the learning goals of basic competencies mapped in accordance with the ability and skill to be achieved. Students' skill was discussed during a planning, capabilities that have been developed and which still need to be developed in the lesson study activities.

During the learning activities, we also reflect on the teaching and learning activities that have been carried out. Apparently, we also find some Bahasa learning problems that have been discussed previously. Through lesson study, we tried to finish the Bahasa learning problems one by one.

We started the lesson study in this year by planning learning activities more emphasis on students' skill to achieve. Discussions in the Bahasa team is quite dynamic, because we discussed about the content and skill which the student must achieved firstly before the next learning activities. We discussed activities that have been done in the previous class so the next learning goals and activities will be more comprehensive. We also discussed a cycle of activities to achieve the basic competencies, not only do the lesson study activity, but some of activities to achieve basic competence.

One of the planning stage that has been done is on Bahasa class in the third grade. The basic competence that we choose is imitated dialogue with the exact expression of the drama text readability child to hear.

When this basic competence discussed for lesson study activities, discussion of planning preceded the discussion of the basic competencies. Accordingly the basic competencies, we discussed the skills that must be achieved by students when learning these competencies. We make the same perception of the basic competencies in order to achieve the learning goals. Teachers' perceptions differ when reading the basic competencies, which are the students doing taking note when listening to the dialogue because the important thing is the sort of expression that

emerged from the dialogue is heard, students should not be taking note of having to memorize and remember the phrase dialogue, and students get the text of his plays and requested expression appears to sort of dialogue he heard.

From our discussions, we see again the definition of the verb on the basis of competence. Then we concluded that the purpose of learning is that students can express various feelings in accordance with audible dialogue so that students can express themselves in accordance with the current context of drama activities or daily activities. In addition, students know the various expressions that can happen in a social environment.

After that, we discussed a cycle of activities to achieve the basic competencies. Some learning activities in accordance with the basic competencies are knowing a variety of expressions, impersonated a variety of expressions, practice listening dialogue text by using the appropriate expression and intonation.

The results of the discussion planning what we did was the first meeting is the introduction of expression through the video. Second meeting is students listening and imitating dialogue based dialogue audible expression. Expression that will be discussed is angry, happy, sad, scared, and shocked. Students are shown again recording the expression of previous meetings via video. In this activity, students give feedback on yourself or her appearance. Third meeting is an exercise for the portfolio. Fourth meeting is the test portfolio.

We chose to develop the expression of angry, happy, sad, scared, and shocked. Expressions have been used most often in children's daily lives. We sort of 16 expressions are often used in everyday life.

There were changes made over the previous year. Last year, with the same basic competencies, students practice impersonating the expression of Indonesian reading printed books. Then practice the dialogue in pairs to memorize in short conversations. Students are also asked to make a short dialogue about feeling happy, sad, disappointed, angry, and surprised. After that, students practice tests to simulate dialogue heard.

Planning is also changing the way the assessment. Last year, the teacher read the sentence as well as the expected gestures, such as "Wow, see a friend, a cloud shaped like a bear's, beautiful, yes!" (Pointing upward and amazed). Then, students were asked to imitate sentences and gestures of the teacher read. This forms the basis of our thinking when planning a lesson study. Based on these discussions, we also plan assessment in accordance with the basic competencies. Assessment was done by portfolio (portfolio assessment) to demonstrate the skill development of children in imitating a dialogue with the appropriate expression from a reading of the text

of his plays were heard and shows the development of each child process undertaken. Student also participate and perform an assessment of group performance when imitating a dialogue with appropriate expression.

We defined the theme of dialogue that contains a variety of expressions. The theme of dialogue related to daily life so that the students can involve. We also create conversation and dialogue recording containing a variety of expressions that have been introduced to the students.

### 3. CONCLUSIONS

According to lesson study experience at Gagasceria Elementary School, this changing the paradigm of teachers and improve students achievement. This is also an evaluation for teacher to prepare lesson more interesting, make a plan for another lesson with prepared method, prepare the assesment and rubric criteria from the beginning.

The result influence students how to express and understand theirs feeling and other in daily life. In this activity, they show anthusiastism, such as prepare custome and material, try to understand the script, also they gave feed back to one another.

## The Effectiveness of Teaching Learning Process Through Seating Arrangement, Innovative Teaching Learning Method and Task Distribution in Lesson Study Activity

Mochamad Taufiq<sup>1</sup>

<sup>1</sup>*Economics Education Department, STKIP PGRI Pasuruan, East Java, Indonesia*

*Taufiq.upp@gmail.com*

**Abstract:** Lesson Study is one of the significant way to improve the teachers quality and professionalism in facilitating the planned teaching learning process. The main goal of teaching learning process in this college is able to produce professional teachers so that the experience that the students got, during the school time, can be taught to their students later when they become a real teacher. However, one thing which is needed to be aware of is the way in managing the teaching learning process, considering that they only got 4-5 years to achieve their S1 degree as well as to learn and practice managing the teaching learning process. Besides, the fact that the teachers graduated from this college are yet satisfying due to the insufficiency of their major and the low quality of the teaching learning process. The findings of the lesson study activity of the economics education department are: 1) seating simulation; 2) innovative teaching learning method; and 3) group work distribution. In conclusion, 1) seating arrangement simulation does affect the teaching learning process especially during the group work discussion, so that the teacher's part in supervising the students' seating position is needed in order to make the students actively expressing their argument in the group discussion; 2) the use of varieties teaching method does affect the teaching learning effectiveness, especially when the teacher explaining the detail of the teaching learning method; and 3) it is needed to have the teacher's instruction during the task distribution for each group so that each student will have the same level of task based on the teacher's instruction and being organized well, this way, each student will have more experience other than only being the group secretary.

**Keywords:** Seating arrangement, innovative method, task distribution.

### 1 INTRODUCTION

In your proceedings paper, don't use any footnotes or endnotes. When you cite a previously published author, do so in the main body of your text. Please follow the *APA Publication Manual* (6th edition) style accurately.

Various problems of education on quality improvement related to supportive elements were done frequently. The need for a new orientation in education was so strong and evident in various aspects and fields of study, both the field of exact sciences and social sciences. Especially in the social sciences tend to be flexible to changes that occur. In response to this, educators and practitioners should be able to respond to changes that occur with the changing paradigm of education. One way to respond to and cope with the changes that occur on an ongoing basis is to implement a variety of innovative learning models, which is expected to boost the quality of the learning process.

Hamalik (2001: 171) states that effective learning is learning that provides opportunities to learn by one self or do activities as possible for the students to learn. The provision of learning opportunities themselves and move broadest expected to assist students in understanding the concepts being studied.

Teaching and learning process is essentially a process of communication, which is a process of delivering a message from the message source through the channel / media messages to specific recipients. The message to be communicated is the content of teaching or education in the curriculum. Source of the message can be lecturers, teachers, students, even the author of the book. The line is the medium of education and the recipient is a student, the student or teacher (Sadiman at all, 2009: 12). According Sadiman at all (2009: 12-13), there are several factors that are a barrier to communication (barriers or noises) that psychological barriers (such as interests, attitudes, opinions, beliefs, intelligence, and knowledge) and physical barriers (such as fatigue, pain, sensory power limitations and disability). Education as a media is one of a learning resource that can deliver a message that helps to overcome it. Because according Sadiman at all (2009: 7), teaching learning media are all that can be used to deliver the message from the sender to the receiver, so as to stimulate thoughts, feelings, concerns, interests and concerns of students so that learning occurs.

STKIP PGRI Pasuruan is a college that emphasizes superior quality improvement for providers of competent teachers in their field, this

way lesson study is the best step that should be done. Similarly, Lesson study is also an assessment of the activity of learning activities, especially about the effectiveness of the learning process. During these times, lectures of Economics Education Department in STKIP PGRI Pasuruan, conventionally taught as the lectures in general, that is by using the method of group discussion on each lecture, which lasted for one semester, this led to the lecturer's disability to know the level of students' mastery after the course takes place.

Economics Education Department deliberately chosen as one of the pilot project for the implementation of lesson study in PGRI STKIP Pasuruan by the reason of activities that occur during the course which can be said to be less successful, given the lectures using the methods already mentioned above, lectures dominated most of the teaching learning process or by a particular student who is usually active in the discussion so that the lecturer is only able to measure the success of learning outcomes in the lecture on a certain amount of students but not the students as a whole. In fact, the main task of the educator is no longer convey knowledge, but rather to cultivate the understanding, guiding learners (students) to learn on their own.

## 2 METHOD

Lesson study activities in economics education department of STKIP PGRI Pasuruan using several methods including, snowball throwing, jigsaw, problem based introduction and quizzes. The subjects in this activity are “Teaching Materials Development”. In developing the course materials, students are expected to be able to make and develop appropriate teaching materials for students of Junior High to High School level, especially in the field of Economics study.

The initial activity began with planning (Plan), which at the planning stage (plan) model lecturer and team designed the teaching learning plan together. The next phase was action (Do) which was intended to implement the lesson plans that were formulated in the previous stage. The model lecturer implemented the plan that has been designed together, while the other team members acted as observers. Other attendees (excluding the members of the plan team) also acted as observers. The next stage was reflection (see), lecturers convey the impression of being a model in teaching, then being observed by the team.

## 3 FINDINGS AND DISCUSSION

The findings in the lesson study activities conducted by the economics education department were: 1) seating arrangements simulation affects the

effectiveness of the learning process, 2) the use of innovative methods affects the effectiveness of the learning process, and 3) the distribution of group assignments affects the effectiveness of the learning process.

The first findings regarding to the effectiveness of the learning process through seating arrangement simulation, the model lecturer discovered a new phenomenon that the effectiveness of the learning process in discussing with less or no circular position is less effective when compared with the group that formed the seat in a circle, because each student in the group which is not circular will be far from each other so that the communication between the students in the group is less effective, and even can cause a passive member of the group. Though the discussion is a scholarly conversation that contains an exchange of opinions is done by some people who joined in the search for truth. In the context of learning the discussion is the way which is done in the study of materials or delivery of material through discussion, with the aim to create an understanding and behavioral change of the student (Naim, 2011: 62).

The second finding was the use of an innovative method greatly affects the effectiveness of the learning process. As the first open class activity of the lesson study can be said to be less successful, it is because the lecturer was less clear in informing about the syntactic method used that the students were confused and did not understand in carrying out the learning activities, considering the students had never experienced activity which the lecturer uses (innovative methods) before. This is proven by the results of reflection (*See* step) in the open class two onwards showed that students in the activities of the learning process were so enthusiastic and enjoy the lectures through group discussion undertaken on each method of learning by the model lecturer. Even students who had appeared relatively passive during lectures (held before the lesson study) can actively and boldly expressed his opinion during the open class activities.

The third findings of seating arrangement simulation settings affects on the distribution of the task group, because students tend to move away from the group discussion or avoid themselves to get involved maximally in a group discussion. So that the students feel involved in the discussions and tend to be in-charge or take over the duties as the minutes. The impact these students will remain passive and can never contribute to the group's opinion. It can also be caused by the model lecturer do not provide information about the distribution of tasks in each group, as well as existing members of the group did not involve the student in question so that the students tend to opt into the minutes. Based on the explanation above, the tasks distribution in a group discussion is greatly needed and could affect on the

effectiveness of the activities in the process of discussion.

#### 4 CONCLUSION

As for the conclusion of implementation of Lesson Study on Economic Education Department of STKIP PGRI Pasuruan, among others are:

1. Seating arrangement simulation greatly affect the effectiveness of the learning process, especially during the group discussion, so the role of the lecturer in supervising the students' attention to the sitting position during the group discussion should be noted, so that all the students are there in the group can both get a chance to contribute and convey arguments on each group discussions.
2. The uses of the varied method greatly influence the effectiveness of learning. In teaching learning activities, teachers should explain in detail about the activities of learning, especially about learning model that will be implemented and syntactic as well. The goal is that students can understand the flow of learning activities to be undertaken and the learning process can run effectively.

The distribution of tasks in each group in the direction of a faculty discussion needs so that every student has the burden of tasks in accordance with the instructions of lecturers and well-organized. So that every student has the same experience-the same argument on the group can provide not only the minutes of the discussions in each group. And it would be better to use notes for lecturers to students that contains the tasks for the students in group discussions.

## Improving Student’s Writing Skill in the Genre-Based Writing through Process Oriented Approach

Riyana Dewi

English Department, AKABA 17, Jl. Seteran Dalam  
No. 9, Semarang, Indonesia

riyana\_dewi17@yahoo.com

**Abstract:** The objective of this study is to find out, to describe and to develop the appropriate strategy of Process-oriented Approach to improve the writing skill of higher students in the Genre-Based Writing. There are two research questions addressed in the study 1) Have the students applied process-oriented approach in their writing classroom?, 2) How do the students optimize process-oriented approach in their writing classroom? The research design used in this study was classroom action research (CAR) which consisted of four main steps: planning, implementing, observing and reflecting. The procedure of collecting the data was carried out by distributing instruments of the study in the form of test. The data were analyzed by using the framework “Process of Writing”. Based on the data analysis it was found out that mostly the students have applied the process-oriented approach in their writing activity. However, they haven’t applied it optimally. In addition, the students have done a lot of correction in stage of revising. The findings of the study should that the implementation of the strategy of Process-oriented in improving students writing skills in the genre-based writing, classically, was high. Finally, the pedagogical implication of the study is the students are supposed to fully motivated that writing activities can be very easily done if they apply the process-oriented approach. The approach, moreover, is applicable to improve students’ final product.

**Keywords:** *writing skill, teaching writing, genre-based, process oriented approach*

### 1 INTRODUCTION

Writing is considered as the most difficult and complicated language skill to learn compared to other language skills (Widiati & Cahyono, 2006:139), the common complaint of the teaching of writing is that the class of writing is boring. Most of the students think that writing is not only difficult subject but also stressful subject. The students of academy level usually learn writing subject in three different level, namely: sentence-based Writing, paragraph-based writing and genre-based writing. Each level has its own competence that must be mastered by the students at the end of the learning process. Richard in Widodo (2007) mentioned that there are four activities that can be implemented in the class of writing:

- 1) Familiarization. It is an activity in which the students learn the grammar and the vocabularies through a text.
- 2) Controlled writing. It is an activity in which the students
- 3) Guided writing. It is an activity which the students join the existing model of the text

- 4) Free writing. It is an activity that the students create their own essay.

Today, a growing issue has already increased in the process of teaching writing for the students at academy level. The issues stated that the students are demotivated when they are asked to write and their writing results are very poor compared to other skills they have. In order to minimize the problems of teaching writing, Raimes in Richard (2003:45) suggests the teachers to help the students write a meaningful piece of writing and eliminate the complexities of writing activity. Additionally the teachers need to develop their techniques in the teaching of writing, the teachers should provide a strategy of how they think writing is learned. Teachers of English should attempt to provide learners with opportunities to express their ideas in a written form which the students can formulate their ideas, choose the right words, join the sentences in the right order, arrange the sentences coherently and cohesively and finally they can create their perfect writing. Many researchers have already developed several approaches to be applied in the

writing class to give an interesting and different experience for the students. Thus, an alternative approach of process oriented approach would be implemented in the process of teaching writing. The process oriented approach, based on the writer's experienced, gave good contributions to the students achievement of writing because it would involved three steps of writing, as follows responding, evaluation and writing. Those three steps are considered as the key of the process oriented approach to improve the students' writing skill. Students were trained to think and write systematically and critically. Moreover, the process oriented approach in writing would help the students to be independent writers of texts as they are eager to find ideas and create the ideas into a good writing and they could solve their problems in writing class.

## 2 REVIEW OF RELATED LITERATURE

Writing is multivarious process. Harmer (2004: 69) said that writing is such a classy skill mingling a quantity of diverse fundamentals that necessitate not only grammatical and rhetorical features. In addition, Mochtar (2004: 58) argues that in language learning, writing is claimed more complicated and integrated than other language skills: listening, speaking, and reading. Brown (2001: 219) added that writing skill obliged not only an aptitude of a writer to correspond with a reader, but also to interpret ideas into language. Writer ought to have a capacity to construct a series of sentences in particular order and link together in certain ways. Halliday (in Nunan, 1999:132) explained that written language is used for the following purposes: (a) for action (e.g: public signs, product labels, television and radio guides, bills, menus, telephone directories, ballot papers, cumputer manuals) and (b) for information (e.g: newspapers, current affairs magazines, advertisements, political pamphlets).

### 2.1 Process Oriented Approach

Murray in Montague (1995) described that process oriented approach refers to a teaching approach that focuses on the process a writer engages in when constructing meaning. This teaching approach concludes with editing as a final stage in text creation rather than an initial one as in a product oriented approach. The process oriented approach may include identified stages of the writing process such as: pre-writing, writing and re-writing. Once the rough draft has been created, it is polished into

subsequent draft with the assistance of peer and teacher conferencing. Final editing and publication can follow if the author chooses to publish their writing.

Process-oriented approaches concern the process of how ideas are developed and formulated in writing. Writing is considered as a process through which meaning is created. This approach characterized writing as following a number of processes: first, a writer starts writing ideas as drafts. Subsequently, he or she will check to know whether the writing and the sentence organization makes sense to him or her or not. Then, the writer checks his or her writing to make sure whether it is clear to the reader. More, Nunan (2001) stated that process approach focuses on how clearly and efficiently a student can express and organize his ideas, not on correctness of form. Students are first asked to go through such writing processes, trying organize and expressing their ideas clearly. The assumption is that what the student as a writer is going to say will become clearer through these processes.

### 2.2 Process of Writing

Meyers (2005:2) uttered that writing can be interpreted as a process of finding an idea, formulating the idea and arranging the idea into a piece of writing then writing it on the paper. Writing can be said to be the same as talking in searching the ideas or topics then communicating through it. However, there are many different things between writing and speaking, such as: when communicating through writing we cannot directly see and hear the response from the hearers or readers so we have to imagine what the reactions given by the readers. We have to choose a topic of interest to the reader and present it in an interesting way as well. We also have to present these ideas in a logical and sequential. In the end we have to read our own writing to be able to fix it until we truly believe we can convey those ideas clearly. A good writing can convey ideas clearly and it must be done through several stages.

Harmer (2004: 4-5) divides into four stages, namely planning writing, drafting, editing (reflecting and revising), and the final version. The stages of the writing process by Harmer called The Wheel Process. Meyers (2005: 3) classify writing into six stages, namely stage 1). Explore ideas (consider the subject, consider the purpose, and consider the audience), 2). Pre-write (brainstorming, clustering, freewriting), 3). Organize (select, outline), 4). Write a first draft (write quickly intervening to record your

thoughts, put notes and new ideas in the margins), 5). Revise the draft (read it aloud, add or omit materials, and move materials around), 6). Produce the final copy (edit, print or copy over a clean copy, read carefully for errors, and then the make another clean copy).

Figure 1. The Wheel Process (Harmer 2004:6)

Seow (2002: 315) cited by Widodo (2007: 118) categorize the stages of writing as follows 1) Activated Process, 2). Planning, 3). Drafting, 4). Revising, 5). Editing, 6) Process Terminated. Hyland (2003)formulates the following stages of the writing process 1). Planning, 2). Drafting, 3). Peer / Tutor Review, 4). Revising, 5). Editing.

Oshima and Hogue (1998: 3-14) recommends three steps in writing: 1). Prewriting (Choosing and Narrowing the topic, and brainstorming (listing, clustering, freewriting), 2). Planning / Outlining (Making sublists, Writing the Topic Sentence, Outlining), 3). Writing and revising Drafts (Writing the First Rough Draft, revising Content and Organization, Proofreading the Second Draft, Writing the Final Copy).

### 2.3 Teaching Writing in Genre-based Approach

The most important reason for teaching writing is that it is a basic language skill, just as important as listening, speaking, and reading. Harmer (2000:98) said that writing activity can also improve the learners' language development. Language learners need to know how to write letters, how to put written report together, how to reply to advertisements, etc. The language learners also need to know some of writing conventions such as phrase based, sentence based, paragraphs construction, text constructions, spelling, capitalization, punctuation, coherence, cohesion, etc. Moreover, Gebhard (2000:132) explained whether it is generally agreed that the beginning EFL students need to learn the basic conventions of writing that include the ability to identify and write down letters, words, and simple sentences as well as to learn the spelling and punctuation convention. The development of teaching writing for the students of academy level has already changed from free writing into genre-based writing. Genre based writing focuses on

developing the student's skill or writing starting from a topic till a complete essay which regards on social function, schematic structure and lexicogrammatical features of the written text they make. Gerot & Wignell (1994:192) said that recall that genres are staged, goal-directed and purposeful. Thus for any text we can ask: 1) what is its social purpose or function and goal?, 2) through what stages does it achieve that goal?, 3) what lexicogrammatical and discourse choices are involved in the above? More, Gerot & Wignell (1994:192-223) mentioned that there are fourteen kinds of texts in the genre based. They are spoof, recounts, reports, analytical exposition, news item, anecdote, narrative, procedure, description, hortatory exposition, explanation, discussion, reviews and commentary. In addition Hyland (2004:5) proposed the four stages in teaching writing, namely building knowledge of the field (BkoF), modelling of text (MoT), joint construction of text (JcoT) and independent construction of text (IcoT).

### 3 RESEARCH METHOD

The research design applied in this study is classroom action research. It is a practical study that used to increase the quality of teaching learning activity. Burns (2010:2) defines action research as the study of a social situation with a view to improving the quality of action within it. It aims to feed practical judgement in concrete situation. The study conducted at one of private colleges in the level of diploma three program in Semarang, Indonesia. The subject of the research was 25 students who took writing class in the academic year of 2013/2014. The data of this study were the students' writing of only six different texts narrative, recount, descriptive, report, analytical exposition and hortatory exposition.

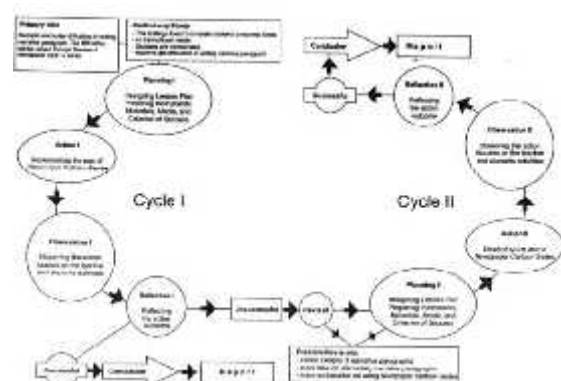

Figure 2 The Cycle's Picture of the research design

#### 4 RESEARCH FINDINGS

The situation in the classroom during the teaching learning process before the use of process oriented approach in writing texts was fed up. It happened because the students had low motivation, they did not have any positive attitude, feeling or even their thought. Almost all students looked confused with what they had to learn. Particularly when they had to construct a text based on its genre, they had to work hard since they only had a topic to be developed. The findings were attained from the optimizing of process oriented approach in the genre-based writing class. The process oriented approach helps the students to gather the ideas during the prewriting stage. By using this approach, it is expected to improve the teaching learning process and to achieve good score on the content quality in writing some texts. Hence, the focus of this study is on the writing pre-process. This division comes with findings of the action of cycle I related to the optimizing of process oriented approach to improve the content quality of the students' composition in writing texts. The findings present the research procedures: planning the action, observing the implementation of the action, and reflecting the results of the observation. Furthermore, the findings analyze the students' writing achievement, the teaching and learning process and the result of cycle I and cycle II.

The finding of this study was 85 students' writing from 6 different texts of narrative, recount, descriptive, report, analytical exposition and hortatory exposition. There were 10 students who wrote all the texts completely, 7 students who wrote 5 different texts, 3 students wrote 3 kinds of texts, and 2 students wrote 2 kinds of texts. In general, the findings of the students writing were 17 narrative, 18 recount, 13 descriptive, 19 reports, 18 analytical exposition and 14 hortatory exposition.

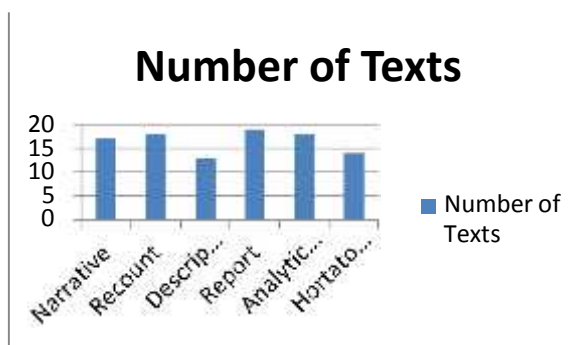

Table 1 The result of the students' writing

From the cycle I, the findings presented three stages of the writing process. First stage, prewriting was done by two steps: choosing and narrowing the topic and brainstorming by giving an activity of

listing, freewriting, and clustering. Through this step the students enjoyed using the first step of choosing and narrowing the topic of 12 different texts. It was about 10.44%. For the second step, the students used listing of 53 texts (46.11%) and clustering 4 texts (3.48%). And the rest of the students did not use the steps but went directly to write rough draft and final product of texts.

The second stage, planning (outlining), the writer used three steps: making sublists, writing the topic sentence and outlining. From the data taken, it can be concluded that about 62 texts (53.94%) applied outlining when writing the text.

The third stage, writing and revising drafts used the three steps of writing the first rough draft, revising content and organization and revising sentence structure, grammar, mechanics and vocabulary. From this stage, it was found 54 texts (46.98%).

From the cycle II, the findings presented three stages of the writing process. First stage, prewriting was done by two steps: choosing and narrowing the topic and brainstorming by giving an activity of listing, freewriting, and clustering. Through this step the students enjoyed using the first step of choosing and narrowing the topic of 25 different texts. It was about 28.73%. For the second step, the students used listing of 60 texts (68.96%) and clustering 2 texts (2.29%). And the rest of the students did not use the steps but went directly to write rough draft and final product of texts.

The second stage, planning (outlining), the writer used three steps: making sublists, writing the topic sentence and outlining. From the data taken, it can be concluded that about 69 texts (79.31%) applied outlining when writing the text.

The third stage, writing and revising drafts used the three steps of writing the first rough draft, revising content and organization and revising sentence structure, grammar, mechanics and vocabulary. From this stage, it was found 62 texts (71.26%).

Table 2 The result of the writing cycles

From the results above, the writer found the optimizing of the process oriented approach improved the student's writing quality, particularly in writing genre. The students used their knowledge in brainstorming activity to find an idea then write it into a text. Here is the students activity in brainstorming activity.

*Genre: Narrative*

*Topic: motorcycle accident*

*Brainstorming (listing): went back, accident, looking for a gas station, call friend, etc.*

*Genre: Description*

*Topic: My House*

*Brainstorming: traditional, main room, paint, small town, dining room, kitchen, bedroom, bathroom, television set, etc.*

While in the outlining activity, the students wrote:

*Genre: Description*

*Topic: My House*

*Outlining:*

*Identification (Par 1)*

*TS: I live in a traditional house located in a small village in east Jepara, the place where RA Kartini was born in.*

- a. trees surrounding
- b. fresh air

*Description (Par 2)*

*TS: The house is a small one painted in grey.*

- a. Main room
- b. Praying room
- c. Bedroom for the guest

*Description (Par 3)*

*TS: In the main room there is a way to the dining room behind it.*

- a. surrounded by 3 bedroom.
- b. kitchen beside it
- c. bathroom
- d. garage

*Description (Par 4)*

*TS: Actually, the house is the same house where my grandmother and grandfather lived long time ago. It's still like it was..*

The student's writing of outline activity in writing description can be seen from the following example:

*Genre: Description*

*Topic: My house*

*Outlining:*

*My house is really comfortable  
My house is small  
It is surrounded by wide ricefields*

*There is a little garden with some beautiful flowers*

*There are 3 bedrooms*

*There are a kitchen, a bathroom, a main room, and a family room*

*It is painted in blue*

*We endure to stay here*

In the revising draft, the students did the peer editing with the lecturer's help. They tried to correct the diction, grammar, vocabulary and linguistic features, as the examples of:

1. Changing or rearranging ideas in first drafts is very practice: *practical*.
2. A frog said to her that her wish would be come true: *would come*.
3. The frog promissed that before a year had passed she would have a baby: *promised*
4. One day there was a man, just called him Nick: *call*
5. His feeling to loved somebody is very complicated: *to love*
6. B e c a u s e i t ' s v e r y e a s y t o d o a n d m o r e e f f e c t i v e t h a n a n o t h e r .  
*It's very easier to do and more effective than another.*

1. It is very easy to change and rearrange ideas in first draft and revising the writing: *revise*
2. She worked with producers Paul Higgins and Trevor Carter on thirteen tracks for an album called Delta, which saw "an ambitious 15-year-old keen to emulate the pop sound of the Spice Girls, Britney Spears and Mandy Moore".  
The words *called* and *saw* were identified as Material Processes however the word *called* belongs to Verbal Process and *saw* Mental Process.
3. He could not control his mad. : *madness*
4. They found their mother and talked her about it. : *told*
5. The second stage of Hyde's solo career started off with the 'HELLO' single that was released on June 2003. : *be of passive voice 'was'*
6. In 1996, she was the cover girl of Gadis, a teen magazine in Indonesia after that Dian started here career on the big screen with a starring role in the box office hit in Malaysia and Indonesia, the movie called AADC. : *After that*
7. Amir Hasan followed by his mate went to Karimunjava island. : *was followed – go*

## 5 CONCLUSIONS

Writing process oriented approach keeps the students free to generate the ideas and to organize texts. This approach gives the students opportunity to experience meaningful interaction to share and communicate their ideas or thoughts and the optimizing of the genre-based writing through the process oriented approach implemented in this study has a positive impact on the improvement of the students' writing texts. In writing activities, the learners experience how to generate ideas, write draft, revise them and edit the final composition. Sharing needs, abilities, and learning experience in peer editing activity improve the learner's self confidence and encourages them to learn and apply their knowledge of language. Facilitating the students to work together takes some of their own learning decision to accomplish the task. The consequence is that it enhances the student's motivation in learning writing.

The teaching of genre based writing through process oriented approach is more meaningful and interesting when it is well-arranged through the four stages of Wheel process. Lesson plans or teaching scenarios are arranged in such a way that the teachers and the learners reflect the optimizing of the oriented approach. Self-access learning is admitted for writing genre based texts independently and personal treatment is expected to be given to the students for it minimizes the gap between teacher and students.

The students are recommended that they practice writing genre texts in various topics by optimizing the process oriented approach because it has been proven in this study that the approach inspire the students to generate their ideas and have brought them to organize the texts.

## 6 ACKNOWLEDGEMENTS

First and foremost, I wish to express my gratitude to ALLAH, the Almighty, for the blessing, inspiration and spirit given to me during the accomplishment of my research. I would like to express my greatest gratitude to my husband and daughter who always accompany me in fulfilling this research. Last but not least, I would like to say thank you to Dikti for the fund on my research and also for my colleagues at Akaba 17 Semarang for their supports.

## Improving Critical Thinking Skills and Student Learning Outcomes in The Public Economics Courses by Using Problem Based Learning Model Approach

Riza Yonisa Kurniawan<sup>1</sup>, Eko Wahjudi<sup>2</sup>

<sup>1</sup>*Faculty of Economics, Universitas Negeri Surabaya, Indonesia  
rizayonisa@yahoo.com*

<sup>2</sup>*Faculty of Economics, Universitas Negeri Surabaya, Indonesia  
mail2wahjudi@gmail.com*

**Abstract:** Based on his observation in the class be known that the critical thinking skills of student still classified as low. It was caused by a student not bold in pour their ideas on the discussion in class. So that by the application of the problem based learning (PBL) is expected to make public economics courses more easily accepted and understood by a student. Research aims to improve the critical thinking skills of students and the level of mastery learning student's in public economics courses with the implementation of economic approach problem based learning in learning public economics courses. Methods used in this research are classroom action research with a model the problem based learning (PBL). In its application using two cycles of learning. A research result of the application of the problem based learning (PBL) is that the critical thinking skills of students in each meeting has increased from cycle I to cycle II. Learning outcomes of the students has increased productivity of 69,2 % in cycles I into 84,6 % in cycles II.

**Keywords:** Problem based learning, critical thinking skills, learning outcomes.

### 1 INTRODUCTION

Developments in science and technology (Science and Technology) are rapid and dynamic changes in society that makes the world of education should automatically evolve in line with advances in science and technology. The success of a nation is no longer dependent on natural resources and physical capital, but depending on the quality of Human Resources, which will eventually make a nation will be honoured and respected by other nations.

Along with the need for qualified human resources, which must be drawn is a quality education as well. In getting a good education then it takes a good learning process as well. Learning can be effective when all components are mutually supportive effect. These components include: students, curriculum, faculty, methods, facilities and infrastructure and the environment.

Students have an important role in the education and development as an agent of change for the study practiced, so they are expected to follow the progress of science and technology as well as productive in the community. Education continue to evolve with advances in information technology are increasingly sophisticated. Rapid technological progress also has implications for the students to gather information from a variety of disciplines. This concept is in accordance with the current curriculum that requires students to learn independently find their own concept of a material being studied. In the process of

teaching and learning teachers hold an important role, but the teachers here only act as a facilitator rather than as a learning centre or main actor in learning activities.

The use of lecture method pulpit or better known as the lecture method which has been used in teaching subjects deemed Public Economics is no longer appropriate and less in accordance with the basic competencies that must be mastered students in the course. According to some research results on the use of the lecture method pulpit or lecture (Suyanto, 1998) indicate that the lecture method is effective for conveying information, but not effective (1) to involve students actively in lectures, (2) less provide meaningful learning experiences for students , and (3) is not effective in improving student learning. Meanwhile, according to Percival & Ellington (1984) full attention in learning the lecture method in the range of attention (attention span) progressively decreased.

Public Economics is one of the courses provided to students in semester Economic Education 6 (six). Public Economics courses studying government policy to economic problems in Indonesia. Therefore, in the course of learning Indonesian economy should be more interesting and challenging so that later can be applied in the real world.

One of the learning model is a model that can be used Problem Based Learning (Problem Based Learning / PBL) has the following characteristics: ask a question or problem, focusing on the linkages

between disciplines, authentic investigation, produce a product / work and show it off, and cooperation. While the main goal the development of PBL is to develop thinking skills, problem solving, and intellectual skills, learning a variety of roles through their involvement in a real or simulated experience and become autonomous and independent learners.

As a lecturer of Public Economics courses should always seek, study and develop models of teaching in accordance with the characteristics and competencies that must be dominated students in the course of teaching. Failure or lack of achievement of the objectives of courses is not solely due to shortage / abilities of students, but lecturer should introspect on what has been given, the learning model is not appropriate, the conditions are less conducive classroom, lack of teaching materials available, faculty teaching behaviours that tend instructive, and evaluation system does not describe all aspects of intellectual, social and affective student is an indicator of lack learning objectives that should be corrected by the lecturer of the course.

Based on public economic exposure to the above learning with PBL approach aims: first to describe the application of learning strategies through problem based learning model (PBL) on the subject of Public Economics. The second to determine the feasibility model of problem-based learning (PBL) in Public Economics courses can improve students' critical thinking skills in terms of: express the problems, analyze problem, and provide alternative solutions to the problem. Third to describe the learning outcomes of students after following the model of the problem based learning (PBL) on the subject of Public Economics.

The results of the study Scott (2014) Findings affirm the importance of problem design characteristics and effective team facilitation, while raising new questions about team-level characteristics such as goal orientation diversity.

According Kurniawan (2013) Implementation Problem Based Instruction (PBI) is student activities at each meeting have a significant escalation. The level of completeness student's learning outcome at validity and reliability of items substance have a significant escalation from 71.43% in the first cycle to 85.71% in the second cycle, then increased to 92.86% on the posttest.

Research Muhson (2009) Findings showed that the implementation of the PBL method was able to increase the students' learning interests both inside and outside the class. By way of case analysis tasks, students showed great participation in the teaching learning process. The PBL method also increased the students' achievement. The students showed great understanding of the concepts and application of advanced statistics.

Marpaung (2005) that learning biology with problem-based learning activity sheets (LKPBM) as an alternative assessment can improve critical thinking skills that can contribute to the formulation of indicators of critical thinking that is the problem, argument, deduction, induction and decide the issue, and can improve learning outcomes that have positive influence on cognitive level.

According research Bilgin, et al (2009) The analysis of results showed that students in experimental group had better performance on conceptual problems while there was no difference in students' performances of quantitatives problems. The results of the study are discussed in terms of the effect of PBL on students' conceptual Learning.

## 2 RESEARCH METHODS

Type of research is Classroom Action Research (Classroom Action Research) (Hopkins, 1993: 48), which is oriented to the quality of learning (improvement-oriented instruction). While the subject of Public Economics course, because in the course many students are less sensitive and critical to the economic problems of the public in Indonesia.

According to Kemmis and Mc Taggart (1998), action research procedures in the classroom, including: plan of action, action research, observation, reflection, and re-planning.

This research was conducted in the Department of Economic Education class of 2011 odd semester 2013/2014 the Faculty of Economics, University of Surabaya, the number of students by 28 people. Selection of subjects was based on the results of preliminary observations that the students in the class are less active and critical in class so based on feedback from peers, then the class chosen as research subjects.

The data in this study were collected by means of observation. The data collected is based on the ongoing process of public economy in classroom learning. The things that are important and interesting note relating to the formulation and research purposes. Observations done twice, in the first cycle and the second cycle. in this study, the researcher acted as a dam involved teaching and learning full by observer peer.

Analysis of the data in this study make use of qualitative, namely the exposure data in accordance with the findings of the field is expressed in verbal statements. in this study data analysis is done by observing the following guidelines: (1) to determine the application of learning strategies through problem based learning model (PBL) on the subject of Public Economics is the attainment of action if the data lecturer in implementing measures of problem-based learning model (problem based learning) reached an average of 3 or with either category. (2) to

determine the feasibility model of problem-based learning (PBL) in Public Economics courses can improve students' critical thinking skills in terms of: suggested problems, analyzing problems, and provide alternative solutions to the problem is the data in the achievement of student problem-solving skills to reach the average 3 between the classifications or categories of 'good'. (3) to describe the learning outcomes of students after following the model of the problem based learning (PBL) in Public Economics courses are student learning outcomes achieved if the rate of at least 75% mastery learning with classical completeness level of 80% in one class.

### 3 RESULT

#### 3.1. Cycle 1

In cycle 1 at the first meeting, which is used as a general reference is the lesson plan that is supported by the observation instrument and learning the instrument.

The description of the first meeting of the first cycle is as follows:

##### Early Stage Events

Early stages of the activities carried out during the first 10 minutes. Deliver learning activities begins with the basic competencies and motivate students with the theme "economic problems in Indonesia". Furthermore, asking questions to the students about how the economic conditions around you. By motivating students to know the importance of the economic problems that can be overcome or provide ideas for future improvements.

##### Phase Core Activities

The next steps carried out for 70 min to do were explain the problem of government in the economy. In any explanation of each part of the theory was used along with examples of problems that can be applied in the analysis or interpretation and students to facilitate student understanding.

Furthermore, the students were divided into 6 groups of 4-5 students per group. Lecturers give a case study to each group to break with his group and the last student to present the results of their discussions to other groups responded to another group.

#### Final Stage Events

After the discussion was completed, the results of discussions with students all recapitulated. After that, the students are given the opportunity to ask about some of the things that becomes their problem in the implementation of the discussion. Furthermore, the results of the discussion were concluded. Students are given the task to create a policy related to the problem as it exists in Indonesia with existing case studies and presented at the next meeting. Furthermore, the rest of the time is used to perform the test cycle 1.

#### 3.2. Cycle 2

In this second cycle, learning mixed a little different than the first cycle. It is based on the observations on the first cycle. The first thing to do is to link the material economic and policy issues associated with the existing problems.

##### 3.2.1. Early Stage Events

Learning activities initiated by getting the students to observe the current Indonesian economic conditions. Further described behold the economic activity generated a lot of problems (10 minutes).

##### 3.2.2. Phase Core Activities

The next steps are performed to prepare students analytical results related to government policies to address the economic problems of Indonesia. Once ready, then students presented the results of the analysis and the problems that arise for other groups to be discussed and solved together.

##### 3.2.3. Final Stage Events

After the discussion is completed, the results of discussions with students all recapitulated. After that, the students are given the opportunity to ask about some of the things that becomes their problem in the implementation of the discussion. Furthermore, the results of the discussion were concluded based on the various existing findings. Thus, what they have learned helpful for them. Furthermore, the rest of the time was used to perform the test cycle 2.

### 4 DISCUSSION

Observation of the critical thinking skills of students performed in each execution cycle. Observed student activity includes activities carried out during the discussion.

Based on observations, it can be concluded that an increase in students' critical thinking skills significantly. In the first cycle of the average critical thinking skills is relatively low, while for the cycle to two significant increases especially aspects make a decision. Overall critical thinking skills in the first cycle is still relatively high when compared with the first cycle, this is because students in the field after observing them more aware of the condition of the field so that when the discussion in their classes easier in describing the findings of the field. From the results of these observations were also seen an average of almost all the aspects already shown good results or have the ability to think critically high. For group one aspect of evaluating and do action was quite good with a value close to 4, but to perform deduction and induction aspect is still low. While group 3 has a value that is relatively stable compared with other groups. This could be due to students enthusiastic in answering or presentation in front of the other groups because of the topics covered in accordance with the task later if becoming a teacher. The high percentage of students showed high activity, so that the discussion seemed more alive and active.

While the average assessment of students' critical thinking skills to decide which aspects of the number 6 and execute both in cycle 1 and 2 show high scores. Through these diagrams can be seen that an increase in the value of the overall performance of students in critical thinking skills.

Based on observations, an increase in the level of mastery learning students from the first cycle to the second cycle, an increase in the level of mastery learning classical from 69.2% in the first cycle to 84.6% in the second cycle.

The increase in the classical mastery learning from the first cycle to the second cycle due to a matter of the second cycle of evaluation is based on student worksheets that have been discussed with the faculty and students. While the completeness repairs class on the second cycle due to the time allocation is adjusted to the complexity of the matter.

Based on the presentation of research data that has been presented in this section, the discussion will be presented the results of research that has been done, as follows:

#### 4.1 Cycle 1

The main obstacle is the difficulty faced by observation of student performance activities. This is due to the number of students is too much. Therefore, the observation is only intended to ten randomly selected students.

In addition, problems or other obstacles that appear in the first cycle can be identified as follows:

(1) Students are not accustomed to think of scientific study and solve the problems contained in the Student Activity Sheet. (2) In a joint discussion, students are not accustomed to express his opinion individually. (3) The sound is relatively less audible researchers.

To overcome these constraints, efforts were made, among others: (2) provide positive reinforcement to students. It is expected that with the positive reinforcement can improve student confidence. (2) in the next cycle, the lecturer took the initiative to be in the middle of the student so that teachers can reach out to the sound of the whole class.

#### 4.2 Cycle 2

In the implementation of the second cycle, the relative constraints do not appear significant. So that the learning process run more effectively and efficiently. This condition is caused because students are better prepared and conditioned to accept the material. In addition, students are also no longer awkward or more dare to express their opinions.

In observation of student performance activities are also selected ten students at random. Progress has been achieved in the second cycle are as follows: (1) Students have been able to develop their own scientific way of thinking and construct their own understanding. (2) The participation of students in the higher learning process. (3) Students have been able to express their views in discussion with the individual. The discussions became more evenly shared and not dominated by a particular group.

### 5 CONCLUSIONS

Based on the analysis of data derived from observations of the management of learning, critical thinking skills of students, student response, and student learning outcomes, it can be concluded some of the following: (1) the application of Problem Based Learning (PBL) in public economics courses, particularly on the material Indonesia's economic problems can generally be run as planned. Some of the barriers that exist can be corrected in the next round. (2) This approach can improve students' critical thinking skills. (3) the results of the study experienced a significant increase of 69.2% in the first cycle to 84.6% in the second cycle.

Based on the findings in the field can be suggested to faculty to use problem-based learning by taking into account aspects that need especially attention and which are not. Thus of gaining good results and correct. The study was conducted in a material with a limited use of the strategy. Therefore, other researchers are expected to be more varied in

applying learning strategies in order to show the important things that cannot be shown in this research.

## An Action Research Study on using Elegant Tasks for Primary One pupils to Learn Art

Poh-Lim Shir Pei<sup>1</sup>, Fiona<sup>2</sup>

*Ngee Ann Primary School, 344 Marine Terrace, Singapore 449149  
poh-lim\_shir\_pei@moe.edu.sg*

**Abstract:** This action research study explored the use of Elegant Tasks for thirty primary one pupils from a typical public school in Singapore to learn Art. According to Sandra Kay, an elegant task is an open-ended-problem approach that serves to elicit ‘creative thoughts’ and ‘elegant’ or ‘aesthetically meaningful’ solutions from pupils. Apart from making the teaching of art interesting, the use of Elegant Tasks helps to amuse the pupils into developing an awareness of his or her own style of thinking including, its strong points as well as its weaknesses. Qualitative data were collected through focus group discussions. The findings from this study showed that pupils like the adoption of Elegant Tasks in their art lessons as they were given enough room to explore materials, make new discoveries, and work collaboratively in groups. Besides, this approach has also developed a strong sense of ownership and pride in their artworks as witnessed from pupils’ presentation of their artworks at the end of each elegant task topic.

**Keywords:** Art, Action Research, Education, Elegant Task

### 1 INTRODUCTION

I have been a Primary School Art teacher for many years. Prior to this research study, I taught Art to my pupils in the same manner that I was taught this subject when I was a primary school pupil. The strategy that I had adopted all these years was a teacher-centred, product-driven approach in which I provided all the required information, instructions, demonstrations, samples and followed by my pupils’ production of artworks. Hence, my pupils learnt Art merely through imitating the samples that I had prepared prior to the lessons.

However, as witnessed in the past Art lessons, pupils listened passively to me while I imparted my knowledge. Although the majority of pupils were able to produce impressive and eye-catching artworks by imitating my styles, colours and methods shown in the samples, I found that their artworks lacked creativity, imagination, emotion and personal voices. In addition, they neither demonstrated ownership of nor pride in their artworks. I also observed that over time, most of my pupils became disengaged during the Art lessons as they were not required to actively participate in the process of ideation and art-making. A few of them even became restless and caused unwanted disruptions in class.

These observations of my pupils’ lack of interest in learning Art and the disruptive behaviours of some of them raised concern and this in turn led me to reflect on and question my own instructional strategies in class. I had asked myself why I was still using the one-mould-fits-all strategy to teach the children despite my cognizance that all children are different, and they love to express themselves and to learn new drawing techniques and skills from their Art teachers. I had also asked myself whether there was a better way to teach art as well as to nurture a child’s creative development. This soul searching gave rise to the conviction that there must be better ways to teach Art and to develop the artist within each child. Fueled by this conviction, I decided to embark on this action research journey with a view of exploring a pupil-centered pedagogy that can offer a beneficial impact on teaching art.

This research study was conducted through a series of five Action Research Cycles with each cycle that alternated between action and critical reflection. As pointed by Dick (2001), Action Research (AR) is both a change methodology and a research methodology within a single process. In this research study, AR has helped to bring about change or improvement (the action) in such a way that better understanding was developed as parallel outcome at

hand. AR also assisted the teacher to pursue understanding (the research) that allowed the action to be based upon a better understanding of the current situation and the research was achieved by being responsive to the situation and by searching strenuously for disconfirming evidence.

## **2 ACTION RESEARCH CYCLE ONE: DERIVATION OF RESEARCH QUESTIONS**

While searching for a pupil-centred pedagogy, I was introduced to “Elegant Task” approach by one of the officers from STAR (Singapore Teachers’ Academy for the aRts) during an Art Workshop in February 2013. During the workshop, I learnt ways of designing art lessons that focused on pupils’ creativity and imagination using Elegant Task. This approach also allows pupils to explore materials and participate actively in the art-making process. After learning about this new approach, I was eager to find an opportunity to try it out on my pupils.

During my first consultation session with STAR officers in May 2013 for my Action Research study project, we brainstormed a few possible pupil-centred methodologies suitable to be used for this study, such as Inquiry-based approach, Experiential Learning approach and Elegant Task approach. After debating on the pros and cons of each method, we came to a unanimous consensus that Elegant Task approach was more suitable for this study as it was a relatively new approach which had not been used or tested in a Primary School in Singapore before and it also fulfilled the criteria of being a pupil-centric, process-driven approach that could develop pupils’ creativity and imagination. By using Elegant Tasks to teach Art, my pupils would have opportunities to make choices and decisions in the ideation stage and during the art-making process. The choice of using Elegant Tasks was subsequently adopted for my Art lessons and simultaneously I embarked on my research project. Hence, for the research, the broad question that my study addressed was: “What are the Primary 1 pupils’ perceptions on the use of Elegant Tasks in Art lessons?”

Beside the broad research question, we also crafted six specific questions to guide my inquiry and to enable me to collect data to answer the broad research question. The STAR officers helped me to scope my research area into three broad themes, firstly, we wanted to find out whether the pupils liked the Elegant Task approach, secondly, we wanted to find out what pupils actually learned if I use Elegant Task approach in Art lessons, and lastly, we wanted to find out whether Elegant Task approach helped the pupils to produce quality artworks. With these three themes in mind, we further broke down each theme into six manageable bite-size questions. These six

specific questions were later used during the focus group discussions to collect data.

The six specific questions were as follows:

1. Do the pupils like the Elegant Tasks approach to learning Art and doing artwork? If yes/no, why?
2. Give an example of an Elegant Task Art lesson which the pupils liked and disliked. Which parts of the lessons do they like/dislike and why do they like/dislike those parts?
3. What can the pupils learn about art-marking when Elegant Tasks are deployed?
4. Apart from art-making, what else can the pupils learn during the Elegant Task Art lessons?
5. Can the Elegant Task approach help the pupils to produce quality artworks? If yes, in what ways? If no, why?
6. What else can be done to enhance the Art lessons? Can the lessons be improved based on pupils’ feedback at the end of each elegant task?

## **3 ACTION RESEARCH CYCLE TWO: CONDUCT LITERATURE REVIEW**

In this action research cycle, the findings of literature review are presented in three different sections. The first section, “the 2009 Primary and Lower Secondary Art Syllabus and its influence on the teaching of Art”, describes the syllabus set by authority. The second section, “Elegant Tasks, its characteristics and its effect”, describes an elegant task and how an elegant task can meet the learning objectives mentioned in section one. The third section, “understanding the different types of learning dimensions in learners and their stages of artistic development”, provides a set of pointers for designing a lesson using an Elegant Task.

### **3.1 The 2009 Primary and Lower Secondary Art Syllabus and its influence on the teaching of Art**

In Singapore, Art is deemed by the Ministry of Education (MOE) as an important subject through which pupils at all educational levels can be equipped with the 21<sup>st</sup> century competencies and be holistically prepared for successful adult life. This is seen in the recent move by the Ministry of Education (MOE) to strengthen aesthetic education (MOE, 2010). Its revised 2009 Primary and Lower Secondary Art Syllabuses recommended that the primary schools’ planning of their Art Instructional Programme should be guided by six principles, namely, “learner-centred”, “process-oriented”, “contextualized”, “interactive”, “initiative-related”

and “fun” to fulfill seven objectives, amongst which are: (1) “create artworks to share their ideas, thoughts and feelings”, (2) “cultivate a spirit of innovation and experimentation” and (3) “develop sensory awareness and imagination” (MOE, 2008, p. 3 & 7). The implementation of the guiding principles for planning the Instructional Programme and the objectives spelt out in the revised 2009 Primary and Lower Secondary Art Syllabus was concretised in 2010 when MOE moved to strengthen Art education.

The learning outcomes for the Primary One and Two pupils are spelt out in the 2009 Art syllabus as follows:

1. Identify simple visual qualities in what they see around them
2. Be curious about what they see
3. Share their imagination, thoughts and feelings through art making
4. Wide use of art materials and medium
5. Enjoy looking at and creating art
6. Talk about what they see and experience (MOE, 2008, p. 5)

These learning outcomes, which are derived from the objectives and the framework of “Seeing”, “Expressing” and “Appreciating” in the Art Syllabus, will allow the students to “observe their environment, generate ideas, create artworks, discuss about art and value the role of art in society” (MOE, 2008). In short, Art education in Singapore aims to enable every student to be visually literate and to appreciate art.

### **3.2 Elegant task, its characteristics and its effect**

Teaching for creative development necessitates designing lessons that allow learners to perceive, select, and explore, through their own lenses, all the possible visual solutions to the problem (Kay, 1998). In short, teaching of Art needs to be pupil-centric and process-driven so as to develop the creativity and imagination of learners. For this study, I had adopted the Elegant Task approach for my art lessons. The concept of Elegant Task originated from Sandra Kay (1998) who defined it as an open-ended problem which will elicit ‘creative thoughts’ and ‘elegant’ or ‘aesthetically meaningful’ solutions from pupils. According to Kay, an elegant task is one that is worth solving, is studio-based and contains forced choices and constraints, and the level of the elegant task, which ranged from ‘beginner’ to ‘independent’ is determined by the degree the choices and constraints co-vary (Sukaimi, 2013).

Therefore, in setting elegant tasks, the Art teacher should select problems that are relevant to the experiences of the pupils for them to be able to relate

to and to find them worth solving. The elegant problem should also be sufficiently flexible for all educational levels and all categories of pupils to adapt it for their own use (flexibility), will allow many possible, creative and original solutions as it is open-ended (fluency), and should also be studio based (Kay, 1998, p. 281).

It is envisaged that setting such elegant problems will empower the pupils to make choices and meaningful decisions in the ideation and art-making process, will enhance their technical and intellectual growth, and encourage them to discover and explore the attributes and characteristics of the materials in greater depth, thereby leading to other extraordinary forms of the craft (elaboration) (Sukaimi, 2013, p. 10). An elegant problem will improve the pupils’ engagement in the task as it will evoke reflection, decision-making and meaning-making which are processes for deriving original and creative solutions (originality). Pupils will intuitively feel a sense of ownership and pride when the art-making experience is meaningful and satisfying (Sukaimi, 2013, p. 9). According to Sukaimi (2013), by designing tasks that invite flexibility, fluency, elaboration and originality of responses, the teacher is engaging his/her pupils in the creative thought process.

The way the teacher shapes an elegant task can affect what and how her pupils learn. Kay (1998, p. 331) says, “Visual problems that are challenging and can be solved successfully by diverse learners have more than one answer. This takes practice on the part of a teacher and a willingness to establish criteria and parameters that allow for individualism. Designing elegant problems takes thoughtful practice.”

Thus, Elegant Task approach is chosen for my research study as it best fits the 2009 Art Syllabus set by MOE. During the study, pupils were given opportunities to identify visual qualities they see around them during the Tuning-in Activity, arouse their curiosity through guiding questions during the exploration and the discovery stages, and express their inner thoughts, feelings and imagination through different medium during the art-making process.

### **3.3 Different types of learning dimensions in learners and their stages of artistic development**

According to Kay (1998), “Elegant Tasks” is grounded in theories which are consistent with other theoretical works. Amongst these are the different types of learning dimensions which affect the pupils’ learning of Art. The learning dimensions are categorised as affective, social and cognitive and are elaborated below.

The affective dimension of learning is described in Csikszentmihalyi’s “flow construct” motivational

theory in which he suggests that learning will be intrinsically motivating when a problem is pitched at an appropriate level of difficulty for the pupil (Csikszentmihalyi, 1990). That is, the task set by the Art teacher must be within the pupils’ current ability level to handle for it to be appealing to them. If it is beyond or below their ability, then they will experience anxiety or boredom accordingly when handling the task. Learning will occur when the pupils find the task assigned by the Art teacher intrinsically motivating and can handle it (Kay, 1998).

The social dimensions of learning are grounded in Vygotsky’s theory of intellectual development. Vygotsky (1978) believed that “cognitive development originated from social interaction” before knowledge is internalised and the “capability to learn under a teacher’s guidance varies tremendously in children with equal levels of mental development”. Vygotsky terms this “area of fluctuation” in developmental level as the “zone of proximal development (ZPD)” and views “good learning” as “that which is in advance of development”. ZPD is the “distance between the actual developmental level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers” (Vygotsky, 1978). Based on this theory, art tasks must be pitched at a higher level than the pupils’ current level of problem-solving skill (Kay, 1998).

The cognitive dimensions of learning are premised on the differences in cognitive development among individuals in artistic problem-solving. Arnheim (1974) suggests that the imagination necessary to engage in artistic problem solving requires abstract thought” (as cited in Kay, 1998, pg.264). Kay (1998) therefore advocated that Art teachers need to first understand the cognitive processes associated with thinking in art if they are to systematically develop abstract thought in their pupils. According to her, pupils respond to an assignment or problem differently. They used problem-solving strategies which required thinking when handling the assignment or problem. Their choice of problem-solving strategies is influenced by their prior experience and whether the assignment/problem is close- or open-ended in nature (Kay, 1998). That is, the level of the students’ expertise in the subject matter affects their perception and interpretations of the assignment/problem and influences the approach they used to perform the assignment or to solve the problem. The higher the level of expertise, the more advanced is the product of their work (Kay, 1998).

On the other hand, understanding the stages of artistic development in children can also aid the Art

teacher to plan and execute lessons effectively. Lowenfeld (1947) argues that there are six defined stages of artistic development in children and that these stages can be witnessed in their artworks. The six stages are: Scribble Stage (1-3 years old), Preschematic Stage (3-4 years old), Schematic Stage (5-6 years old), Dawning Realism Stage (7-9 years old), Pseudo-Naturalistic Stage (10-13 years old), and lastly Decision Stage (13-16 years old). As my Primary One pupils are between the ages of six to seven, majority of them are progressing from the Schematic Stage to the Dawning Realism Stage as observed in their artworks. Thus, during the study, the four Elegant task unit topics were designed to pitch at the Dawning Realism Stage whereby pupils were required to use more complex schema when conceptualising and creating their artworks.

Hence, in order to design meaningful assignments/problems for optimal engagement and learning in pupils, the Art teacher needs to know the different types of learning dimensions in learners and the stage of artistic development the pupils are at so as to set the tasks to be done in Art accordingly. By paying attention to the affective and social dimensions of learning, the Art teacher could empower the pupils to take ownership of their learning while being cognizant of the cognitive dimensions of learning which “can enhance the learning of a novice or assist the non-artist’s appreciation of the complexity of thought in producing ideas in art” (Kay, 1998, pg.266).

In summary, I have summarised the above literature review of different types of learning dimensions in learners as follows:

- Point a: Task must be within the pupil’s ability
- Point b: Opportunity for independent problem solving
- Point c: Collaboration with more capable peers
- Point d: Choice of problem-solving strategy

#### **4 ACTION RESEARCH CYCLE THREE: MY INTERVENTION IN CLASS**

The study commenced in May 2013 and ended in September 2013. However, the research project spanned a total of 10 months from conception to completion of the written research report.

##### **4.1 Selection of participants**

The sample for this research study comprised a class of thirty Primary One pupils, who were seven year-old from a typical public primary school. This class was a multi-ethnic class with mixed-ability and mixed-gender. Table 1 below shows the distribution of pupils by ethnicity, academic grouping and gender. There were thirteen girls and seventeen boys,

of whom eight were high-progress pupils, fourteen middle-progress and eight low progress pupils.

Primary 1 pupils were selected for this research study as they were fresh from Kindergarten and had not gone through any formal Primary School Art Education yet. There were no previous primary school Art experiences to influence their views.

## 4.2 Elegant Task Lessons

Four Unit topics totalling eleven Elegant Task lessons were carried out with the pupils who participated in this study. These Unit topics were (a) Colour Theory, (b) Drawing from Observation, (c) Fold and Dye and (d) Printmaking. Refer to Appendices A to D for the detailed lesson plans. I have used the Colour Theory lesson plan (Appendix A) as an example on how I have linked the Literature Review to my lesson plan by incorporating the Points (a, b, c and d) as highlighted in this AR Cycle 2. In addition, I have also added three new points here as my own initiative to value-add and to enhance my pupils' engagement in the art lessons. The three new points are:

Point f: Group discussion

Point g: Class presentation

Pupils' safety is very important during Art lessons. I always make sure that my pupils are not allowed to handle sharp objects that would compromise their safety. Teacher's supervision is necessary when pupils are exploring art medium and materials. Group discussions are also added into each unit topic as pupils could also learn from their peers when they talked among themselves in their own language. To conclude each unit topic, I have added in the class presentation segment to create opportunity for pupils to share and talk about their feelings, experiences, thoughts and ideas before, during and after the art-making process.

The eleven Elegant Task lessons were conducted between May 2013 and September 2013. The pupils had their conventional (teacher-centred) Art lessons from January 2013 to April 2013 before the commencement of this research study.

**Table 1.** Distribution of Students by Ethnicity, Academic Grouping and Gender.

Ethnicity	Students' academic grouping						Total
	High progress		Middle progress		Low progress		
	Male	Female	Male	Female	Male	Female	
Chinese	2	6	7	2	2	2	21
Indian	0	0	1	0	2	0	3
Malay	0	0	0	2	2	0	4
Others	0	0	1	1	0	0	2
<b>Total</b>	<b>2</b>	<b>6</b>	<b>9</b>	<b>5</b>	<b>6</b>	<b>2</b>	<b>30</b>

**Table 2.** Descriptions of the Four Elegant Task Art Lessons.

Unit Topic	Number of lessons	What the Teacher Did	What the Pupils Learnt	Elegant Task for Art-Making
Colour Theory	2 lessons spread over two weeks	Being a repeat lesson, the teacher used the time to teach the pupils what elegant task is and how to solve problems	Pupils learnt about primary and secondary colours and discovered for themselves which 2 primary colours mixed together to produce a secondary colour <i>(Point a, b, f and g)</i>	Mothers' Day is coming! You want to design a very special Mothers' Day card for your mother. Draw a portrait of your mother on the card and outline it with black permanent marker. Cover the whole card with yellow, red and blue coloured tissue paper. Use only water and brush to paste the tissue paper on the card. Give the completed card to your mother to surprise her on Mothers' Day.

Drawing from Observation	3 lessons spread over three weeks	The teacher showed pupils some unique houses found around the world and discussed about the structures, functionality and aesthetic values of the houses. The teacher also asked pupils to think what a house meant to them.	Pupils learnt about sketching building blocks from observation. They discovered that in order to make their sketches more realistic, they had to include the side view as well. <i>(Point a, b, c, d, f and g)</i>	You have a piece of land. You want to design and build a house for you and your family to live happily in. Create your house using six building blocks and sketch it onto the sketch book using pencil. Colour it with coloured pencils. Consider each family member's likes and dislikes and build a house to surprise them.
Fold and Dye	3 lessons spread over three weeks	The teacher taught the fold and dye technique in Lesson 1 followed by self-discovery and exploration time for the pupils.	Pupils learnt the technique of folding and dyeing paper. They discovered that when they opened their folded paper, repeated patterns were created. Thus, this led them to discover that different kinds of folding would produce different kinds of repeated patterns. <i>(Point a, b, c, d, f and g)</i>	Your school has bought plastic covers for all pupils to protect their desks. Your Principal wants all the pupils to decorate their desks beautifully. You are given a piece of white rice paper to decorate your desk. Using the fold & dye method, fold your rice paper no more than 6 times and dye it with batik dyes to achieve your desired repeated patterns. Decorate your table proudly with your new rice paper once you have finished.
Printmaking	3 lessons spread over three weeks	In lesson 1, the teacher taught the pupils the printmaking technique followed by self-discovery and exploration time for the pupils.	Pupils learnt the printmaking technique. They discovered that if they cut the fruits or vegetables from another angle, they would end up getting a unique shape when printed. They also discovered that materials have textures and the rougher it is, the better the print will turn out. <i>(Point a, b, c, d, e, f and g)</i>	You have spent almost a year now in Ngee Ann Primary School since you left kindergarten. Imagine that next year, you will buddy a new batch of Primary 1 pupils! What would you say to your new buddy about the best moment/event you had in Ngee Ann Primary School since January this year? Capture this memorable moment/event using the Printmaking technique. Ink your object with water-proof paint using a brush and print it by hand-pressure. You may also use other objects found around you. Be creative and have fun!

#### 4.2.1 Unit Topic 1

Colour Theory, the data collected from the two lessons were not used for this study as the pupils studied this topic twice, once via the conventional way and the second time using the Elegant Task way. However, the latter lessons served as a time for training and hand-holding the pupils to learn Art via Elegant Task. Two lessons were used to introduce pupils to Elegant Tasks.

#### 4.2.2 Unit Topic 2

Drawing from Observation, the pupils did different art activities. In Lesson 1, they shared what a house meant to them personally, discussed about some unique houses found around the world, played with the building blocks and attempted to build their

dream house for the first time. In Lesson 2, they confirmed their designs after several attempts and sketched these in their respective sketch books. In Lesson 3, they coloured their sketches and presented their designs to their group members. Finally, a few pupils were selected by the teacher to present their dream houses to the whole class.

#### 4.2.3 Unit Topic 3

Fold and Dye, the art-making activities progressed from simple to complex tasks. During the first lesson, the teacher introduced the Fold and Dye technique. After that, each pupil was given five small pieces of rice paper to explore the technique. They then pasted their completed work in their sketchbook as part of their learning process before sharing their best piece of artwork with their group members in the next

lesson. In Lesson 3, the pupils did fold and dye on a desk-size piece of rice paper. By this lesson, each pupil would have decided on how they wanted to fold their paper. When all the students had completed their artwork, they stood in a big circle to appreciate each other’s handiwork. A few students who had not presented before were chosen to present their artwork to the whole class.

#### 4.2.4 Unit Topic 4

Printmaking, three lessons were conducted. In Lesson 1, after the teacher had taught the printmaking technique, each group chose one fruit or vegetable to explore four different ways of cutting and printing it. The pupils in each group discussed which way they wanted to cut the fruit or vegetable. After they had discussed and decided, I would then cut the fruit or vegetable for them as pupils at this age are not allowed to handle a knife. After each cut, pupils printed the fruit or vegetable on their individual worksheet. At the end of Lesson 1, the pupils pasted their prints in their sketchbook. They presented their group findings to the whole class during Lesson 2. They taught their classmates how to cut the fruit or vegetable to achieve certain unique shape when printed. There was interaction between the group doing the presentation and their classmates seated on the floor. Some pupils even suggested other ways of cutting the fruit or vegetable after the group had presented. In Lesson 3, guided by the Elegant Task, the pupils used the given fruit, vegetables and other textured materials to create their individual print. A few pupils were then selected to present their prints to the whole class near the end of the lesson.

### 5 ACTION RESEARCH CYCLE FOUR: DATA ANALYSIS

#### 5.1 Data collection and instrumentation

As this research was a qualitative study, data were collected via focus group discussions. Refer to Appendix E for the list of focus group discussion questions. Five focus group discussions of six pupils per group were conducted to gather data on their perception of using Elegant Tasks to learn Art and doing artworks. The questions for the focus group discussions were patterned after the six specific questions. They covered the three themes of pupils’ reactions to the use of Elegant Tasks to learn Art, what they had learnt in the Elegant Task Art lessons and how the use of the Elegant Task approach helped them to improve their artworks.

As the Primary One pupils were still very young, being only six to seven years of age, the size of each focus group discussion was kept small to avoid their being easily swayed by the views of their classmates.

Also to help them to overcome inhibitions during the discussions, the pupils answered an open-ended questionnaire patterned after the six specific questions prior to the focus group discussions so that they could speak up at the discussion sessions. I was the facilitator for all the focus group discussions and another teacher assisted in note-taking. The focus group discussion sessions were also video recorded.

#### 5.2 Data analysis

The qualitative data from the focus group discussions were then compiled based on the three themes identified. The three themes were: the pupils’ reactions to the use of Elegant Tasks in art lessons, what the pupils learnt through the Elegant Task Art lessons and ways the Elegant Task Art lessons enabled the pupils to produce quality artwork. The three themes were used to narrate the data on the pupils’ perceptions on the use of Elegant Task to learn Art.

##### 5.2.1 Question 1 and 2: Pupils’ reactions to the use of Elegant Tasks in Art lessons

The pupils’ reactions to the use of Elegant Tasks in Art lessons were very positive, favourable and encouraging. To the pupils, the Elegant Task lessons were “exciting”, “fun” with “a lot of interesting activities to do”, and “cool and amazing”. They not only “got to play with their friends when doing art” but they also learnt “new things”, “a lot of new techniques” and “new skills”. They found learning meaningful because they understood the reasons for doing their artworks, and they could do them “creatively” as exemplified by this remark, “No right answers. We can do our own art creatively”. Besides providing opportunities for them to play and learn, the use of Elegant Tasks also helped them to improve their art as they could draw and paint better compared to the artworks done before the research study. The pupils were highly motivated by the use of Elegant Tasks to learn Art as seen from these responses of the students: “I can’t wait for Thursdays to have art lesson. I am happy when it is Thursday”; “It is better than normal art lesson”; “The lessons are great and I love them all” and “It is exciting, interesting and fun. I look forward to [the] art lesson. Although it is at the last 2 periods but I am not tired at all. I’m excited when [the Art teacher] comes in”.

In terms of the four Unit lessons, the most popular lesson with the pupils was Fold and Dye. In their words, it was “fun”, “exciting” and “interesting”. The pupils liked different parts of the Fold and Dye lessons. Some liked the painting part, some like the dyeing part and others like the folding and opening of the rice paper. The painting and

dyeing appealed to the pupils because they liked to paint and create different designs and patterns. The opening of the rice paper was thrilling for the pupils as they excitedly anticipated seeing the patterns they had created. These feelings are summarised by a pupil when he said: “I like the Fold & Dye because it is interesting. I like the opening part because it is exciting to see what the final artwork look like. When I’m painting the patterns, I don’t know how it will look like until I open it.”

The least popular topic was Drawing from Observation. Only two pupils voted for this topic. One of them liked to draw the blocks while the other one liked to colour the blocks using different tones to make them looked three dimensional. Most pupils mentioned that the sketching part was the toughest as this could be that they have not grasped the concept and skill of three dimensional drawing.

The pupils also strongly approved the use of Elegant Tasks to teach Art. Personally, they wanted more lessons using elegant tasks. In the words of one pupil which was echoed by many of his/her classmates, “I want every art lesson to be Elegant Task. It is so fun”. Eleven Art lessons using Elegant Tasks were not sufficient for them. They wanted more of such lessons. Besides thinking of themselves, they also wanted all the Primary One classes to have the opportunity to learn Art using Elegant Tasks. As several pupils recommended: “Every P1 class should have Elegant Task. It is very good”; “All P1 classes should use Elegant Task because it is fun” and “All classes should have Elegant Task. It is very good”. Their reactions to the Elegant Task Art lessons were positive and they had nothing to suggest for improving the lessons.

### 5.2.2 Question 3 and 4: What the pupils learnt through the Elegant Task Art lessons

Through the Elegant Task Art lessons, the pupils acquired artistic and technical skills. They learnt to mix primary colours to get secondary colours, draw the side views of the building blocks to make their house look more three dimensional, create their own repeated patterns and paint them on the rice paper and print the same fruit or vegetables in many different ways after exploring and experimenting with their group members. In the course of art making, some of them also made other discoveries to their delight and amazement. They explored and discovered for themselves how to paint repeated objects instead of just creating patterns and that everyday objects found around them could also be used for printing and making beautiful artworks. For example, one of the pupils painted a quarter of a butterfly and when she opened the rice paper, to everyone’s pleasant surprise, there was a complete

butterfly on the paper. They also learnt how to draw a portrait and make a card (eg., “I learnt to make a Mothers’ Day card for my mother. I feel proud.”), to fold papers creatively, to dye and wait until the rice papers were dry before opening them (so that they would not be torn), to stack up six blocks to make a dream house and “to look at things carefully before drawing”.

In addition to mastering the art-making techniques during the Elegant Task Art lessons, the pupils also acquired soft skills including teamwork, interpersonal, and presentation skills. For teamwork they had learnt, they shared:

- “I learnt to cooperate with my friends during group work. We helped each other and cleaned up together.”
- “I learnt to share things with my group members. We must take turn to use the brushes.”
- “I learnt to wait for my turn patiently.”
- “I learnt to do my part during group work. For example, I laid out the newspapers on the tables. I put the art materials in the middle to share with my friends.”
- “I learnt how to work with my friends. I share materials with them and also help them when they are in trouble.”

Examples of interpersonal skills which the pupils said that they had learnt included “be nice to my friends”, “help them when they need help” or “are in trouble”, “listen when others are talking”, “help each other and cleaned up together” and took responsibility for mistakes made, for example, “I accidentally dropped a drop of paint onto my friend’s pencil case. I quickly took out my handkerchief and wiped the paint off. Luckily, my friend was not angry with me.” and “I accidentally topple a container of batik dye. I ... clean the tables and mop the floor myself”.

In terms of presentation skills, one pupil said: “I can stand in front of my class and talk about my artwork. I know what to say and I say it loudly. Last time, I’m very scared and very shy. After doing in my group a few times, I can now talk in front of my class”.

The pupils also developed characteristics that were related to the 21<sup>st</sup> century competencies (such as Critical and Inventive Thinking, and Communication, Collaboration and Information Skills) and student outcomes (such as being a confident person, self-directed learner and active contributor) (taken from website: <http://www.moe.gov.sg/education/21cc/>). The pupils learnt to persevere, to problem-solve “creatively”, “to face fear”, to be “more willing to try new things during art lessons”, to focus when doing art and not to be distracted easily and to concentrate

when doing art instead of talking to friends. One pupil said, “I learnt how to solve problems myself. For example, when dyeing the rice paper, I cannot get the right colour I want, so I keep trying by mixing two colours until I get it”. Another pupil added, “I learnt to face my fear. When I have fear of doing things, I tell myself to be brave and try it. Now, I’m more willing to try new things during lessons”. They took ownership of their learning.

### 5.2.3 Question 5 and 6: Ways the Elegant Task lessons enabled pupils to produce better artwork

According to the pupils, their artwork had improved compared to the beginning of the year. One area which they indicated that had improved was drawing. From their perspective, their drawing now had “improved a lot”, was “nicer”, “more interesting” and “better”, and “look more real”. Not only were they able to produce quality artwork, they also picked up skills and developed better habits and quality. They could “draw more shapes” and “hold the pencil properly”. They also practised “drawing more often at home” and during “free time” and had more patience now when drawing, thus showing their ability to self-direct their own learning.

Besides drawing, they improved their painting and colouring as well. Their painting was “nicer” because they could “control the brush well”, “paint within the line”, paint and colour “without white spaces”, and “paint in one direction”.

## 6 ACTION RESEARCH CYCLE FIVE: MY REFLECTION AND PERSONAL LEARNING

The results of this study showed that the Elegant Task Art lessons were well-received by this group of Primary One pupils. They enjoyed the Art lessons because they were more meaningful, interesting, fun and exciting than past Art lessons (from January to April). They also benefited from the exposure to Elegant Tasks both in terms of artistic skills and personal development. They viewed their artworks with pride. They were so motivated and inspired by the Elegant Task approach to learning Art that they did extra practice of artwork at home and during free time and they wanted more of such lessons not only for themselves but also for other Primary One pupils. These findings supported Sukaimi’s (2013) point that “when the art-making experience is meaningful and satisfying, students will intuitively feel a sense of ownership and pride”. The use of Elegant Tasks to teach Art seemed to have fulfilled the principles of “learner-centered”, “process-oriented”,

“contextualised”, “interactive”, “initiative-related” and “fun” as articulated in the 2009 Art Syllabus (MOE, 2008).

I had also observed some positive behaviour that the pupils exhibited while learning Art using Elegant Tasks. Firstly, I noticed that most of the pupils were able to think independently and critically to explore and generate new ideas during the group discussion and collaboration stages. When guided by me, they were able to expand and develop their ideas further (ZPD as mentioned in this research cycle 2), and completed their final artwork independently and confidently. Secondly, the pupils were also able to communicate effectively with me and their peers during the group presentation and class presentation. Thirdly, they were more outspoken and asked questions and sought clarification when they were in doubt and following clarification, they would reflect on their own actions during the art-making process and persevere till they completed the tasks. Fourthly, the pupils were able to work effectively in groups. Good teamwork not only promoted a deeper level of learning among the peers but also, learning to talk with and to listen to one another were important communication skills that pupils had acquired along the way. Lastly, they took responsibility for their own learning as all of them had completed and handed in their final individual artwork for all the art lessons. These observations made (triangulated) support the perceptions of the pupils that they had grown cognitively, affectively and socially through the Elegant Tasks Art lessons.

The notion of Elegant Task could only provide a framework or a structure for me to work on. Ultimately, I had to decide what could work or not in my class by knowing my pupils well when planning the lessons. Therefore, my selection of topic and the design of the lesson plans in this research study were not a do-this-and-do-that lesson. They were based on three considerations: simplicity, involvement, and achievement. They were intended to amuse the pupils into developing an awareness of his or her own-style of thinking, its strong points and its weaknesses. One pupil might get blocked at a certain point. Another pupil may never make use of certain strategies. Awareness is the first step to correction and improvement in any skill – this is the essence of my lesson plans. In fact, the only effort required from a pupil is that he or she should ask himself or herself the question: “Why am I having difficulty over this?” during the art lessons.

I observed some limitations during this research study. This study was carried out over one term, from July to September. A few lessons were disrupted due to public holidays and closure of school due to National Examination. Thus, I could not carry out the full lesson in each unit as planned. I had to borrow periods from other subject teachers to make up for

the lost time. As the period for implementing the Elegant Task Art lessons was short, with only four Unit Lessons, it was not possible to see its full impact.

In addition, this research project is a very small scale study. The data collected and analysis could not be generalised due to the small sample size. Time did not permit the use of other methods of data collection so that the additional data source(s) could be used for triangulation. Furthermore, no similar previous research studies were done in this area. Consequently it was also not possible to validate the findings of this study with the findings of other similar research.

Hence, it is recommended that this study be replicated in future with modifications to the design to avoid the pitfalls/gaps of this study. The sample size should be increased and the duration of the study lengthened to better determine the effect of the Elegant Task approach. It is also recommended that the timing of the project be changed to the beginning of the year so that there would be sufficient time to implement the Elegant Task Art lessons to assess their impact.

## 7 CONCLUSIONS

In conclusion, the pupils’ perceptions on the use of Elegant Tasks in Art were favourable and promising. The eleven Elegant Task lessons benefited this group of pupils by developing them artistically, socially and affectively.

In fact, Hase and Kenyon (2007), Hase and Tay (2004), and Tay and Hase (2004, 2010) make a distinction between knowledge and skill acquisition and that of learning. Knowledge and skills or competencies can be acquired and even reproduced. But, this is not learning at a deeper cognitive level. Learning is an integrative experience where a change in behaviour, knowledge, or understanding is incorporated into a pupil’s existing repertoire of behaviour and schema (values, attitudes and beliefs). For example, let’s recall a pupil’s comment from “Question 3 and 4” in the “Data Analysis” section. That particular pupil learnt that a third colour could be formed by mixing two different colours in class. However, to get the intended colour for dyeing the rice paper, that pupil had to go beyond just merely mixing of two colours. Firstly, that pupil had to identify the valid category of colour by selecting a pair of different colours. Secondly, that pupil had to work out the required proportions of each colour from the chosen pair of colours from step 1 in order to obtain the intended colour tone. The two steps mentioned were not taught to that pupil. That pupil had to keep trying in unanticipated situation by mixing the two colours until the intended colour was obtained. In other words, it is possible to acquire a

set of competencies that one can repeat in familiar or known circumstances. However, if learning has taken place, competencies can also be repeated and even adapted in unfamiliar, unanticipated situations.

After using this pupil-centred approach in my study, I realised that the benefits outweighed those from the traditional teacher-centred approach to teach Art. Looking forward, I will be switching to this new approach to teach art without hesitation. I strongly believe that for now this is a positive way forward in teaching Art and would strongly recommend it to all Art teachers.

## 8 ACKNOWLEDGEMENTS

I would like to extend my heartfelt thanks to:

- my school leaders, Mr Koe Ee Tiong (Principal), Mr Edwin Hoy (Vice-Principal), Mrs Cheah Poh Teen (Vice-Principal), my Reporting Officer, Miss Sharon Kuah (HOD Aesthetics) for giving me their support and the opportunity to embark on this Action Research project with the pupils in Ngee Ann Primary School.

- my colleagues in Ngee Ann Primary School for their help in video-taping all the AR lessons and their kind assistance in one way or another to complete my AR journey.

- Ms Tang Hui Jing and Ms Ira (STAR Officers), Ms Poh Chwee Sian (STAR AR Consultant), for their tireless guidance and financial support throughout this AR journey.

- Dr Tay Boon Hou for his invaluable support, guidance and constructive comments in my Action Research journey.

- Mdm Sangeetha and Research@EastZone in organising consultation sessions.

## Empowering Students' Autonomy In Learning Tefl Subject Through Lesson Study

*A study conducted to 6th semester students of English Education study program of FKIP Unpak*

Atti Herawati<sup>1</sup>

<sup>1</sup> English Education Study Program, Pakuan University, Bogor, Indonesia  
tihera@gmail.com

**Abstract:** This study is meant to improve students' autonomy in learning TEFL subject through Cooperative Learning and lesson study. The study is conducted in English Education Study Program, and the participants are the students of semester VI A and B. This study involves a team of TEFL lecturers who collaborate with more than five observers. The data of this study are gained from observation, documentation, questionnaire, and interview. The method used in this study is Classroom Action Research by implementing Lesson Study design. The teaching strategy used in this study is the modification of Cooperative Learning method. The data show that there is an improvement of students' autonomy in learning TEFL. Besides, they enjoy learning because through lesson study along with the application of cooperative learning method the classroom atmosphere is more conducive. Their involvement and participation in learning is also improved. The lecturers who facilitate the subject also improve their teaching strategy in order that the students achieve the goal of learning. Thus, it can be concluded that the application of Lesson Study design along with Cooperative Learning method can improve students' autonomy in learning TEFL subject as well as lecturer's strategy in facilitating the students to reach the goal of learning.

**Keywords:** Learning autonomy, TEFL subject, lesson study

### 1 INTRODUCTION

#### 1.1 Background of the Study

Learning system in higher education demands the students to become autonomous learners who can initiate their own learning, monitor their own learning progress and evaluate their own learning achievement (Schunk, 2005). Learning autonomy is supposed to start since the first year of their study so that after several semesters of their study, the students get used to be autonomous learners. However, based on the writer's observation the students who were studying in semester 6 in English Education Study Program did not show that they were autonomous learners. Some indicators that show the phenomenon are: (1) during the learning process the students tend to depend merely on the explanation given by the lecturer; they did not search or explore the knowledge by themselves, (2) the students did not have textbooks or any other sources as the references for their study, (3) even though they did not understand the lesson, the students tend to study individually rather than studying cooperatively with their friends.

By looking at those indicators, the writer tried to identify the factors that make them happen. Some of the factors are: (1) the lecturer did not facilitate

interaction among the students, (2) the lecturer did not

facilitate the students to do self assessment and peer assessment, (3) there is no collaboration among lecturers to do team teaching and open lesson.

Seeing the problem and its causes the writer conducted a study to develop learning autonomy in Teaching English as a Foreign Language (TEFL) subject through lesson study. This study was conducted to the 6th semester students of English Education Study Program, Faculty of Teacher Training and Educational Science, Pakuan University.

#### 1.2 Limitation of the Problem

This study is limited only on learning autonomy in Teaching English as a Foreign Language (TEFL) subject through lesson study in which modified cooperative learning structure is also implemented.

#### 1.3 Aim of the Study

This study is aimed at empowering the 6th semester students' learning autonomy in learning TEFL subject through lesson study.

#### 1.4 Research Question

Based on the aim of the study, the research question for this study is “How can lesson study empower the 6th semester students’ learning autonomy in learning TEFL subject?”

### 1.5 Theoretical Foundation

TEFL is one of important subjects for the students of English Education Study Program. TEFL become one of the required subjects for Practice Teaching Program in which the students practice their teaching skill in the real situation (the school). In TEFL subject the students learn about the principles of teaching English as a Foreign Language, classroom management, lesson planning, media development, teachers’ roles and other things related to pedagogy of English teaching. To understand more about this subject the students should read many references, discuss both with their classmates and the lecturer, observe the real teaching in real situation and do some teaching practices in the classroom. Thus, to understand this subject better the students should be able to understand the theory and do the theory into practice. To achieve the goal of learning, it is important that the students become autonomous learners.

Autonomous learners are those who are able to state their learning target, assess their own achievement, as well as question and cooperate with other people to solve problems. Brandes and Ginis called autonomous learning as Student-centered Learning which has the following principles:

- The learner has full responsibility for her/his learning
- Involvement and participation are necessary for learning
- The relationship between learners is more equal, promoting growth, development
- The teacher becomes a facilitator and resource person
- The learner experiences confluence in his education (affective and cognitive domains flow together)

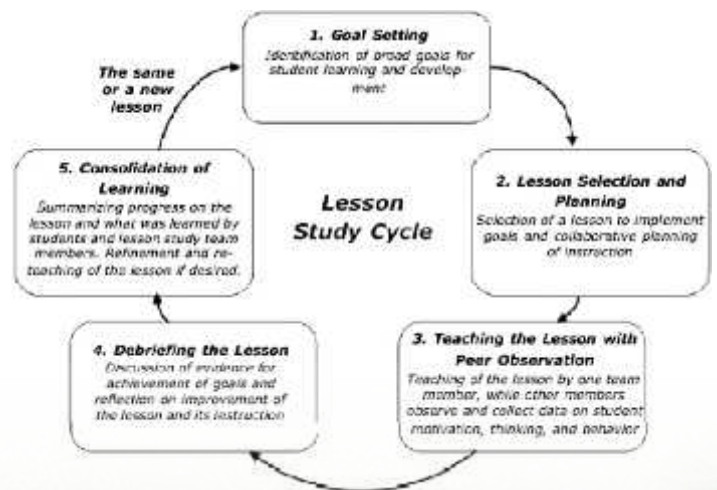

It shows that in autonomous learning the students are responsible toward his/her own learning. It also involves other people in the learning process, while the lecturer only plays a role as a facilitator of the learning process and one of the resources.

The principles of autonomous learning (Lacey) should be in line with its learning principles as follows:

- Autonomy means moving the focus from teaching to learning.
- Autonomy affords maximum possible influence to the learners.
- Autonomy encourages and needs peer support and cooperation.
- Autonomy means making use of self/peer assessment.
- Autonomy requires and ensures 100% differentiation.
- Autonomy can only be practised with student logbooks which are a documentation of learning and a tool of reflection.
- The role of the teacher as supporting scaffolding and creating room for the development of autonomy is very demanding and very important.
- Autonomy means empowering students, yet the classroom can be restrictive, so are the rules of chess or tennis, but the use of technology can take students outside of the structures of the classroom, and the students can take the outside world into the classroom.

The principles indicate that autonomous learning does not only involve the students themselves but also involving support from other people such as classmates, the lecturer who teaches the subject and also other collaborated lecturers. The involvement of other people in learning can be done through lesson study.

Lesson study emphasizes on learning reflection which aims at enhancing the next learning process. There are three steps done in lesson study: plan, do

and see. The following is the steps in lesson study:

Figure 1 Lesson Study Steges

Lesson study emphasizes on students learning, not teacher teaching. It means that the focus of lesson study is identifying how the students learn in the

classroom, what problems they have, and any other things about learning as stated by Lewis dan Hurd (2011), “Lesson study focuses on student learning and development. It provides a rare and valuable chance for teachers to be in a classroom solely to investigate student learning, unencumbered by the need to manage students or provide instruction.”

	Obs#2: A student did not pay attention Obs#3: - Obs#4: A few students did not pay attention on another group presentation
Learning materials	Obs#1: - Obs#2: Different tasks made the students have different understanding Obs#3: - Obs#4: -
Classroom activities	Obs#1: - Obs#2: Pre-activity did not engage the students' attention on the lesson Obs#3: - Obs#4: -
Classroom equipment	Obs#1: The technical error disturbed the students' concentration Obs#2: - Obs#3: The name tag was too small Obs#4: -

## 2 RESEARCH METHOD

This study applies descriptive method which uses observation, questionnaire and interview as the instruments to collect the data. Observation is done in four times open lessons. In each of the open lesson either the number or the name of the observers are not the same. The questionnaires are distributed to the students directly after the class. This study involves the students from semester 6, two teacher model and some lecturers of English Education Study Program.

## 3 DATA DESCRIPTION AND ANALYSIS

The overall of the study shows that lesson study can empower students' learning autonomy. The following is the description.

### 3.1 Data from observation

There are two materials that the students learned during the study: lesson planning and classroom anticipation. The observation cover five things: group work, monitoring activities, learning materials, classroom activities, and classroom equipment.

Table 1 First meeting bservation result

Classroom management	Observation notes
Group work	Obs#1: There was unbalanced grouping Obs#2: Some students dominate the talk Obs#3: Some students dominate the talk Obs#4: There were skillful and unskillful group work
Monitoring activities	Obs#1: A few students did not pay attention on another group presentation

From the observers' observation, it can be concluded that:

- In doing group discussion there is a group which has not understood how to work efficiently, especially when they should fill in the worksheet. Instead of discussing the answer together with their team mates, they write the answer directly on their own book then they discuss the answer with their team mates.
- Some shy and passive students have not engaged with their team mates during the learning activities.
- There are some groups that are still discussing when another group is presenting their discussion result.
- When one group is presenting the other groups are evaluating and comparing their work with other groups.
- There is a group that cannot discuss effectively because there is no clear job description among the group members so that some students are dominant.
- There is a group whose the members are still confused of what to do and they should rewrite the discussion result when the time for writing ends.

However, it was also found that:

- Discussion activities make the students discuss actively and effectively with their team mates.
- More students can answer the questions given by the lecturer more comprehensively.
- More students are motivated to respond the lecturer's questions.
- More students are ethusiastic to know their achievement.

From the findings the writer and her team replan the lesson to fix the problem. In the new lesson plan, the writer manage central group discussion activity and presentation activity. It is

done to minimize group discussion while another group is presenting. Besides, the students are asked to bring textbooks or other sources so that they can get valid reference to answer the questions given by the lecturer or the problems they find during the discussion session.

In the next lesson, the new plan is implemented and many negative findings in the previous lesson decreased significantly. For example, more students bring textbooks and other references into the classroom, and since the grouping places the students with heterogenously, the group discussion worked better; more students were involved in the group discussion activity.

Table 2 Last meeting bservation result

Classroom management	Observation notes
Group work	Obs#1: The students were actively involved in pair work and group work. Obs#2: Group work ran better. Obs#3: Learning activity ran better; no more domination Obs#4: Grouping was more effective.
Monitoring activities	Obs#1: Some students were less responsive. Obs#2: A few group are less active in doing the discussion. Obs#3: Some pair were active, the others were passive. Obs#4: A few students were very active.
Learning materials	Obs#1: A few students made mistakes. Obs#2: Some students could explore more problems. Obs#3: - Obs#4: -
Classroom activities	Obs#1: A few students could not respond the lecturer's question. Obs#2: A few group could give very clear explain. Obs#3: - Obs#4: Different point of discussion made one student confused.
Classroom equipment	Obs#1: - Obs#2: - Obs#3: - Obs#4: -

In general, the observers evaluate that the lesson run better and better from one class to another class. The students' responses given in the reflection stage strengthen the observers' findings. The students said that the class which implements open lesson is more dynamic and anthusiastic. Discussion activity in group made them able to give opinion freely without being afraid of making mistakes. Besides, various activities given such as individual work, pair work and group work make the students who are dominant give opportunity to other group member to give opinion, and shy students start to speak and get involved in the discussion activity. Discussing with

pair and with team mates in the group and exploring knowledge by themselves indicate that learning autonomy happens from learning individually, learning with pair, and learning in a group.

### 3.2 Data from Questionnaire

Besides from observation, the data for this study are taken from questionnaire distributed to the students to find out their responses toward the learning process. The data from the questionnaire can be seen in the figure 2.

Figure 2 Students' responses toward the learning process

From the figure it can be seen that 61% students agree if open lesson is done in TEFL class to empower learning autonomy. The rest of them, 18% totally agree, 14% doubtful, 5% disagree, and 2% totally disagree. It means that more than half of the students give positive response toward the implementation of lesson study in TEFL class to empower the learning autonomy.

### 3.3 Data from Interview

To find out the students' response on the implementation of lesson study to empower students' learning autonomy, the writer conducted interview with some students involved in the study. The interview result shows that the students found through open lesson, where many lecturers were observing them learning, the class was more interesting and challenging (S#1). They also said that the learning process was enjoyable (S#3) and the discussion was more focused (S#2) because they were challenged to identify the problems as well as to find the solution through discussion and collaborative work (S#4). In conclusion, lesson study can make the classroom activities run better, because the students work actively and collaboratively with their peer or with their team mates. Figure 2 shows that 77.5% students find that lesson

study could make them be autonomous learners, while 22.75% students said that lesson study could not make them autonomous learners.

Figure 3 Students' Response on the Impact of Lesson Study on Learning Autonomy

#### 4 CONCLUSIONS

From the data analysis taken from observation, questionnaire and interview this study shows that the implementation of lesson study in TEFL subject can empower the 6th semester students' learning autonomy. Even though few students think that lesson study cannot help them become autonomous learners, the writer suggest that lesson study is implemented in the classroom in other subjects. The weaknesses found in this study is not about the lesson study, but it is more about classroom management. The writer then suggest that the future lesson study concentrates on classroom management and involves more observer to find out classroom problems the students face in learning or any other aspects besides learning autonomy.

## Lesson Study In Teaching Practicum: A Case Study

Chiew Chin Mon<sup>1</sup>, Jong Cherng Meei<sup>2</sup>

<sup>1</sup>*Institute of Teacher Education Tuanku Bainun Campus, Penang, Malaysia*  
chiewchinmon@gmail.com

ongcherngmeei@yahoo.com

**Abstract:** Lesson Study, originated from Japan has provided a potential and innovative approach of teacher professional development. From the year 2011, Lesson Study has been implemented progressively by the Teacher Education Division of the Ministry of Education Malaysia to enhance teachers' teaching aimed to improve students' learning and ultimately, their academic achievement. Despite some challenges to carry out Lesson Study, there were generally positive responses and encouraging outcomes from the participating teachers. They espoused that the concept and notion of Lesson Study ought to be exposed early to trainee teachers in their teacher education programmes. This would then help to promote Lesson Study more broadly at school level. A research study was initiated in one of the 27 teacher education institutes in Malaysia. Lesson Study was introduced to 41 mathematics teacher trainees. Due to logistic matters, they were informed to be self-initiative and carry out Lesson Study on their own accord. The justification was Lesson Study is indeed self-initiative and moreover, it was not a compulsory requirement in their course of study. Overall, it was lukewarm response in their 4-week practicum due to very tight schedules and other tasks assigned to their practicum. Nonetheless, three teacher trainees showed keen interest and implemented Lesson Study in the first practicum. They vowed to continue Lesson Study in their second 8-week practicum in the following semester. It was our interest in this paper to expose and reveal what had transpired between the trainee teachers during their teaching practicum. The findings may provide suggestions for Lesson Study to be incorporated in the teacher education programme.

**Keywords:** Lesson Study, professional development, self-initiative, reflective practice, lesson plan.

### 1 INTRODUCTION

Many countries are dissatisfied in teacher preparation and this has pressured the move towards more school-based experiences (Korthagen & Kessels, 1999). Prospective mathematics teachers continue to show lack of images of “reformed” teaching that engage students to experiment, analyse, conjecture, justify and make connections. Hence, to better prepare the teachers, it seems more relevant to link the pedagogical theories into practices, thus engage the teachers in collaborative tasks, discourses and environments. This will help them more systematically to develop the reformed images of mathematics teaching. In Japan, Lesson Study as a form of professional development practice was credited to enable the Japanese teachers to build an emphasis on problem-solving and “teaching for understanding” in mathematics. It engages teachers in small group to systematically

examine their teaching plans and practices, with the goal of becoming more effective.

### 2 WHAT IS LESSON STUDY?

*Lesson Study* is a form of teacher professional development practised decades ago in Japan. Small groups of teachers (4 or 5 teachers) meet at stipulated time to plan, implement, evaluate, and revise lesson plan collaboratively. According to Shimahara (1998), the main purpose of Lesson Study is to enhance teachers' pedagogical knowledge and skills through peers' review, critique and collaboration among teachers. In the Japanese teaching career, teachers would engage in a relentless and continuous process of improving their teaching by participation in Lesson Study groups (Stigler & Hiebert, 1997; Shimahara, 1998; Lewis & Tsuchida 1998; Stigler & Hiebert, 1999; Yoshida, 1999; Lewis, 2000). Consequently, the Japanese teachers have well adapted Lesson Study as part of

their teaching career and profession. Briefly, a Lesson Study cycle consists of the following 6 steps (Fernandez & Yoshida, 2004, pp. 7-9). All participating teachers are expected to work together to:

*Step 1: Collaboratively planning the lesson plan*

Teachers come together to plan a lesson in collaborative nature. They share their teaching knowledge and ideas of an effective lesson drawing on their past experiences, observations on students' abilities and ideas from resources and textbooks. Ideally, there are at least three discussions. The first discussion is aimed to brainstorm and share teaching ideas and problems; the second one is to draft the sequence of the lesson while the third one is to refine the lesson in terms of coherence and appropriateness for the students. The end product is a lesson plan that describes in details the process of teaching and learning.

*Step 2: Seeing the lesson plan in action*

A teacher from the group will implement the lesson plan to his or her students while other teachers will act as observers during the lesson. Teachers are not encouraged to help the students but instead reflect on the weaknesses of the lesson plan. Occasionally, an expert from an educational institution is invited to observe the lesson.

*Step 3: Discussing the lesson plan*

This step should be carried out immediately after the teaching of the lesson. The teachers come together to reflect on the lesson that has been taught in a real classroom context. The teachers share what they have observed during the lesson, comment on their reflections and provide suggestions. The objective is to identify weaknesses and improve the lesson.

*Step 4: Revising the lesson plan*

Based on the teachers' observations and reflections of the lesson, the teachers would decide collaboratively to revise and update a new version of the lesson plan.

*Step 5: Teaching the new version of the lesson*

Although this step is optional, very often another teacher from the group will teach the revised version of the lesson in another classroom. As in the previous observed lesson, other teachers will again act as observers during the lesson.

*Step 6: Sharing reflections about the new version of the lesson*

The teachers will come together again to discuss and reflect on the revised version of the lesson taught. Again, the teachers share their observations, comments and suggestions. Following this, they collaboratively revise the lesson plan.

In brief, a Lesson Study's cycle consists of the following steps:

Lesson Study's cycle

### 3 PURPOSE OF THE STUDY

The purpose of this study was to examine and evaluate if Lesson Study is viable to be incorporated in the 4-year teacher education programme. Based on our feedbacks, practising teachers have espoused that Lesson Study ought to be introduced and exposed to the trainee teachers in their teacher education programme. This would then help to promote and spread Lesson Study more broadly to the schools later. Lesson Study is relatively new as an approach for teacher professional development, in particular the pre-service teachers in the Malaysian education context. Hence, the researchers hoped to examine the feasibility of Lesson Study to be incorporated in the teaching practicum.

### 4 METHODOLOGY

Prior to the study, the researchers conducted a four-hour Lesson Study workshop to 41 mathematics trainee teachers in one of the teacher education institutes. The workshop was held before their first 4-week practicum in their third year of study. During the workshop, the background, concept and process of Lesson Study were introduced and explained. This included a 20-minute video presentation entitled *Lesson Study: An Introduction*, produced by Global Education Resources of the United States. Subsequently, the benefits of Lesson Study were revealed based on the research studies conducted. In addition, small groups of discussion to plan lesson was also held within their own ability. Due to logistic matters, the trainees were advised and informed to be self-initiative. The justification was Lesson Study is indeed self-initiative and any top-down instructions may put dilemmas and unnecessary worry to the trainees. Nevertheless, they were informed to seek assistance from the

researchers if the need arise. No specific instructions were imposed as voluntarily participation should be adhered in research ethics (Creswell, 2003; Bryman, 2004).

Under such circumstances, it was lukewarm response as only three teachers tried out Lesson Study in one of the schools. This was however within our expectation as the 4-week practicum is indeed very short. Moreover, this was their first time in real teaching and they also had other tasks assigned to them during the practicum. Most trainees ignored it probably because Lesson Study is not any compulsory requirement in their course of study. Our brief interaction with the three trainee teachers after the first practicum encouraged us to seek more information. The trainee teachers expressed positively the outcomes and proposed Lesson Study to be included as part of their teaching practicum. Without hesitation, they vowed and expressed they will continue doing Lesson Study in their next practicum in the following semester. We were very pleased and decided to probe for further details. We then proposed to the three trainees if they could become the participants of our study. We agreed to provide our expertise in Lesson Study and work together with them, and in return they will provide their thoughts, beliefs and perceptions of Lesson Study as data for our study.

The following semester has 8 weeks of teaching practicum. Unfortunately, one of them was assigned to a different school which was rather far from her friends. Hence, she decided to withdraw on her own accord while the other two trainees remain determined and keen to carry out Lesson Study. It is our aim in this paper to reveal and expose what are the pulling factors or attractions of Lesson Study to them during the teaching practicum. This study employed qualitative research methods to examine the perceptions of the participants towards the implementation of Lesson Study. Interpretative research paradigm was adopted to enable the researchers to interpret and “make sense” of the research context, thus able to provide an understanding with regards to the participants’ perceptions of Lesson Study. Multiple methods were employed for the data collection. The researchers made field notes based on their observations while the participants were encouraged to write their self-reflection. The lesson plan developed was also taken as part of the data collection. At the end of the Lesson Study cycle, clinical interviews were conducted with the two participants that provided the bulk of the data. In-depth semi-structured questions were posed to gauge the participants’

thoughts, beliefs and perceptions of the Lesson Study. The discussions of the lesson plan as well as clinical interviews were audio-taped while the two classroom teachings were video-taped. The qualitative data collected was then transcribed in the text format and the technique of content analysis was employed in this study.

The two participants, Wendy and Fei (both pseudonym) were assigned to the same school which is approximately 40 km from the teacher education institute. The participants met twice (dated 7 August and 14 August) with the researchers at the institute premise to discuss and plan a lesson plan. Both the researchers facilitated the discussion sessions with the participants concern. The topic chosen was *Time* whereby the Year 3 pupils were required to read, understand and write any given time to them. Subsequently, Wendy taught the planned lesson on 28 August which was observed by Fei and one of the researchers. The reflection of the lesson and modification of the lesson plan was conducted on the following day at the teacher education institute. Later, Fei taught the modified lesson plan on 8 September in another class which was observed by Wendy and the other researcher. Subsequently, reflection of the lesson was held at a later time on the same day at the school premise. Due to time constraint, only one Lesson Study cycle was implemented.

## 5 FINDINGS AND DISCUSSION

Apparently, Wendy and Fei were both novice in Lesson Study. Perhaps, the workshop conducted did not convey clearly the notion and concept of Lesson Study when Fei expressed the following, “*I actually have problem with Lesson Study. The first teaching, Wendy teaches in the good class but I have to modify it for my weaker students. If not suitable, do we have to modify again? Then how? We keep changing it and there is no end*” (Interview: 18/09/14). In our context, Lesson Study is about learning process for teachers and not an end product – lesson plan as perceived by Fei.

The analysis of the data were mainly derived from the clinical interviews with Wendy and Fei. The focus of this paper is to reveal the basis why Wendy and Fei had demonstrated positively towards Lesson Study. More importantly, they had vowed to continue doing it voluntarily despite their course mates continuing to shy away in the second practicum. The findings may then provide some fruitful information and perhaps suggestions for Lesson Study to be incorporated in the teaching

practicum in near future. The distinct strands that emerged from the analysis are: (i) more brains, more ideas, (ii) making lessons more interesting, and (iii) promoting reflective practice.

### More brains, more ideas

Wendy and Fei seemed to appreciate Lesson Study very much because it helped them to plan “good” lesson plan. As Fei said, “*Very good sir. Because first thing it is not based on your idea only. When create lesson plan, we get so many ideas. The idea is out of the box, I mean more creative that we did not think about it before this. When we discuss, maybe we can get ideas that we may not think about it*” (Interview: 18/09/14). For instance, she cited that prior to the Lesson Study discussions, she did not has the idea of producing clocks [teaching aids] that allow the students to draw on it. Fei recalled that the discussions made her to get new ideas easier. “*When we start this practicum, doing lesson plans . . . I felt difficult but when we have more heads, then it’s easier.*” (Fei, interview: 18/09/14).

Wendy admitted that the Lesson Study had somehow changed her strategy to teach the lesson of Time, “*Initially, maybe I will use slides only but then Fei suggested the idea to use the real clock. At first, I think it is difficult to use real clock but then when I use it, it’s ok*” (Interview: 18/09/14). Naturally, through the Lesson Study discussions, they were supported to think in-depth as they engaged actively with the researchers. This actually improved their ability to make better pedagogical decisions. The collaborative structure of Lesson Study allows them to come to joint understandings, such as effective teaching strategies for a particular lesson. This actually improved their ability to make better pedagogical decisions. Lesson Study, thus provided a venue for teachers to discuss and share their instructional strategies. Wendy admitted, “*After trying out Lesson Study, maybe idea from one person is not very good. Maybe other people ideas are better than us*” (Interview: 18/09/14).

### Making lessons more interesting

As both Wendy and Fei were novice in real teaching context, they struggled to prepare very detailed lesson plans as required in the practicum. Hence, one main concern was inadequate time and knowledge to prepare these lesson plans. Coincidentally, the Lesson Study conducted seemed to provide great help to both the participants to plan and write their lesson plans. Fei became interested in

doing Lesson Study as it really helped her to plan interesting activities. She explained, “*When students have problem, we can get more ideas. We can actually get idea on the spot to overcome problems. If doing it (lesson plan) alone, the activities may be boring but when we suggest and modified it, the lesson will be more interesting*” (Interview: 18/09/14).

For Wendy, she never regretted to engage in Lesson Study, “*Throughout my involvement, I feel like very helpful. Sometimes, maybe my ideas not really be able to help students. So we need help from our partner to give ideas. Because when discuss together, not only teaching ideas but ideas how to help the students*” (Interview: 18/09/14). Both participants were thrilled when they were able to get ideas about activities that helped to solve students’ learning problem.

### Promoting reflective practice

Research studies indicated that Lesson Study provides the venue and opportunity for teachers to develop their ability to see a lesson from the student’s perspective. This is one of the important goals in Lesson Study which Lewis (2002) referred as developing “*the eyes to see children.*” In taking part in Lesson Study, the participants either consciously or unconsciously became more aware of their students’ learning. As Fei reflected after the Lesson Study, “*After this first and second practicum, I realised some differences (to me). Now, even without the group discussion, when I write and prepare lesson plans, I already used to think. My brain has automatically thinking how to make it (lesson plan) better.*” (Interview: 18/09/14). As for Wendy, she realised her weaknesses in teaching through Lesson Study process. She explained, “*Like when I observed Fei’s teaching, I see my limitations and weaknesses. When the lesson plan is modified, I realised it is better for Fei’s class*” (Interview: 18/09/14).

Through the Lesson Study process, there was an overall improvement in the second teaching compare to the first one. Wendy acknowledged that the second teaching by Fei achieved better result than her first lesson. Most of the students were able to read the time as more time was allocated in the second teaching after their reflection of the first teaching. With continuous support from peers during the Lesson Study process, the participants were able to make self-reflection and this develop further their awareness towards students’ learning. This showed that the Lesson Study process is able to assist trainee

teachers in planning and writing up of their lesson plans more effectively during practicum.

## 5 CHALLENGES FOR LESSON STUDY IMPLEMENTATION

There seems to be a strong perception that Lesson Study is an extra task if it is mandated to the pre-service teachers. The fact that only 3 out of 41 trainee teachers carried out Lesson Study voluntarily suggested many challenges ahead. After the Lesson Study workshop, Fei seek more details from the researchers as she was unclear how to carry out Lesson Study with her friends. In fact, she was not aware that it is not compulsory. She explained, *“Initially, we don’t want. I mean in the first practicum. But because we thought it is compulsory, then only we come and meet sir. We are not really sure (Lesson Study). It is a mistake actually (that Lesson Study is compulsory). We just try it and it seems ok. Coincidentally, it turn out to be a good thing for us”* (Interview: 18/09/14). Finally, Fei was glad and she offered her justification for her course mates who shy away from Lesson Study. She explained, *“Because . . . first, they have not try it yet, so they don’t know. They must go through the process, and then only they know how important this Lesson Study. Must force it initially”* (Interview: 18/09/14). As such, probably it would be a strategic move to make it compulsory for the trainees to engage in Lesson Study so as to soak them with the *“real feeling”* of Lesson Study. According to Guskey and Sparks (1996), professional development activities may change teachers’ teaching, in turn change students’ learning that ultimately change teachers’ attitude and perceptions towards professional development. Wendy felt that Lesson Study is not a burden for her but indecisive if it should be made compulsory for the trainee teachers in their practicum. *“For me it’s not a burden, we can do it with our partners. When we discuss, we can ask others. Maybe for other people, maybe a burden”* (Wendy, interview: 18/09/14).

Nonetheless, for the practising teachers in schools, Wendy and Fei shared similar view that it depends much on the teachers’ own desires and attitudes. As Wendy said, *“Lesson Study is possible if they are willing to do. Some teachers would complain because they also have many other works to do.”* (Interview: 18/09/14). Fei echoed, *“Teachers have different life style, some have to care for their families. This is a cluster school. Not only in the class, there are a lot of works till they cannot enter the class (no time). If they do Lesson Study, it is just adding extra work”* (Interview: 18/09/14). Under

such circumstances in school, Wendy and Fei did not attempt to involve their supervising teachers as they will likely be reluctant participants. Consequently, even though Wendy and Fei were at school for only a brief period, they expressed two factors: *time constraint* and *workload of teachers* as the main challenges to implement Lesson Study in the Malaysian schools. These perceptions are consistent to many local research studies concerning Lesson Study (such as Goh, 2007; Chiew, 2009). Hence, even though Lesson Study is perceived positively in the context of professional development, the actual implementation would likely to face challenges and constraints.

## 6 CONCLUSION

Based on the findings and outcomes, we deduced that the participants have developed favourable and positive perceptions on Lesson Study. Specifically, their perceptions changed after they had personally experienced it. As revealed earlier, Fei was reluctant initially but soon become comfortable with the support of researchers as knowledgeable others.

Lesson Study, if practiced willingly by trainee teachers will in long term improve the quality of teaching. It has the potential to change prospective teachers’ beliefs and attitudes towards effective teaching practices as highlighted in most research studies. Lesson Study is unique in the Malaysian education context, in the sense that it is teacher-directed and bottom-up approach of professional development. To implement and sustain Lesson Study in Malaysia, a paradigm shift of teachers’ mindset and attitude would absolutely necessary. To date, it has never been easy to recruit neither the pre-service nor the in-service teachers to voluntarily participate and form Lesson Study group. In fact, Lesson Study is very relevant in the context to promote and cultivate the concept of lifelong learning in the teaching profession. Therefore, perhaps the practice of Lesson Study ought to be initiated and promoted at the pre-service level in the teacher education programme. However, to implement Lesson Study as part of the teacher education programme would require much effort and planning from the relevant educational authorities. This ultimately will lend support for Lesson Study to be implemented in the schools.

chia\_chun\_kiat@moe.edu.sg

ang\_lay\_eng@moe.edu.sg

zariney\_ahmad@moe.edu.sg

**Abstract:** The aim of our research lesson was to help our students to infuse and develop personal voice in their argumentative writing so as to improve their persuasiveness. A shift towards expository rather than narrative writing has been observed in the new GCE ‘O’ Level English Language examination syllabus. Therefore, there is a need to teach our students the necessary skills and strategies for them to express their opinions and arguments effectively. Most of our students show positive attitude and interest towards argumentative writing but their essays are often flat, disengaged pieces of writing where arguments are simply stated and seldom argued. Thus our team designed a lesson to help students infuse their personal voice in their writing so that their essays would be more authentic and persuasive.

**Keywords:** expository, writing, argumentative

### 1 Background Information and Research Goals

Clementi Town Secondary School is a government school that houses three education streams - Express, Normal Academic and Normal Technical. The school typically admits students with a PSLE aggregate range of 231 to 246 for Express students, 181 to 199 for Normal Academic students and 141 to 156 for Normal Technical students. There are usually 4 Express Classes, 2 Normal Academic and 1 Normal Technical class per level. Our students hail from varied family backgrounds, and are generally competent in conversational English.

Although students are fairly able to write an expository essay, they lack the personal voice in the development of their viewpoint, making their essay sound too contrived at times. Due to this, students often struggle to persuade readers into accepting their stand on any given topic.

Another concern we had with our students was that many of them are now very dependent on the PEEL template. Students feel that the PEEL template is the only way to write an expository essay. Some students do not even explain their points clearly and do not give a proper example to support their viewpoint.

#### 1.2 Broad goal for students and the research team’s aim

While the students are generally able to cope with the English Language examinations, the arguments, as felt by the team, possess much potential to be developed. Hence, our research team decided to focus on guiding our students to infuse personal

voice in their writing so as to improve the persuasiveness of their writing and encourage students’ self-expression.

### 2 Overview of Lesson

To cater to students who are still relatively new to expository writing, the lesson employs predominantly explicit teaching and the modelling method to get students accustomed to the three things that we will be emphasising on to improve their writing. They are: utilizing a personal voice, emotive words as well as a more narrative mode of elaboration. This is followed by group construction so that students can discuss, work collaboratively and clarify any doubts, without feeling apprehensive that they will be judged and graded personally. Lastly, the students will embark on individual construction, where the teacher can assess how much the students have learnt.

Prior to the lesson, the teacher will conduct a non-intimidating brainstorming session to get the students used to vocalising their opinion so as to prepare them for group work.

### 3 Research Lesson Instructional Plan

Steps of the lesson: learning activities and key questions (and time allocation)	Student activities/expected student reactions or responses	Teacher’s response to student reactions/Things to remember	Goals and Method(s) of evaluation
<p><b>1) Pre-lesson</b> (<i>conducted before study lesson</i>)</p> <ul style="list-style-type: none"> <li>Lead-in activity (5 mins): TR to ask students about their views regarding school uniforms, why school uniforms are necessary</li> <li>TR gives class a prompt (<i>It is said that school uniform gives pupils a sense of identity and encourages good discipline. Do you agree?</i>) and get students to discuss their views with their peers</li> <li>Teacher goes through a recap of the 5 paragraph structure for expository writing and PEEL format for paragraphs</li> <li>In groups of 4, students construct 2 PEEL paragraphs (one on sense of identity and one on good discipline) and submit to TR.</li> </ul>	<p>Students may give responses like “identify students from a school”, “make sure everyone is the same”</p> <p>Students who agree may say their uniforms are unique and so help identify others of the school they are from, or that they will be more mindful of their behaviour when in uniform. Students who disagree may say that they don’t like the uniform and so don’t like to be associated with the school.</p> <p>Students recall what they understand by the PEEL structure: Main point, elaborate, evidence and link</p> <p>Students may not be clear about what PEEL when attempting to write about school uniforms. They may put P as the question about school uniforms.</p>	<p>Teacher to encourage vibrant brainstorm of ideas and facilitate students’ participation</p> <p>Teacher to ensure that students engage in active discussion or debate with their peers and arrive at their own opinion.</p> <p>Teacher to give further examples of P, E, E, L for students to reinforce what PEEL is about.</p> <p>Teacher to explain that the P is one of the reasons for them agreeing or disagreeing that school uniforms inculcates discipline and instils belonging.</p>	<p>Students are enthusiastic to speak up and give suggestions</p> <p>Students form their own opinion on whether they agree or disagree with the topic</p> <p>Students are able to apply the structure of PEEL correctly when planning their paragraph.</p>
<p><b>2) Study Lesson</b></p> <ul style="list-style-type: none"> <li>(Before start of lesson, TR chooses one group’s body paragraph - preferably one of the better ones and put it up on word document / powerpoint slides)</li> </ul>	<p>Students should feel that teacher is giving them relevant feedback. They might be curious about the owner of the work.</p>	<p>Teacher to give affirmation and compliment students for their good effort.</p>	

Steps of the lesson: learning activities and key questions (and time allocation)	Student activities/expected student reactions or responses	Teacher’s response to student reactions/Things to remember	Goals and Method(s) of evaluation
<ul style="list-style-type: none"> <li>(10 mins) TR to show class the student group’s paragraph on sense of identity and ask them to critique/comment.</li> <li>(15 mins) TR then show how this paragraph can be improved. For each of student’s sentence, TR demonstrates how it can rewritten for improvement. (Teach students to avoid repeating question wording, use pronoun ‘I’ when stating opinion, use strong evocative words to express attitude and opinion, provide anecdotal evidence to support topic sentence)</li> <li>(15 mins) In groups, students work on improving the 2<sup>nd</sup> body paragraph about school uniforms inculcating identity in students</li> <li>TR to model how 2<sup>nd</sup> body paragraph can be improved.</li> <li>Students then try to follow the strategies and improve another paragraph individually (based on good discipline)</li> </ul>	<p>Students express their opinion on whether they like the paragraph or not, and the reason why.</p> <p>Students to copy the recommendations made by the teacher.</p> <p>Collaboratively, students engage in active discussion to recall and apply what they just learnt into a piece of group writing</p> <p>Individually, students can copy teacher’s model answer or improve on their group work</p> <p>Individually, students work on their own body paragraph about school uniforms and good discipline</p>	<p>Teacher to validate and ride on students’ opinions while teaching the strategies for writing a good body paragraph</p> <p>Teacher to validate students’ own creation</p> <p>TR to monitor group activity in the classroom and clarify or render help if necessary</p> <p>TR to monitor individual writing in the classroom and clarify or render help if necessary</p>	<p>Group can complete elaborating a paragraph based on the techniques taught earlier</p> <p>Individual can complete elaborating a paragraph based on the techniques taught earlier</p>

## 4 Observation Guide

Based on the team goals and research questions, we have selected the following questions for observers to consider during the lesson. These questions will also be the topics discussed at the post-lesson discussion.

- Are students able to use the PEEL format to craft their body paragraph?
- Are students expressing their personal viewpoints through the use of personal pronouns?
- Do students use strong modals and emotive vocabulary to express their opinions?
- Do students use story-telling techniques to improve student engagement?

When observing the lesson, we requested that observers follow these protocols:

- Focus on student actions and behaviours within the classroom.
- Limit notes and scripting to factual information and quantitative data; avoid judgmental comments.
- Circulate freely when students are working individually or in groups, but move to the side or back of the room during whole-class discussion.
- Make sure they are not blocking students' view.
- Refrain from interaction, teaching, or assisting the students in any way. Occasional interaction is permissible if done discreetly and with the purpose of understanding student thinking.
- Take detailed notes throughout the lesson.
- Take notes on individual students' responses, using the student's names.
- Record how students begin their work and approach the tasks.
- Record interactions between students and between students and the teacher.
- Document common misunderstandings the students had and when their understanding changed.
- Indicate how individual students constructed their understanding through activities and discussions.

## 5 Observations and Post-lesson Analysis

After the pre-lesson activity where students were supposed to construct 2 PEEL paragraphs to argue

their stand for the given prompt, the teacher realised from the students' submission that many of the students have a wrong understanding of PEEL format. Many of them thought that 'P' refers to the stand that they wish to take, but it actually refers to the main point or the topic sentence of the paragraph to support the stand. Thus many started off their paragraph with a statement of their stand (whether they agree or disagree with the statement) instead of the reason why they agree or disagree. As a result, the teacher had to reteach the PEEL structure as part of the planned research lesson to correct their misconceptions.

The students were then taught the techniques to infuse personal voice in their writing. After that, they were asked to write a PEEL paragraph about their view on whether wearing school uniform encourages good discipline. It was observed that most students attempted to use these techniques in their writing. However, a number of students still did not infuse their own personal opinions or experiences to support their stand, when the topic is clearly one that is close to their hearts. One example is the lack of personal pronouns in the writing:

*“School uniforms encourage good discipline because the students who wear the uniform try not to misbehave and do anything bad in public. When the students wear the uniform, they are reminded that they are representing their school and that anything they do, the public will see and report to the school or base the students' misbehaviour on the school. If a student from the school wears the school uniform, while another from the same school did not, and they both committed a crime, the public will first inform the school about the boy in the uniform. Therefore, I think school uniforms encourage good discipline as students do not wish to disgrace their whole school in public.”*

In terms of the content and persuasiveness of their arguments, the team also found such qualities lacking in the students' writing. Students who did try to make use of person pronouns to evoke personal voice ended up writing responses that feel contrived and do not reflect their true opinions on the subject:

*“I agree to a great extent that school uniforms encourage good discipline. Whenever I wear my school uniform in public, I feel like a representative of Clementi Town Secondary School. Whether I do a good or bad deed, the public will recognise me as a student of the school and judge all other*

*Clementeens to be the same like me. I do not want the public to assume that CTSS is a bad school with bad behaving students because of me, as that would make me feel extremely guilty. Therefore, whenever I wear my school uniform, I must remember to always be on my best behaviour."*

When asked by the teacher whether their writing reflects their true opinion, a number of students voiced out that they did not really share the same feelings as what they had written.

The above observations suggest that the students are still not confident in expressing their own viewpoints, and are very dependent on a fixed structure for their writing. When provided with a scaffold, many are unable to modify or adapt the scaffold to their own style of writing.

## 6 CONCLUSIONS

During the post-lesson discussion, the team concurs that a stand-alone lesson is not enough to change students' writing habits and influence them to become more confident in self-expression. Our students need more opportunities to share their personal thoughts and reflections in writing, and this could be done through various platforms such as journal writing, blogging or forum discussions. The team also recommends a review of the English curriculum to introduce personal reflective essay writing at Secondary One level, and only introducing argumentative writing at Secondary Two. This would allow a spiral progression of skills in the student, from being able to reflect on personal biases to expressing one's personal opinions and supporting arguments with factual and anecdotal evidence.

## Meningkatkan Kualitas Proses Pembelajaran Bilangan Berpangkat dan Bentuk Akar melalui Permainan Kartu Bilkat

(Kajian terhadap Open Lesson dua siklus kelas VII pada Lesson Study Berbasis Sekolah di SMP Negeri 1 Tomo)

Drs. Asep Syarifhidayat<sup>1</sup>, M.S, Encang Jana<sup>2</sup>

<sup>1</sup>FPMIPA Universitas Pendidikan Indonesia Bandung

<sup>2</sup>Sekolah Menengah Pertama Negeri 1 Tomo Sumedang

**Abstrak:** Bilangan berpangkat dan bentuk akar merupakan materi prasyarat untuk pembelajaran Matematika selanjutnya, maupun sebagai penunjang mata pelajaran lain, seperti Ilmu Pengetahuan Alam dan Ilmu Pengetahuan Sosial. Sehingga penguasaan materi ini harus benar-benar memadai, jika tidak pembelajaran selanjutnya akan menghadapi kendala. Tetapi melihat kondisi pembelajaran bilangan berpangkat dan bentuk akar saat ini, menunjukkan bahwa pembelajaran kurang menggembirakan. Proses pembelajaran tidak menggairahkan, tidak menarik dan menjemukan. Pembelajaran bilangan berpangkat dan bentuk akar dengan menggunakan kartu BILKAT telah mengubah situasi pembelajaran. Pembelajaran menjadi bersemangat dan bergairah, terjadi kolaborasi dan kompetisi antar siswa. Data kualitas proses pembelajaran, tes uji pemahaman dan motivasi belajar menunjukkan peningkatan yang menggembirakan. Kualitas proses pembelajaran pada siklus I mencapai 83,6 dan siklus II mencapai 88,9 kedua-duanya berada pada kategori baik. Hasil pembelajaran memperoleh rata-rata 89,4 pada siklus I dan 90,9 pada siklus II. Ketuntasan belajar mencapai 93,5% pada siklus I dan 100% pada siklus II. Motivasi belajar pada siklus I mencapai 84,7 dan siklus II mencapai 86,9 kedua-duanya berada pada kategori baik. Kendala terjadi diawal permainan, permainan berjalan lamban. Dan ketika akan tes uji pemahaman, hampir semua siswa tidak mau menghentikan permainan. Mereka bukan menolak melaksanakan tes, tetapi mereka asyik dan ingin terus bermain kartu BILKAT.

**Kata kunci :** proses pembelajaran, bilangan berpangkat, bentuk akar, kartu BILKAT.

### 1. PENDAHULUAN

#### a. Latar Belakang Masalah

Bilangan berpangkat dan bentuk akar selain merupakan pengetahuan prasyarat untuk materi selanjutnya, juga merupakan materi penunjang mata pelajaran lainnya, terutama mata pelajaran Ilmu Pengetahuan Alam dan Ilmu Pengetahuan Sosial. Seperti kita ketahui, bahwa; ketika pengetahuan prasyarat belum dikuasai, maka untuk menguasai pengetahuan selanjutnya akan menghadapi beberapa kendala. Kendala umum yang sering kita jumpai adalah kesulitan untuk memahami materi selanjutnya. Selain itu ada dampak lain yang lebih bahaya dari kesulitan itu sendiri, yakni dampak psikologis. Mungkin siswa akan mengalami tekanan mental, malu dengan sesama temannya dan berasumsi bahwa matematika itu sulit. Bukan hal yang mustahil jika akhirnya siswa membenci segala sesuatu yang ada kaitannya dengan Matematika, dan tidak ada lagi motivasi untuk belajar Matematika.

Hal seperti ini terjadi hampir disemua kelas, masih banyak diantara mereka yang menjawab  $2^3 = 6$  dan  $3^2 = 6$ , ada juga siswa yang menjawab  $2^3 = 2 \times 2 \times 2 = 6$ . Siswa yang lainnya menjawab  $2^3 = 8$

dan  $3^2 = 9$  tanpa penjelasan. dan hanya beberapa siswa yang menjawab  $2^3 = 2 \times 2 \times 2 = 8$  dan  $3^2 = 3 \times 3$ . Hal ini menunjukkan betapa rendahnya pemahaman konsep perpangkatan pada mereka, walaupun secara teori materi ini sudah diberikan di Sekolah Dasar. Selain pemahaman konsep perpangkatan yang belum memadai, suasana pembelajaran di kelas pun seperti kehilangan semangat, lesu dan tidak bergairah. Materi pembelajaran sepertinya tidak menarik bagi mereka. Mereka belajar tidak sungguh-sungguh, seolah-olah tidak memiliki tujuan yang jelas, apa yang diharapkan dari pembelajaran tersebut. Interaksi antar siswa hampir dikatakan tidak ada, begitu juga interaksi antara siswa dengan guru. Komunikasi hanya terjadi satu arah dari guru ke siswa.

Berdasarkan permasalahan di atas, maka perlu mencari solusi supaya pembelajaran lebih menarik dan bersemangat, tercipta kesungguhan dalam belajar, materi dipahami dengan baik dan memberikan kesan bahwa Matematika itu menyenangkan. Salah satu cara yang bisa dilakukan adalah dengan menerapkan metode dan media pembelajaran yang bisa membantu meningkatkan

semangat dan kesungguhan dalam belajar sehingga siswa bisa belajar dengan maksimal.

Sebagai guru, saya berupaya mencari alternatif yang paling tepat dengan memanfaatkan metode dan media pembelajaran. Dan dalam penelitian kali ini saya menggunakan metode permainan dengan media kartu bilangan berpangkat (BILKAT).

### **b. Rumusan Masalah**

Rumusan masalah pada penelitian tindakan ini adalah:

- (1) Apakah permainan kartu BILKAT dapat meningkatkan kualitas proses pembelajaran dalam pembelajaran bilangan berpangkat dan bentuk akar?
- (2) Apakah permainan kartu BILKAT dapat meningkatkan hasil belajar siswa pada materi bilangan berpangkat dan bentuk akar?
- (3) Apakah permainan kartu BILKAT dapat meningkatkan motivasi siswa untuk belajar bilangan berpangkat dan bentuk akar?

### **c. Tujuan Penelitian**

Berdasarkan rumusan masalah di atas, maka tujuan penelitiannya adalah:

- (1) Untuk mengetahui seberapa besar permainan kartu BILKAT dapat meningkatkan kualitas proses pembelajaran dalam pembelajaran bilangan berpangkat dan bentuk akar.
- (2) Untuk mengetahui seberapa besar permainan kartu BILKAT dapat meningkatkan hasil belajar siswa pada materi bilangan berpangkat dan bentuk akar.
- (3) Untuk mengetahui motivasi siswa terhadap pembelajaran bilangan berpangkat dan bentuk akar dengan metode permainan kartu BILKAT.

### **d. Manfaat Penelitian**

Manfaat hasil penelitian tindakan kelas ini bagi siswa diharapkan dapat meningkatkan semangat belajar siswa, dapat meningkatkan penguasaan siswa pada materi bilangan berpangkat dan bentuk akar dan menumbuhkan kesan yang baik terhadap Matematika. Bagi guru diharapkan dapat merancang pembelajaran Matematika yang efektif, dan dapat meningkatkan kemampuan guru dalam memilih model, metode dan media pembelajaran yang menarik, sehingga hasilnya optimal.

## **2. KAJIAN TEORI**

### **a. Bilangan Berpangkat dan Bentuk Akar**

Bilangan berpangkat dan bentuk akar diajarkan di

Sekolah Dasar, Sekolah Menengah Pertama maupun di Sekolah Menengah Atas. Materi ini memiliki tingkat keabstrakan cukup tinggi. Sulit untuk dibuatkan pemodelannya. Jangankan dibuatkan model/alat peraga yang kongkrit yang semi kongkritpun sulit. Sehingga materi ini merupakan salah satu materi yang sulit dibelajarkan kepada siswa. Tetapi guru harus berusaha agar materi ini mudah dan menarik untuk dipelajari siswa. karena materi ini merupakan pengetahuan prasyarat untuk pelajaran selanjutnya. Sri Wardhani (2010 : 24): “objek kajian matematika yang abstrak itu perlu disiasati agar mudah dipelajari siswa.”

Mengingat materi yang abstrak ini merupakan pengetahuan prasyarat untuk pelajaran selanjutnya, maka upaya maksimal agar siswa menguasai dan memahami materi ini menjadi suatu keharusan. Jika tidak, siswa akan berhadapan dengan berbagai kesulitan dalam pembelajaran selanjutnya. Sri Wardhani (2010 : 22) mengemukakan: “Pemahaman siswa dalam belajar matematika yang diperoleh sebelumnya sangat berpengaruh terhadap diperolehnya pemahaman berikutnya. Siswa yang penguasaan kompetensinya baik akan cenderung lancar dalam mempelajari kompetensi berikutnya dan sebaliknya.” Seorang siswa akan sulit memahami materi selanjutnya jika materi sebelumnya yang merupakan pengetahuan prasyaratnya belum dipahami secara memadai.

### **b. Permainan Matematika**

Metode permainan dalam pembelajaran matematika adalah suatu metode belajar dimana kualitas proses pembelajaran dilakukan dengan cara atau dalam suasana bermain. Ada beberapa definisi metode permainan yang dikemukakan oleh beberapa orang ahli, diantaranya adalah:

- (1) Sriyono mengatakan: metode permainan matematika merupakan kegiatan yang menyebabkan siswa senang dan asyik dalam mempelajari matematika.
- (2) Menurut (Ruseffendi, 2006 : 312), Metode permainan matematika adalah sesuatu kegiatan yang menyenangkan (menggembirakan) yang dapat menunjang tercapainya tujuan instruksional dalam pengajaran matematika baik aspek kognitif, afektif, maupun psikomotorik

Metode permainan dapat menciptakan suasana belajar yang dinamis, penuh semangat, bergairah, dan antusias. Metode permainan juga dapat digunakan untuk mengubah suasana belajar dari pasif ke aktif, dari diam menjadi gerak, dari kaku menjadi fleksibel, dari jenuh menjadi riang. Metode permainan dapat menciptakan suasana belajar yang menyenangkan, serius, dan terarah.

### c. Kelebihan dan Kelemahan Metode Permainan

Metode permainan memiliki beberapa kelebihan dan kelemahan, seperti yang dikemukakan oleh Estiprastikaningsih (2013). Kelebihan dari metode permainan adalah:

- (1) Melatih anak untuk mendramatisasikan sesuatu serta melatih keberanian.
- (2) Metode ini akan menarik perhatian anak sehingga suasana kelas menjadi hidup.
- (3) Anak dapat menghayati suatu peristiwa sehingga mudah mengambil kesimpulan berdasarkan penghayatan sendiri.
- (4) Anak dilatih untuk menyusun pikirannya dengan teratur.

Sedangkan kelemahan dari metode permainan adalah:

- (1) Tidak semua topik dapat disajikan melalui metode permainan.
- (2) Memerlukan banyak waktu
- (3) Penentuan kalah menang dan bayar-membayar dapat berakibat negatif
- (4) Mungkin juga terjadi pertengkaran
- (5) Mengganggu ketenangan belajar di kelas-kelas lain.

### d. Manfaat Metode Permainan

Banyak manfaat metode permainan dalam meningkatkan pembelajaran matematika. Ruseffendi (2006: 312) mengatakan, bahwa manfaat metode permainan dalam pelajaran matematika ialah:

- 1) menimbulkan dan meningkatkan minat.
- 2) menumbuhkan sikap yang baik terhadap matematika.
- 3) untuk mengembangkan konsep.
- 4) untuk melatih keterampilan
- 5) untuk penguatan.
- 6) untuk memupuk kemampuan pemahaman
- 7) untuk pemecahan masalah
- 8) untuk mengisi waktu senggang.

Sedangkan menurut Diner (dalam Lisnawaty, 1993: 91) mengatakan, bahwa dengan mengaitkan bermain dengan pelajaran matematika siswa akan:

- (1) berkenalan dengan konsep matematika melalui benda-benda konkrit.
- (2) menambah atau memperkaya pengalaman peserta didik.
- (3) tertanam konsep matematika pada peserta didik.
- (4) dapat menelaah sifat bersama atau dapat membedakan antara dua jenis benda.

- (5) mampu mengatakan representasi suatu konsep dengan belajar membuat simbol.
- (6) belajar mengorganisasikan konsep-konsep matematika secara formal sampai pada aksioma dalil atau teori.

### e. Kartu BILKAT Bilangan Berpangkat

Kartu BILKAT adalah seperangkat kartu yang berisikan bilangan-bilangan berpangkat yang didesain sedemikian rupa, sehingga mirip dengan kartu domino. Adapun rancangannya adalah sebagai berikut:

- (1) ukuran sama dengan ukuran kartu domino
- (2) banyaknya kartu BILKAT dalam satu set ada 28 kartu
- (3) warna disesuaikan dengan keinginan, tetapi satu set dalam satu warna
- (4) Bahan: kertas karton

### f. Cara Permainan

Metode permainan sama halnya dengan metode permainan kartu domino. Bermain kartu BILKAT dapat dengan cara terusan dengan tanpa perhitungan, tetapi dapat juga dengan perhitungan agar dapat ditentukan pemenang dari permainan tersebut.

## 3. METODOLOGI PENELITIAN

Penelitian tindakan kelas ini dilaksanakan dalam 2 siklus di kelas IX A Sekolah Menengah Pertama Negeri 1 Tomo, semester ke-2 tahun pelajaran 2013-2014. Masing-masing siklus terdiri dari 2 kali pertemuan @ (2x40') sesuai jadwal pelajaran. Siklus I untuk materi bilangan berpangkat bulat dan siklus II untuk bilangan berpangkat pecahan/akar. Pembelajaran dilaksanakan dengan berkelompok, yang tiap kelompoknya beranggota 4 orang. Kegiatan pertemuan pertama: siswa belajar konsep bilangan berpangkat positif, nol dan negatif dengan diskusi dan tanya jawab, kemudian dilanjutkan dengan permainan kartu BILKAT, pertemuan kedua: langsung bermain kartu BILKAT dilanjutkan dengan tes dan pengisian angket siswa. Siklus II untuk bilangan berpangkat pecahan/akar; dengan kegiatan: siswa belajar konsep bilangan berpangkat pecahan /bentuk akar dengan diskusi dan tanya jawab, kemudian dilanjutkan dengan permainan kartu BILKAT, pertemuan kedua: langsung bermain kartu BILKAT dilanjutkan dengan tes dan pengisian angket siswa. Penelitian difokuskan kepada kualitas proses pembelajaran, hasil belajar dan motivasi siswa terhadap pelaksanaan pembelajaran matematika. Yang

bertindak sebagai pengamat adalah 3 orang teman sejawat.

Data kualitas proses pembelajaran diperoleh melalui observasi pada pelaksanaan tindakan, dilaksanakan oleh 3 orang pengamat dengan menggunakan rating scale. Data hasil belajar siswa diperoleh melalui tes pada akhir tiap siklus dengan soal bentuk uraian. Data motivasi siswa terhadap pembelajaran diperoleh melalui pengisian angket, yang dilaksanakan diakhir tiap siklus, diisi oleh tiap siswa. Indikator keberhasilan penelitian, mengadopsi pendapat Ridwan Saadah (2000) tentang kriteria keberhasilan pembelajaran yang sesuai dengan tujuan Penelitian Tindakan Kelas ini, yaitu dengan perolehan skor dalam prosentase (%) sebagai berikut :

- $\geq 80$  : sangat tinggi
- 60 – 79 : tinggi
- 40 – 59 : cukup
- 20 – 39 : rendah
- $< 20$  : sangat rendah

Untuk tindakan kali ini penulis menargetkan keaktifan, hasil belajar dan motivasi siswa mendapatkan kategori tinggi. Sedangkan untuk hasil belajar, penulis mengadopsi dari apa yang dikemukakan oleh H. Erman (2003 : 11) dalam R. Gita Ardhy Nugraha (2014),: “ketuntasan belajar suatu kelas belum mencapai 80% perlu diadakan diagnostik dan remedial sebelum materi dilanjutkan.” Jadi target hasil belajar dalam penelitian tindakan kelas kali ini adalah banyaknya siswa yang memenuhi dan atau melampaui kriteria ketuntasan minimal mencapai 80%.

#### 4. HASIL PENELITIAN

##### 4.1 Hasil Penelitian Siklus I

Data proses pembelajaran siklus I dapat dilihat pada table berikut:

Tabel 1. Kualitas Proses Pembelajaran Siklus I

No	Aspek	Kelompok					Presentase	
		I	II	III	IV	V		
1	Dasar dan konsep belajar pembelajaran	3	13	2	10	0	11	76
2	Interaksi antar siswa	3	13	4	15	12	14	64
3	motivasi belajar siswa dan disiplin	2	13	2	12	2	9	73
4	Tempo dan waktu dalam kegiatan pembelajaran	3	13	1	11	0	13	59
5	Sarana pembelajaran	3	13	2	15	10	11	58
	Rata-rata	27	81	10	60	14	15	78,7%

Nilai tertinggi untuk kualitas proses pembelajaran pada siklus I dengan rata-rata prosentase 81% diperoleh kelompok I dan nilai terendah dengan rata-rata prosentase 73% diperoleh kelompok V. Rata-rata kualitas proses pembelajaran siklus I mencapai 78,7%, dengan

kategori tinggi. Jika data tersebut dibuat dalam bentuk grafik, maka akan terlihat seperti berikut:

Data hasil belajar siklus I dapat dilihat pada tabel berikut:

Tabel 2. Hasil Belajar Siklus I

No	Nama	L.P	Nilai					Nilai Rata-rata	KET	
			1	2	3	4	5			
1	Angga Maulana	P	90	80	100	90	90	90	T	
2	Arif Nur Hafid	P	90	100	100	90	100	94	T	
3	Arya Pratomo	L	100	100	100	100	100	100	T

22	Swietania	61	81
23	Windi Mulyawati	63	84
	<b>Rata-Rata</b>	<b>63.2</b>	<b>84.3</b>

Keterangan: Jumlah maksimum = 15 x 5

Motivasi tertinggi mencapai 96 dan terendah 76. Motivasi pada siklus I rata-ratanya mencapai 84,3 dengan kategori sangat tinggi. Jika data tersebut dibuat dalam bentuk grafik, maka akan terlihat seperti berikut:

#### 4.2 Hasil Penelitian Siklus II

Data kualitas proses pembelajaran siklus II dapat dilihat pada tabel berikut:

Tabel 4. Kualitas Proses Pembelajaran Siklus II

No	Aspek	Kelompok						Presentase
		I	II	III	IV	V	VI	
1	Dasar-mendasar mengenai pembelajaran	14	13	15	12	11	17	81
2	Metode pembelajaran	15	13	13	14	14	13	91
3	Intelektual siswa dan guru	14	14	13	13	13	11	103
4	Eksplorasi siswa terhadap masalah pembelajaran	14	12	14	13	12	14	88
5	Sistematika pembelajaran	15	15	14	11	14	17	94
	<b>Rata-rata</b>	<b>14</b>	<b>13</b>	<b>13</b>	<b>13</b>	<b>13</b>	<b>13</b>	<b>88,4</b>

Nilai tertinggi untuk kualitas proses pembelajaran pada siklus II terjadi pada kelompok I dengan rata-rata 95 dan terendah terjadi pada kelompok V dan VI dengan rata-rata 85. Rata-rata kualitas proses pembelajaran siklus II mencapai 88,4, dengan kategori sangat tinggi.

Jika data tersebut dibuat dalam bentuk grafik, maka akan terlihat seperti berikut:

Data hasil belajar siklus II dapat dilihat pada tabel berikut:

Tabel 5. Hasil Belajar Siklus II

No	Nama	LSP	Nilai ulangan					Rata-rata	Tingkat

	Rata-Rata	64.3	85.7

Keterangan: Jumlah maksimum = 15 x 5

Motivasi siswa tertinggi mencapai 97 dan terendah 73. Motivasi pada siklus II rata-ratanya

mencapai 85,7, dengan kategori sangat tinggi. Data dalam bentuk grafik adalah sbb:

## 5. PEMBAHASAN

Kualitas proses pembelajaran dari siklus I ke siklus II menunjukkan adanya kenaikan. Rata-rata kualitas proses pembelajaran siklus I mencapai 78,7 dengan kategori tinggi dan siklus II 88,4 dengan kategori sangat tinggi. Secara keseluruhan rata-rata siklus I dan siklus II adalah 83,6 berada pada kategori sangat tinggi.

Table 7. Proses Pembelajaran

No	Aspek	Siklus		Rata-rata
		I	II	
1	Tingkat pencapaian proses pembelajaran	76	84	80
2	Interaksi antar siswa	81	81	81
3	Interaksi antara siswa dengan guru	78	86	82
4	Terlaksananya siswa terhadap materi pembelajaran	79	88	83
5	Suasana pembelajaran	78	93	86
	Rata-rata	78.7	88.4	83.6

Kualitas proses pembelajaran dalam belajar akan mempunyai dampak terhadap hasil belajarnya. Rata-rata hasil belajar siklus I adalah 87,2 dengan kategori sangat tinggi dan pada siklus II adalah 92,8 kategori sangat tinggi. Hal ini terjadi mungkin karena pada pembelajaran dengan permainan kartu BILKAT, siswa dituntut untuk paham dan mengerti materi pelajaran, (bukan hanya sekedar hapal). Jika tidak mengerti siswa tidak akan bisa mengikuti permainan, dan dengan tidak mengikuti permainan artinya ia keluar dari kegiatan yang menantang. Demikian halnya pada ketuntasan belajar, kebanyakan siswa nilai tesnya memenuhi kriteria ketuntasan minimal (KKM) yang telah ditentukan. Ketuntasan belajar pada siklus I mencapai 95,2% dengan kategori sangat tinggi dan pada siklus II mencapai 100%, kategori sangat tinggi. Ada kenaikan sebesar 4,8%. Data tersebut dapat dilihat pada tabel berikut:

Table 8. Hasil Belajar

Siklus	I	II
NILAI TERENDAH	72	82
NILAI TERTINGGI	98	98

KETUNTASAN	95.2	100.0
RATA-RATA	87.2	92.8
STANDAR DEVIASI	7.00	4.26
KETUNTASAN	95,2	100

Kualitas proses pembelajaran dan hasil belajar yang memuaskan akan menumbuhkan motivasi siswa terhadap matematika. Motivasi siswa terhadap pembelajaran matematika menggambarkan bagaimana pandangan dan pendapat mereka terhadap matematika itu sendiri. Motivasi siswa pada siklus I mencapai 86% dengan kategori sangat tinggi dan siklus II mencapai 87%, kategori sangat tinggi pula. Pada siklus I motivasi siswa dengan kategori tinggi mencapai 24% dan sangat tinggi mencapai 76%. Sedangkan pada siklus II siswa dengan kategori tinggi mencapai 9% dan sangat tinggi mencapai 91%. Secara keseluruhan motivasi siswa dengan kategori tinggi mencapai 16,2% dan dengan kategori sangat tinggi mencapai 83,5%.

## 6. SIMPULAN

Berdasarkan data yang diperoleh dapat disimpulkan bahwa:

*Pertama:* Metode permainan kartu BILKAT dapat meningkatkan kualitas proses pembelajaran bilangan berpangkat dan bentuk akar. Kualitas proses pembelajaran pada siklus I mencapai 78,7%, dengan kategori tinggi, dan pada siklus II mencapai 88,4 % dengan kategori sangat tinggi.

*Kedua:* Metode permainan kartu BILKAT dapat meningkatkan hasil belajar bilangan berpangkat dan bentuk akar. Rata-rata nilai pada siklus I mencapai 87,2 dengan kategori sangat tinggi dan pada siklus II mencapai 92,8 kategori sangat tinggi. Ketuntasan belajar pada siklus I mencapai 95,2%, dan pada siklus II 100%.

*Ketiga:* Metode permainan kartu BILKAT dapat meningkatkan motivasi siswa pada pembelajaran bilangan berpangkat dan bentuk akar. Motivasi siswa pada siklus I mencapai 84,3 % dengan kategori sangat tinggi, sedangkan pada siklus II mencapai 85,7%, dengan kategori sangat tinggi juga.

## 7. SARAN

*Pertama:* Mengingat pelaksanaan penelitian ini baru berjalan 2 siklus, maka peneliti lain diharapkan dapat melanjutkannya untuk mendapatkan temuan yang lebih signifikan.

*Kedua:* Instrumen yang digunakan dalam penelitian ini masih merupakan instrumen yang validitasnya belum memuaskan. Peneliti berikutnya dapat mencoba dengan instrumen yang terstandar.

*Ketiga:* Walaupun secara keseluruhan kualitas proses pembelajaran dalam kategori tinggi. Tetapi perlu ditingkatkan bagaimana agar siswa mengeksplorasi materi lebih mendalam dan bagaimana meningkatkan rasa ingin memahami matematika yang lebih tinggi.

*Keempat:* Hasil belajar menunjukkan hal yang memuaskan, tetapi beberapa siswa masih mendapat kesulitan untuk menyelesaikan soal-soal tingkat aplikasi. Siswa harus banyak dilatih untuk menyelesaikan soal-soal (berpikir) tingkat sedang dan atau tingkat tinggi.

## **Improvement of Collaborative Activities In Working Group with *Group in Group Learning Model* in Cartography Course of Geography Education Program Fis Unp**

Ernawati<sup>1</sup>

<sup>1</sup>*Geography Department, State University of Padang, Padang, Indonesia  
ernageo@yahoo.co.id*

**Abstract:** .The purposes of this paper are: describing implementation of Group in Group method in cartography course in Geography Education Program FIS UNP; describing what kind of study material should be prepared by lecturer in the Group in Group learning model in cartography course in Geography Education Program FIS UNP; and also knowing the ability of the Group in Group learning model for improving student activities in collaborative group work on learning cartography in Geography Education Program FIS UNP. Subjects were studied in this Lesson Study activities are 64 first-semester students, who take independent regular class of cartography courses. The event was held for three cycles; three times of "plan, do and see" approach. Technique of data collection is observation, which data were collected using observation sheets, filled out by the observer during open class. Through qualitative analysis, data which have been collected, analyzed, classified and interpreted for seeing the trend of the data; then discussed and concluded. Based on the findings in this lesson study activities, it can be concluded: 1. Group in Group learning model is very effective to improve the collaborative work group class activities for bigger class of cartography course students. 2. In this learning model, it is need to prepare learning materials such as LKM and clear work instructions for each member of the group. 3. Percentage increase in the activity of student groups working collaboratively on cartography course increased from 60% to 95%, so 35% increase from the prior lesson study

**Keywords:** Collaborative activities, working group, *group in group learning model* , cartography

### **1 INTRODUCTION**

Law Number 20 in 2003 on National Education System, Article 1 paragraph 1 states that education is a conscious and deliberate effort to create an atmosphere of learning and the learning process so that learners are actively developing their potential to have spiritual strength of religious, self-control, personality, intelligence, noble character, and skills needed him, society, nation and state.

The successful development of the potential learner is determined by the implementation of the learning process, as it should implement an interactive learning process, inspiring, fun, challenging, motivating the students to actively participate and provide enough space for initiative, creativity, and independence in accordance with the talents, interest, and the physical and psychological development of students. For each implementation poses that, educators should learning preparation about lesson planning, implementation and assessment of learning processes to improve the efficiency and effectiveness of the achievement of the competence of graduates (Permendikbud No. 65, 2013)

In order to achieve competence in college graduates, lecturers have prepared the lecture by considering the characteristics of each course and subject characteristics of the students who attend college. Characteristics of subjects need to be considered for the formulation of the learning device in accordance with the respective rules of science.

Specific characteristics that are expected from the learner are development and improvement of attitude/behavior, cognitive development, and motor skills. Improvement and development building of attitude is the attitude among the learners and learner attitudes towards lecturers/educators. The attitudes expected in learning process such as emotional control, mutual respect, and cooperation within the group. If the characteristics of the courses and subjects that students are ignored then there is a possibility of the lectures that were made can not be used optimally.

One attempt to improve the quality of learning in order to improve the creativity of learners and educators through professional guidance for assessment is the application of Lesson Study on the principles of collegiality and mutual learning to build a learning community (Summer, 2002). Lesson Study

is a model of "teacher professional development". Through Lesson Study activities, developed learning can encourage students to learn actively, creative, effective, and fun through hands-on and mind-on activity, daily life, and local materials. In addition, the learning process can be developed collaborative activities learners, for example by the method of group work, learners can inform each other, respect each other opinion of friends/others, mutually explain/discuss, as well as competition between groups.

In lesson study activities in 2013, one of the Lesson Study courses is cartography. Cartography courses in Geography Education Program Study Faculty of Social Science State University of Padang usually be taught in two semesters, in first semester (Cartography weights 2 credits) and in second half (Practical Cartography weight 2 credits). However, starting in 2013 with compacting the curriculum changes and course load reduction credits for students, so that the two subjects are combined into one course that is only 3 credits cartography weight, but operationally practical activities include into this course.

During the implementation of this course on cartographic theory is more dominated by the lecture method varies, where professors use power point and slide projectors, and students in the lecture seemed happy to listen and record material that is explained by lecturer. In learning process, there are not a lot of students who want to asked while it has been given the opportunity to ask questions, but when asked the question as a feedback to the students, there are students who still can not answer the questions posed by the lecturer.

Implementation of cartography lab course in the next semester with more dominant practice, where lecture gives clues of lab work, and describes that part which is not understood by the students, then students work on practical tasks personally, because lecturer demanding individual student skills, and experience so far if the task practicum administered group, there is the tendency of some members of the group do not go to work, but only the passenger name, let alone the work completed outside of lecture hours for not enough time and queue usage workspace / workshop room.

When the presentation of the results of work carried out this task, it is clear that not all members of the group could master the concepts and the workings of the task, so author thinks that we have to change the way of learning that can enhance the collaborative activity within the student group work.

The method that the author made is forming small groups within a larger group which the author call the method "Group in Group". Author considers this method can increase the activity of a group of

students working collaboratively on cartography course.

## 2 METHOD

Please be advised that all the papers must be in English and without many errors. Please do not add any text to the headers and footers. Do not add page numbers.

1. Subjects were studied as data source.  
Subjects were studied in Lesson Study activities this is the first semester students, who take regular classes independently cartography courses, totaling 64 people.
2. Lesson Study Implementation Plan/  
This activity is carried out for three cycles, consisting of plan, do, and see in each cycle.
  - a. Plan  
The first plan was held on Friday 25th October 2013, this Plan was attended by all members of the team cartography courses, task force, Monevin, and chairman of the Department of Geography FIS UNP. The second plan dated 8 November 2013, and the Plan to 3 on November 29, 2013.
  - b. Stages of Implementation (Do)  
Implementation of learning / do the first conducted on Tuesday at 7:00 to 10:30 dated October 29, 2013 in Space Workshop Geography, the model lecturer is my own. Cartography team leader courses. Do the second time held on Tuesday November 12, 2013, and a third is planned on Tuesday dated December 3, 2013 at 7:00 to 9:30 in the morning.
  - c. Stages of Reflection (See)  
Stages of reflection carried out immediately after the open class, the implementation is a local workshop room that was used as a place open class. Reflection attended by all observers and lecturers models.
3. Techniques and data collection instruments  
Data collection techniques were performed was observed, and the data collected using observation sheets filled out by the observer based on the observation during the open class.
4. Data analysis techniques.  
The analysis technique was used is based on the qualitative analysis of the data which has been collected from the observer sheet. The data has been collected analyzed, classified and interpreted to see the trend of the data. Then discussed and concluded.

## 3 RESULT AND DISCUSION

### Plan

In stage plan / planning, team members joined in the Lesson Study design collaborate to discuss chapter and lesson design and student job sheet which have been prepared in advance. In this activity, discussed the problems that often become obstacles in learning cartography, namely the difficulty of building creativity

and teamwork for students, usually when students are given a task/work groups tend to this task is only done by some members of the group only, while the rest of the group just riding name only, in terms of the scoring task/work groups are the same, so it does not feel fair, and skills possessed all students are not optimal.

Then discussed methods and models are considered to improve the collaborative activity within the student group work. From the discussion the authors suggest that developing implemented by creating groups of 4-6 people, the size of the group members because the number of students in this class is quite large ie 64 people. Six people per group assessed the number of members is not effective to be able to increase the activity of all members of the group, because it needs to be turned down again, but when the number of group members be diminished, resulting the number of groups and workshop space in increasing and is not adequate for it. Then the authors suggested that the relatively large group consisting of 6 is further divided to 3 small groups so that each small group consisting of 2 students.

Each small group was given student job-sheet of the lecture material that is on the map scale changes and their impact on the presentation of data on the map. Each small group is also equipped with two sheets of topographic maps or maps Indonesian RBI scale 1: 50,000 and 1: 250,000. Then the students were told to understand the content of student job-sheet and work orders that have been written in the Student job-sheet. So finally revised with the lectures, and agreed methods and learning models that will be done at the open class / do.

The second plan was held on Friday November 1, 2013, the plan was discussed both the advantages and disadvantages of methods, models and student job-sheet in the previous plan and the fix for the next material diminution in the form of lab-scale maps and generalization processes that occur. The third plan is planned on Friday 29 November, 2013

1. **Do/open class**

- a. Activities do / open class was attended by 6 observers to observe and record the activities done by the students during the learning process. Once done do, the observer and lecturer reflection models (see), At this stage the observations discussed observer. Almost all observers have a positive impression on the implementation of the open class, although there are still some students were a little confusion in the early stages, but as faculty models responsive to students are not focused and do not understand the material and the task / work groups to be solved, then the models approach the lecturer concerned student.
- b. In the early stages of lecturers models explain facts and concepts map scale changes and the impact on the data and generalization of detail due to the change of the map scale, all students observed data on both maps of different scales based on the suggested reading material and student job-sheet already been distributed to each small groups, work to be done between the different groups of students in a small group in a large group and the task is part of a large group assignment. Then each group read the student job-sheet, observed data on both maps, discuss it with friends in a small group, noted.

Once the work is completed in small groups, discussed the findings of a small group in a large group, confirmed, and then be presented to the class.

- c. At this stage of class discussion almost all students excited and wanted to ask, respond, and give opinions about their findings in their respective groups. Do this first of a clearly visible improvement collaborative creativity of students in the task group.
- d. Do the second was held on Tuesday dated 12 November 2013 at 7:00 to 9:30 in Room Workshop Geography Education Program Faculty of Social Science State University of Padang. Observer in attendance amounted to 6 persons. In this second Do students practice the reduction process of map scale 1: 50,000 to 1: 100,000, meaning a double reduction.
- e. Implementation of learning also begins with an explanation of the task group is to be done on each student small groups and large groups. The entire small groups in large groups distributed student job-sheet that contains a brief lecture material and groups of tasks that must be done together. Small groups of 2 people, 1 person observing generalized maps and data, while another person or generalizations describe changes that occur, record and classify the type of generalization that occurs. Observed data is just data about the river (symbol line) and the data of settlement (symbol extents).
- f. After the small group's work was completed, a discussion and confirmation with other small groups in large groups. After the entire group work in the classroom was completed, a presentation, and the other listened, and added. So that eventually all the students in the class smile and feel happy with the day's lesson.

2. **See**

In the see / reflection stage is a very important stage for further efforts to improve the learning process will depend on the sharpness of the analysis of the participants based on observations of teaching practices that have been implemented. Reflection activities carried out in the form of discussion that followed throughout the lesson study participants were guided by the task force. The discussion starts from the delivery of the impressions of the observer and the observation of activity at the time students do.

Furthermore, all observers submit responses or suggestions are wise to the learning process has been implemented (not the teacher concerned). In conveying suggestions saranya, observers must be supported by evidence obtained from observations, not based on his opinion. Various discussions were developed in the discussion can be used as feedback for all participants for the benefit of the improvement or enhancement of learning processes. Therefore, all participants should also have records of discussions took place in the discussion.

## 4 CONCLUSION

Based on the findings and the discussion above, it can be concluded:

- a. Group learning model is very effective to improve the Group's collaborative group work activities cartography student learning for large classes.
- b. In the learning model of the Group in the Group needs to be prepared learning materials such as job sheet and clear work instructions for each member of the group
- c. The percentage increase in the activity of student groups working collaboratively on cartography courses increased from 60% to 100%, so increased 35% from the prior lesson study.

## The Implementation of Lesson Study at Strategy in Mathematics Instruction Lecture

Fitrani Dwina

*Mathematics Department, Faculty of Mathematics and Science, Padang State University,  
Prof. Hamka Street, Air Tawar, Padang, Indonesia  
fitrani\_dwina@yahoo.com*

**Abstract:** Strategy in Mathematics Instruction is an obligated lecture at Mathematics Department, Faculty of Mathematics and Science, Padang State University. This lecture was given to student as a candidate teacher. There are some problems happened during this lecture such as: student activity in questioning do not fluent, reading motivation and the capability of student in discussion still weak, sometime lecture preparing not optimal. Lesson study is an activity to improve lecture quality. Generally, it consist of three parts, those are: plan, do, and see. To implement lesson study at Strategy in Mathematics Instruction lecture is conducted several stages, those are: discuss with the colleague for preparing lesson plan, work sheet for student, all activity in open lesson, and reflection after open lesson. There are four times for open class activity. The method that used in each open class depend on the topic of discussion. The student are divided into small group with 3 to 4 student, doing student worksheet, reading the topic that can be discuss, and then presentation their result discussion in class. The result of the implementation lesson study can be improve the quality of this lecture such as: the increasing of student activity in questioning, reading motivation, the capability of student in discussion, and lecture preparing can be optimal.

**Keywords:** Lesson Study, Strategy in Mathematics Instruction Lecture

### 1. INTRODUCTION

The quality of teaching and learning process do not just indicate by increasing the result of study, but sometime also point that increasing the activity of student. The student have to have soft skill and hard skill to be success as a teacher. Their must be have a skill how to communicate nicely, and a higher motivation to read. Besides that the lecturer also have to prepare the lecture process, to be success achieve a goal of teaching and learning activity.

Strategy in Mathematics Instruction is an obligate lecture at Mathematics Department, Faculty of Mathematics and Science, Padang State University. This lecture was given to student as a candidate teacher. There are some problems happened during this lecture, such as: student activity in questioning do not fluent, reading motivation and the capability of student in discussion still weak, sometime lecture preparing do not optimal.

Lesson study is an activity that can be improve the lecture quality. Lesson study ( or kenkyu jugyo) is a teaching improvement process that has an origins in Japanese elementary education, where it is a widespread professional development practice. Working in a small group, teacher collaborate with one another, meeting to discuss learning goals, to plan an actual classroom lesson (called a research lesson), to observe how it works in practice, and then to revic and report on the results, so that other teachers can get benefit from it.

Cooperative learning is a model of teaching that can be conduct student to help each other. Student team learning is making cooperation in learning teams a routine part of a classroom organization, not an occasional fun activity. More importantly, carefully controlled studies have demonstrated that use of learning teams under specific conditions increases student achievement in mathematics and other subjects. Roger and David in told that do not all group discussion be a cooperative learning. To get a maximum outcome, there are five substance can be conduct in coperative learning: 1) positive dependence, 2) invidual responsibility, 3) face to face, 4) communication between member, and 5) group evaluation. The successfullly of group is depend on the effort of member. All member try to be good and do the best for their group.

Impementation lesson study at strategy in mathematics instruction lecture, the student divided into some group with 3 or 4 member in each group base on their cognitive ability. Each group try to find the information base on the topic that can be discuss in class. Assigment method is on of method that can be make student more active to get the information. This method was applied to ask student resposibility about their task. They have to find, read, discuss, and prepare their slide presentation about te topic. After student presentation, lecturer and student do the activity, discuss about the subject matter. At the end of this lecture student by guiding of the lecturer making a conclusion.

## 2. DISCUSSION

Lesson study is a teaching improvement and knowledge building process that has origins in Japanese. Lesson study was implemented at strategy in mathematics instruction lecture. In this paper, will be discuss about how was lesson study be implemented in this lecture. There are three steps activity in this lecture, they are plan, do, and see.

### a. Plan

In this section team lecturer in the same subject begin by selecting a topic and goals for student learning. They select a topic that interest to them. They are some topic selected from the syllabus: 1) opening and closing skill, 2) cooperative learning, 3) problem based learning, and 4) direct instruction.

Figure 1. Team lecturer discuss about plan

In plan section, the lecturer also discuss about a time and strategy that can be done in this lecture. After dicuss about plan, one of the lecturer be a model of lecturer in teaching. All material, such as worksheet, lesson plan, and observation sheet have to prepare before do section.

### b. Do

in this section lecturer model be implemented lesson study to conduct that lecture. There are some strategy used in this lecture. The student divided into a group with 3-4 member. Before starting a lecture the student asked to sit in group. During this lecture the student have to follow some activity, present the topic that will be discuss in class, asking and aswering question about their friend presentation, and making conclusion based on their discussion. The group that will be present choose randomly by a lecturer.

There are some observer can be observe all activity of student during the lecture. The observer can be used the observation sheet, to know about student activity. There are some question in that sheet: 1) when the student start concentrate to study? how was the prossess? 2) are there any student do not study or discuss? 3) why they don't study or discuss?

4) is the lecturer try to handle the student who don't study or discuss? 5) what are the advantages of this lecture that can you get today? 6) the blank space to give a chance for observer to write some comment from their observation.

Figure 2. Student activity during the lecture

Figure 3. The lecturer give a reflection for student activity, there are some observer in that classroom

There are some strategy that implement during the lecture is based on the topic will be discuss. 1) student asked to read the topic before start lecture, 2) present their result discussion using slide power point, sometime they can show by using the paper, and hang on the wall, so all student can see, 3) watching video about model of teaching problem based learning, then they are discuss a worksheet in group.

By using many variation strategy to conduct this lecture, the student can be more active, and enthusiasm follow all the avtivity. At the end of the lecture the student must be make a resume based on their discussion.

### c. See

It is an activity to discuss or give a reflection after do. In this section all observer can be discuss all thing that be happened during do. See or refleksi must be done as soon as possibble after do. Participant include the lesson study team members and guest observers. The moderator can start to be a guide discussion. In this discussion participant share the idea based on their observation. Based on the discussion the lecturer who take responsibility to open the class revise the plan to the next open class.

There are some information get from the observer: 1) some student do not consentrate at the beginning of lecture, but after fifteen minutes they

start to follow all activity in class, 2) some of them do not discuss in group although the lecturer try to remind them, 3) in general, the lecture be success based on plan, 4) variation strategy in teaching can make the student be more active and enjoy the class, 5) based on the discussion, team try to find another alternative, in next meeting for lecture,

Figure 4. Reflection between observer and team

Participants share their observations and examine additional evidence from the lesson, such as student written work, searching for pattern that may reveal important insight into teaching practice and student learning [5].

### 3. CONCLUSION

During implementation of lesson study at strategy in mathematics instruction lecture, some advantage that can be get:

- a. The experience of learning by student are increase:
  - 1) their activity in questioning,
  - 2) their motivation to read,
  - 3) their capability in communication,
  - 4) their responsibility in group discussion
  - 5) their responsibility in doing task
  - 6) their enthusiasm in lecture
- b. Based on the lecture:
  - 1) the plan for preparing lecture can be better
  - 2) the implement of lecture can be optimal
  - 3) the quality of lecture can be improve
  - 4) the lecturer can be handle the situation during learning process
- c. Suggestion:
  - 1) in activity at open lesson, more observer attend that class, can be more better,
  - 2) hopefully, lesson study can be implement for all subject,
  - 3) all observer must be give their report based on their observation
  - 4) this activity can be support with a good equipment.

### 4. ACKNOWLEDGEMENTS

I would like to say thank you for all people that help and give me a chance to implement lesson study at my lecture. Thank you for commitee lesson study batch 1, Faculty of Mathematics and Science, Padang State University. My team lecturer that give me responsibility to be an open class lecturer. I can't tell one by one to any body, and also to my student who company with me in this activity.

**Abstract:** How to develop students' understanding of the concepts about the volume of the cuboid? How to build students' understanding about concept of the volume of the cuboid? This is the basis of our thinking in designing a lesson about volume of the cuboid in the 5<sup>th</sup> grade. Through various learning experience, we expect the student will have more meaningful learning and can improve student comprehension. In this year we are carrying out a second cycle for the material taught in the previous year. In the first cycle (we conducted last year) we found a lot of unpredictable problems. The lesson that we have conducted did not appropriate focus learning objectives. This is a challenge for us to design better learning in the second cycle. In the second cycle we did a deeper repersonalize for designing learning activities. We did a lot of changing when we plan the second lesson. We designed a different learning sequence for the whole unit, not only for the open lesson. We also change the apperception that we give to the student, exploration activities, teacher's question and instruction. All of it is very important for us when design the 2<sup>nd</sup> cycle lesson. With this repersonalize, we can design 2<sup>nd</sup> cycle lesson more focused and directed.

**Keywords:** repersonalize, mathematics, cuboid volume.

### PREFACE

Meaningful learning is student-centered learning that means student involved actively on the process. Generally, it's been a long time that teaching-learning activity in Indonesia carried out by using conventional methods. This method cannot stimulate students' motivation. We are agree that it is not a mistake when teacher using a conventional method on an appropriate subject but this method is not appropriate for mathematics.

According to David Ausebel, meaningful learning is the lesson that can make student easily to understood because the teacher have capability to make it easily so students can connect their experience and their prior knowledge. Teachers have to develop student cognitive through meaningful learning. At the primary level, will be more beneficial if the students directly involved in learning activities.

Lesson study can be used as an alternative solutions to encourage the development of a learning methods. Lesson study is not a strategy or method in learning (Sudrajat, 2008). Lesson study was an effort to improve the learning process which conduct by a group of teacher in a collaborative and sustainable, not only in the planning process but also in observing and reporting a lessons.

According to that idea, we try to apply lesson study when we teach the concept of the cuboids' volume in a fifth grade. We designed the lesson through a series of activities in two cycle by using the principles of DDR (Design Didactical Research). In which the principle of DDR is puts forward thinking way at before, during and after learning. Teacher needs to do re-personalize by predict students' respond before the lesson, analyze the relationship between teacher, student and subject, and do reflection process about prediction

at before lesson and the fact that happened in the class.

By applying DDR, we are trying to map the problems occur in the first cycle that causes the purpose of learning in this first cycle is not achieved optimally. After doing reflections on the first cycle we formulate problem that happened:

- A-perception that we presenting are not helped students in the process of thinking when explore how to find the cuboids' volume.
- Instruction and duties which teachers gave not yet set the student at the purpose of learning to be achieved.
- Students' prior knowledge has not supported to achieve the purpose of learning.

Based on the problems, we make a new design learning activities for the same material, so that the aim of lesson can be achieved.

## LEARNING ACTIVITIES: CUBOIDS' VOLUME

In order to achieve the aim of meaningful learning in the subjects of mathematics at GagasCeria elementary school, has conducted two cycles of learning. Both learning cycles have the same objectives: how to find the volume formula through the exploration that involves students actively, so that students can find the formula of cuboids' volume by them selves. The second cycle is performed with the approach of the lesson study using the principle of DDR which consists of the stages of planning, implementation and reflection.

### 1<sup>st</sup> Cycle reflection result

In the first cycle, teachers with the team plan and learning activity together with regard to aspects of the manner of thinking at before, during and after learning. On the planning process, teachers are doing re-personalize. Teacher try to predict the student response before learning and analyze the relationship between teachers, students and subject content. On this stage, the first things that noticed is the purpose of learning. Starting with the process of analyzing competency standard and basic competence, the aim of leaning was formulated. The aim of learning was formulated based on graduates' competency standard. The aim of learning must be made carefully because it will determining what stage are conducted in a class in order to achieve this aim. Finally, has decided that the aim of learning is how to find cuboids' volume formula.

Reference to the purpose, teachers made a cuboids' volume lesson tree. Just like a tree, lesson tree is consist of: root which represent the matter that student have to know before learning about

cuboids' volume, stem which represent the stage of learning, and branch which represent the aim of learning to be achieved .

Teachers should do re-personalize herself being a student so teacher can predict student condition in the class. By noticed to a lot of aspect, learning media that used is cube unit and transparent cuboids which made from plastic. Transparent cuboids will fill by cube unit, it was made to help the student easily count the number of cube unit filled in the transparent cuboids and hope the student realize what the meaning of volume. Transparent cuboids made in three different sizes because student will compare the number of cube unit filled in.

All of possible things that will happen during the implementation discussed with the all anticipation including a-perception planning. Learning activity started by giving an illustration on the number of books that can fit in a place. In this activity children still enthusiast and studied attitude began to build. Then a-perception followed by showing two objects and students were asked to determine what objects that have larger volume. Teachers show many things to compare.

In the second activities, student in group conduct exploration to count cube unit filled in transparent cuboids. Each group has three transparent cuboids, cube units and worksheet that must be done by student. Each group consist of four persons, teacher have arranged the group consist of different student capability. From this activity the teacher predict some of group who will find the sum of unit cube by multiplying of the number of length, width and height of cubes so student can get the formula. But in fact many student cannot make a conclusion that formula to find cuboids volume is from multiplying length, width and height. So, at the end the conclusion the formula given by a teacher not come from the students. Why it happened?

After the reflection with a team that makes planning, we concluded a few things that causes the aim of learning cannot be achieved. Comparing many objects at a-perception turns out students attention and not connecting prior knowledge and the concept would be taught. Beside that learning activities also not build students understanding to find the formula cuboids volume. Comparing the three transparent cuboids not guide the students to find cuboids volume, because student that only riveted on counting the number of cube units without think how to count the volume.

### 2<sup>nd</sup> Cycle Planning

Based on the results of the reflection in the first cycle, we try to create a better learning plan. We

did analysis of what it should be owned by the students so that they are ready to find the formula cuboid volume. When the team make the learning plan we got some suggestion from some experts. Prof.Didi Suryadi says students must understand the concept of multiplication of three numbers, because they are worried students are still difficulties in multiplication. Before getting into the volume must consider first experience multiplication ability of three numbers. When we teach a multiplication we always remind the definition of that multiplication is repeated addition.

The learning activities in this second cycle is more organized. When we are planning not only to plan for the learning material that will be presented to the child on that day only but we have to plan lessons for the whole unit so that the learning will be conducted continuously. In the context of studying the volume of the cuboid the subject of area becomes an important thing that should be reinforced to the students because it will help students in understanding the concept of this cuboid volume.

We had a lot of discussion to plan this second cycle. Many things to think about, because in our opinion not only the learning activities that affect student learning but the instructions and learning media must also support learning. In designing this study in the second cycle we were assisted by some experts as Prof. DR. Didi Suryadi M.Ed, DR. Endang Mulyana, and Tatang Suratno M.Sc. We also received suggestion from Mr. Muchlis as mathematics lecturer from ITB.

### Implementation

The learning activities are provided to the students are:

### Apperception

Teachers provide apperception by a game of numbers. Students will be required to take the card that has been provided by the teacher. The card will contain a number that is 12. The teacher provides 4 cards that contains the same number. Teachers will provide instruction: Type 3 integers that if the three numbers are multiplied produce number 12. We choose three numbers as apperception due to connect multiple length x width x height as a destination to learn how to calculate the volume of the cuboid. We have a reason why we choose number 12. Because it has multiple answers when the child must determine the multiplication of three integers that can produce alternative answers 12. The teacher can ask the answers to some of the students randomly.

### Core Activity

Students are divided into several groups. Each group will get a transparent mica blocks and 60 unit cubes. The teacher asks the students to think of three ways to obtain the number of unit cubes that can fill in the cuboid. Students will write the answers on a piece of paper. In this activity students are expected to answer the  $3 \times 4 \times 5 = 60$ .

To find out more the student has been able to figure out how to find the volume of the cuboid, the teacher will provide two pieces of cuboid image with different sizes.

Then the students should calculate the volume of this cuboid (the size shown in the figure). If students are able to calculate the volume by given cuboid image, next the teacher will provide the cuboid without size information and ask students about the elements of the cuboid (length, width, and height).

Based on the results of the activity, students are directed to find that the formula the cuboid volume is the length x width x height.

### Closing

For the validation of students' understanding in calculating the volume of the cuboid then the teacher gives the cuboid image with description of the size and students could calculate the volume of the cuboid.

### Reflection Activity

There are many changes in the learning activities to calculate the volume of the cuboid when we compare with last year learning activities. Difficulties experienced by the students in the first cycle can be solved through the activities carried out in this second cycle. Learning activities in

cycle 2 is more focused on how the students calculate the volume of the cuboid. Activity apperception of multiplication of numbers can facilitate students in calculating the volume of the cuboid. The student was able to work systematically. It can be seen from how the students in counting the number of unit cubes using the multiplication of the area of the base x height or using multiplication sides. Question direction or instruction teachers can build more structured systematic thinking in the child's head, so that children are stimulated to associate learning experience possessed by the new experience gained achieve the learning objectives.

## CONCLUSION

Learning activity at primary school will take properly if through stages of thinking accordingly. The process of learning from concrete-pictorial and abstract packaged in contextual learning is a series of activities or processes that need to be passed by a child learning to understand a particular concept in math lessons. This understanding is evidenced also in this open lesson. Children are expected to do their own exploration in finding various ways to calculate the volume of a cuboid by using unit cube. Students are then asked to find the easiest way to calculate the number of unit cubes. Students will learn that by counting the number of unit cubes as well as calculating the volume of the cuboid.

These direct experiences will connect students to compose the meaning of the concept of cuboid volume. Through this activity students will be able to remember the concept of the volume of the cuboid and can apply it in various contexts. It is not only about the memorizing formulas.

In the implementation of learning is not going exactly as planned. There will always be new things that appear which is not predictable before. The ability of teachers to understand students' difficulties when learning is very necessary so the learning does not become stalled in a difficult situation. Teacher's ability to improvise so that learning objectives can still be achieved, because the important thing is not to implement according to plan but learning how to create a learning bring the students reach the expected goals. The ability of teachers do repersonalize activities that have been carried out on various aspects such of attitudes, skills, and cognitive students is a teacher's success in implementing a learning activity. And it will be a material improvement for future learning.

**Abstract:** The aim of this research is to determine the level of English children's reading comprehension. This article is based on a report that the learning process is carried out by three English teachers to students through reading exercises, analysis of the child's responses and provide a way to answer the questions based on the text. Students are able to understand the text, although they sometimes face difficulties. Mostly they did not understand the vocabulary. First until third grader need a visualization (property, picture and body gesture) to understand the text. Fourth until sixth grader understand the text from discussion with a stimulus questions about the text (using WH Questions).

**Keywords:** Reading Comprehension, Lesson Study, Reflective Practice

### 1. INTRODUCTION

Reading is very important in the educational process. Through reading, we will find out students development widely. Reading is also a tool to measure our ability of reading, both Indonesian and foreign languages. Reading can measure student ability in understanding subjects. Besides that reading is also a part of education as a tool that can be used in education competition both domestically and abroad. In this era of globalization, learning and mastering English is considered important and a necessity. English is the implication of subjects studied at each level of education. In fact, teaching English in primary schools is more difficult than the first or middle school. It is because the primary students do not know English before. Learning to read, understanding the meaning of the writing is very important for children education and personal development, which can be implemented with appropriate lesson (Cameron, 2001).

In fact, learning English is often considered difficult by students. They feel burdened because they have to understand new vocabularies. The thing which is the most difficult for elementary school students is to understand a text in English. There are a lot of factors which can make the students feel difficult. The understanding will be different when they read text in bahasa and in english.

The factors that make students feel difficult are because they do not understand the contents of the reading and they do not understand what is being asked in the question related to the text. If this condition is ignored, probably students would not like English because of the complexities of vocabulary that requires students to understand

reading, reading skills so that learning goals are not achieved.

### 2. LITERARY REVIEW

#### 2.1 Reading Definition

Reading is a complex and complicated process. The complex means that in the reading process involved a variety of internal factors and external factors from the reader. Internal factors such as intelligence, interest, attitude, aptitude, motivation, purpose of reading, and etc. External factors such as means of reading, social and economic backgrounds, reading habits. Complicated means external and internal factors interact to form a complex coordination to support reading comprehension (Nurhadi, 2008: 13).

Klein et.al. (Farida Rahim, 2005: 3) the definition of reading include :

- 1) Reading is a process  
Reading is a process intended information from the text and the knowledge possessed by the reader has a major role to form a meaning.
- 2) Reading is a strategy  
Pembaca yang efektif menggunakan berbagai strategi membaca yang sesuai dengan teks dan konteks dalam rangka mengkonstruksi makna ketika membaca.  
Effective readers use different appropriate reading strategies to text and context in order to construct meaning.
- 3) Reading is an interactive  
People who love to read, will meet some of the objectives to be achieved, readable text that

should be easily understood sehingga no interaction between reader and text.

## 2.2 Reading Interest

Reading habits related to the habit. Interest is an acceptance of mind that are active to to receive something from outside. Interests can be divided into two types, firstly spontaneous interest and interest pattern. Spontaneous interest is an interest that grew spontaneously from inside without being influenced by outsiders. Patterned interest is an interest that arises as a result of the influence and activities of the plan or pattern, especially teaching and learning activities, both at school and outside of school. Dawson & Bamman in Sutini (2010).

Reading interest appear from a long process and phase changes that appear regularly and continuously. As described previously, interest is a likely feeling and interested feeling to activity that shown by desire to notice the activity spontaneously without being influenced by outsiders, with glad feeling.

## 2.3 Interest Factor in Reading

According Anna Yulia (Kholianti, 2011: 33-34), challenges or obstacles in growing interest in reading is :

- 1) Reading culture  
According research from ASEAN Libraries (Anna Yulia Blogs,2011), develop country citizen mostly has a low reading culture. For example, citizens will choose to talk with someone when they waiting in the public area.
- 2) Television  
The influence of television is huge for adult and childre. Most of them spending their time in front of television. Although they watch a good program, still they spending too much time in front of television. They should be allocated to the things that are useful, which is reading a book.
- 3) Book is not priority  
Generally, in develop country, the citizen still struggling with economic factor so that they only had a focus on to daily need. Citizen generally do not pay attention to education and book.
- 4) Lack of Facilities  
Environmental conditions or the community is really affect reading culture. In developing countries that the problem is still struggling around economic and political problems as in Indonesia. Education often ignored by the government so that citizen frequently visit library.
- 5) Family

Accordingly Rubin (Farida Rahim, 2008: 18), warm, democratic, can direct their children to activities with education oriented because it will chalange them to think, encourage children to be independent and get ready to study at school. Parents who like to read, have books collection, appreciate reading and like to read story to their children generally deliver children who like reading.

## 2.4 Reading Interest Data In Indonesia

Data from Badan Pusat Statistitik (BPS) in 2012 show that 91,68% Indonesian citizen from age 10 and above like watching TV and only 17,66% who like reading newspaper, book or magazines.

Data in 2011 from United Nations Educational, Scientific and Cultural Organization (UNESCO) lack interst of reading in Indonesia, showed by reading index 0,001 (from one thousand citizens, there is only one person who still has a high interest in reading).

Data in 2012, Indonesia got rank 124 from 187 countries around the world in Human Development Index, especially about basic needs, including education need, public health, and recognition of reading. Indonesia has 165,7 million citizens, only had 50 million books came out to public each year. It means that, average only a book read by 5 people.

## 2.5 Reading Strategies and Techniques

- 1) Scanning :  
Scanning is really about deciding if a resource is going to be useful or not.
  - a. Use the contents page and subheadings to get a general idea of its suitability.
  - b. Look out for bold, italic or different font prints
  - c. Scan for specific words or key phrases
  - d. Use your finger to guide you down the page and maintain focus
- 2) Skimming  
One you have scanned a resource and decided that it is suitable for your purpose, you may then want skim read for further information. This is used for getting the ‘gist’ of a text without painstakingly reading word for word with an internal monologue. The act of reading changes so that you read 3 – 4 words at a time. A useful way to think about this is to consider individual letters in a word – you don’t *read* each letter but *see* the whole word. The same applies to skim reading – you don’t *read* each word but *see* clusters of information.
  - a. Use organisational features of the texts (i.e. start/end of paragraphs; conclusions, etc).

- b. Read further away from the text than what you would normally do (creating a larger space between your eyes and the written word).
  - c. Don't let your eyes move from left to right as this encourages word for word reading. Instead, try to keep your eyes still with a loose focus down the middle of the text.
  - d. Practice, you will only develop these skills if you practice them. It may be easier to start off with light reading at first.
- 3) Detailed Reading
- Scanning allows you to locate information quickly. Skimming allows you to digest the main ideas of a text quickly. Sometimes, you will need to spend more time on a particular extract. Detailed reading sets aside more time for you to focus on the essence of what you are looking for.
- a. Make it interactive using highlighting or note-taking to record important aspects.
  - b. Do it in combination with scanning and skimming so that you can allocate your time efficiently and effectively.

**2.6 Lesson Study**

Lesson Study has been implemented by the Japanese education system since 1900's. However, Stigler and Hiebert described Lesson Study extensively in 1999 in their book “The Teaching Gap” (Hock & Sam, 2010). Lesson Study is an approach used to conduct the research on teaching in the classroom. This approach is able to explore the development of more meaningful teaching because it emphasizes the teaching process. The exploration of the teaching process is in the form of inquiry investigation (Chassels & Melville, 2009) and systematically through the observation of teaching (Fernandez, 2002).

Lesson Study is a continuation of collaborative teaching methods and has its own characteristics (Daipi, 2009). Lesson Study can enhance teachers' learning experience as well as improve their teaching. Teacher learning experiences include teachers' knowledge of the content of the lesson (content knowledge) and knowledge of teaching methods (pedagogical knowledge), which should be built and derived from observation and reflection activities of teaching practices (Dotger et al., 2012; Lewis, 2008; Post & Varoz, 2008). It also does not marginalize the importance of students' learning in the teaching process. The evaluation and reflection of each lesson is not only on teachers but also focuses on the development of student learning. Teachers observe learning ability and intelligence of students (Cheng & Yee, 2012; Lewis, 2008).

This helps teachers plan lessons carefully and meet the students' needs. In addition, the Lesson Study approach enhance creativity and critical thinking of trainee teachers (Ong et al., 2010), particularly when analyzing in-depth lessons, stimulating innovation, and reforming teaching and learning to find solutions to a problem and to expand understanding skills as well as the ability of teachers and students. Lesson Study can be implemented in various ways to suit the teachers, students, and the environment while meeting the criteria in Lesson Study cycle, as shown in Figure 1.

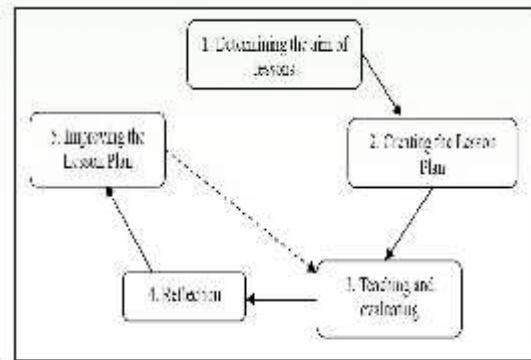

Figure 1. Lesson Study Cycle

Lesson Study implementation involves several teachers teaching sessions. Uniquely, the teachers work together to determine the objective of each teaching session. The first step in the Lesson Study involves teachers' discussion to determine appropriate learning objectives with targeted students. The teaching objective should be reasonable as students need to understand the concept and teach effectively. In the second step, teachers are asked to build a complete Lesson Plan for teaching together (Lewis, 2008; Post & Varoz, 2008; Teacher Education Division of the Ministry of Education, 2011) based on long-term judgments about student learning. Lesson Plan contains detailed information about different aspects of each lesson to be carried out (Fernandez, 2002).

Cooperation in the preparation of this Lesson Plan is expected to generate more thoughtful ideas. In the third step, a teacher will implement teaching in a simulation classroom based on the proposed Lesson Plan. Another teacher will monitor and evaluate the teaching (Lewis, 2008; Post & Varoz, 2008). Both are expected to understand the subject matter taught, as they will develop a Lesson Plan.

Therefore, the observation of the students responses is based on observations protocol then the results is recorded (Fernandez & Robinson, 2006). Deep observations will provide detailed feedback to stimulate the teacher to understand their students' learning better (Cheng & Yee, 2012). After completing the lesson, the teacher will reflect on the

teaching and learning and discuss the strengths and weaknesses of teaching during the process of teaching (Teacher Education Division of the Ministry of Education, 2011).

As such, the Lesson Plan can be improved based on the reflections, which can be used to identify weaknesses in the operation of learning (Marble, 2007). Next, the second lesson can follow the improved Lesson Plans. Indeed, during the second lesson, the teacher can try to modify the thoughts of students who previously adopted the wrong concept of learning (Cheng & Yee, 2012).

### 2.7 Reflective Practice

The most critical step in professional education is when students are able to transfer theory learned in the classroom into practice. Unfortunately, many students are unable to transfer and apply this knowledge successfully. Reflective practice forms the basis of deep learning from past experiences. It helps develop critical thinking, problem-solving, and self-directed and lifelong learning skills through gaining new understandings, new perspectives, and new alternatives for future experiences.

Using these phases to define how teachers think about their teaching, Loughran (1995) developed a framework to help make the invisible day to day reflective practices of teachers visible. The framework consists of “reflecting during the act of planning the lesson (anticipatory reflection), and during the actual teaching of the lesson (contemporaneous reflection), as well as after the lesson (retrospective reflection)” (Freese, 1999, p. 2).

Through this process, teacher educators can employ instructional strategies to train pre-service teachers to use reflection for asking the harder, deeper and more probing questions regarding practices and to analyze the effects on our classrooms and students. This level of reflection has been described as a complex and multidimensional search for understanding, drawing from the past and the present, with implications for the future (Smith, 2001).

Despite the development of a framework, a clear definition of reflective practice remains elusive (Ross, 2002). Freese (1999), a researcher working in the field of pre-service teacher education, supports making reflective practice more explicit by calling for a shared definition through modeling and conversation about reflection. She conceptualizes reflection for her students as: “The process of making sense of one’s experiences by deliberately and actively examining one’s thoughts and actions to arrive at new ways of understanding oneself as a teacher”. Duncan-Andrade (2005) describes the need for pre-service teachers to critically examine their actions in terms of the b of **emancipatory pedagogy**:

**engage, experience, empower and enact.** These critical learning activities ultimately encourage students to examine and act out their sense of agency, imagining the best possible teaching--what could happen, rather than what did happen (Davis, 1996; Smith, 2001).

### 3. RESULT

Reading comprehension is one of language competencies required in EFL lesson. However, there are constraining factors impeding primary students to comprehend English texts at hand. Most notably are their limited vocabularies, as well as their reading interests and skills. Such situation gives rise to our awareness of the importance of understanding students’ learning as the subject of teachers’ learning. Therefore, this presentation has two focuses. Firstly the authors discuss the way we, as EFL teacher group, grasp students’ obstacles by means of conducting a set of pre-test relating to reading comprehension. In doing so, we do pre-test to know at which level their reading comprehension ability was.

After reading text, students should answer the questions. The results provided initial evidence for grounding our lesson study practice. Accordingly, we then worked out reading techniques, for example we provide reading techniques, search the correct answer and advise the children to borrow English books from the library to increase their vocabulary.

To enhance our sense making of children’s progression, we conducted classroom observation of the designed lesson followed by post lesson discussion. In fact, it is not always the case that such attempts would achieve the expected improvement. Secondly, we share our lessons learned from our Lesson Study practice. As our group consists of teachers from different grades, Lesson Study provides platform for teachers’ collaboration and mutual learning. Hence, factors that might promote or inhibit teachers’ reflective practice will be discussed. Indeed, there is reciprocity between teaching and reflective practice from which we mirror our practice of improvement as to maintain that teaching is the learning profession.

**Table 1. Reading Comprehension Percentage**

Test	%				
	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>	6 <sup>th</sup>
1	75,5	77,9	<b>85,9</b>	81,0	75,4
2	81,2	84,7	96,1	81,5	75,0
3	83,1	88,	44,7	69,5	86,5
4	79,0	79,3	91,3	65,2	84,5
5	69,4	91,8	81,3	75,3	83,2
6	88,6	68,5	87	72,0	71,0
7	81,6	87,3	89,7	95,2	83,2
8	77,9	84,8	72,6	82,5	85,1
<b>Average</b>	<b>79,5</b>	<b>84,8</b>	<b>72,6</b>	<b>77,8</b>	<b>85,1</b>

The research was conducted on second to sixth grade. First grade was not recommended because their vocabularies was still very limited and reading comprehension still focused in the mother tongue ( Indonesian language ).

Table 1 showed that the percentage of reading comprehension still fluctuates. The results of research showed that second to fourth grade preferred to do the multiple choice. They did not really like an essay because they had difficulties related to their vocabulary they have. Beside that, fourth grade seen more easily doing the instruction text in multiple choice. In explaining an essays, they had difficulties in answering on the question “*why*” and “*how*” and “*what do you think*”, or getting the meaning of text or the stories they read. In addition , they preferred to answer a text related to theme they learned and they had difficulties in answering a text outside of the themes. When we evaluated, students had difficulties because there were different vocabularies they read and learned. After seeing the score of students of second to fourth grade, in certain days, teacher asked them to borrow English book from library to increase their vocabularies.

One of the most interesting time for second and third grade was story-telling. Story telling is a creative process in telling story so that children convey that those things were truly heaven. We used puppets, animal figure and pictures. The aim of using media activities (puppet or animal figure) is to help children understand the content of story in English by changing abstract to concrete. Primary school students are in the period of intellectual and stages of concrete operations

Fifth and sixth grade preferred a multiple choice to an essay. If we did discussion process in reading text, they would understand it more. For example, they read paragraph by paragraph, in every paragraph teacher asked some stimulus questions and they answered them. So that students will be more understand the contents of the text. Besides, due to the process of discussion students become more open or eager to ask about some vocabularies that they did not understand so they had meaningful discussion.

Some factors that affect the children’s interesting of reading are:

- 1) Teacher  
Every teacher has a their own style of teaching. It can reflected in the time when they are teaching. influenced by his own styles of teaching, concepts of psychology they used, and the curriculum implemented
- 2) Student  
Every student have different kind of skills and personality. Student’s skills are potential to be developed or they can grow it while they study.
- 3) Environment

The environment can be positive if it can give impetus and stimulus for children to do good things.

- 4) Appreciation  
The appreciation for students is one of many efforts can teachers give, with the hope of interest and enthusiastic students in learning especially understand reading always preserved.

After doing evaluation we can know the competence of students and as teacher, we can evaluate our teaching styles. They are good for teachers and students.

#### 4. CONCLUSIONS

- 1) Students can get the meaning of the text reading, although there are several difficulties related to the understanding of the vocabulary , interest in reading, ability in understanding and the attitude of reading. Second and third grade needed pictures, body gestures to understand them.
- 2) Fourth to sixth grade had a better understanding to the contents of reading through the process of discussions with a stimulus questions about the contents of reading every paragraph using “WH” questions. But, they still have difficulties in answering questions by writing.
- 3) Type of text reading also affect the achievement or competence of students. If the reading text in accordance with the theme of which are being studied, children would have the interest in reading .
- 4) If they see or read a text outside the theme, they have anxiety, perception that it would be hard .
- 5) Teachers needed to be someone who capable to propell and motivate students so that they would have high reading motivations.
- 6) Teacher could give guidelines through questions that could give make the willingness of students to improve their competence. Teachers could responds positively to reading activities that children do. We could provide the opportunity to convey the outcomes of their reading comprehension.

hadi\_suwono@yahoo.com

**Abstract:** Equality advances in science and the development of nations in the world becomes a challenge to face the 21<sup>st</sup> Century. One of the components of life skills that are important in life is a 21<sup>st</sup> century scientific literacy. Scientific literacy is the ability to combine science and technique to advance the social and cultural life, as well as putting science and technology in modern life. Scientific literacy of students can be improved by developing new learning methods. This study will introduce a new learning method called *Terjun Tulis Saji* (TTS). TTS is a modification of the Think Talk Write (TTW) that was initiated by Huinker and Laughlin in 1996. TTW needs to be modified so that students can make the science processes more meaningful. TTS invites students to make observations, write, and present the results of his writings. At the stage of *Terjun* (observe) the students make observations (see, read, and hear), and was led to make inquiries so that it falls more focused activities. *Tulis* (write) is the activity in which students will be looking for answers to their questions by way of associating the information from various sources, and write an article in the form of a newspaper article. During *Saji* (present), students present the results of writings by utilizing social media *facebook* as a medium of learning. This study is a Lesson Study (LS)-based action research that were performed in Class X-MIA3 students of SMAK Kolese Santo Yusup Malang-Indonesia for 4 open lessons. The action involving the LS team consists of 7 people. This study provides valuable input for improving the professionalism of teachers and students' learning process. Inputs from the LS team include improving learning lesson plan, instructional media, reference sources (web address or an online journal for students), teachers accommodate students' learning techniques, the use of social media *facebook* and improvement of assessment rubric for scientific literacy. Results showed improvement of the learning process (preparation of lesson plans, ways in helping students learn, assessment procedures) and biology learning outcomes by increasing the scientific literacy of students.

**Keywords:** action research, lesson study, scientific literacy, *Terjun Tulis Saji* (TTS)

### 1 INTRODUCTION

Life skills to be one important aspect of the curriculum that was developed in 2013. *Lembaga Penjaminan Mutu Pendidikan (LPM)* states that the ATCS (Assessment and Teaching for 21<sup>st</sup> Century Skills) concluded four major issues related to 21<sup>st</sup> century skills which are a way of thinking, working, working tools, and life proficiency. This way of thinking include creativity, critical thinking, problem solving, decision making, and learning. The workings include communication and collaboration. Tools for working include information and communication technology (ICT) and information literacy (Trisdiono, 2013). The same aspects of the paradigm of national education as written on the 21<sup>st</sup> Century Partnership Learning Framework, that the

competence and/or skills to be possessed by the human resources of the 21<sup>st</sup> Century: the ability of critical thinking and problem solving, the ability to communicate and work together, the ability to communicate and collaboration, the ability to create and update, information and communication technology literacy, contextual learning ability, and media literacy information.

Information literacy an important part in the education of the 21<sup>st</sup> Century in line with the rapid development of science and technology, because of the nature and practice of science affect the social, economic, and political (Hurd, 1998). Further it was explained that scientific literacy can combine science and technique to advance the social and cultural life, as well as capable of putting science and technology in modern life. The implication is that scientific

literacy would urge people to be socially responsible and competent as citizens. Scientific literacy is seen as a social competence necessary for rational thinking about science in relation to political, economic, social, issues that arise in life. Characteristics of scientific literacy needs to be taught where the students more involved in learning to solve problems, conduct investigations, or develop a specific project. Laboratory activities and supported the activities went to the field to find the data will bring more students understand the concepts of science and its application in society (Hurd, 1998).

Scientific literacy of students needs to be improved to accommodate students' learning strategies. The lesson activities are designed with the modification of learning strategies that have been used in the classroom. Learning strategies that can be modified is Think Talk Write (TTW). TTW is one of the learning strategies implemented in order to achieve the learning objectives with precise through the process of thinking, speaking and writing. This learning model is introduced in the article entitled Talk Your Way Into Writing, written by Huinker and Laughlin in 1996. The process of learning in the model consists of three steps, namely Think, Talk, and Write (Huinker, 1996). Learning TTW can be one of the learning activities that can develop scientific literacy skills which can be seen from the indicators that apply understanding of concepts and to consider solutions in problem solving. Think and write down the results of his thinking then discuss those in class is one important aspect of scientific literacy, where students will be trained to evaluate ideas based on evidence and to apply conclusions from such thinking (Shwartz, 2006). To improve scientific literacy, then TTW should be modified so that more students be able to explore their ideas from a variety of sources.

Modification is done by introducing learning strategies TTS (*Terjun Tulis Saji*). TTS is a learning model of learning in which students conduct *Terjun* or observe (see, read and hear), so in this activity students will think (Think) as in TTW, but students are also expected to find the problem and ask questions related to issues there and do a search for information. Resources can be searched by students through direct interviews, experiments, reading textbooks, or search the internet. *Tulis* is an activity in which students will seek answers to their questions in a way associate the information from various sources. At this writing activity, students will write an article in the form of newspaper articles. Newspaper articles is selected so that students can pour their association results into a written form. During this activity students can conduct discussions with peers and teachers. *Tulis* activities is similar to activities of Write in TTW. The last activity of the student is *Saji*, where students present the results of

his writings to be read and commented on by friends and teachers. This presentation is done by utilizing social media *facebook* as a medium of learning. *Facebook* will allow students to be able to access the writings anytime and anywhere, as well as other students' and teachers' comments can also be read.

The effectiveness of the application of the TTS as one of the TTW modification needs to be studied using LS as a means of control. So it can be monitored successful learning strategies, student activities while learning, it can also provide feedback to the teacher related to the learning processes.

## 2 PARTICIPANTS

This research was conducted in class X MIA 3 SMAK Kolese Santo Yusup Malang-Indonesia, amounting to 44 students with a Biology lesson 2. LS team consists of 7 people, where there is one Professor as a lecturer, two new junior teachers who has been teaching for 3 years, 1 model teacher and 3 master students in the Department of Biology Education UM. All team members have been introduced in the LS theory about this and have known TTS and know TTW well.

## 3 RESEARCH PROCEDURE

This study is an action research-based LS conducted on the students of Class X MIA 3 SMAK Kolese Santo Yusup Malang-Indonesia for 4 open class the action involving the LS team consists of 7 people. The following cycles were performed LS (Smith, 2010).

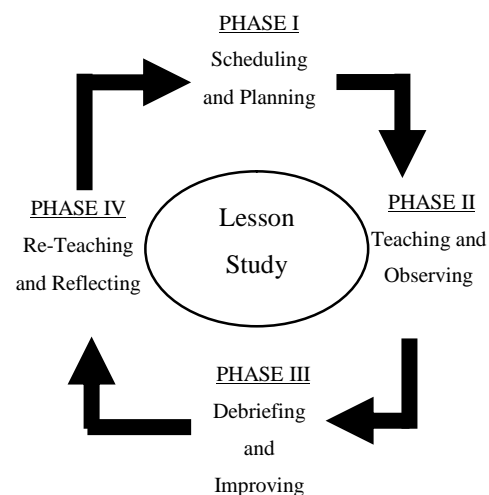

Figure 1. The Cycle of Lesson Study (Smith, 2010)

During TTS students do learning activities in which students will observe (do lab work, reading text books, interviews, reading the online literature), write, and present the results of the writing on the

*facebook* group. Students are grouped into discussion groups, and the teacher gives feedback on the discussion and the results of papers have been uploaded in the *facebook* group.

All activities are carried out by a team of students discussed the LS, and then modeled by teachers and observed by the other team members which further reflected the results of his study to see how far the TTS can be used to improve the scientific literacy of students.

#### 4 DATA AND DATA ANALYSIS

The data used is the improvement of the learning process (preparation of lesson plans and how to teach) and learning outcomes include increased scientific literacy (the assessment process). LS team input for improvement include improving learning a lesson, instructional media, reference sources (web address or an online journal of teachers to students), teachers accommodate students' learning techniques, the use of social media *facebook* and improvement assessment rubric for scientific literacy.

TTS learning process that learned through the LS tested using observations and field notes of the observer in the classroom, while the students' scientific literacy data is obtained from the writing of the article being evaluated using the scientific literacy assessment rubric.

Data obtained from observation sheets and field notes were analyzed using data reduction and conclusions in the form of qualitative descriptive. Scientific literacy data of students was analyzed using a minimum value of student mastery of 75%. Value of minimum completeness follow a predetermined minimum value school.

#### 5. FINDINGS

Observations and reflections of LS team showed that scientific literacy skills during the learning process can be enhanced through TTS. All of the observers stated that the learning process can be applied through TTS to teach Biology subjects of class X with a different formula that trains students to hone his writing skills.

The process of learning that encourage students to read a lot of literature is categorized as a good learning process to train the scientific literacy of students according to the results of observations of LS team. The results reflect what the LS team mentioned that there are some improvements to be done so that the learning process is better through TTS.

Based on field notes and observations, it appears that when the TTS was first implemented, a few students do not fully focus on learning techniques

performed. This is apparent by the record of one observer Egi (February 12<sup>nd</sup>, 2014):

*'There is a student who is passive and some cool students chatting outside the material discussed, David stunned and can not give a conclusion of the learning activities today.'*

The above note shows that students are not familiar with TTS and the teacher have not been able to explain in detail the techniques that should be learned to students. The student looked confused at the time of writing the article. It becomes reasonable because previously students had not been trained to write newspaper articles.

In the next lesson the students had been more focused and no students were filmed or not doing anything. One solution that emerged from previous reflections have been able to be accommodated by teacher, the teacher during learning process continues to go around from one group to another group to anticipate if there are things that need to be asked by students, so that students are no longer stunned and increasingly focus on doing their task.

Ira and Herawati as observers also agree that:

*'learning conditions are generally going well and according to lesson plans, activities and group discussions in class discussion that has been properly conditioned, the teacher is always over and check the condition of the students during the learning activities, students are quite active in the group discussions as well as discussions of class discussion.'*

(taken from the reflection Ira and Herawati, February 13<sup>rd</sup>, 2014).

These notes provide meaningful input for the learning process in the classroom for the better. This can be seen in further learning is seen that each student got busy and focused with the writing of the article, the students began to run the learning activities in accordance with the instructions given by the teacher. Learning takes place when conditions indicate each student individually to create articles, classes for each student sits quietly busy with their respective task.

These improvements can not be separated from the input that appears on previous learning. TTS strategy can make learning more interesting than learning activities that have been carried out by students. This statement is in line with the notes written by the observer as follows:

*'The lesson that can be copied from the teacher summarizes the current model is a more old-fashioned look, making the article may be one strategy to make*

*students think creatively because there are opinions of the students in it.*  
(taken from the reflection Egi, February 18<sup>th</sup>, 2014).

The planning of future learning for the better, this is reflected in the students' learning process as noted by Ira following:

*'All the students are really active to improve the article, and complete the task on time. The student was very excited and interested in making an interesting article, and funny looks from their uniqueness gives the title, looking for references to find journal articles or related topics covered in the newspaper article that they make.'*  
(taken from the reflection Ira, February 20<sup>th</sup>, 2014).

The results showed that the reflection on the learning plan have been planned better so that the processes that take place in the classroom to be better than ever before. It also reflects that the teacher may or can provide direction in a systematic way and uses a light-weight language that is easily understood by students. Teachers wa also seen to be more relaxed than ever before, but remains firmly so that the goal can be achieved with good learning. Before the teacher made improvement and reflection on the learning process, there are still many students who are confused and dazed but after being given a lot of input, the students become work quickly, efficiently, and well-organized.

Improvements also appears on the learning steps *Terjun*, where technically, when students find literature online frequent internet connection problems so it appears that the teacher provides the input offline literature such as e-books. At the time of *Tulis*, the input appears that students should make the framework in advance using the questions as a guide. As well, when *Saji*, it is better to limit the number of newspaper articles pages so that every student has the same opportunity to write and read.

The conclusion that can be drawn from the results of observation and reflection during learning is TTS can challenge students to do the work of making a newspaper article so more students read literature, to think more of his opinions, more writing and more convey ideas. Students also seem to work hard doing its part as well as the author of the article information seekers.

The following syntax TTS learning that has been perfected in accordance with the input LS team.

Table 1 TTS Learning Syntax

Activity	Student Activities	Teacher Facilities
<i>Terjun</i>	<ol style="list-style-type: none"> <li>1. Reading textbooks.</li> <li>2. Viewing the contents of a text book.</li> <li>3. Creating questions about problems that arise.</li> <li>4. Seeking information.                             <ol style="list-style-type: none"> <li>a. Other reference sources.</li> <li>b. Interview (speakers).</li> <li>c. Experimental (laboratory).</li> </ol> </li> </ol>	<ol style="list-style-type: none"> <li>1. Gives information on the topic of learning.</li> <li>2. Invites students to look for problems related to the topic of learning.</li> <li>3. Invites students to discuss the results of the plunge.</li> </ol>
<i>Tulis</i>	<ol style="list-style-type: none"> <li>1. Associating information obtained.</li> <li>2. Writing a reference source to the reference card.</li> <li>3. Discussing with friends and teachers.</li> <li>4. Writing a conclusion in the form of a newspaper article.</li> </ol>	<ol style="list-style-type: none"> <li>1. Invites students to associate information.</li> <li>2. Invites students to write a newspaper article.</li> <li>3. Observes student activities</li> </ol>
<i>Saji</i>	<ol style="list-style-type: none"> <li>1. Presenting newspaper articles in the media <i>facebook</i>.</li> <li>2. Mutually commenting on articles.</li> </ol>	<ol style="list-style-type: none"> <li>1. Provides a <i>facebook</i> group for the presentation of the article.</li> <li>2. Provides comments.</li> </ol>

Rubric assessment of scientific literacy is also changing during LS underway. Some things are improved in terms of picture details the assessment of students included in the article, there is not a final conclusion, and the relation of fact raised. Here is a repair section that is fixed for the LS process takes place.

Table 2. Scientific Literacy Assessment Rubric Beginning

Criteria	Skor	Explanation
Title	5	Title in accordance with the theme, informative, complete, consisting of short sentences and dense, interesting.
	3	Title in accordance with the theme, informative,

		complete, too long or too short.			demonstrates the ideas and views of the authors of the topics covered, showed no association with the idea of the possibilities of the current situation, please indicate which opinion is, do not indicate a problem solving.
	1	Title according to the theme, informative, incomplete, unattractive.			
Facts	30	This article demonstrates the present information which is supported by the fact, scientific studies, and contain clear information.			
	15	Article showed enough present information which is supported by the fact, scientific studies, and contain enough information.			
	10	Articles lacking shows present information which is supported by the fact, scientific studies, and contain enough information.			
	5	The article does not indicate present information which is supported by the fact, scientific studies, and contain information that is not clear.			
Idea (Opinion)	40	Article points out some of the ideas and views of the authors of the topics discussed, showing weak idea with possibilities of the current situation, shows that opinion is, indicate a problem solving.			
	30	Enough articles showing some of the ideas and views of the authors of the topics covered, enough to show the relationship of ideas with the possibilities of the current situation, please indicate which opinion for what it is, simply indicate a problem solving.			
	20	This article demonstrates the author's ideas and views on the topics discussed, has not show linkage with the idea of the possibilities of the current situation, please indicate which opinion is, do not indicate a problem solving.			
	10	This article			
			Writing Technical	10	Articles written in accordance with the provisions of which are: 1) containing a title, information, opinions, and conclusions; 2) do not contain any typos; 3) proportional; and 4) contain images / tables / graphs supporters.
				5	Articles written not in accordance with the provisions that: 1) contains the title is not yet complete, the information, opinions, and conclusions; 2) contains elements of typos; 3) proportional; and 4) does not contain images / tables / graphs supporters.
				1	Article writing is not in accordance with the provisions of which are: 1) does not contain a title, information, opinions, and conclusions; 2) often contain elements of typos; 3) disproportionate; and 4) does not contain images / tables / graphs supporters.
			Communicative	10	Articles written in good and right Indonesian and is in accordance with the enhanced spelling, sentence written attractive, and easy to understand
				8	The article has not been written in the good and right Indonesian language and is in accordance with the enhanced spelling, sentence written is quite interesting, and quite easy to understand.
				5	Articles are not written in the good and right Indonesian language and

		is in accordance with the enhanced spelling, sentence written unattractive and difficult to understand		scientific study, and contains information that is clear, is only equipped with a single image
Reference	5	Overall written sources used and listed in the article, there is no element had plagiarized other people.	40	This article demonstrates the present information which is supported by the fact (lab / reference sources / interviews), scientific study, and contains information that is clear, is not equipped with an image or a graph or table
	3	Not a whole written sources used and listed in the article, there is no element had plagiarized other people.		
	1	The source used is not written and included in the article, there are trace elements have others.	40	Article showed enough present information which is supported by the fact (lab / reference sources / interviews), scientific study, and contains enough information, supplemented with pictures or graphs or tables

Scientific literacy assessment rubric in Table 2 above have not shown a detailed account of the complexity of students' writing in a newspaper article as well as the diversity of ideas generated. LS team is able to provide suggestions and ideas to supplement aspects that scientific literacy so that the value of the article was finally able to reflect the results of the students' learning process through TTS. Here is a scientific literacy assessment rubric that has been repaired and used as a rubric for further assessment.

Table 3 Scientific Literacy Assessment Rubric Final

Criteria	Skor	Explanation		
Title	5	Title in accordance with the theme, informative, complete, consisting of short sentences and a solid, attractive		
	3	Title in accordance with the theme, less attractive, too long or too short		
Facts	50	This article demonstrates the present information which is supported by the fact (lab / reference sources / interviews), scientific study, and contains information that is clear, complete with pictures or graphs or tables	30	Article showed enough present information which is supported by the fact (lab / reference sources / interviews), scientific study, and contains enough information, not provided with pictures or graphs or tables
			30	Article shows the overall facts of information derived from the guidebook, complete with pictures or graphs or tables
	45	This article demonstrates the present information which is supported by the fact (lab / reference sources / interviews),	25	Article shows the overall facts of information originating from one internet source, supplemented with pictures or graphs or tables
			20	Article shows the overall facts of information derived from the Internet or from a single source

		guide book, is not equipped with an image		authors have not shown any conclusions
	15	Articles lacking shows present information which is supported by the fact both of guidebooks and other sources, it contains enough information, do not have a picture		10 Article only shows the author's conclusions are related to the overall facts obtained
	10	The article does not indicate present information which is supported by the fact, scientific studies, and contain information that is not clear, the picture does not fit the topic		5 Article shows that opinion is not related to the facts obtained
	5	The article does not indicate present information which is supported by the fact, contain information that is not clear and is not appropriate to the topic, not with pictures	Communicative	5 Articles written in accordance with the provisions that: 1) contains the title, facts, opinions; 2) do not contain any typos; 3) proportional; and 4) contain images / tables / graphs supporting
Idea (Opinion)	30	This article demonstrates some of the author's opinion on the facts obtained from various sources, the relationship between opinion with facts obtained, indicate the authors' conclusion		3 Article writing is not in accordance with the provisions of (one of the terms are not met), namely: 1) contains the title, facts, opinions; 2) do not contain any typos; 3) proportional; and 4) contain images / tables / graphs supporting
	25	This article demonstrates some of the author's opinion on the facts obtained from various sources, the relationship between opinion with facts obtained, the authors have not shown any conclusions		1 Article writing is not in accordance with the provisions of (two or more provisions are not met), namely: 1) contains the title, facts, opinions; 2) do not contain any typos; 3) proportional; and 4) contain images / tables / graphs supporting

<b>Average (%)</b>		<b>45</b>	<b>77</b>

Improvement of scientific literacy assessment rubric indicates that LS is not only improve the learning process, but also improve the assessment process so that the end result may be a reflection of the learning process that takes place.

Increased literacy of students has increased quite good during the learning process. It can be shown from the data in Table 4 below. Improved writing articles as a result of learning TTS tune with the learning process improvement experienced by the students. Writing a newspaper article can be a reflection that the students read literature well, doing lab work well, express their opinions, and summed up the results of his study. The increase also reflects the value of the scientific literacy of students understand the directions given by the teacher. In addition, the increase in this value also shows that take place in a conducive learning process.

Table 4 Scientific Literacy Assessment

No	Students Name	Article	
		Pre	Post
1	Albertus Emilio K	44	84
2	Alicia Alberta	46	93
3	Alyssa Geraldine	42	93

14	Eric Hansen Irawan	44	66
15	Felicia Aileen Genial	46	95
16	Florentina Evelyn P	41	68

Scientific literacy assessment conducted before students are given learning TTS and after students are given learning TTS. Based on the table above, an increase in the average value of the scientific literacy of 32%. This increase looks very well be due to the new students first wrote newspaper articles and first time doing crossword learning strategies. Average increase also shows that through LS, the value of scientific literacy of students can be improved.

## 6. DISCUSSION

The above findings indicate that the LS is able to improve the learning process (preparation of lesson plans and how to teach) and learning outcomes include increased scientific literacy (the assessment process). LS was able to form a collaborative team focused on making a formula learned that the learning objectives achieved. Required to learn the right formula for the TTS is a new strategy that is raised, the result of the modification of TTW. LS to be a means to see the extent to which TTS can be applied and can improve scientific literacy.

LS were becoming more student centered as teacher began to encourage students to share, discuss, and debate their solutions and errors. Teachers began to develop a shared vision of what good teaching looks like and teaching began to develop greater consistency throughout school (Stepanek, 2007).

LS-based TTS creates a more challenging learning environment for students and experienced improvement from one meeting to another meeting. Syntax of TTS also be more appropriate, for example when *Terjun*, the syntax for the better with the feedback that better teachers provide resources in the form of an e-book offline so that students do not need to be difficult when there is a problem with internet connection. According to Cerbin (2011) LS makes the otherwise mostly private domain of the classroom a site for systematic study and knowledge building.

Further it can be explained that as a new learning strategy, TTS requires LS to improve the learning stages. Cerbin (2011) states that LS try to improve teachers practice in a multitude ways such as by updating their courses and materials, adopting new teaching practices, creating new assignments, and using alternative methods to evaluate students. LS instructors collectively can examine their goals for student learning, discuss student difficulties with the subject matter, explore how instructional strategies can support specific forms of learning, create a class lesson intended to bring learning goals to life, investigate how students learner do not learn from the lesson, observe students as they react and respond to classroom instruction, analyze multiple sources of evidence about student learning, and use evidence of student learning to revise teaching.

This study also shows that the TTS is able to improve the learning of scientific literacy of students. TTS is able to deliver better results because in the learning step involves stages that are able to support this increased scientific literacy. Stages in learning TTS was observed (see, read and hear), in which the students will be trained for the stage of searching for information that triggers any questions. The question that arises is of course expect answers so that students will return to dig up information as a result of asking. Excavation continued information can be made with the experimental observation of such bacterial colonies and observations protists also through the collection of information through the internet. This kind of activity will encourage students to gather facts more than just writing in the regular student worksheet. The most important thing is to increase scientific literacy writing activities, through student can write their ideas and observations that can be passed on to others and can tell a phenomenon that occurs, the problem that is found, it describes and explains the observations (either from reading, viewing, and listening), and explain the data through the evidence found.

Phases of TTS activity are in accordance with the words of Century (2001) who wrote that research have examined various language-based strategies for development of scientific understanding that

begins with direct experience. The techniques include:

1. Reading from scientific journals, the popular press, and the internet;
2. Writing of individual student scientific journals with reflections on classroom or laboratory experiences;
3. Collaborative writing about the scientific work of a group of students;
4. Laboratory notebooks using templates that guide student thinking and elicit critical evaluation of evidence that supports their own or others' science claims;
5. Informal discourse among students for the peer exploration of original ideas;
6. Formal individual or group presentations of well-organized and well-defended thinking; and
7. Discussion, questioning, and debate that stimulates clarification of thinking and simulates the discourse that occurs in the scientific community.

Communication skills is important in 21<sup>st</sup> Century skills, where students practice their knowledge by informing others about what they do and develop effective explanations, construct and maintain the opinion, and provide appropriate responses to critical comments about their explanation.

## 7 CONCLUSIONS

The results of this study indicate that a new learning strategy drawn up by the teacher as an innovation to accommodate the students' life skills is by means of LS. Learning TTS which is a result of the new strategy be taught to students using the LS will get the right formula in terms of both the learning process and also of the assessment of scientific literacy.

TTS-based LS is applied to the subjects of Biology Class X is able to provide improvements in measures of learning and scientific literacy assessment rubric so that learning can take place better.

## 8 ACKNOWLEDGEMENTS

I would like to thankfull SMAK Kolese Santo Yusup Malang-Indonesia, which has provided the opportunity to conduct this study. I would also like to thank Prof. Dra. Herawati Susilo, M.Sc, Ph.D and Dr. Hadi Suwono, M.Si who had guided during the process of this study.

## The Indonesian 2013 Curriculum Implementation: Understanding and Barriers

Tuti Afiatun<sup>1</sup>

, <sup>1</sup>*Indonesia University of Education, Bandung, Indonesia*  
*brebestea@gmail.com*

**Abstract:** Teacher plays a crucial role in the process of curriculum implementation. This study was conducted to investigate the teacher's understanding about the Indonesian 2013 curriculum and the teacher's barriers in implementing the current curriculum. This investigation involved one female English teacher who works for a secondary Islamic boarding school in Subang, West Java, to be the subject of this study. Employing case study as its research design, this study used observation and semi-structured interview as its main data collection means. The finding of this study reveals that the teacher had well-understanding about the demand of the 2013 curriculum. It was reflected from her argument which stated that the 2013 curriculum is the development of the previous curriculum. The 2013 demands the teacher to be the facilitator, not to be the one who knows everything, because the curriculum clearly requires the students-centered should be applied in the process of teaching and learning activities. Even though the teacher possessed well-understanding about the curriculum requirements, the teacher still found some barriers in meeting the ideal implementation as mandated by the 2013 curriculum. Some of the teacher's obstacles in implementing the 2013 curriculum are having big class, over workload, and insufficient learning resources.

**Keywords:** Indonesian 2013 curriculum, implementation, teachers' understanding and barriers

### 1 INTRODUCTION

The development of educational needs always opens possibility to reform the existing curriculum. Richard (2001:27) stated that the change of need in the field of education is one of the factors which influence the need to change or reform the existing curriculum. Guskey (2002) and Villegas-Reimers (2003) commented that curriculum transformation is also affected by the changes of political as well as educational paradigm. In relation with this case, Indonesian government through the Ministry of National Education has launched new curriculum, namely the 2013 curriculum. Syahmadi (2014) noted that this new curriculum is believed as one of the Indonesian government's continuation steps to improve the previous curricula such as KBK 2004 (Competence-based curriculum 2004) and KTSP 2006 (School-based Curriculum 2006). This idea is supported by the statement of Indonesian minister of education and culture, M. Nuh as cited in Alwasilah (2013) who said that the 2013 curriculum is essentially an improvement of preceding curricula. M. Nuh emphasized that the 2013 curriculum really promotes character education and critical as well as creative thinking culture to cultivate the betterment of quality of Indonesian education.

The settled curriculum will never be successfully implemented if the curriculum implementers do not

have sufficient knowledge about the curriculum itself both conceptually and technically (Durlak&Dupre, 2008; Mafora&Phorabatho, 2013). One of the curriculum implementers is the teacher. Richard (2001) argued that the teacher holds a vital role in succeeding the curriculum implementation. In his view, teacher is the one who interprets the instructional planning stated in the curriculum into sets of teaching and learning activities. Richard (2001) further believed that the quality level of teachers' ability in specifying the instructional planning stated in the curriculum is affected by several pedagogical factors such as teaching experience, skills, training and qualifications, morale and motivation, teaching style, and beliefs and principles. Specifically, Marsh and Willis (2007) asserted that the success of particular curriculum implementation in the process of teaching and learning activities relies on the teacher's understanding about the curriculum itself. The teacher's understanding about the curriculum will affect the teacher's choice on teaching approaches and learning materials. When the teacher possesses well-understanding of the curriculum demand, he/she can provide learners' learning outcome as mandated by the curriculum. Thus, there is a wide possibility to find different curriculum interpretation among teachers since they have diverse pedagogical competences as well as curriculum understanding.

Research on the area of curriculum implementation has revealed that the curriculum implementation has various problems in practice, even though the curriculum has been planned and designed as perfect as possible. Mafora and Phorabatho (2013) have investigated the implementation of new curriculum in South Africa. This research studied the perceptions and experiences of School Management Teams regarding their roles in managing the implementation of National Curriculum Statement (NCS) as curriculum change. Using multi-site case study, principles of secondary schools in the Moretele Area Office, North West Province were selected purposively to be the participant of this study. The finding of this study reported that most of the school principals have inadequate understanding of their roles in implementing new curriculum and also have difficulties in managing the implementation NCS. Among those difficulties are lack of training, lack of relevant resources, lack of district office support, and unreasonable workload for principals.

In the context of the implementation of the Indonesian 2013 curriculum, some research also reported that the implementation of this recent curriculum cannot be free of difficulties in reaching the ideal implementation. Muniroh (2014) has studied seven English junior high school teachers in Malang city. This study informed that most of the teachers had lack of understanding on the concept and implementation of scientific approach. It is also reported that the teachers found obstacles in assessing students' manner competence. With the same notion, Shofiya (2013) conducted a research to dig the teachers' responses toward 2013 curriculum. Using survey method, this study involved sixty senior high school teachers to be its research respondents. The finding of this study informed that most of the teachers had positive response to the 2013 curriculum. They stated that implementing the 2013 curriculum was not a big problem for them. However, students' assessment became the most complicated issue to implement for the teachers.

Seeing the fact that the implementation of new curriculum cannot be far away from barriers, this current study would like to investigate the English teacher's understanding and barriers in the implementation of the Indonesian 2013 curriculum, particularly in the context of English subject. It is expected that the finding of this study could enrich the information about the teacher's understanding and difficulties in implementing the new curriculum which has been promoted by the previous research. Hopefully, this few information as revealed in the finding of this present study could be a valuable resources for the school management boards, English education practitioners, and English curriculum developers to develop some alternatives in coping with the problems of Indonesian 2013 curriculum

implementation. It is also hoped that the finding of this study is useful to generate other fresh research ideas on the same topic discussed in this study for revealing some other precious information to succeed the implementation of the Indonesian 2013 curriculum.

## 1.1 Research Question

This study was conducted to answer these following research questions:

1. What is the English teacher's understanding about Indonesian 2013 curriculum?
2. What are the English teacher's barriers in implementing Indonesian 2013 curriculum in the context of English subject?

## 2 RESEARCH METHODOLOGY

This study aims to respond the formulated research questions. It was a qualitative study in design. Since this study tried to uncover the English teacher's understanding about Indonesian 2013 curriculum and their barriers in implementing the current curriculum, a single case study was applied as its research approach. A case study is defined as “empirical inquiry that investigates a contemporary phenomenon within its real life context” (Yin, 2011, p. 13). Nunan (1992) supported that single case study is commonly used to explore a single case or single instance. Particularly, Heigham and Croker (2009) mentioned that single case study generally describes intrinsically the case itself. Thus, “there is no attempt at all to generalize from the case being studied, compare it to other cases, or claim that it illustrates a problem common to other, similar cases” (p. 69-70).

### 2.1 Research Site and Participant

This study was carried out in an Islamic Boarding Junior High School in Subang, West Java. This school was selected to be the research site of this study mainly because of the researcher's convenience to access this educational institution. Since the case addressed in this study was the implementation 2013 curriculum in the field of English subject, a female English teacher participated to be the research participant of this study. Bogdan and Biklen (1992) agreed that an individual can be a research subject in case study. Moreover, Mackey and Gass (2005) contended that case study

allows taking single individual to be the research subject. They, in further, said that small group of research subject enable the study to provide detail description of specific issues being investigated.

The research participant was selected because of two considerations. First, she had possessed more than two years experience of teaching English as a foreign language. Second, she had experiences in implementing KTSP curriculum and also 2013 curriculum. However, her willingness to be the subject of this study was actually the main consideration above other considerations of research participant selection.

## 2.2 Instruments

Interview and observation became the two main research instruments for collecting the needed data regarding the issues addressed in the formulated research questions. Interview was used by to gain information about the English teacher's understanding on 2013 curriculum. In addition, interview was also employed to clarify some unclear points found in the observation. The interview process was conducted by hiring some guiding questions which need direct response from the research participant. Meanwhile, direct observation was occupied to elicit the data on how the research participant implement 2013 curriculum in real practices of English language teaching and learning. A field note was used to record the important facts which relate to the topic being studied. The information got from both interview and observation was always crosschecked to reveal trustable data and coherent justification as well as increase its validity (Creswell: 2009, p.191; Fraenkel and Miller: 2007, p.594).

## 2.3 Data Analisis Technique

The collected data from interview and observation passed three major steps of data analysis process. The first step was transcribing. In this stage, the recorded data were transcribed, particularly the interview data. Meanwhile, transcribing the observation data was done by rewriting the important points which were recorded on the field note by using computer. Therefore, the information on the field note was easier to organize. The second step of data analysis was coding in which the data were categorized based on their characteristic similarity by putting a label on each category. Finally, the labeled data were interpreted for eliciting the general ideas to discuss which would be treated as the findings of this study.

## 3 FINDINGS AND DISCUSSION

The ideas generated from both the interview and observation are discussed under two major categories,

namely the English teacher's general understanding about Indonesian 2013 curriculum, and the English teacher's barriers in implementing Indonesian 2013 curriculum.

### 3.1 The English Teacher's General Understanding about Indonesian 2013 Curriculum

The information about the English teacher's general understanding about Indonesian 2013 curriculum was acquired mainly from interview. From the interview, it was revealed the research participant of this study showed her well-understanding on the case of general knowledge about Indonesian 2013 curriculum. All the data from interview indicated that the participant of this study highlighted three points which were being typical feature of Indonesian 2013 curriculum.

First, the participant of this study viewed that 2013 curriculum was basically not a new one, but the development of KTSP curriculum 2006.

*“...menurut saya, kurikulum 2013 itu bukan sesuatu yang baru, melainkan pengembangan dari KTSP 2006. Intinya mah sama saja. Hanya bedanya kurikulum 2013 lebih menekankan pada pengintegrasian nilai budi pekerti, pengetahuan, dan keterampilan dalam setiap pembelajaran. Ini yang tidak menonjol di KTSP 2006....”*

The interview excerpt above informed that the teacher assumed that there were no many differences between KTSP 2006 and 2013 curriculum. She mentioned that 2013 curriculum required the integration among the competence of skill, knowledge, and behavior in every teaching and learning process. This point was not emphasized in the KTSP 2006. This teacher's understanding is seemingly confirmed by Syamhadi (2014). Syamhadi pointed that 2013 curriculum requires the teaching and learning activities should not only focus on students' knowledge development which is usually textbook-based and teacher-centered in style, but also their characters and skills to implement the knowledge that the students have learned. It means 2013 curriculum actually desires teaching and learning activities are able to create active, meaningful, and respectful learning atmosphere. In this sense, the students are being the main actor of learning activities who love to explore particular knowledge and are skillful in implementing the obtained knowledge in real life context by taking high responsibility on every learning process they pass. This idea was supported by Suherdi (2012) who said that students' good character and behavior is also an indicator of successful education. In other words, it is expected that teaching and learning activities conducted in formal school are able

to produce knowledgeable individuals with high value of good behavioral personality.

Second, the participant of this study claimed that 2013 curriculum promoted students-centered learning activities. In this case, the teacher plays a role as facilitator who helps the students acquiring knowledge, not as a producer of knowledge.

*"...paham pembelajaran yang didengungkan oleh K13 kan scientific approach yang menuntut siswa aktif di setiap aktifitas belajar. Ini kan artinya guru bukan lagi subjek pembelajaran, melainkan murid. Fungsi guru lebih banyak ke fasilitator bukan orang yang segala tahu. Makanya guru harus lebih kreatif lagi dalam merancang pembelajaran agar murid mau mikir dan tidak terlalu bergantung pada guru. Ya... selain media dan strategi pembelajaran juga harus kreatif yah...."*

The teacher's response above indicates that the teacher had been really aware that 2013 curriculum demands activities-based learning, not content-based learning. It means the teaching and learning activities provide more spaces for students to learn and less space for the teacher to explain the learning materials a lot. This teacher's assumption goes in line with the statement of Hamied (2014) that there are two key attributes of the 2013 curriculum namely science-based and holistic. Science-based is defined as learning activities which involve students to think critically about the learning content that they discuss in the lesson. Meanwhile, holistic learning activities suggest that learning activities do not focus only on students' mastery of learning material concepts, but also should be integrated with other learning competence such knowledge implementation skills and social skills as well.

In order to support science-based learning environment, the teacher thought that she had to be able to equip herself with numerous teaching strategies as well as creativity to develop teaching and learning media. It is all needed to serve learning activities which is appropriate with the curriculum requirements and students' learning characteristics as well. Syahmadi (2013) also proposed the same ideas as the teacher's. He argued that the 2013 curriculum gives wide room for teachers to be a creative educator. It is purely because the 2013 curriculum yearns for meaningful and holistic learning which demand meaningful teaching media, meaningful learning sources, and authentic assessment. Thus, all learning activities should support students not to be a knowledgeable man only, but also a dexterous man as well.

Finally, the teacher admitted that the 2013 curriculum is the curriculum which really wants the teacher to be a progressive learner in term of teaching skills. She believed that being a facilitator for students as mandated by the 2013 curriculum is not only a matter of facilitating them with learning equipments,

but also a matter of guiding them to achieve the intended learning goals.

*".....menjadi fasilitator disini bukan berarti guru membiarkan murid belajar sendiri ya. Mencari sendirian tanpa arahan, kemudian gurunya enak-enakan menyuruh-nyuruh mereka lakukan ini, lakukan itu, dan sejenisnya. Tapi, justru ini menantang guru untuk terus menambah kapasitas pengetahuannya supaya ia bisa menjadi pembimbing murid untuk bisa memperoleh esensi dari setiap aktifitas belajar yang mereka lalui. Bagaimana bisa jadi pembimbing yang baik, kalau sendirinya cuma tahu sedikit tentang ilmunya? .....yang jelas, gurunya kudu mau terus belajar weh..."*

To be able to become a good learning guide for students, the teacher was really conscious that she needed to always upgrade her English subject knowledge as well as teaching skills. The improvement of teacher's professionalism capacity, in her opinion, was necessarily to do for being a good learning advisor for her students. Therefore, the teacher could be a trusted person in terms of English knowledge possession for the students to rely on whenever they find difficulties in overcoming their learning tasks. Here, it is clearly seen that the teacher has positive spirit to be a learner-teacher in doing her profession as an English teacher. This positive teacher's attitude is supported by Suherdi (2013) who stated that being a real teacher is actually being a lifelong learner. A good teacher is the one who is able to take something constructive to learn from every single process of teaching and learning activity he/she passes.

Those are the three general understandings about 2013 curriculum hold by the English teacher who becomes the participant of this study. It is clearly seen that the teacher seems having well-understanding about the 2013 curriculum. Even, she knows what needs to do to deal with the demands of the 2013 curriculum regarding to be a professional English teacher.

### **3.2 The English Teacher's General Understanding about Indonesian 2013 Curriculum**

Those are the three general understandings about 2013 curriculum.

Even though the teacher has well-understanding about the 2013 curriculum, it does not mean that she is free of barriers in implementing the curriculum. The data obtained from interview and observation evidently indicated that the teacher faces some problems to deal with along the process of implementing the 2013 curriculum. It is noted that, at least, there are three general obstacles felt by the teacher when implementing the 2013 curriculum,

namely big class, over workload, and learning resources deficiency.

Handling big class is seemingly being the main issue to be concerned by the teacher. The classes that the teacher handles have thirty up to thirty four students in general. This big number of students precludes the teacher to do authentic assessment holistically. She has difficulty in assessing students individually when the teaching and learning activities are running in the classroom.

*".....kelas besar itu hingga saat ini masih menjadi kesulitan yang paling saya rasakan. Karena, K13 menghendaki authentic assessment dalam setiap pembelajaran yang berlangsung. Tapi bagiku masih agak sulit untuk melakukan authentic assessment secara sempurna kepada setiap individu yang ada di ruang kelas....."*

In addition, big class still also becomes the major problems in giving more English exposures to the students. The teacher wants more English activities which require students to get involved actively on it, but she does not have much time to explore students' English performance. This problem, more or less, happens because there is no balance between the provided time and the number of students. However, the teacher said that big class would be no longer her major problems in performing ideal assessment as required by the curriculum as long as it is supported with 'normal' workload.

Over workload is then being the second teacher's barrier of having ideal implementation of the 2013 curriculum. The teacher revealed that she had to teach 24 hours plus four hours extra classes for national examination preparation in a week. The school where the teacher works applies different system from other schools. It has national examination preparation for nine graders earlier than other schools generally do. The program of national examination preparation is usually done since the beginning of school academic year. This preparation program is usually conducted at 1 PM until 3 PM from Monday to Friday. Therefore, the regular class is organized only up to 12 PM.

*".....saya harus ngajar 24 jam seminggu. Belum ditambah 4 jam pemantapan kelas 9 sore harinya. Jujur, jam ngajar ini kebanyakan bagi saya. Terlebih, kalau saya dilibatkan dalam kepanitiaan suatu kegiatan sekolah. Hampir habislah waktuku untuk mengajar dan mengurus hal-hal lain sampe sore. Sebetulnya, saya ingin mengkreasikan metode dan media pengajaran. Tapi, apalah daya... keinginan tidak selamanya mulus terlaksana. Hasilnya, yaaaa, seperti yang kamu lihat, hanya sebatas yang saya mampu lakukan. Semaksimal dan sebisa saya....."*

It can be seen that over workload affects the teacher's work quality. Actually, she has strong desire to be maximal in her teaching performance, but the reality does not provide energy to accomplish it. More than 24 teaching-hours have forced her to have lesser

time for preparing and designing various teaching methodologies which fit with the students' learning needs. However, it does not mean that the teacher performs teaching and learning activities monotonously in the classroom. There were some variations of teaching methods and learning activities, but not really distinctive.

Furthermore, the teacher also complains on the lack of learning resources for students. She informed that the boarding system does not allow students to access internet. The internet can be accessed by the students only when they study ICT subject. This condition is worsen by the fact that the students only have one English handbook and the library provides limited numbers of English textbooks or other relevant English books which are needed by the students. The teacher feels that this kind of situation sometimes becomes the students' main reason for not being a resourceful learner.

*".....karena sekolah ini boarding, masalah lain yang sedikit menghambat pelaksanaan scientific approach itu ketidakbisaan murid untuk mengakses internet setiap saat. Ga apa-apa sih ga pake internet juga, asal ada referensi-referensi buku yang bisa dipakai murid. Tapi nyatanya, jumlah sumber belajar bahasa Inggris di perpustakaan juga terbatas. Yaaa ambil positifnya aja sih. Jadi, saya bisa mengeksplorasi kemampuan bahasa Inggris anak-anak lewat sumber belajar lain, selain buku, yang ada dilingkungan sekolah....."*

It can be seen that the teacher found the inadequacy of learning resources for enhancing the students' scientific ability. Nonetheless, this limitation did not make the teacher to have lesser energy and spirit to perform her best teaching performance. It precisely motivated the teacher to develop her creativity in teaching by involving whatsoever learning materials which could be found in the school environment. In short, the teacher seems to be able to cope with the problem of accessing internet and English textbooks inadequacy.

#### 4 CONCLUSION

The implementation of the 2013 curriculum is perceived positively by the teacher, especially the teacher who teach English subject in an Islamic Boarding Junior High School in Subang. The teacher shows her well-understanding about what to do with the 2013 curriculum, a curriculum in which she has just dealt with it for about five months. The teacher views that the 2013 curriculum is basically not a new curriculum. It is just the development of the previous curriculum namely KTSP 2006 curriculum. This curriculum, in the teacher's mind, promotes students-centered learning activity which should incorporate moral values on every learning activity done in the classroom. In this case, the teacher realizes that the

teacher' role in the process of teaching and learning activities is mainly to be a facilitator for students. It means the teacher is not a knowledge provider anymore for the students, but it has been shifted to be a students' learning advisor who help students to cope with learning difficulties.

Unfortunately, the possession of well-understanding about the curriculum does not make the teacher free of barriers in having ideal implementation of the 2013 curriculum. This study has highlighted three major problems of the 2013 curriculum implementation felt by the English teacher who has been the participant of this study. Those three major barriers are having big class, over workload, and learning resource inadequacy. However, these barriers seem not to decrease the teacher's motivation for always improving her teaching performance by being a creative teacher in handling with the insufficiency of supported learning and teaching facilities.

## Connecting Content and Children Contextual Life Within GagasCeria Preschool Classroom Activities

Annisa Nursofia Fazrin<sup>1</sup>, Wilma Kailola<sup>2</sup> and Delila Saskia<sup>3</sup>

GagasCeria Preschool, Bandung - Indonesia

saquenas@yahoo.com<sup>1</sup>

wilmakailola@yahoo.com<sup>2</sup>

delila.saskia@yahoo.com<sup>3</sup>

**Abstract:** Preschool activities have to contribute to all aspect of development and provide the opportunities for children to learn easily about whole the world and their daily life. Children activities in preschool classroom have little benefits if the content is not connecting to the learner's daily life and meaningful for children. To support that opportunities, preschool teacher need to reflect the lesson regularly and design the activities carefully consider to these main point: the children, the purpose, the activities narrative, the classroom environment, and the materials. The authors would like to describe that Lesson Study process could brings out the progressive impact on teacher's depth reflection and better designing of children activities. The selection activity of this presentation purposed to build the children understanding on science theme and bring it in daily life scheme at GagasCeria preschool in Bandung – Indonesia.

**Keywords:** Preschool, contextual learning, teacher's reflection

### A. INTRODUCTION

GagasCeria preschool implements the thematic strategy to tell this concept the children. The thematic strategy was chosen because has several advantages, including child-centered, to give direct experience for children, combining some or even all development field (cognitive, language, motor, social and emotional) in accordance with children interest.

The character of preschool children in knowing and perceiving a thing or concept is through the activity that is contextual and matter to them. It is concerned with the theory of a pre Piaget when 2 -7 years children experienced pre-operational.

In this stage they already had mental representation and got a better consideration and able to use symbols (Boeree, 2005). Because of the implementation of the thematic approach in GagasCeria, the theme becomes a tool for dressing the knowledge concept and content that are contextual to be more attractive to be explored by children. Through the theme children are asked to conduct a study of the scientific unimaginitive and social awareness about phenomena in their area. The theme that is used in GagasCeria have a goal starts from knowing themselves and then to contribute to their environment. Theme will be clad in an interesting scenario as written by Sandra Rollins Hurley , Ph.D and Sally Blake Ph.D, in an article of *Animals and Occupations : Why Theme-Based Curricula*, early childhood education in the journal .

*"Almost every child care center and preschool has used a theme-based curriculum at one time or another. Thematic units are popular among young children and teachers alike. What many early childhood educators don't realize is that the use of thematic units provides an integrated approach to teaching and learning. Such an integrated approach is supported by research on how the brain works and how human beings learn. Ultimately, the use of thematic units helps young children achieve higher levels of learning. (Hurley and Blake, 2008)"*

#### 1. Wheel theme

In GagasCeria, the selection of theme depends on children interest and all things familiar with them. So does with the selection of topics on every single week. This happens when we choose wheel theme as one of ways to introduce the concept of science and technology on children. The consideration is because the objects that and how it works can be found in their environment and familiar in children everyday as on car, a bicycle, stairs , slide, etc. The topic that is discussed every single week always associated with a children interest and trend in the everyday life.

To make the concept of a wheel interesting for children, we designed a variety of activities that can be explored actively by children. Toys that are designed on this theme are car's

miniature; geometry block with the circle shaped side, square and triangular, etc. on track, experiments and moving objects with a wagon or trolley, dramatize as a wheel to understand the meaning of spin and rolling, etc. All playing activities expected to help children understand that wheels on objects they play has a spinning working principle and make it move faster.

## 2. The Finding: How lesson study cycle solve the problem

It is not easy to introduce the wheel theme for the teacher. The consistency of activities with the purpose of the theme must remain maintained by teachers. On the wheel theme usually teacher stuck on only introduce the concept of a kind of vehicle and its functions. So the purpose of theme to introduce the simple concept of science not delivered. On the theme, the goal is to build children understanding about the working principle of a wheel that rotates and rolling as well as to make people work easier. The conditions in instrument and environment class that less supportive on achieving the concept of the theme of it is very possible. Such as when teachers provide activities and instruments, the possibility is that the children are more interested to get to know different types of cars than the function of a wheel according to the form and its size. Guidance and response from teachers need to plan well so children have deep curiosity on the concept that appropriate to theme.

To know the education success of the theme, teachers agreed to do lesson study as an instrument for examining the effectiveness of the child in introducing the simple concept of a wheel. Lesson study on the wheel is made to check activity at the age of three classes for three days in a row.

### 2.1. Learning process at first class

In planning the lesson study in first class, we and the team design an activity in form of story that a problem as an activity prologue and also provocation activities for children do observations on the wheel.

The story begins by presenting provocation story by the presence of a crew schools who will move 20 mineral water boxes but he cannot continuing the activity because his hand hurt after tried to lift several bags of the mineral water.

By observing the phenomenon that occurs, the teacher tried to encourage children to have the sensibilities in finding the actual problem

.The teacher asks, 'what can we do to help the crew?' Without answer, spontaneous children help the crew raised the mineral water boxes. At the middle of the process of moving boxes, the school crew asks the children about the easiest and the fastest way to move dozens of boxes of mineral water. Then children were given time to make a prediction of suitable way and exchanging ideas with their friends to finish the process of transferring the boxes more quickly.

Then children are doing various activities with a simple experiment using toys at class in order to: 1. find the right tools to help move heavy objects, and 2 to prove their opinion. Some area prepared for the experiment activity are 1.the miniature experiment of carrier equipment with a number of the burden of various choices of wheels in form of the geometry of a circle, a triangle, and square, 2.the move book with circle wheel of various sizes, and 3 imitate wheels writing.

### 2.2. Lesson study reflection in first class

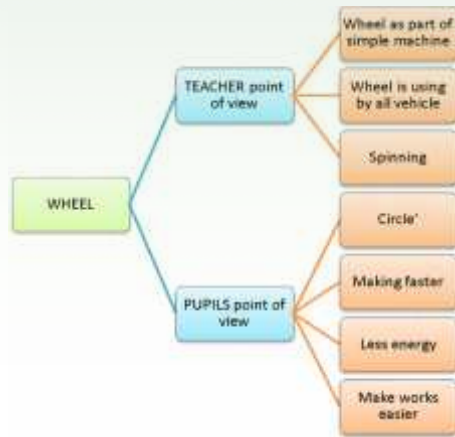

In a first class reflection session, we found that the purpose that will be used in lessons in first class or water class still in form of abstract not focusing on children . At first the teachers expected that the children know if a wheel is one instrument that could make the work easier. The purpose which are still abstract in teacher's mind affected in setting instrument and selection material, such as an area to invite children to prove about the form of a wheel is a circle (the activities of making a carrier equipment with a variety of the wheel in form of geometry), but in other areas instead already proved that a wheel shaped is circle (moving books using circled shaped equipment in various size).

The other reflection point is that to educate children focused on the number of the burden that will be transported, not the form of a wheel that is used .This happened because the questions from teachers make children response not accordance with the proof that have already been done . The question from teachers is, “Which carrier equipment that can lift more weight in addition?” There are activities wrote RODA word that process the ability to read and write, whereas these activities not relating to the mission will be done by the children.

### 2.3. Lesson plan for second class

Based on the reflections on the earlier class , we will improve the purpose of learning .Teachers asked to formulate more about the

concept will be discussed based on the perspective of children, because the purpose formerly based on teachers perspective which is abstract. These are the description of basic thought of wheel concept based on the perspective of teachers and children.

After formulating the fundamental concept of a wheel based on teachers and children perspective it was finally decided that that objectives of the activities lesson design in the next class will lift the purpose which is based on children perspective, so that the children know that the wheels is circle and ease a job.

Then the lesson design was made based on the prediction of positive response and negative responses that might emerge from the children. The negative responses that appear make teachers indirectly think of an intervention so that the response becomes positive. Intervention will guide teachers to achieve goals that had been determined. The next step is to make lesson study plan in our class as second class. Based on lesson design and children characteristic, we decided to make the purpose of learning activities more concrete that the children know that the wheel shape is circle. The learning method used is a discovery method where children will find by themselves the purpose of learning at that day through experiment activities.

#### 2.4. Learning process in second class

In accordance with the flow that already made, we purposely eliciting problem on how to help school crew who have difficulties carrying boxes of mineral water to a warehouse. The children spontaneous push boxes of mineral water; working together to lift the box or even tried to carry by them. All feel exhausted. Then school crew say that he still has tens other boxes. The children excited to help though

know that it will make them feel tired. But now the children agreed will find the fastest ways and easiest way to help crew carry boxes of mineral water whose amount is tens so that children and crew did not feel tired.

At first time, we did discussions with children. There are many responses from them; some of them is helping by using truck, using trolley, cart. From the discussion, we found that all mentioned equipment uses wheel. And asking questions to children, “With what form of wheel should be used?” All the answer that a wheel was a circle. To prove their opinion we invite children do various experiments in some area of activity.

#### 2.4.1. Small group area

One of the area in our lesson study activity is using geometry block as parts of wheels. First children given a single container containing miniature of people and some things. The container parable as carrier vehicles. And children asked to deliver people who were in it from one point to end point by using various wheel. The children asked to do experiments with various wheel to see what form that can easily move without using many power. Each children can select 3 wheel-in same shape for the test.

When did the experiment, there are some children who quickly arrange wheel under the container and pressing the container above so that a wheel is sticking in a container. There are also children who use the form of that geometry as a motor of container by moving one wheel to another wheel to front so that the container can be moved. Some decided to use only two wheels and put it in vertical position as if a wheel is a bridge. But even so the comments were almost all the same, “A circle wheel should not need to thrust frequently,” said one child. “The fastest is the wheel that is circle,” said the other children.

#### 2.4.2. Choice Time Area

In this area there are two types of experiment both used miniature carts that will be tested by replacing every wheel which have diverse form of geometry (square, circle, triangular). The difference is on one spot using the 3 dimensional forms of geometry and the other of using the 2 dimensional form of geometry using sponge.

On both spot the children spontaneous furnish the miniature container with a circular

shape wheels and test it along 1 m line along provided by teacher. They cheering see the container fast. Then teacher motivate the children to use other shape of wheel as a comparison. They had tried this out on the same track. After the entire test the response that appear as follows, ‘the coolest and the fastest is this’, pointing to circle wheel. Now another response that arises is he tried to associate miniature wagon wheel with a complete circle like *hot wheel s*, this is *hot wheels* fast speed’ while pointing miniature wagon- with circle on track.

### 2.4.3. Children finding’s application

Various kinds of responses reflected by the children expressed the interests on the experiment. However, in the session describing the results of the experiment in every spot, all the children described tools that equipped circle wheel.

At the next meeting, the children tried to apply the results of the experiment has been done to help crew who have trouble moving boxes of mineral water. They just looking for instruments around the school that can help move those boxes focus to seek instrument that have wheel-shaped as they have experience the results of experiments that they have done before. After around the school, children find a trolley and agreed if trolley is the most appropriate to move the entire mineral water boxes quickly and used a little energy.

### 2.5. Post lesson discussion

In the post lesson discussion at second class, we found that:

- First problem who came touch child’s empathy to help others
- But children’s motivation to help being down when they felt tired and difficulty
- The motivation could be improved by did intervention in form of challenge to make the fastest and the simplest way to find a carrier equipment.

- he provision of challenges can be raised children curiosity to prove that their opinion about wheel was right

- .activities that related to the interest of children make a child felt happy and enjoy this observation and experiment voluntarily

We realize that good planning before class activity is very important. The plan is including having a clear purpose or aim; interesting activities choose a proper material and choose the right methods. One more that also should not forget is to choose an activity that is appropriate interest children and close to a child.

## B. CONCLUSION

From the whole set of activities undertaken we draw the conclusion that lesson design made based on the perspective of children will help ease the purpose of learning in class who make more concrete and more contextual to children. An activity that more contextual to children will make a child more easily understood the concept from the teacher, so that a child acquire new knowledge (or strengthening their knowledge previously existing) that can help the child to solve the problems he met.

The description above describing that the lesson study give positive impact on deep reflection owned by teachers and teachers learning capability in designing better.

**Abstract:** Lesson Study of 2014 in Brunei Darussalam focuses on Year 1 and Year 4 primary mathematics. At least 12 government schools were selected to practice lesson study as a school based practice and the features of the Lesson Study concentrated on Concrete-Pictorial-Abstract (C-P-A) approach for Year 1 and problem solving for Year 4. It is expected that through C-P-A approach, pupils would have more opportunities to see, experience and link the intended concept through its representation from concrete materials to picture presentation and finally its abstract form. Since January 2014, Brunei primary mathematics teachers from year 1 until year 6 had the opportunity to develop their knowledge and understanding on using C- P-A approach. Based on our lessons observations of three schools selected from the twelve schools, we found that the implementation of C-P-A approach in mathematics lesson was somewhat different despite using the same concept. This study is looking at the variations in the classroom practices in the three different schools. Based on the videotaped lesson observations, it seems that the way the teachers present the mathematical concept from one representation to another and showing its transition between representations may affect the effectiveness of the lesson. The similarities and differences in the classroom practices of C-P-A will be further explored in the study.

**Keywords:** C-P-A; Representations; Lesson Study; Primary Mathematics

## 1 INTRODUCTION

Brunei Darussalam has undergone educational reform under the Ministry of Education Strategic Plan 2007-2011 called National Education System for the 21st Century (SPN21). In the education reform, there is a call towards achieving the mission and goal of SPN 21 which focuses on student centered learning and also creating a fun learning environment for students.

In 2006, a revised curriculum framework and syllabus content showed a recommendation to use concrete materials as an approach to teaching, where it stated In the early

years, concrete materials will help children to develop basic mathematical concept...Concrete experiences provide the foundation for developing and clarifying abstract concepts (Curriculum Development Department, 2006, p.6) In addition to concrete materials, other modes of representation were recommended to be used in mathematics instructional strategies to cater to students learning styles.

One of the approaches to promote student-centred learning, that is the concrete- pictorial-abstract (C-P-A) approach, were recommended to primary mathematics teachers involved in Lesson Study Project. The teachers worked

collaboratively within their schools to plan a lesson using C-P-A as their instructional strategy. From 12 selected schools doing Lesson Study, the research focused on three schools of different background. Based on observation of video recorded lessons of the three schools there were evidence that C-P-A approach was implemented in the classrooms. Despite the similarities in the C-P-A approach, there were still differences in terms of effectiveness of the lesson being carried out, students' engagement during workgroup and also the learning environment itself.

Thus this paper will look at the instructional practices of teachers from three different schools involved in Lesson Study employing the C-P-A approach in teaching operations without regrouping.

#### Concrete-Pictorial-Abstract approach

C-P-A approach is an instructional strategy that has three components, where each representations promote the understanding of an idea or concept. Concrete element include manipulatives, tools or any tangible objects students can grasp during the lesson. Pictorial component include drawings, graphs, diagrams that students produced or given to them in the lesson. Abstract representations include symbols, numbers or letters that students generated to show their understanding of mathematical ideas or given to them to interpret.

The C-P-A approach which is based on the work of Jerome Bruner (Bruner, 1960), is hope to foster an understanding of mathematics through different modes of representations so that students develop conceptual knowledge in addition to acquired procedural knowledge. In addition, the transition that happens in the C-P-A approach enables students to solve problem in a progressive manner starting with concrete then pictorial and finally solving abstract problem. With the presentation of different modes of external representations, students can benefit more to cater to their sensory reception to approach a mathematical concept (Shih, Speer, & Babbitt, 2011). This can also caters to students with learning difficulties as the different stages of representation of a mathematical concept or skill requires different level of cognition (Sousa, 2008).

In order to maximize the learning environment and conceptual understanding in mathematics, the schools involved in lesson study were encouraged to practice C-P-A in teaching mathematics topics particularly for basic operations

which requires manipulative and pictorial representational almost in every introduction of elementary mathematics topics.

#### C-P-A instructional practice

It was important that in order to design an effective C-P-A approach lesson a lot of options need to be considered. From choosing the appropriate concrete materials, to replicating the materials to imageries form and presenting the symbols where students can easily interpret. In order to make sure that the mathematical concepts are clear to the students, the C-P-A approach has to be carried out in an appropriate sequence or stage. The implementation of the three modes has to have smooth transition. This is to make sure the connections between concrete, pictorial and abstract are relatable and easily understood.

Students with different learning styles can benefit from C-P-A approach, but it caters specifically to students with mathematics difficulties. This is because students experience the same mathematical concept in different forms where the concept progressed gradually from concrete manipulative to images form and to abstract symbols (Jordan, Miller, & Mercer, 1998). With C-P-A approach, students are not merely looking for a solution but also exploring the strategies to answer mathematics problem (Sousa, 2008).

The instructional practice of the teachers will be the main factor in the explicit progression of the representations of mathematical ideas. Thus this will be the main focus of this study. What we are expecting to see from the 3 lessons from 3 different schools is how the teachers interpret the C-P-A in their own way. Could the C-P-A be carried out effectively if the pictorial component is not included in the lesson? Could the abstract be taught earlier alongside with the concrete and pictorial? Could the pictorial and abstract stage be introduced together?

## 2 METHODOLOGY

The selected schools are few of the schools involved in 2014 Lesson Study Project. The schools have different background based on their performance in the Primary School National Examination (PSR) where teacher A is considered from top performing school, teacher B from mid-range performing school, and teacher C is considered to be from low performing school. The limitations of this study maybe due to the differences in teachers'

qualifications and experiences in teaching mathematics. The teachers’ background can be found in table 1. our paper will be part of the conference proceedings. Therefore we ask that authors follow the guidelines explained in this example.

In your proceedings paper, don’t use any footnotes or endnotes. When you cite a previously published author, do so in the main body of your

text. Please follow the *APA Publication Manual* (6th edition) style accurately.

Teacher	General Teaching Experience	Mathematics teaching experience	Highest qualification
Teacher A	12 years	7 years	Diploma Primary Education
Teacher B	Almost 10 years	6 years	BA Primaria Education
Teacher C	Almost 10 years	9 months	BA Primaria Education

The students are of mixed abilities. The lessons used in these three lessons looked at the topic of addition and subtraction without regrouping. All three teachers were encouraged to employ C-P-A approach in their instructional practices. Qualitative method was used in this study. The authors used video-recorded lessons and teachers’ lesson plans as the evidence to look into the instructional practices used in this study. For the validity and reliability of the study, three researchers observed the video-recorded lessons separately and cross-checked their observation notes.

## 2.1 Findings

### Teacher A

Teacher A’s topic was on subtraction without regrouping where the lesson objectives were to solve subtraction in word problems and to write mathematical sentences. The representations used in the set induction were concrete and abstract representations. The concrete representation used was a packet of cookies for counting and subtracting. As for the abstract part of the induction, the concept shown using the cookies was translated to mathematical sentences written on

the whiteboard. [to enable pupils to make reference based on the demonstration of counting the total number of the cookies available, taken and remained].

The development stage of the lesson emphasized more on the abstract representation of the subtraction concept. These were word problem, mathematical subtraction sentences, number bond and timeline. These were projected on whiteboard. The word problem was presented in simple sentences. Then the concept presented was translated to pictures depicting the word problem. The subtraction concept during the pictorial stage was explained briefly by showing a movement of images being taken away (disappearing from the screen). The mathematical sentence then shown to answer the problem. Finally for the number bond and timeline were shown consecutively as an additional method in solving the word problem.

For students’ group activities, each group was given a word problem to solve where counters were provided for students to use to aid them in solving the word problem. Although counters were provided, the video recordings showed that the students did not use it and instead draw the images used in the word problem instead. Then with the images, students wrote the mathematical sentence. In this activity, only abstract and pictorial representation was used. As for the presentation,

the sequence was similar to the activities stage. A presentation of the work was explained in front of peers.

### Teacher B

Topic by teacher B was on addition 2-digit by 2-digit numbers without regrouping. Lesson objectives were to add 2-digit number with 2-digit number without regrouping and add correctly using the column method.

The initial part of the lesson was carried out with an addition of 2-digit by 2-digit through video presentation. Questioning and answering session were carried out after the video session. The presentation of the addition of 2-digit by 2-digit was further explained through the base ten charts or known as the column method chart in which the ones and tens place values were highlighted.

During the developmental stage, abstract representational was repeatedly carried out. The abstract representational also took place during the representation of pictorial and concrete. It showed that during the development stage reliance on abstract was more than on pictorial and concrete. As for the pictorial part of the developmental stage the lesson focused on images of 10-based of ones and tens and followed by the usage of column method. Discussion was carried out during the presentational of the images. The development stage was further explained briefly through the use of 10-based blocks (concrete) in column method sheet and more instruction was directed in asking of numbers and symbols in solving the questions presented.

During the activity stage, a set of 2-digit by 2-digit addition flashcard was distributed to each group. There were two activities carried out during the group work. First activity required the used of addition without regrouping in symbols and for the second activity involved the usage of 10-based blocks which were pasted on a column sheet in which was a representational from the first activity. As for the presentation stage, explanations of the tasks by the pupils were similar of how the activity was carried out during the group work activity.

### Teacher C

Teacher C was doing addition of 2-digit without regrouping using based ten blocks. Lesson objective as specifically to add ones and tens without regrouping using base10 blocks.

The lesson started with an abstract. Then the abstract was supported through the usage of concrete. Based 10 blocks were used as the concrete manipulative. The transition from the abstract to concrete was carried out repeatedly throughout the set induction. The place values and the values of the based 10 blocks were also highlighted during the set induction.

The development and activities were carried out in concurrently in which involved the transition from abstract to concrete to pictorial and finally into abstract. The first group activity which was carried out in the developmental stage was the transition of abstract to concrete and later back to abstract. The first group activity which was on addition of 2-digit by 2-digit was presented in addition mathematical sentence.

Then a transition occurred in which this addition mathematical sentence was then presented into concrete on a column method sheet. It was then rewritten into abstract. A brief explanation and comparison of the work done on transition was highlighted before proceeding to the second group activity.

For the second group activity, the concrete was translated into pictorial and finally into abstract. In which the presentation of the 10-based pictorial was drawn similar to that of the concrete whether it was the 10-blocks which represents as tens or ones. The pictorial were later presented into abstract. A demonstration of the transition was highlighted during the group discussion before the pupils are allowed to proceed to demonstrate the pictorial session so that there was real evidence of such transition of the concrete to pictorial happening in real time.

For the presentation, the work done during the second activity was further shown on the white screen and discussed. The images representation from the concrete was highlighted and further discussion was carried out and finally feedbacks were gathered before worksheets were given.

Teacher	Introduction/ Set	Development	Activities	Presentation
A	$C \rightarrow A$	$A \rightarrow P \rightarrow A \rightarrow A$ $\rightarrow$ $A$	$A \rightarrow P \rightarrow$ $A$	$A \rightarrow P \rightarrow A$
B	A	$P \rightarrow A / P \rightarrow A /$ $A /$ $A \rightarrow$	$A \rightarrow C \rightarrow$ $A$	$A \rightarrow C \rightarrow A$
C	$A \rightarrow C \rightarrow$ $A$	$A \rightarrow C \rightarrow A$ & $A \rightarrow P \rightarrow A$		$A \rightarrow P \rightarrow A$

Table 2: Sequence and transition in lesson development using C-P-A

\*C – concrete, P – pictorial, A - abstract

### 3 DISCUSSION

From teachers' lesson plans, all teachers sequenced their lesson based on standard division of classroom activity where it started with set induction section, development section where the activities were done mostly by the teacher, then the guided practice

activities where students work in groups with the peers, and then students present their group work to the class. After reviewing all the lessons on operations without regrouping, all three teachers used multiple modes of representations in their teaching namely concrete, pictorial and abstract components. However from the summary of the C-P-A modes in their lessons, each teacher has different representational sequence and the role of the representations, especially concrete materials, was used differently in their classroom activities.

#### 3.1 Representational Sequence

From table 2, all three lessons showed that multiple representations were present and the most prevalent mode of representations is abstract representation. However, the representations pattern that is the combinations of concrete, pictorial and abstract differs. The use of multiple representations provide students with different types of external representation system that can each can help students to grasp the mathematical concepts. Not only each mode of representations are important, but the sequence that provide the translations among the representations and transformations within the representation also need to be considered (Lesh, Post and Behr, 1987).

In terms of translations among the representations, only teacher C had explicitly done this when she combined the representations in the development and activity tasks. As Hall (1998) has emphasized, teachers typically led students to manipulate the materials quickly to echo the standard algorithms. Teacher C done this in her lesson but she combined this with the pictorial representations after the manipulations of the materials. Thus the translations were made clear for the students.

When the sequence of the representations in table 2 is to be further summarized and generalized, teacher A would have C-A-P-A, teacher B would have A-P-A-C-A and teacher C would have A-C-A-P-A sequence. All teachers end their lessons with the abstract representations but started differently. While both teacher A and teacher C had similar sequence, teacher B had a different order where pictorial came before concrete. The reason for teachers different sequence can be discussed further in relations to the role of concrete materials used.

#### 3.2 Role of concrete representations

Authors discovered that teachers used concrete representations differently in their lessons. For Teacher A, the concrete materials were used at the beginning of the lesson to demonstrate the concept of counting and subtraction. Although concrete counters were provided during group work, but students did not use it and teacher did not emphasise on the use of counters to aid students' thinking. Teacher B utilized concrete materials, namely base-10 blocks, in the lesson for students to explain their

thinking and not to aid them in thinking. This can be seen during group work where students found the answer to the problem and then try to show the answer using the base-10 blocks. Students used the concrete materials to show their procedural standard algorithm. Hence, teacher B was the only one who has A-C-A sequence towards the end of the lesson instead at the beginning of the lesson.

Among the three lessons, teacher C demonstrated full use of the concrete materials, namely the base-10 blocks, to aid students in conceptualizing addition concepts. This is because from the lesson, teacher C incorporated the materials from set induction until guided practice group work activities; and presented the materials where the objective is to aid students to 'see' addition and utilize the materials to aid the students computation and thinking. All three lessons however had used concrete materials corresponding to the abstract algorithm procedure (Bruner, 1966) but with different degree of transitional clarity between the two.

#### 4 CONCLUSION

This paper on able to study the nature of teachers implementation of C-P-A in these lessons where it seems to depend on the how they see the roles of the representations in the instructional practices. Perhaps our findings can be further strengthened with the analysis of students' work and interviewing the teachers to investigate their beliefs on the use of C-P-A in the lessons. However, we believe that by exploring the sequence and transition of C-P-A in classroom lessons, it provides a window into teachers instructional practice and its impact on their students learning.

## Using Online Tool “Popplet” to Teach Primary 5 Chinese Composition Writing

Ling Yi Chin<sup>1</sup>, Ruth Lim<sup>2</sup>, Lee Sok Hoon<sup>3</sup> and Sim Suat Lee<sup>4</sup>

Mother Tongue Department, St. Anthony’s Primary School, Singapore City, Singapore

<sup>1</sup>ling\_yi\_chin@moe.edu.sg

<sup>2</sup>ruth\_lim@moe.edu.sg

<sup>3</sup>lee\_sok\_hoon@moe.edu.sg

<sup>4</sup>sim\_suat\_lee@moe.edu.sg

**Abstract:** The dominant language of Singapore’s education system is English. This resulted in many pupils to be weaker in the command of Chinese language, especially in the area of composition writing. Hence, a group of Chinese Language teachers in our school embarked on a lesson study project to explore ways to improve pupils’ writing skills - the effective way of using descriptive phrases to enhance the quality of their composition. We decided to leverage on online information and communication technologies (ICT) tool “Popplet” to help pupils create their own set of good phrases. Pupils were divided into groups and instructed to do their homework of researching on good phrases before the lesson. They worked together as a group to combine their research on the “Popplet” platform. Peer evaluation took place through the “Popplet” platform. There were clarifications and discussions among group members on the suitability of phrases chosen and thus in-depth understanding of the application of good phrases among pupils was achieved. At the end of the lesson, teachers compiled pupils’ works into printed notes for pupils’ ease of reference in future. Since these notes are primarily inputs from pupils, pupils also felt a sense of ownership and therefore have a higher tendency to put them to use. Indeed, the Pre- and Post-Lesson study results showed a significant increase in the usage of the phrases in composition writing. From the cycle of lesson study, teachers found that the “popplet” platform has facilitated self-directed learning, group work and peer evaluation.

**Keywords:** ICT-based lesson, Popplet, group work, self-directed learning, peer evaluation, composition writing

### I INTRODUCTION

In order to improve our pupils’ standard of Chinese language, there is a need to come up with a pragmatic way of teaching.

As English is the dominant language in Singapore’s learning environment, many pupils lack the language skill to write a good composition. Teachers had long noticed that among the Higher Ability (HA) pupils, their compositions are in general quite adequate in content but lack in the area where the description of “emotions” is concerned. As a result, pupils’ compositions, though grammatically correct, are dull in content.

Therefore, in order to improve our pupils’ Chinese composition writing standards, we conducted this Lesson Study with the hope of improving their writing skills. By using ICT as our teaching tool, we also hope to arouse pupils’ interest in learning the Chinese language and enhance effectiveness of our teaching.

### 2 LITERATURE REVIEW

ICT is an integral part of our modern living. It also plays an important role in enhancing pupils’ learning and improving educational outcomes (Buang, 2011). According to Kumar (2011), in keeping with the changing needs and characteristics of learners of today, there is a call for greater use of ICT for Mother Tongue Language (MTL) learning. Hence, our first thought about improving pupils’ Chinese writing standards was through the use of ICT. We strongly believe that through the effective use of ICT, our pupils will also develop competencies for self-directed and collaborative learning (Buang, 2011).

“Popplet” was chosen as the ICT tool for this lesson study for 2 simple reasons – it is a free resource and very user-friendly. Positive reviews on “Popplet” like “the interface is simple to use” and “viewing finished Popplets is also very straightforward. A single mouse click allows users to zoom in on an area of the graphic they’d like to examine in more detail.” further convinced us that

this Popplet is a suitable tool to be used our lesson study.

### 3 THE PROCESS OF LESSON STUDY

Teachers identified the target group to be the Primary 5 High Ability (HA) pupils. Pupils from the 2 classes chosen were somewhat similar in terms of their Chinese proficiency. With that in mind, we assumed the adjustments made to the subsequent lesson plans would be minimal in terms of difficulty level of materials and task designed.

#### 3.1 First Discussion – Structure of the Lesson

During our first discussion, teachers decided on teaching pupils to use good quotes and phrases to describe “emotions” in their composition writing.

Given the widespread use of computers nowadays, teachers decided to integrate online ICT tool “Popplet” to teach composition writing. One advantage of “Popplet” is that pupils are able to see their peers’ work and give comments without the restrictions posed by time and space. As most of these pupils have prior knowledge of computers and the Chinese input system, teachers only need to briefly introduce the use of “Popplet” and teach them how to set up a Popplet account. Prior assignment given to pupils was to do a research on good quotes and phrases to be used for Chinese composition writing after school hours.

As a measurement of the effectiveness of our teaching, teachers also suggested letting the pupils write a picture composition as a pre-test, and use the same picture composition as a post-test to determine whether there is an increase in the usage of good quotes and phrases after their “Popplet” lesson.

#### 3.2 First Lesson and Post-Lesson Suggestions

Prior to the first lesson, pupils were already taught on the usage of “Popplet” and the setting up of personal account on “Popplet”. When the first lesson was conducted, teachers observed that most pupils were familiar with the functions of “Popplet” but the majority was not able to complete the task given as they did not do a prior research on good quotes and phrases as required by the teacher. Some pupils had either forgotten what they had researched on or were not very proficient in the Chinese input system (as the teachers thought they would be) and hence resulted in delay in completing the task.

Nonetheless, pupils were mostly engaged in learning. The air-conditioned computer laboratory where the group work took place created a conducive

environment for learning. The group reward system implemented by the teacher also helped to encourage individual groups to produce better quality work.

Teachers who observed the lesson study suggested allowing the pupils to bring their notes of prior research for reference during “Popplet” time, with the hope that it would help the pupils to complete the task within the time frame.

Teachers also observed that pupils faced difficulty in completing the task as there were too many “emotions” to describe in just one picture assigned to them. (see Figure 1) Hence, one may have to spend more time in choosing the appropriate and good phrases for the different emotions like “sadness” and “fear” present in one picture. Pupils were either taking too much time to analyse the many “emotions” of the pictures or thinking about what to write. Some were simply confused. Teachers suggested letting each group concentrate on describing the same “emotion”.

Figure 1:

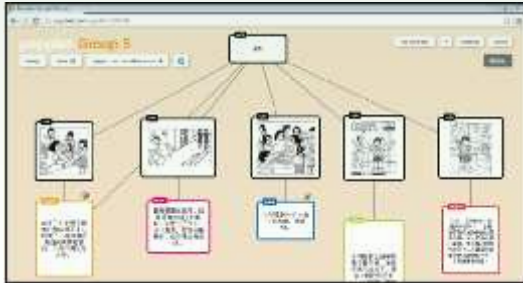

As for peer evaluation, teachers noticed that pupils’ comments were very similar. Thus, teachers concluded that pupils did not have the skill to give constructive comments. Teachers felt that pupils should be advised that simple comments like “appropriate use” and “used incorrectly” are sufficient. Nonetheless, the pupils of higher proficiency in Chinese may add in personal comments if they wish to.

#### 3.3 Second Lesson – Re-design, Re-teach and Reflect

The refinement to the second lesson plan focused on allowing each group to describe one “emotion” only (See Figure 2). There was healthy competition amongst the members of the same group as they were competing against one another to come up with the better phrases to describe the specific “emotion” assigned to their group. Pupils were able to complete their task within the time frame and so there was ample time allowance for peer evaluation. This approach seemed more

practical as pupils had more time to do critical thinking.

Figure 2:

As for peer evaluation, there were circumstances whereby the pupils were able to pinpoint what their peers had put on on “Popplet” were inappropriate or incorrect, but were unable to explain in speech. Teacher concluded that it would be better if pupils were to be provided a simple evaluation checklist as reference when commenting on their group members’ work (NCLRC, 2004).

#### 4 THE OUTCOME OF THE LESSON STUDY

After the lesson on using “Popplet” to learn Chinese composition writing, teachers conducted a post-test by asking the pupils to write a picture composition. As mentioned earlier, pupils wrote a composition using the same material prior to the lesson study.

The following data were collected:

	Cycle 2	Cycle 1
Class (No. of Pupils)	5-1 (34)	5-3 (35)
Improvement (More usage of good quotes and phrases)	22 64.7%	27 77.1%
Regression (Less usage of good quotes and phrases)	1 2.9%	3 8.6%
No Change (in the number of good quotes and phrases used)	9 26.5%	4 11.4%
Did not use good quotes and phrases before and after	2 5.9%	1 2.9%

\*Note: Class 5-1 has higher mark range for Chinese than Class 5-3

Based on data collected, pupils did try to use the good quotes and phrases which they have learnt during the course of the lesson study. In fact, we see

encouraging results of 64.7% and 77.1% from class 5-1 and 5-3 respectively. More pupils used more good quotes and phrases for their composition writing. We believe the increase was more significant in Class 5-3 because Class 5-3 is a weaker class (compared with Class 5-1) to start with and hence the “Popplet” lesson benefitted Class 5-3 the most.

Teachers believe that although the traditional way of classroom teaching may also allow the pupils to learn more good quotes and phrases, the effective integration of computer technology does enhance the pupils’ interest in learning. Use of online tools like “Popplet” allows quick interaction among teachers and pupils, which is not quite possible in a typical classroom setting.

Having said that, ICT in our opinion, is a secondary tool when learning is concerned. We believe effective learning is still largely dependent on the learners’ attitude and mentality. In our opinion, we should use ICT liberally, but not have the mentality that it is the only way to solve all problems relating to language learning.

It is through this lesson study that teachers discovered the majority of pupils though they were HA pupils, they were rather weak in word recognition, resulting in them selecting the wrong Chinese characters when typing. Hence, teachers may choose to work on this area for their next year’s lesson study.

#### 5 CONCLUSION

Lesson study is an effective method to improve our teaching. After the several rounds of trial teaching, we gradually perfected the lesson plan and implemented it in our actual teaching, and have achieved the desired teaching outcomes. Teachers also gained expertise, pedagogically speaking. In conclusion, we should continue with Lesson Study as it helps in improving teachers’ teaching skills and brings about effective learning for both teachers and pupils.

#### 6 ACKNOWLEDGEMENTS

We wish to thank our school leaders, Mdm Christina Teo and Mr Jeffrey Aw, for providing us with the support and guidance to make this lesson study a successful one. We also thank our School Staff Developer Mdm Lau Kai Yen for sitting in our meetings and rendering her help towards the editing of this paper.

## Improving The Quality of Thematic Scientific Learning Based on Soft Skill Through Lesson Study in Elementary School

Sri Utaminingsih<sup>1</sup>

<sup>1</sup>PGSD FKIP Muria Kudus University,, Gondang Manis, Kudus, Indonesia  
utami\_ningsih28@yahoo.com

**Abstract:** Implementation curriculum 2013 in elementary school required The integrative thematic scientific Learning. Its new things problem for the elementary school teacher's, to meet the requirements the teaching models will be taken through the lesson study with optimalization in soft skill for the teacher and students. The purpose of this articles are: (1) to descript thematic scientific learning in elementary school; (2) to identify the obstacles in application of thematic scientific learning in elementary school; (3) to formulate the thematic scientific learning in elementary school concept models based on soft skill using the lesson study. In planning thematic scientific learning in elementary school; the teacher will communicate and cooperate with their college to analyze the competence standard, theme, indicator, determine the objective and the learning content, equipment, the instrument for evaluation. The step of learning will covered such as: observing, asking, trying, analyzing, and to communicate the materials, and the end using authentic evaluation for evaluate the learning process. The end of learning process the teacher will provide the conclusion and give the test for the student. And also give analysis for the learning process as a input for the next learning process.

**Keywords:** Quality, Thematic Scientific, Soft Skills, Lesson Study, Elementary School

### 1 INTRODUCTION

Improving the quality of learning curriculum 2013 in elementary school need to be done in a systematic and comprehensive with a range of creative and innovative efforts. The learning process with thematic and scientific approach as new things important to developed through research activities, lesson study or discussion of perceived learning so that students are really meaningful and fun.

The improvement integrated scientific learning in curriculum 2013 implementation with the purpose the student able to understand live comprehenship live problem, the tintegrated scientific learning should be ltaught since childhood, so the student already familiar using scientific approach and they ableusing analytical thinking and high proficient. The scientific attitude able be performed through the learning scientific process, the scientific learning process consist of observing, asking, experimenting, analyzing and communicating. In the thematic scientific learning process the planning should embedded the quality soft skill. As Krueger said (2007:23) soft skill is also as fundamental skill ( ability to good work; manage the information; able to solve the problem), thesoft skill also has meaning in intrapersonal skill ( belief in his/her self and ability to manage his/her self); soft skill also as interpersonal skill ( social awareness and able conducting a good

communication), all of be mentioned above should be adapted by the people for improvement.

For handling the future challenge the student have to be taught the soft skill. Because the soft skill is essential ability for human life, especially to face the 21<sup>st</sup> century. With the good soft skill, student able to entrance the competition of life. The method in soft skill learning process many various, such as: the soft skill able be improved through the school culture, inclusive in the learning process and also through the extra curricular activities. In line with the (Koswara, 2001; Puliam, 2008:2, Pai, 2008:168-17, Utaminingsih, 2011). The improvement of soft skill in learning process especially for increasing the quality of the result of learning and increasing the competitive human resources.

The orientation of curriculum year 2013 to make balance between *hard skill* dan *soft skill*. *Soft skill* should be thaugt since childhood through thematic scientific learning process, starting the elementary school as the fundament to entrance in real life. Starting the childhood, student to use critical thinking, problem solve, able to communicate with other people and make cooperation. For have good attitude the learning process also need to adopt the good norm and local value as they character. The local culture need to be adopted in planning the thematic scientific learning.

The thematic scientific learning, the student able to formulate the problem, when they have a problem

they will active to find some information through asking the question for gathering more information, when they have felt enough with the information, the able to make the information usefull for analytical process, using the analytical process student able to find some alternative in solve the problem, they able to choose the best alternative, the best alternative will be applied in experimenting in solving the problem. The experimenting wil inform if the good alternative already be choosen for solve the problem. Finally the result will be disseminate as communicating the result of learning. The thematic scientific learning as learning system that will give the individual or group active in digging the knowledge concept and principle in holistic way, meaningfull and authentic (Rusman, 2011:254).

Thematic learning scientific problems in the curriculum of 2013 is new for teachers and elementary school students. Then it needs to be an increase in the quality of learning by optimizing the soft skill of teachers and students, as well as conducting lesson study collaboratively. Lesson study is done to improve teacher professional competency through a system of activities that enhance the professionalism of teachers and koegalitas with the philosophy of the great expectations placed on students (Masaki Sato, 2014: 2).

According the crucial need The thematic scientific learning so the problem for this article be formulated as: 1) How The thematic scientific learning in elementary scholl ?; 2) What is the challenge of thematic scientific learning ?; 3) How the best model of thematic scientific learning based on soft skill using the Lesson study methods?

## 2 METHODS

The methods of this study is R & D that is already developed by Bord and Gall, (1998), for the paradigm of the research is Qualitative. The locus of this research in 4 elementary school in Kudus Regency, the 4 elementary are: SD I Jati Wetan, SD II Jati Wetan, SD I Purwasari (as a public scholl) and SD I Muhammadiyah Kudus (as private school). SD I Jati Wetan hav been executing curriculum 2013 allready 2 years and the rst starting using curriculum2013 start year 2014 . The object of this research is grade IV. The Focus of this research is The thematic scientific learning process in elementary school. The finding will be used to formulate the model thematic scientific learning based on soft skill through lesson study

The technique of the data collection using as follows: in depth interview, observation, forum group discussion, and study documentation. An instrument for this research is the researcher, because the best instrument for qualitative paradigm is the researcher.

The data will be analyzed using triangulation methods, in triangulation methods the analyze of the data can be done together with the collecting data.

## 3 RESEARCH FINDINGS

The elementary school that has been implied by 2013 2013 curriculum implementation in the scientific approach to learning is better, than the new elementary school beginning in 2014. Applying the scientific approach is understood by all teachers class IV that in learning to use the scientific activities to observe, ask yourself, try, others are allegorical; and communicate. Teachers understand the learning process using this scientific approach is intended to give insight to the learners know, understand the various materials using a scientific approach. Information can come from anywhere, at any time, do not rely on direct information from teachers. Therefore the expected learning conditions are created to encourage learners are directed to find out from various sources of observation, not informed. Just the fact of understanding and application of very different, many teachers find impelemntasi in problems both in the ability of the teacher amupun students as well as learning material.

The elementary school in which already implementing The thematic scientific learning starting 2013 felt the learning process is better, than before the had not applied it. The implementation have been understand by all teacher for grade 4, they have already using observing, asking, experimenting, analyzing and communicating in teaching for the student.

The process using thematic scientific learning as the approached, some student already active and doing process of scientific approach, the process of learning more better, more joyfull and more meaningfull .

The research results showed that 76% of teachers have done learning the process of observation. In the activity observed, making every effort to facilitate teachers to observe it well, teachers already using either media images as well as real goods, only lectures are still dominant in learning. In the process of learning, observing, learning activities students are told to read the readings on the student book, hear and listen to explanations teacher, view pictures or media objects prepared teachers. The disadvantage, observations of students not yet systematic, process of communication and problem-solving are still a bit. Students secaris outline view only for a moment, but pengamtan a scientific process after seeing, hearing should be eliciting responses and high level thinking processes such as analysis or reasoning

In inquiring into the activities, the ability of teachers to facilitate the improved still need to ask

yourself in a learning activity ask yourself the teacher has done, in one study on apersepsi activity of an average of 3 times the teachers ask the students one time and ask. In the core activities of the teacher asking an average of 8 times and students asked 3 times but uneven. Students who ask still dominated by certain children. Ask not to be that is not understood, it could also be understood but need to be asked in order to achieve a high level of thinking process creates or creative. Ideally the question starts from the question to the factual question hipotetik.

The activity of trying or mengumpulkan information, teachers create groups to discuss competencies achieved, working on the LAS (student activity sheets). There are teachers who still wear the old model'S LAS/LKS. One school or class management discussion process is better than the other two schools. Most of their learning activities still reading other sources in addition to textbooks and observe objects/events/activities in collecting information

Others are allegorical; in the activities carried out at the time of the discussions or working on LAS/LKS teachers hope the others are allegorical; can be maximum. Activities in a presentation or communicate, in one study an average of 2 times the teachers facilitate communicate or present. Each learning yet all children get the chance to present the results of the discussion or LAS menegrjakan/LKS. The dominance of certain children are still visible. It addresses the factors also affect the success of the students indiidu the implementation of the curriculum of 2013.

The obstacles in implementing scientific approach such as : (1) The limitation of materials, teachers, student. Some times the teahers hesitate what they have to do, but after a few minutes the teachers able to manage the activities; (2) Every sub theme and one class have to prepare one copy of material; (3) The thematic scientific learning is a new one for the teacher so sometimes they have to accelerate it in practical; (4) The limitation of materials ; (5) The application of authential evaluation to many requirement to be met, an all aspect such as cognitive, affective and phsycomotorisc.

The active learning process enjoyable and scientifically on thematic learning is new to all the teachers in the primary research. They seek to understand and implement the curriculum make the 2013. Although many teachers who complain still provide support by applying the learning. On the learning process of teachers is still focused on the application of scientific approaches, not to develop models of learning.

#### **4 THEMATIC SCIENTIFIC LEARNING IMPROVEMENT BASED ON SOFT SKILL**

To improve the quality of learning in a scientific approach to megoptimalkan ability soft skill students and teachers, including the ability to communicate, collaborate and solve problems. Students essentially have the ability to speak or communicate. Observations showed the ability to communicate, ability to ask, not possessed by all students.

The ability of scientific cooperation in the thematic learning can be realized by applying various models of learning. A study on an active, creative, fun can be created through the use of varied learning models and innovative as well as in tune with the characteristics of the students. One of them with a learning cooperative. Sanjaya (2011: 244) posited different cooperative learning with other learning strategies. The difference can be seen from the learning process that emphasizes the process of cooperation within the group, so as to enhance learning activities. Objectives to be achieved are not just academic ability in the sense of mastery learning materials, but also an element of cooperation for the control of such material. The existence of a partnership that became the hallmark of cooperative learning.

Problem-solving abilities students will also need to be trained continuously through thematic scientific learning. In activities observing the students could be trained further activity of problem solving, students are given questions or inquiring into the issues related to the ordered, students try to solve the problem, others are allegorical; a problem and communicate the results breakdown for nurturing Cedar [to be the activities that can enhance the ability of the soft skills of students

#### **5 LESSON STUDY BASED ON SOFT SKILL**

Improved quality of learning that applying the scientific approach needs to be done with lesson study by utilizing the kolaboratur classroom teacher, student internships, supervisor, principal or parents of students. Lesson Study based soft skill is learning activities beginning with the learning plan (Plan) by teachers with engaging collaborators. Further implement the learning process (Do) with the approach of the scientific, thematic and liveliness of the stressed students to communicate, collaborate and solve problems. After the completed reflections/sharing (See) with the aim of improving the quality of learning.

The study focused on forming students' ability to communicate, collaborate and solve problems so collaborative learning in learning will be created in school classrooms;. This will form the next lesson study-based collaborative learning because it's all students will communicate with each other, teachers and collaborators. (Ali Mustadi, 2013). There will be an intensive communications students with students, students with teacher, teacher with teacher, so that collaborators would be created between the learning community. (Masaki Sato, 2013).

The involvement of numerous collaborators each had advantages and disadvantages. Classroom teacher collaborators, problems that arise who taught the class abandonment? The benefits of teachers know the weaknesses and strengths of teaching colleague friend so it can be used to improve learning is doing. The principal collaborators, his infirmities when principals do not understand the scientific approach or learning curriculum 2013, its teachers don't feel grogi because already understand the principal.

Collaborators can pair together, together have a disadvantage because the students concentrate in school classrooms; a lot of people who were observed. Collaborators observe, communicate and cooperate with the teacher model since the teachers make the learning plan which specifies the methods, models, media, classroom settings, preparation of assessment instruments. So when in learning collaborators already understand the RPP (lesson Planning) and the learning process, so the collaborators will be able to provide corrections, suggestions and development learning teachers model using a thematic approach by optimizing the scientific ability students to communicate, collaborate and problem solving. Collaborators observed the start of activities apersepsi, core activity and closing activities. The observations focused on the activity of teacher and student activity. After the completed reflections through the FGD. The reflection result is being made as the basis to arrange continous enhancement in order to improve learning quality of 2013's curriculum.

## 6 CONCLUSION

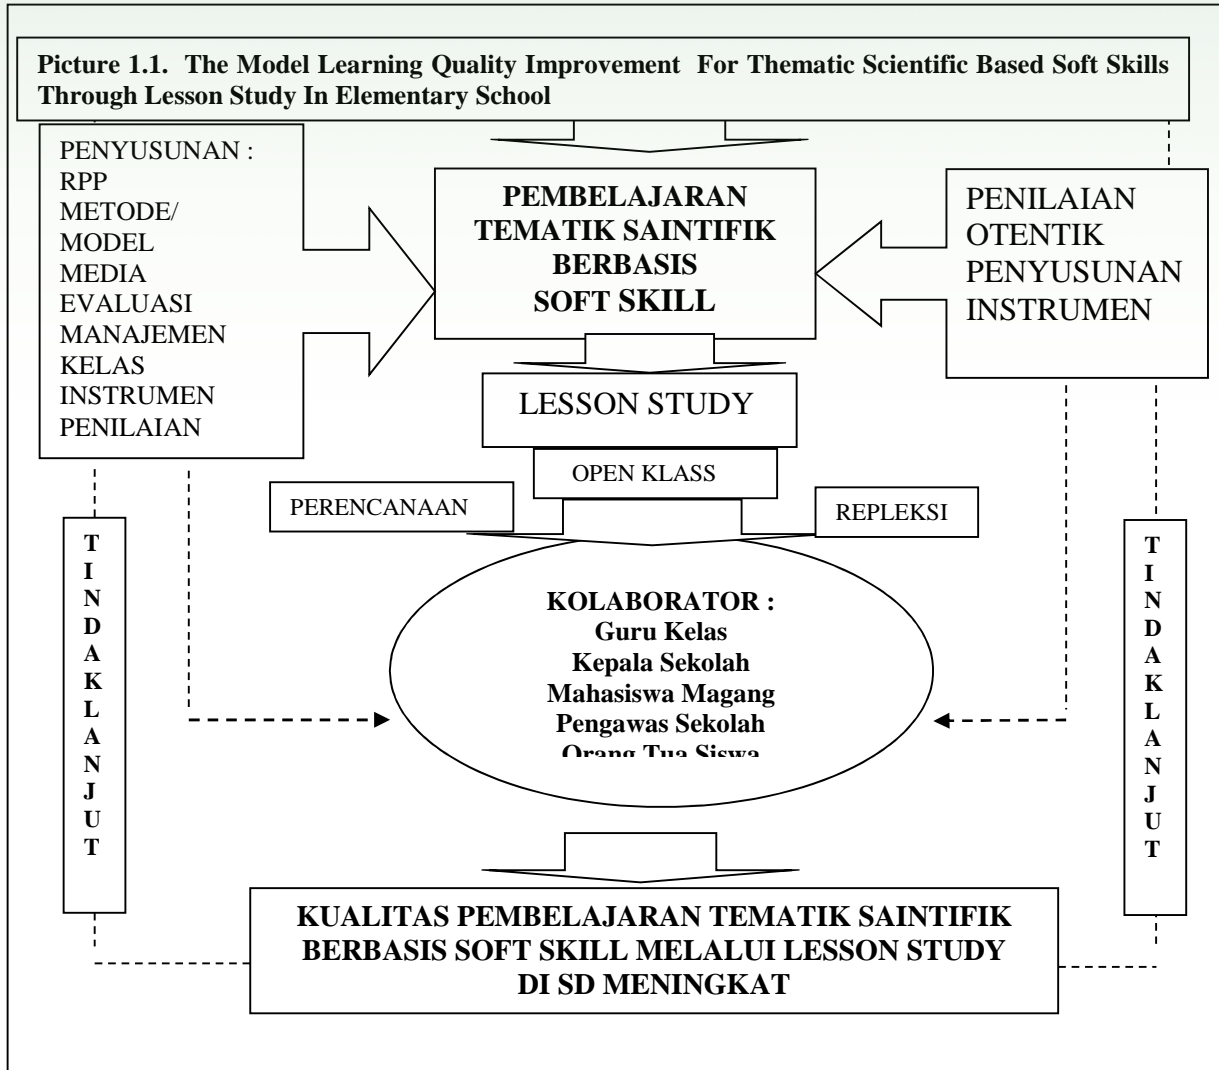

Implementation scientific curriculum thematic approach to 2013 by optimizing the ability of pupils to communicate, collaborate and solve problems on individual learning activities in observing, asking questions, trying, others are allegorical;, and communicating. This learning can be improved by doing continuous improvement through lesson study based soft skill both in planning, implementation/open class and reflection of learning curriculum 2013 could rise.

niquede@yahoo.com*

**Abstract:** This study was conducted to observe the communication in teaching and learning mathematics in delivering new topic to the pupils of 11 years old in rural area. The study focussed on 3 aspects which are : (1) to indenfy pupils understanding through communication in the classroom; (2) to identify types of communication in learning mathematics that can be enhanced mathematical understanding; and (3) to identify pupils perception of communication in teaching and learning mathematics. Teaching and learning began with set induction conducted by the teacher to make known to pupils what they are going to learn then, pupils were given a worksheet each and they were required to answer the questions in the worksheet individually in 20 minutes. This was followed with a group discussion on the solution. An interview session with the pupils was carried out to acquire pupils’ reaction on the teaching and learning process. Pupils were also answering questionnaires. In addition, field notes were recorded to complement the findings. The findings showed that the pupils were able to carry out the lesson and understand the needs of the questions given. A group discussion was the most used of communication in the classroom.

**Keywords:** communication, understanding

### 1 INTRODUCTION

The aim of the study was to obtain the perceptions of primary school pupils regarding communication in teaching and learning mathematics. The study was carried out in two primary schools in rural areas namely Balik Pulau and Berastagi. The pupils involved in this study were from 11 years old pupils. This quantitative and qualitative study required pupils to answer the questions given by the teacher. But first, the teacher explained the objectives of the lesson before the questions was given to the pupils. Hence, the research questions were as followed :

Was the pupils understand the questions asked by carrying out communication in their classroom, what types of communication in learning mathematics that can be enhanced mathematical understanding and what are the pupils’ perception of communication in teaching and learning mathematics?

### 2 RESULT AND DISCUSSION

The findings of this study were discussed according to : (1) to indenfy pupils understanding through communication in the classroom; (2) to identify types of communication in learning mathematics that can be enhanced mathematical understanding; and (3) to identify pupils perception of communication in teaching and learning mathematics.

#### 2.1 Pupils Undertsanding Through Communication

From the study pupils were first need to answer the questions given individually then after 20 minutes pupils were allowed to discuss the answer with their friends within their group. From the result, pupils were not be able to get the answer correctly at the first time because they were not confident with their ability to

answer correctly, they were lack of encouragements from their friends and teacher since the questions need to be answered alone and they were not creative enough in delivering their answer and understand the question needs. When pupils were in the group discussion, they became different in the way they talk, act and react to the questions given. They were confident to argue with their friends about the problems occurred in the questions. When the arguing happened, automatically their mind were generated to respon to their friends and here comes the creativity in finding the answer together and understanding the question needs. Pupils were motivated by their friends and therefore, they were confident and brave to step in front and asked the teacher about questions in order for them to understand better. Zulkardi R. & Ilma stated that learning should not be initiated with a formal system whereby a teacher directly teach a certain topic. This means that teachers need to be able to employed different method or approaches in their instructions to enable pupils to have deep understanding on the concept taught and one of the method, was carried out in this study.

## 2.2 Type of communication and mathematical understanding

Teaching and learning through teacher-cenerd approach is not much of a help for pupils in rual area seemed they will not be able to have a deep undertanding of the concept taught. However, this study was conducted to show that pupils-centered as group discussion were one of the teaching approaches that can be used to enhance pupils understanding. When pupils were in their group discussion, they were actively asked the teacher about the questions and as a teacher, the role is not only providing an answer but infact asking them back so that they will manipulate the question thrown by the teacher and get back to the real problems they were facing. According to Sanders N.M., the way the teacher questioned their pupils can help to direct pupils' thoughts and at the same time will help the pupils to have more interactions with the teacher and also within their group discussion. For this study, type of communication that were able to enhance pupils' understanding is group discussion which involve writing, visualising and arguing. This communication type was also mentioned in Malaysia's Curriculum Specification.

## 2.3 Pupils perception of communication in teaching and learning mathematics

In this section, pupils were asked about their perception of communication in teaching and learning mathematics. Pupils were given a set of questionnaire.

100% of the pupils chose learning in a group than learning by themselves. All the pupils were also said that they were happy when learning in a group and they were able to understand better.

## 3 CONCLUSIONS

To conclude, majority of pupils were observed to agreed that communication in tecahing and learning mathematics is important to enchance pupils' understanding, to encourage pupils to be more confident in expressing their thoughts and also pupils were able to understand better about the question needs.

## 4 ACKNOWLEDGEMENTS

I would like to express my gratitude towards my supervisor, Dr. Faizal Nizam Lee for his guidance and support in completing this project. I also would like to thanks Prof. Madya Jamaludin Md. Ali for his moral support to keep me going and same goes to my families. My thanks and appreciations also go to the pupils and teachers in North Sumatra's primary school and Balik Pulau's primary school for their kind co-operation and encouragement which help me in my project.

## EFFECTIVENESS OF WHOLE WORD READING APPROACH FOR STUDENT WITH LEARNING DISABILITIES

Pujaningsih

*Special Education Department, State University of Yogyakarta, Yogyakarta, Indonesia  
puja@uny.ac.id*

**Abstract:** Your abstract should be one paragraph summarizing the content of the paper and should consist of more or less 250 words. Please use Times New Roman of 9-point font size, justify, and have a hanging indent of 2-centimeter. Students with learning disabilities encounter a variety of academic difficulties, one of them is reading. Therefore, they must receive special educational services with effective approach. The purpose of this study was to determine the effectiveness of whole word approach for student with specific learning disabilities who has reading difficulty. The approach used in this study was a single-subject research by taking subject student who has specific learning disabilities. Data collection methods used are interviews, documentation and informal tests. Data were analyzed by descriptive statistics and content analysis. In the baseline phase consisted of 3 sessions and 5 intervention sessions. The results of the baseline phase ( A ) by using the data obtained misspelled the average reading ability of 8.33 and average ability at the time of the intervention ( B ) 21.2 . Both the data A and B declared stable and level ability in phase A parallel ( no change ) while the phase ( B ) there is an increase ( 8 ). Therefore, whole word approach is effective for improving reading ability of student with learning disabilities. Significant findings will be discussed.

**Keywords:** Children with learning disabilities, whole word reading approach

### 1 INTRODUCTION

The research was motivated by 2 main reasons, which are: **first:** the existence of children with learning disabilities (AKB) particularly on studying reading in regular school. They are recognized by their friends and teachers as slow learner because of lack of their achievement. Some profiles of children with learning disability are caused by some internal and external condition. There are some findings of research showing the variety of children with learning disabilities. In 2002, Pujaningsih et al. found that there are 36% children with learning disabilities in Berbah District with the detail: 12% slow learner, 16% learning disability and 17% mentally retarded. Marlina (2006) found 55 children with specific learning disabilities in Padang. Specifically, reading difficulty is 10%-20% found in students of elementary school (Gorman C in Time Magazine on 31 August 2003). **Second:** the complex impact of learning disability. Children with learning disability (AKB) including reading difficulty often get failure in describing their self concept, negative emotional

and personality development (Lackaye and Margalit, 2006). If the failure is not immediately overcome, it will evolve to be kind of depression (Maag & Reid, 2006).

Reading skill is being a main focus indicating mastery of other subjects. Problems of reading skill of children frequently are related on lack of mastery of other subjects. Story-based question in mathematics, some written instructions in evaluation test, supporting reading material of other subjects (religion, citizenship, science, etc) need reading skill. The inability of reading on children must be taken care of seriously.

The research focused on children with specific learning disability in one of Elementary School in Yogyakarta. The inability of students in recognizing letter gives problem to teacher to give other subjects. Suitable method development of learning for children can prevent them to the accumulation of problems in the following level. The finding of the research can be an input for teacher to conduct remedial learning to children with learning disabilities in the class.

Some learning method on reading are developed for elementary students yet still the unsuccessful students are found failed in mastering reading skills with some existing methods because it does not meet their needs. Accordingly, the research wants to examine global method as the result of needs of children with specific learning disability by comparing with the previous method applied by teacher in remedial class. Teacher applies method in which student has to read by syllable in 4 months yet it has not showed the satisfying result.

## 2. Children with learning disability

Terrell (Smith. 1998) believes that the problem of reading on children give impacts on their low level of learning as well. Language problems are frequently related with difficulty in understanding other people, speaking clearly, choosing suitable words to bring up ideas and finding it hard to construct language to communicate effectively (Smith, 1998; Harwell, 2001:36). Reading difficulty in the early stage will complicate the advance level of language lesson, e.g: reading comprehension, sentence structure, and writing skill, if it is not taken care of immediately. The other difficulties they will possess are when they are trying to communicate to others. Being understandable in conveying the ideas and understanding people talk are uneasy for them. It is not a problem of their listening, but it is a matter of verbal information process. It wil also influence in their: abstract thinking, idiomatic, jokes etc.

In particular, they have a problem in their listening comprehension, letter and word identification, word and syllable choice, and reading comprehension (Benner, et al. 2005). Torgesen in (Benner, et al. 2005) believes that we can divide the area of their problem into 2 area, first is their ability to recognize letter correctly and quickly. They cannot associate sound of letters and words. The second area is their language skill in oral e.g listening comprehension. Minimum language skill in oral brings to fewer vocabularies they possess and gives impact greatly on their skill of reading and writing.

Many researchers found that children with social adaptability problem often have problem in reading as well (Benner, et al. 2005). There are 4 findings related in reading skill problems and mal-adaptive problems which are: a) 25 % - 85 % children with social adaptability problem often have problem in reading as well (Betchman et al., Benner et al, Greenbaum, et al in Benner, et al. 2005), b) Prevalence between children with reading difficulty and children with

social adaptability problem tend to be stable and increase by year.

Distinguishing appearances of children with learning difficulties that commonly found, which are:

- a. Reading slowly and grudgingly
- b. Tracing the text or sentences with finger
- c. Neglecting syllable, word, phrase or line
- d. Reversing the arrangement of word or syllable
- e. Sounding known words wrongly
- f. Changing syllable with another words
- g. Arranging meaningless word
- h. Neglecting punctuation

## 2. Identification and Assessment of Reading Difficulties

Based on the developing definition, Lerner & Kline (2007) explains that there are 4 main elements led to definition of specific learning disability (LD), which are :a) central nervous system dysfunction, b) basic psychological problems, c) difficulties on doing assignment, and d) discrepancy between potential and skill.

Steps to identify learning disability (Lerner. 2006) are explained as follows:

- a) Investigation on cases related with children by collecting information about: 1) identity (children, parents, brother and sister), 2) Birth record, 3) Medical record (health, accident, disease), 4) Medical condition (diet, sleep), growth (standing, walking, sounding a first word, language disorder and locomotors body disorder (if any).
- b) Mapping of ability (able to use scissor, crayon, pencil, able to write down his name, prominent behaviour, depression state, passive or active attitude, expressive or not, love listen to story or not, other activities at school, responsibilities and so on)
- c) External and social factors (friendship, relationship with brothers and sisters, hobby, interest, parental treatment, responsibility taken).
- d) Factors at school (whether through kindergarten, class changing, teacher changing, attitude at school, special treatment).
- e) Self-acceptance (when doing assignment, adaptive attitude to new material.
- f) Psychomotoric condition (when doing writing, the writing, how to hold the pencil).
- g) Attitude when writing, reading and playing).

The research identify reading difficulties by using: 1) interview guide for parents and

teachers, 2) observation guide to reading activities, and 3) reading instrument of first grade students (curriculum based measurement) which is in form of test of reading words in 1 minute and curriculum based assessment developed by Helen Keller International)

**3. Global Reading Method**

Global Reading Method is a reading learning method to the whole text. In 1950's, Diary of Dick and Jane published by Scott Foresman tells that whole text is an approach in learning reading. Word is taught repeatedly so that student can keep it in mind. It is what behaviourist says. This method is based on sentence approach. Teacher teaches reading and writing by showing sentence below the picture. Then student has to parse sentence into words, words into syllable and syllable into letter.

The steps of applying the method are: 1) student can read sentence by picture help. If it works, then student will read with no picture. 2) Parse sentence by words. 3) Parse word into syllable. 4) Parse syllable into letter. Visually, this is the application of the method described below:

Picture 1: Steps of Global Reading Method

**4.1 Design of Research**

The research was using SSR (single subject research) method with pattern A-B. Borg (2003) says that the design can be undertaken by choosing participants for the experiment, then deciding the behaviour target, measuring the behaviour target and applying the treatment. The research will apply global method to children assumed having specific learning disabilities which have studied reading by syllable method.

**4.2 Subject**

The research was carried out in one of Elementary School in Yogyakarta by taking subject a student named DV who has learning disability on reading based on assessment indicating some criteria of specific learning disabilities as stated by Lerner (2000):

- a. Having academic difficulty, one of them is on reading skill
- b. Writing skill and the problem solving is imbalance
- c. Showing some types of specific reading errors in children with perception disorder causing specific learning disability

**4.3 Data Collection**

Data collection in this research was carried out by some stages:

- a. Choosing subject for experimental group through curriculum-based assessment and curriculum-based measurement (CBM) which is completed by an observation guide and Bahasa Indonesia test which is suitable with curriculum of class 1.
- b. Doing measurement of reading skill of students by measuring their reading skill per minute.

**4.4 The instruments of the research are:**

- a. At the assessment point, the researcher aimed to discover problems on children's reading and the record of the cases so the instruments are: a) the result of parent's interview. The draft used to uncover information such as birth record, growing record, medical record and educational record, b) the result of teacher's interview aimed to know problems faced by children in the class, c) CBA (Curriculum Based Assessment) to understand the ability of children's reading ability and children's learning style. This assessment is developed by a team of Indonesian teachers which is modified from book *Grade Level Assessment Device for Children with Learning Problems in Schools* (HKI, 2009)

**4. METHOD**

completing words (1-12 words)

incomplete words student complete the incomplete word

- b. At the intervention point, the researcher use the measurement of reading ability by CBM (Curriculum Based Measurement) in the form of reading test which ask the subject of research to read letters (a, e, I, o, u, b, c, d, f, g, h, j, k, l, m, n, p, q, r, s, t, v, w, x, z) per minute.

**4.5 Data Analysis Technique**

Data analysis technique of the research was qualitative analysis to compare the ability of reading before and after interventions. According to Juang, S et. al (2006:43), to increase the validity of research in behavior modification using A-B design, the researcher should pay attention to several points:

- a. Define the behaviour of target being measured.
- b. Measure and note the data in baseline condition until the direction trend and the data level clearly appear.
- c. Do intervention when baseline is stable.
- d. Measure the target’s behaviour when intervention is doing continuously in a period of time until it is stable.
- e. Make a conclusion that there is a functional relationship between dependent variable and independent variable.

**5. Findings**

The subject of the research is a first-grade child in elementary school with specific learning problem. The result of assessment is:

Name : Dd (pseudonym)  
Age : 7 years old  
Educational record : Dd learned in kindergarten level for 2 years

Medical record : No serious ill. However, parent’s interview informed that Dd diagnosed as impaired attention sufferer so the subject is in psychological treatment by couple-game therapy.

Teacher information : Dd can spell letters but find difficulty on spelling words. Dd getting of letters b, a, e, i, u,o. Now, Dd learn using a module to read syllables: /ba/, /ca/, /da/, /ha/, /ga/, /ma/, /ja/, /ka/, /na/, /la/ dan /ra/. However, the teacher conveys that Dd find difficulty when letter /a/ switch with /i/.

**5.1 Case Record**

Dd’s mother informed that Dd is now 6 years old plus 9 months. Dd is the youngest child in the family. Dd’s

father and mother work as an entrepreneur and aa lecturer. No flaw on birth record. In 2000, the mother was infected by CMV. In the growing record, Dd ever got high fever caused by *fimosi*s. Dd do not eat rice. Dd’s growing record is fine except in year 3; Dd spoke too fast and unclear that Dd got electronic diet and blowing candle therapy. Dd’s educational record began in 3 months age in Childcare for 3 years. Then, Dd is drawing out to Kindergarten for 2 years.

**5.2 Assessment result using CBA (curriculum based assessment)**

Language. Dd’s language capability in the beginning of the semester grade 1. Dd had no problem on auditory ability. Dd showed the right pictures, letters and words as what Dd heard. It assumed that Dd has no difficulty on auditory perception. Dd also give comment and solve problems related to daily life easily. However, Dd showed the difficulty on visual perception. It can be assumed by:

**Table 1: Ability of reading letters**

Letters	spoken	description
b, c, d, f, g	b, c, da, fa, ga	Addition /a/
h, j, k, l, m	Ha, l, ka, l, ma	Substitution /j/-/l/
n, p,	h, t, l, b, d	Substitution /n/-/t/, /n/-/h/, /p/-/d/, /p/-/l/, /p/-/b/

**Table 2: Ability of reading words**

Words	spoken	description
Ban	ba	Omission /n/
Pil	pela	Addition /a/, Substitution /i/-/e/
Sup	pela	Distortion

Table 1 and 2 showed that Dd’s error of reading is dominated by Addition. It may happen because of the syllable method which influenced Dd to read with letter /a/. Dd can do summation fast. Dd also can answer story based question with summation under 20 in less than 2 minutes.

**5.3 Global Method for Reading Learning**

The learning needs 60 minutes. The media are:

- a. Picture card + word
- b. Word card
- c. Letter card
- d. Agreement, use to control Dd’s attitude so Dd will show 4 attitudes: sit in the chair, look into

teacher and book, do what teacher ask, and do it seriously. When Dd did those attitudes, Dd will get point. In contrast, when Dd did not do those attitudes, the teacher will get the point.

- e. Puzzle

The method begins with game Puzzle continued by agreement. Then, the learning schedule is:

- a. Read 5 pictures
- b. Re-write 5 words from pictures
- c. Pointing 1 word from 5 pictures according to instruction
- d. Spelling words (5)
- e. Games
- f. Read letters in 1 minute
- g. Dictate letters
- h. Complete 1 letter from 5 words
- i. Complete 2 letters from 5 words

Lesson plan and words list of the learning program is enclosed.

**5.4 Data of reading capability at baseline and intervention point.**

The research consist of 3 sessions aim to understand the baseline and 5 sessions aim to do intervention. Generally, Dd's reading capability at baseline has validity on 8.33 (mean) while the reading capability after intervention rises to 21.2 (mean). The tabulation of Dd's capability every session can be seen on the tables:

**Table 3: Reading capability (Baseline)**

Session	Number of right answer
1	8
2	9
3	8

**Table 4: Reading capability (intervention)**

session	Number of right answer
1	12
2	20
3	28
4	26
5	20

The analysis above is done with success criteria 50%. Juang S. et. Al (2006:68) stated that level of stability can be determined by counting

total data which on 50% stretch above and below the mean. The analysis consists of the length of condition, direction trend, stability trend, data track, Stability and stratch level, and level change. The data can be seen on the table 5.

**Table. 5 Case analysis**

	A (baseline)	B (Intervention)
1. The length of condition	3	5
2. Direction trend	Parallel (=)	(+) /
3. Stability trend	Stable	Stable
4. Data track	Parallel (=)	(+) /
5. Stability and straches level	Stable (8-9)	Stable (12-28)
6. Level change	8 – 8 = (no change)	20 – 12 (+8)

From table.5, it can be concluded that Dd's way of reading is change in the 5th day after interventions with level change (+8). The detail calculation of 6th analysis data is enclosed.

**6. Discussion**

- a. Assessment Result of Dd's need for learn

As the subject of the research, Dd assumed to have a specific learning difficulty as Lerner & Kline (2007:9) stated that there is a gap between achievement and potential. The experts suggested to use these steps to identify learning difficulties (Lerner J. , 2000):

Appreciating the gaps in academic prosperity, for example: a child is really good in Math yet has difficulties in language learning. It is strengthened by Dd's ability to solve problems on accounting or in daily life. However, Dd found extreme difficulty on recognizing symbols which differ in size (long and short) such in letters /n/ and /h/, direction (right and left) such in letters /b/, /d/, and /p/ also /j/ and /l/.

Error on thinking process of Dd headed for visual perception related to size, shape and direction. These are the types of error:

**Table 6: analysis of Dd's error type**

letters	spoken	description	analysis
b, c, d, f, g	b, c, da, fa, ga	Addition /a/	influenced by previous method which concern on syllable
h, j, k, l, m	Ha, l, ka, l, ma	Substitution /j/-/l/	Difficulty on visual direction perception
n, p,	h, t, l, b, d	Substitution /n/-/t/, /n/-/h/, /p/-/d/, /p/-/l/, /p/-/b/	Difficulty on visual direction perception /p/ = /d/,/b/ Difficulty on shape perception /h/ = /n/

**b. Ratio of Dd’s reading capability after intervention**

Based on the analysis, there is a significant disparity on Dd’s reading capability in baseline point and intervention point. From direction trend and level alteration point of view, Dd’s reading capability using reading syllable method is the same as before while using global method at intervention point showed an increase (+8)

The global method in this research begins with reading pictures and the students love it because they find no difficulty. Comparing letter cards and word cards is also easy for them because they just need their visual capability. Some experts declare that using pictures in reading learning is suggested to motivate the students (Bursuck & Damer, 2011:125)

Development of reading capability in picture 1 reach the peak in 28 letters but then it eases up. It happens because the test reading for letters /a/, /i/, /u/, /e/ and /o/ substituted with other consonants so the level of difficulty increases.

From the chart, it can be concluded that global reading method is more effective than reading syllable method. Reyhner (2008) said that the use of global method and reading syllable in development country is still arguable. Based on the Dd’s assessment result, it shows that the capability of visual memory is more dominant than auditory one. Then, for this case, global

method which uses visual memory is proven to be more effective.

Picture 2: Dd’s capability of reading

**7. Conclusion and Suggestion**

Global reading method is much more effective for Dd than reading by the syllable. There is an improvement (8+) in the 5th day of intervention.

It is suggested to teacher, if they find some students with dominant visual memory, they can use global reading method in handling student with reading difficulty.

mazaniak@yahoo.com

**Abstract:** Seorang guru yang baik akan sentiasa menilai kembali proses pengajarannya. Penilaian kembali proses pengajaran seseorang guru dikenali refleksi. Tujuan kajian ini dilaksanakan untuk mengkaji amalan refleksi di kalangan guru pelatih IPG Kampus Tawau dan sejauhmana ia membantu mereka menghasilkan inovasi sepanjang latihan mengajar. Seramai 15 orang guru pelatih sains yang telah menjalani latihan mengajar dipilih sebagai responden dalam kajian ini. Instrumen yang digunakan adalah terdiri daripada borang analisis dokumen dan temubual berstruktur ke atas responden. Data dianalisis menggunakan teknik analisis dokumen dengan berpandukan kategori penulisan reflektif Hatton dan Smith. Manakala temubual dilaksanakan bagi menguatkan lagi dapatan bagi melihat sejauhmana amalan refleksi terhadap penghasilan inovasi dalam bilik darjah. Dapatan kajian, menunjukkan 8 daripada 15 di kalangan guru pelatih berjaya menghasilkan inovasi dalam pengajaran pembelajaran. Di harapkan kajian ini dapat meningkatkan amalan refleksi di dalam menghasilkan lebih banyak alat bantu mengajar dan kaedah pengajaran yang berinovasi. Lantaran itu guru-guru pelatih harus disedarkan akan kepentingan penulisan reflektif yang betul agar mampu menjadikan mereka menjadi guru yang kreatif dan inovatif.

**Keywords:** Amalan refleksi, Inovasi, Pengajaran Pembelajaran, Guru Pelatih.

### 1 PENGENALAN

Malaysia sedang giat berusaha untuk mencapai status negara maju menjelang 2020. Oleh itu, bidang pendidikan merupakan sektor yang perlu diperkukuhkan dan ditingkatkan kerana kemajuan sesuatu negara boleh dinilai melalui kejayaan sistem pendidikan. Sejajar dengan visi dan misi negara, Institut Pendidikan Guru Malaysia berikrar melahirkan guru yang kompeten dan berjiwa pendidik melalui program pembangunan guru yang dinamik ke arah pendidikan sekolah bertaraf dunia. Bagi memastikan visi dan misi ini tercapai, amalan penulisan refleksi di dalam proses pengajaran dan pembelajaran perlu ditekan. Guru-guru perlu mempunyai kebolehan membuat refleksi tentang pedagogi mereka sendiri bagi menambahbaik amalan pengajaran mereka. Menurut Macintyre (2000), tanpa refleksi, guru tidak dapat mengubah amalan mereka. Sedar atau tidak, melalui refleksi guru dapat meningkatkan professional keguruan kerana ia bertindak sebagai satu wadah membuat keputusan yang mengakibatkan sesuatu tindakan di dalam pedagogi diambil. Dewey (1933), menyatakan

refleksi menjadi satu asas yang kukuh dalam mengkaji kognitif guru semasa membuat keputusan tentang pengajaran dan pembelajaran.

Refleksi dapat memberi peluang kepada guru untuk menilai kekuatan dan kelemahan diri. Kesannya guru boleh melihat kesan ke atas pengajaran dan pembelajaran pada kelas seterusnya. Guru merupakan pemangkin ke arah membina pemikiran yang analitikal, kritis dan kreatif pelajar. Oleh itu, guru seharusnya menguasai kemahiran dan pengetahuan yang terkini selari dengan arus transformasi pendidikan negara. Pemupukan budaya inovasi di kalangan guru juga harus ditingkatkan, bagi meningkatkan pemikiran kritikal yang sesuai dengan perubahan dalam pendidikan. Sehubungan dengan itu, guru harus meningkatkan tahap amalan refleksi yang lebih kritikal dan kritis bagi meningkatkan lagi keberkesanan pedagogi mereka.

## 2 LATIHAN MENGAJAR

Misi Institut Pendidikan Guru Malaysia ialah melahirkan guru yang kompeten dan berjiwa pendidik melalui program pembangunan guru yang dinamik ke arah sekolah bertaraf dunia. Sehubungan dengan itu, IPG telah menetapkan latihan mengajar sebanyak tiga fasa iaitu praktikum 1, 2 dan 3. Latihan mengajar adalah komponen penting dalam kurikulum latihan perguruan yang berlandaskan hasrat dan matlamat Falsafah Pendidikan Kebangsaan. Ia menyediakan peluang kepada guru pelatih mempraktikkan teori dan amalan pengajaran dan pembelajaran. Melalui pengalaman dan proses refleksi, guru pelatih akan menghasilkan ilmu binaan (situational knowledge) yang menjadi asas kepada ilmu profesional keguruan.

Melalui latihan mengajar guru pelatih dapat menunjukkan dan mengamalkan tingkah laku yang ingin diinginkan untuk mengajar secara berkesan serta cuba menggunakan segala teori yang telah didedahkan kepada mereka. Unit praktikum telah menetapkan selama 24 minggu latihan mengajar sebagai syarat pengajian program ijazah sarjana muda pendidikan.

## 3 REFLEKSI

Refleksi ialah satu elemen penting bagi meningkatkan profesionalisme perguruan. Ee (2001), menyatakan refleksi merupakan satu teknik membuat pertimbangan teliti tentang segala tindakan yang telah dijalankan oleh seseorang individu. Proses refleksi dapat membantu guru pelatih menambah baik amalan dalam pengajaran dan pembelajaran. Dewey (1933), mengemukakan refleksi adalah batu asas dalam mengkaji kognitif guru semasa membuat keputusan. Amalan refleksi yang berterusan bukan sahaja memberi impak kepada pengajaran di dalam kelas malah meningkatkan sendiri diri seorang guru. Melalui penulisan refleksi guru dapat melatih pemikiran yang lebih kreatif dan kritis.

Menurut Hoover (1994), penulisan refleksi dapat menjadikan guru lebih kritis terhadap pengalaman dan masalah yang dihadapi dengan berusaha mencari alternatif bagi mengatasi masalah tersebut. Bagi guru pelatih, penulisan refleksi direkod dalam buku rancangan harian dan juga jurnal di dalam portfolio. Ong (2004) menyatakan bahawa penulisan berupaya memainkan peranan sebagai bahan bukti yang membolehkan guru menterjemahkan pemikirannya secara tersurat untuk diselaraskan dan mengambil tindakan susulan. Penulisan refleksi

bukan hanya ditulis semata-mata, tetapi hendaklah dijadikan rujukan bagi sesi pengajaran dan pembelajaran seterusnya.

## 4 TAHAP PENULISAN REFLEKSI

Tahap penulisan refleksi Hatton dan Smith (1995) dipilih bagi kajian kes ini. Terdapat empat kategori iaitu penulisan deskriptif, penulisan refleksi deskriptif, refleksi dialog dan refleksi kritikal. Tahap pertama iaitu penulisan deskriptif ialah penulisan yang melaporkan sesuatu peristiwa yang berlaku di dalam kelas secara tidak terperinci. Tahap kedua ialah penulisan refleksi deskriptif yang menyatakan sebab, akibat dan justifikasi yang tidak menyeluruh. Tahap ketiga ialah refleksi dialog iaitu lebih terperinci dengan tambahan tindakan dan hujahan yang lebih mendalam. Manakala tahap keempat iaitu refleksi kritikal ialah penulisan refleksi yang menjurus kearah pemikiran yang lebih kompleks dan berupaya mengaitkan dengan prinsip dan falsafah serta melaksanakan tindakan.

Pada tahap ini, guru pelatih sudah mampu menghasilkan alat-alat bantu mengajar dan kaedah pengajaran yang berinovasi. Penulisan refleksi guru pelatih ketika menjalankan kajian penyelidikan dirujuk menggunakan tahap ini. Latihan mengajar seharusnya dapat menjadikan guru pelatih mencapai tahap penulisan refleksi kritikal. Ramai penyelidik bersepakat mengatakan amalan refleksi merupakan matlamat yang diperlukan dalam program pendidikan guru.

Rajah 1: Tahap Penulisan Refleksi Hatton dan Smith (1995) dipetik dari Nor Hasniza (2006)

## 5 OBJEKTIF KAJIAN

- 1) Mengenal pasti tahap penulisan refleksi di kalangan guru pelatih sains IPG kampus tawau.
- 2) Mengkaji amalan refleksi dalam penghasilan inovasi pengajaran dan pembelajaran di kalangan guru pelatih sains IPG Kampus Tawau.

## 6 METODOLOGI

Kajian kes ini menggunakan kaedah kualitatif ke atas kumpulan responden yang kecil. Pendekatan kualitatif berupaya mengenal pasti secara terperinci dan lebih mendalam tentang sesuatu yang dikaji (Cohen, Manion dan Marison, 2004). Instrumen yang digunakan ialah analisis dokumen dengan mengumpul penulisan reflektif guru pelatih dalam kajian tindakan mereka. Bentuk penulisan reflektif dinilai mengikut empat tahap Hatton dan Smith. Sesi temubual pula dijalankan bagi menyokong dapatan yang diperolehi analisis dokumen.

### 6.1 Responden Kajian

Pemilihan peserta kajian adalah menggunakan persampelan bertujuan dengan mengambil kira guru pelatih yang melaksanakan kajian tindakan semester akhir iaitu semester 8. Seramai 15 orang guru pelatih sains dipilih bagi kajian kes ini.

## 7 DAPATAN DAN PERBINCANGAN

Berikut adalah hasil tahap penulisan reflektif guru pelatih sains di dalam kajian tindakan mereka.

### 7.1 Tahap Penulisan refleksi

Tahap penulisan refleksi dari kajian tindakan guru pelatih

Rajah 2 : Penulisan refleksi guru pelatih sains

Tahap penulisan guru pelatih daripada kajian tindakan yang telah dijalankan didapati terdapat tiga tahap penulisan reflektif dikenalpasti. Tiada penulisan deskriptif di kalangan guru pelatih dan ia memang dijangkakan kerana guru-guru pelatih ini telah menjalani tiga fasa. Penulisan refleksi yang diharapkan adalah lebih ekplisit dan kritikal.

### Penulisan Reflektif Deskriptif

*“Saya mendapati murid yang lemah amat sukar untuk memahami pengelasan haiwan berdasarkan pemakanannya, masalah tersebut bukan sahaja berlaku terhadap murid lemah tetapi juga kepada murid yang pintar”*

*Murid masih tidak dapat menguasai konsep rantai makanan*

*Murid kurang berminat mengikut proses pengajaran dan pembelajaran*

(GP/L/05)

Hanya seorang guru pelatih menulis pada tahap kedua, penulisan tahap ini menunjukkan guru pelatih masih tidak berupaya mengaplikasi amalan refleksi sampai ke arah tindakan penambahbaikan. Penulisan hanya membincangkan apa yang berlaku di dalam kelas tanpa menyatakan tindakan mengatasinya. Zembal-Saul, Blumfield dan Krajcik (2000), ada menjelaskan majoriti guru pelatih sains walaupun secara teori telah diperkenalkan kepada makna pemikiran dan amalan refleksi namun mereka masih kurang berupaya untuk mengenalpasti masalah atau peristiwa yang sangat memberikan kesan terhadap pengajarannya dan perlu di beri perhatian supaya proses pengajaran dan pembelajaran dapat berjalan dengan jayanya sekali gus membantu meningkatkan kefahaman pelajar terhadap konsep sains yang diperkenalkan.

### Penulisan Refleksi Dialog

*“Masalah yang paling ketara adalah kelemahan murid dalam menguasai kemahiran.*

*Pelajar tidak dapat memindahkan maklumat daripada jadual kepada bentuk graf dan meletakkan pembolehubah pada paksi yang betul.*

*Guru berusaha mencari jalan penyelesaian bagi mengatasi masalah tersebut.*

(GP/L/07)

Terdapat empat orang guru pelatih menulis pada tahap ini. Pada tahap ini, guru pelatih sudah mampu mengenalpasti tindakan yang seharusnya diambil tetapi tidak terus mengambil langkah seterusnya pada ketika itu. Jenis penulisan ini lebih baik berbanding penulisan refleksi deskriptif.

**Penulisan Refleksi Kritikal**

*“Murid menjadi kurang responsif semasa sesi soal jawab berkaitan konsep. Guru memperuntukkan masa tambahan untuk menerangkan konsep semula.*

*Suasana kelas yang suram dan tidak bermotivasi, terdapat beberapa pelajar yang mengganggu rakan disebelahnya. Guru mengambil inisiatif mempelbagaikan intonasi suara dan menyelitkan unsur kecindan dalam penerangan.*  
(GP/P/02)

*Guru berusaha mencari jalan penyelesaian bagi mengatasi masalah tersebut.*

*“Guru mendapati kebanyakan murid mempunyai masalah menguasai konsep yang diajar serta tidak dapat menjawab dengan baik latihan yang diberikan. Guru menggunakan pendekatan konstruktivisme dalam pengajaran dan mengaplikasikan konsep 5 fasa Needham dalam prosedur pengajaran. Guru juga menerapkan elemen teknologi seperti video dan powerpoint dalam PDP.”*  
(GP/L/09)

*“Murid tidak tahu cara menjawab soalan kemahiran memerhati dengan betul, ini akan membawa kesan apabila murid ingin melaksanakan eksperimen kelak. Guru telah merancang satu teknik menjawab soalan pemerhatian yang dinamakan ‘Bulatan Panca D’ bagi meningkatkan penguasaan kemahiran memerhati di kalangan murid.”*  
(GP/P/04)

Seramai sepuluh orang guru pelatih dapat menulis refleksi pada tahap yang paling baik iaitu penulisan refleksi kritikal. Setelah melalui latihan mengajar sebanyak tiga fasa, seharusnya guru pelatih dapat menulis pada tahap ini. Menurut Hatton dan Smith, pada peringkat ini guru pelatih telah berupaya membuat hubungkait sesuatu yang berlaku di dalam kelas dengan prinsip sebagai

seorang guru, falsafah guru dan falsafah pendidikan. Penulisan refleksi ini dapat ditunjukkan dengan jelas segala tindakan yang diambil ketika pengajaran dan pembelajaran berlangsung.

**7.2 Hubungan Tahap Penulisan Refleksi dan Penghasilan Inovasi**

Jadual 1: Rumusan dapatan tahap penulisan refleksi dengan penghasilan inovasi

Bil	Responden	Tahap penulisan refleksi	Kaedah
1	GP/L/01	Kritikal	Infoladder (Inovasi)
2	GP/L/02	Kritikal	Model Fasa bulan
3	GP/L/03	Dialog	Video kartun
4	GP/L/04	Kritikal	Apakes (Inovasi kaedah)
5	GP/L/05	Refleksi Deskriptif	Kad permainan masira
6	GP/L/06	Dialog	Mnemonik
7	GP/L/07	Kritikal	Graffy tools (Inovasi)
8	GP/L/08	Kritikal	STAD
9	GP/L/09	Kritikal	Kapsul TABU
10	GP/P/10	Kritikal	Foldabel Note (Inovasi)
11	GP/P/11	Kritikal	Hands up (Inovasi Kaedah)
12	GP/P/12	Dialog	Role Play Station
13	GP/P/13	Kritikal	Bulatan Panca D
14	GP/P/14	Kritikal	Lock Key Chain kits (Inovasi)
15	GP/P/15	Kritikal	Woit (Inovasi)

Berdasarkan jadual di atas, di dapati seramai enam daripada sepuluh orang guru pelatih yang mencapai tahap penulisan kritikal berjaya menghasilkan inovasi dalam pengajaran dan pembelajaran. Inovasi berbentuk alat bantu mengajar dan juga Sebanyak empat alat bantu mengajar yang berinovasi dan dua inovasi kaedah dihasilkan.

Kebiasanya guru pelatih yang berjaya mencapai amalan refleksi yang kritikal dapat menghasilkan alat bantu mengajar yang lebih baik dan kreatif.

### 7.3 Temubual

Jadual 2: Analisis temubual Item 1

Item 1: Apa yang anda faham dengan amalan refleksi ?

Responden	Pernyataan
R1	aaa.. yang saya faham mengenai amalan refleksi adalah mengambil rumusan dan kesimpulan selepas melakukan pengajaran. Sama ada dari segi kelemahan, kekuatan dan penambahbaikan bagi kelemahan.
R2	Apa yang saya faham ialah membuat pertimbangan bagi saya perbaiki pengajaran saya. Saya banyak menulis kepada cara penambahbaikan kaedah. Penulisan refleksi akan saya tulis selepas pdp.
R3	Pada saya, refleksi adalah untuk memperbaiki diri bagi menghasilkan pdp yang lebih baik. Saya akan lihat kelemahan saya dan saya akan perbaiki, dan menulis refleksi adalah bukti yang menunjukkan saya menjalankan pdp.

Daripada temubual item 1, kesemua guru pelatih faham apakah amalan refleksi dalam bidang pendidikan. Mereka faham akan kepentingan refleksi dalam menambah baik amalan mereka. Dalam menentukan kaedah pengajaran, guru pelatih harus mereflek diri mereka bagi menghasilkan pengajaran dan pembelajaran lebih baik.

Jadual 3: Analisis temubual Item 2

Item 2: Sejauhmana anda membuat refleksi dalam buku rekod mengajar?

Responden	Pernyataan
-----------	------------

R1

Refleksi ni adalah sesuatu yang wajib ditulis bagi saya menilai diri saya dan murid. Adakah pengajaran saya berkesan atau tidak. Jadi setiap kali habis pengajaran saya akan membuat refleksi sama ada strategi pengajaran saya berkesan atau tidak

R2

Mmmm ...pada awalnya, praktikum fasa 1, saya lakukan refleksi hanya tentang murid sahaja. Tetapi semakin lama amalan refleksi saya semakin baik di mana saya lebih menumpukan kaedah pengajaran, kelemahan dan kelebihan terhadap sesi pengajaran.

R3

Aaaa....setiap kali pdp, selepas mengajar saya akan terus menulis di ruangan refleksi kerana kalau tidak ditulis, saya takut lupa. Saya akan tulis kekuatan, kelemahan saya. Bagi Journal mingguan pula saya akan tulis cara saya mengatasi kelemahan pdp saya dengan membuat rujukan.

Dalam temubual item 2, semua responden membuat refleksi setiap kali selesai proses pengajaran dan pembelajaran. Guru pelatih setuju di mana penulisan refleksi semakin baik setelah menjalani tiga fasa latihan mengajar. Mengenalpasti kekuatan, kelemahan dan cadangan penambahbaikan dapat membantu guru pelatih meningkatkan pengajaran dengan alat bantu mengajar yang berinovasi.

Jadual 4: Analisis temubual Item 3

Item 1: Daripada amalan refleksi yang ditulis, berapa banyak inovasi yang telah dilaksanakan atau direka?

Responden	Pernyataan
R1	Seingat saya, setiap kali praktikum saya akan membuat inovasi sama ada alat bantu mengajar atau kaedah pengajaran yang digunakan. Sekurang-kurangnya satu inovasi telah sy buat sepanjang latihan

*mengajar, Cuma bagi fasa 3. sy telah menghasilkan lebih banyak inovasi dihasilkan kerana saya banyak belajar daripada latihan mengajar sebelumnya.*

R2 *Saya tidak pasti berapa...setiap kali pengajaran saya akan menghasilkan alat bantu mengajar yang berbeza. Saya tidak sedar adakah ia inovasi atau tidak. Apa yang saya lakukan ialah menghasilkan alat bantu mengajar yang memudahkan murid. Alat bantu mengajar saya semakin kali semakin baik sehingga ke praktikum 3.*

R3 *Pada saya, mungkin 2 atau 3 kot. Inovasi yang saya buat di dalam kelas adalah on the spot. Saya perhatikan pelajar sangat gembira dengan inovasi yang saya buat. Inovasi ini telah saya menangi dan saya akan terus membuat ABM yang lebih baik masa akan datang.*

Ketiga-tiga guru pelatih bersetuju terdapat penambahbaikan dari segi alat bantu mengajar yang dihasilkan sepanjang latihan mengajar yang diikuti. Terdapat bukti penghasilan alat bantu mengajar yang banyak namun guru pelatih tidak dapat membezakan sam ada ABM tersebut adalah inovasi atau tidak.

## 8 KESIMPULAN

Pendidikan di Malaysia telah menjalani beberapa fasa transformasi. Ini adalah bertujuan untuk menjadikan pendidikan di negara ini mampu bersaing dengan negara-negara maju. Guru adalah wadah utama untuk merealisasikan harapan ini. Keberkesanan sesuatu pengajaran dan pembelajaran banyak bergantung kepada kaedah atau teknik yang digunakan oleh seseorang guru di dalam kelas. Guru yang cemerlang hendaklah sentiasa melaksanakan refleksi sendiri serta amalan dalam pengajaran dan pembelajaran. Penulisan refleksi yang kritikal mampu melahirkan guru yang kompeten dan bersedia bersaing dalam dunia globalisasi.

## 9 PENGHARGAAN

Pertama sekali kami ingin mengucapkan syukur ke hadrat ilahi atas limpahan rahmatnya telah memberi kesihatan dan kekuatan kepada kami sehingga berjaya menyiapkan kajian kes ini.

Setinggi-tinggi penghargaan dan terima kasih kami ucapkan kepada pengarah IPG Kampus Tawau iaitu Puan HJh Masni binti Madat dan Ketua-ketua jabatan yang terlibat kerana telah memberi peluang dan dorongan kepada kami untuk memantapkan lagi profesion kami sebagai pensyarah dalam memberi dan mencari ilmu pengetahuan. Ucapan ribuan terima kasih juga diucapkan kepada semua guru pelatih sem 8 dari unit Sains IPG Kampus Tawau kerana telah memberikan kerjasama yang amat baik selaku responden dalam kajian ini.

Tidak dilupakan ucapan terima kasih ditujukan kepada rakan-rakan pensyarah dan semua pihak yang terlibat sama ada secara langsung mahupun tidak langsung yang telah berkongsi ilmu dan kemahiran dalam menjayakan kajian kes ini. Akhir sekali penghargaan yang tidak terhingga diucapkan kepada keluarga kami kerana sentiasa memberi sokongan dan dorongan yang tidak mampu untuk kami balas. Semoga kajian kes ini memberi manfaat kepada semua pihak khususnya mereka yang terlibat dalam dunia pendidikan.

# CHALLENGES AND OPPORTUNITIES IN IMPLEMENTING PROBLEM BASED LEARNING (PBL) MODEL IN MATHEMATICS CLASSROOM

*The Case of Ninth Grade Mathematics at Laboratorium School in Indonesia  
University of Education (UPI)*

**Abstract:** Problem based learning (PBL) is a constructivist approach to learning. PBL is a student centered instructional strategy in which students collaboratively solve problems in a group, (ideally 6-10 students) and reflect on their experience. Students are encouraged to exchange ideas, feelings, experiences, information and insights, to tease out and define the limits of their existing knowledge and together actively build a new level of understanding that could be achieved individually. In this paper an attempt was made to examine the challenges of implementing PBL in Mathematics classroom in a Junior Secondary School at Laboratorium School of Indonesia University of Education(UPI). More specifically, this paper was to answer the question “What are the challenges in implementing PBL to Mathematics classroom? What are the opportunities that PBL brings to both students and mathematics teachers at this level? Data was collected from 23 Math and Science teachers from Indonesia University and Ethiopian TCTP groups by using observation check-lists in an open lesson study class. To achieve the intended objectives a mixed approach (Qualitative and quantitative) methods of data analysis was used. The study revealed that two variables namely **Tutor Behaviour** and **Team work** found to be the major challenges in implementing PBL to Mathematics Classroom in grade nine. However, the other five variables (**Prior knowledge, Quality of the problem, Student centeredness, Group Dynamics** and **Ground Rules**) were found to be minor challenges in the process of PBL. The study also revealed that there are some significant opportunities of using PBL in Mathematics classroom that all Mathematics teachers should consider.

**Keywords:** Problem based learning(PBL), Problem solving, Challenges and opportunity

## 1 INTRODUCTION

Problem-based learning (PBL) is a constructivist educational approach that organizes curriculum and instruction around carefully crafted “ill-structured” problems (Barrows, 1988). Guided by teachers acting as cognitive coaches, students develop critical thinking, problem solving, and collaborative skills as they identify problems, formulate hypotheses, conduct data searches, perform experiments, formulate solutions and determine the best “fit” of solutions to the conditions of the problem. Problem-based learning enables students to embrace complexity, find relevance and joy in their learning, and enhance their capacity for creative and responsible for real world problems.

The goals of PBL are to help the students develop flexible knowledge, effective problem solving skills, self-directed learning, effective collaboration skills and intrinsic motivation.

When thinking about implementing PBL in our teaching contexts, the words of Marinovich (2000) provide a pertinent perspective on the differences

between PBL and traditional classrooms and the implications for us as teachers: it is easy to overlook the many ways in which PBL goes against the grain of faculty and postsecondary educational life. While faculty are devoted to their discipline, eager to dispense knowledge, and content-oriented, PBL asks them to be student-centred, guiding rather than directive, and process-oriented (p. 3). It is easy to conjure up images of traditional classrooms with tables and chairs in rows, and the teacher at the front of the classroom “dispensing knowledge”. But Marinovich reminds us that perhaps the image we have we think about PBL is, or should be, different. The notion of being “student-centered”, “guiding rather than directive”, and “process-oriented” arise from research into learning and learning theories. The roots can be found in a learning theory broadly labeled “constructivism”. Although the conceptual links between constructivism and PBL are rarely discussed in the literature, examining constructivism more closely may reveal some insights into some origins of the practice of PBL

In the PBL process students work in groups, identify what they already know, what they need to know, and how and where to access new information that may lead to resolution of the problem. The role of the instructor (known as the tutor in PBL) is to facilitate learning by supporting, guiding, and monitoring the learning process. The tutor must build students' confidence to take on the problem, and encourage the students, while also stretching their understanding. PBL represents a paradigm shift from traditional teaching and learning philosophy, which is more often lecture -based. However, as the teaching learning in general and the teaching of Mathematics in particular is concerned PBL model is not been frequently used by classroom teachers in Ethiopia. Therefore in this paper an attempt was made to implement PBL in Mathematics classroom at Junior secondary school at Indonesia University of Education and thereby to examine the challenges and opportunities during it's implementation. More specifically this paper tries to answer the following basic questions. What are the challenges in implementing PBL in grade nine Mathematics classroom? What are the opportunities that PBL brings to both mathematics teacher and students of grade nine?

### 1.1 Factors Determining the Successful Implementation of PBL

Many factors are needed in order to achieve a successful PBL that leads to achievement of acquisition of retrieval knowledge. Those factors are:

1. **Prior knowledge:** the amount of prior knowledge and activation of the prior knowledge in the discussion is very important determinant of the achievement and increasing the interest in the subject matter. The prior knowledge is one of the elements in the constructivism theory of learning
2. **Quality of the problem:** The well constructed problem will trigger and stimulate discussion and will increase the time spent in the tutorial group and in self study.
3. **Tutor Behaviour:** The tutor that maintains the discussion to the context of the problem will increase the quality of the problem.
4. **Student centeredness:** Motivation of the students is increased when the learning is his/her responsibility. This will lead to

application of the self determination for learning.

5. **Team work:** the well functioning team will lead collaboratively to efficiency in all steps of PBL process.
6. **Group Dynamics:** Group dynamic will ensure that every one is participating efficiently and effectively, this will lead to improve the team work.
7. **Ground Rules:** Organization is one of the principles of learning, ground rules are very important in maintaining the organization of the tutorial group and maintain group dynamic.

### 1.2 Statement of the Problem

Several medical schools around the globe have incorporated problem-based learning into their curricula, using real patient cases to teach students how to think like a clinician. More than eighty percent of medical schools in the United States now have some form of problem-based learning in their programs. Research of 10 years of data from the University of Missouri school of Medicine indicates that PBL has a positive effect on the students' competency as physicians after graduation

In Malaysia, an attempt is being made to introduce a problem-based learning model in secondary mathematics, with the aim of educating citizens to prepare them for decision-making in sustainable and responsible development.

In 2008, Parramatta Marist High School a secondary Catholic school in Australia employed the methods of PBL in their teaching for year 9 and 10 boys. The learning system was a great success and since has been expanded to lower grades to challenge students to think outside of the box and relate content drive courses to problems in the real world.

In 2002, Gadjah Mada University of Yogyakarta, Indonesia began offering an International Medicine program based on problem-based learning. Gazeira University in Sudan was the first in the country to adopt PBL in its medical college, a trend that was followed by some of the newer medical colleges. In 2008 the famous Faculty of Medicine of the University of Khartoum, which was following a traditional curriculum since its foundation in 1924 made a being change in

curriculum structure by adopting a blend curriculum that incorporate problem solving learning strategies.

Some documents indicate that this method is being under use in some Medical schools in Ethiopia and other African countries. However, there are no evidences showing that PBL was used as an instructional Model both in Ethiopia where the researcher had carried out his 12 years of teaching carrier. My observation of classes here in Indonesia University of Education (UPI) also indicates that this model is not used by Math and science teachers. Therefore, the researcher seeks to know why the PBL is not frequently used by Math and science teachers in UPI. Based on this observation, the following basic research questions were formulated by the researcher. What are the challenges in implementing PBL in grade nine Mathematics classroom? What are the opportunities that PBL brings to both mathematics teacher and students of grade nine?

### 1.3 Statement of the Problem

Advocates of PBL claim that using PBL model for classroom instruction enhance content knowledge while simultaneously fostering the development of communication, problem-solving, critical thinking, collaboration, and self-directed learning skills. PBL may position students in a simulated real world working and professional context which involves policy, process, and ethical problems that will need to be understood and resolved to some outcome. By working through a combination of learning strategies to discover the nature of a problem, understanding the constraints and options to its resolution, defining the input variables, and understanding the viewpoints involved, students learn to negotiate the complex sociological nature of the problem and how competing resolutions may inform decision-making. This study is important for teachers in the primary, secondary and university so that they could have a chance to shift their teaching paradigm from more teacher dominant traditional classroom to a modern style student centered and active learning approach which best suits with the 21st century young generation. The study will also be so important for curriculum designers, educational supervisors and policy makers to give priority to this method in any curriculum revision in the future.

## 2 THEORETICAL FRAMEWORK

### 2.1 Constructivism and PBL Model

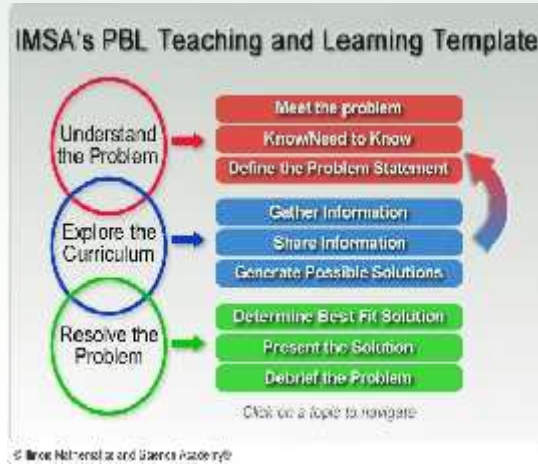

Problem Based Learning addresses the need to promote lifelong learning through the process of inquiry and constructivist learning. PBL can be considered as a constructivist approach to instruction, emphasizing collaborative and self-directed learning and being supported by flexible teacher scaffolding. Yew and Schmidt, Schmidt, and Hung elaborate on the cognitive constructivist process of PBL as follows.

1. Learners are presented with a problem and through discussion within their group, activate their prior knowledge.
2. Within their group, they develop possible theories or hypotheses to explain the problem. Together they identify learning issues to be researched. They construct a shared primary model to explain the problem at hand. Facilitators provide scaffold, which is a frame work on which students can construct knowledge relating to the problem.
3. After the initial team work, students work independently in self directed study to research the identified issues.
4. The students re-group to discuss their findings and refine their initial explanations based on what they learned.

The are seven steps in PBL process. These are:

1. Clarify terms and concepts not readily comprehensible
2. Define the problem
3. Analyze the problem,( brainstorming).
4. Resolve issues based on prior knowledge (inventory of explanations)
5. Formulate learning objectives
6. Information gathering, (self-study)
7. Synthesize and test the newly acquired information

Figure: IMSA’s PBL Teaching and Learning Template

PBL follows a constructivist perspective in learning as the role of the instructor is to guide and challenge the learning process rather than strictly providing knowledge. From this perspective, feedback and reflection on the learning process and group dynamics are essential components of PBL. Students are considered to be active agents who engage in social knowledge construction. PBL assists in processes of creating meaning and building personal interpretations of the world based on experiences and interactions. PBL assists to guide the student from theory to practice during their journey through solving the problem.

### 3 METHODOLOGY

#### 3.1 Study Design

In this study both qualitative and quantitative (mixed approach) was used

#### 3.2 Target Population

Math and science teachers at Laboratorium school of UPI and Ethiopian TCTP group

#### 3.3 Sample Size and Sampling Technique

Seventeen teachers from indonesia university and six teachers from Ethiopia(TCTP) groups a total of twenty three Math and science teachers have been

involved in this study. Available sampling was used in this case.

### 3.4 Data Collection Instrument

Observation checklist was used as the main data collection instrument.

#### 1.1 3.5. Method of Data Analysis

Descriptive statistics such as percentage, median and mode were used as the main statistical tool in this research.

## 4 DATA PRESENTATION AND ANALYSIS

### 4.1 Participants Background

As table 4.1 shows there are 17 participants (six males and eleven females) from indonesia university of education and six participants (one Female and five Males) from Ethiopian Teacher education Colleges (TCTP group) composing the total number of participants in this study to be 23. The age group and the teaching experience they have is as indicated on the table above.

Data was collected by using an observation check-list which is a five point Likert scale. The questionnaire contains seven variables in which the researcher think challenges on the implementation of PBL in Mathematics classroom. There are 15 close ended questions and one open ended question in this check-list as the responses were organized by the following table.

Table 4.2 the frequency and percentage of responses obtained from the five-point likert scale

As table 4.2 above shows for question 1.1, 26,09% of the respondents disagree, 17,39% were neutral, 34,78% were agree and 21,74% where strongly agree. Similarly for question 1.2 which is in the same category as Q1.1, 30,43% of the respondents were disagree 4,35 % were neutral 52,17% were agreed and 13,04% were strongly agreed.

Similarly for question 2.1, 4,35 % of the respondents are strongly disagree, 26,09 % were disagree, 17,39 % were neutral, 34,78% were agree and 17,39% where strongly agree. Similarly for question 2.2, 8,70 % of the respondents were disagree, 17,39% were neutral 60,87% were agreed and 13,04% were strongly agreed

In the same way for question 3.1, 13,04% of the respondents disagree, 34,78 % were neutral, 34,78 % were agree and 17,39 % where strongly agree. For question 3.2, 30,43 % of the respondents were disagree 34,78 % were neutral 21,74% were agreed and 13,04% were strongly agreed

For question 4.1, 4,35% of the respondents disagree, 17,39% were neutral, 69,57% were agree and 8,70% where strongly agree. Similarly for question 4.2, 8,70% of the respondents were disagree 21,74% were neutral 60,87% were agreed and 8,70% were strongly agreed

For question 5.1, 17,39% of the respondents disagree, 21,74% were neutral, 34,78% were agree and 26,09% where strongly agree. Similarly for question 5.2, 13,04% were neutral 69,57% were agreed and 17,39% were strongly agreed. On the same way for question 5.3, 4,35% of the participants were neutral, 78,26% agree and 17,39% respondents were strongly agreed

For question 6.1, 13,04% of the respondents disagree, 30,43% were neutral, 52,17% were agree and 4,35% where strongly agree. Similarly for question 6.2, 4,35% of the respondents were disagree 34,78% were neutral 56,52% were agreed and 4,35% were strongly agreed

Finally for question 7.1, 8,70% of the respondents disagree, 13,04% were neutral, 60,87% were agree and 17,39% where strongly agree. Similarly for question 7.2, 17,39% of the respondents were disagree 26,09% were neutral 43,48% were agreed and 13,04% were strongly agreed

The following table shows the median and mode of respondents on the five- point likert scale obtained through the same check-list.

As you can see on the table 4.3 above the median and modal value was calculated for the the response of 23 participants obtained through a five point likert scale. Based on this, let's see the median and modal values of each of the seven variables.

1. Prior knowledge: As the table above clearly shows the median calculated is 4 and the modal value is also 4. This results shows that most of the respondents agreed that students have been activated to use their prior knowledge and applied their prior knowledge to solve the problem under discussion
2. Quality of problem: As the table above clearly shows the median calculated is 4 and the modal value is also 4. The results indicate that most participants agree that

the problem is well designed in such a way that it triggers and stimulates discussion and is related to students real life so that it promotes contextual learning.

3. Tutor's behaviour: As the table above clearly shows the median calculated is 3.5 and the modal value is 3. As the result here shows most participants are neutral on the idea that the tutor has maintained the discussion to the context of the problem which will increase the quality of the problem by asked open questions to stimulate the discussion. Here the median 3.5 also indicates the respondents are between neutral and agree.
4. Student-centeredness: As the table above clearly shows the median calculated is 4 and the modal value is also 4. This shows that respondents agree that students have been motivated to to be responsible for their own learning and they were active participants in a group discussion which lead to a self directed learning.
5. Team-work: As the table above clearly shows the median calculated is 4 and the modal value is also 4. As the median and modal values obtained shows that participants agree that each group developed a team spirit and working collaboratively that lead to efficiency in all steps of PBL process. They also agree that students share information within their group and listen to and respect contributions of others in a group.
6. Group dynamics: As the table above clearly shows the median calculated is 3.5 and the modal value is also 4. Here we see that most participants still agree that every group member is participating effectively and each group follow the steps of the process of PBL as it has been agreed upon. But the median value shows that they are in between neutral and agree wich shows still there is a challenge in mantaining group dynamics.
7. Ground rules: As the table above clearly shows the median calculated is 4 and the modal value is also 4. As we can observe from the table that the participants agree

that the activity is well organized and ground rules are set to maintain the organization. They also agree that ground rules were strictly followed by groups and maintained group dynamic.

In the check-list there was one open-ended question stated as “Give the tutor tips for improvement (short and precise).”. The response obtained from the participants is as follows. For the open-ended question 17 participants responded in Bahasa Indonesia and later it was translated into English.. Here I would like to inform you that each Capital letter below represents a code of each respondent and its English version was put in italics in the paranthesis. If there is any inconvineces with my translation it is still open for correction

A: Permasalahan dalam pembelajaran dengan pendekatan PBL tidak mendapatkan penekanan yang jelas, serta tahapannya tidak terlihat jelas(*Problems in learning with PBL approach did not get a clear emphasis, as well as the stages are not clearly visible*)

B: Tahapan PBL belum terlihat dengan jelas, sehingga pembelajaran dirasakan seperti pembelajaran biasa. Sebaiknya tahapan-tahapan pbl dapat di sajikan lebih jelas dari awal pembelajaran dengan pemberian masalah yang ada relevansinya dengan materi yang akan di bahas (*PBL stages have not seen clearly, so it felt like learning conventional learning. It would be better if PBL learning stages be presented more clearly from the outset that the problem of learning with the provision of no relevance to the material that will be discussed*)

C: Tahapan PBL tidak terlihat, pembelajaran seperti konvensional. seharusnya guru memberikan soal di awal pembelajaran dengan pemberian masalah setiap kelompok diberi permasalahan yang sama. Anggota kelompok bersama-sama menyelesaikan soal tersebut. Saat presentasi setiap kelompok menyajikan hasil diskusinya(*PBL stages are not visible, such as the conventional learning. Actually the teacher in using PBL should give the same problem at the beginning of the learning to each group given a problem giving the same problem. Together, all the members of the group solve the problem. Then each group must present the results of their discussion.*). Guru memberikan penguatan, memperbaiki setiap kesalahan(*The Teacher should provide reinforcement to fix any error*)

D: Pada pembelajaran yang menggunakan pendekatan PBL, biasanya disajikan sebuah permasalahan di awal pembelajaran. Pada

pembelajaran tadi siswa hanya mengerjakan soal biasa secara berkelompok, tidak ada tahapan dalam pbl (*In PBL learning approach, usually a problem is presented at the beginning of the lesson. In the earlier lesson students only do the problem as usual in groups, there are no PBL stages* )

E. Akan lebih bermakna jika peran siswa diberi porsi yang Lebih banyak(*It would be more meaningful if the students are given more opportunity ( time). Soal-soal yang dikerjakan lebih baik jika soal-soal problem solving( It would be better if those Problems that should be solved are typically problem solving)* 3. Pendekatan bahasa lebih efektif jika menggunakan bahasa sejenis(*The use of language would be more effective when using similar language*)

F: Upayakan aktifitas siswa lebih aktif lagi. Artinya dalam kelompok siswa lebih aktif lagi dari semua anggota kelompok tersebut (*Try to make the students more activey during group activity*). Upayakan pembelajaran student-center jangan terlalu banyak di dominasi guru(*In student-center learning the dominance of teachers should be minimized*)

G: Kegiatan pembelajaran tidak tampak penggunaan pendekatan pbl, dan tidak ada tahapan. Tahapan pbl dalam kegiatan pembelajarannya(*Learning activities do not seem to use PBL approach, and there is no PBL stages in the learning activity*)

H :Siswa harus lebih aktif dengan pemberian soal yang kontekstual dan merangsang keinginan siswa (*Students should be active by providing a contextual problem and stimulate students' desire*). Tahapan pbl harus lebih tampak dengan cara pemberian soal masalah di awal pembelajaran(*Pbl stages must be seen by providing problem to be solved at the beginning of the learning process*)

I: Dominasi guru dikurangi dengan lebih mengaktifkan keterlibatan dan kreativitas siswa(*Dominance on the teachers side should be reduced by involving the students to be more creative*). Persoalan yang diberikan pada siswa sebaiknya yang lebih kontekstual (*Problem given to the students should be more contextual*)

J: 1:sebaiknya pada saat pendahuluan siswa yang harus di aktifkan agar diketahui pengetahuan prasyarat yang jelas mereka miliki(*preferably at the time of the introduction of students who are known to be activated in order to clear the prerequisite knowledge that they have*). 2. soal-soal yang diberikan siswa sebaiknya soal-soal problem solving yang menantang siswa mencari solusi dengan

pengetahuan yang jelas mereka miliki bukan soal-soal rutin yang hanya mengeksplorasi keterampilan prosedural siswa saja (*questions that students should be given preferably are problem solving questions that challenge students to look for solutions with the knowledge that they have clearly not routine matters that only students explore procedural skills course*)

K: Pada saat membimbing kelompok tutor memberikan bimbingan dan penguatan mengenai langkah-langkah pemecahan masalah tersebut bukan hanya sekedar penyelesaian secara prosedural (*By the time the group guiding, tutors provide guidance and reinforcement of the steps in solving the problem, and not just the completion of the procedure*)

L: Tahapan PBL tidak dijelaskan di awal sehingga banyak siswa tidak mengikuti prosesnya (*PBL stages are not described in the beginning so that many students do not follow the process*)

M: Permasalahan dalam pembelajaran dengan pendekatan pbl kurang begitu mendapatkan penekanan (*Problems in learning with PBL approach recieved less emphasis*)

N: Guru kurang merespon siswa yang aktif, lebih memperhatikan respon yang di keluarkan siswa sebagai umpan balik (*Teachers respond to students who are less active, more attention to students' responses issued as feedback*). Masalah sebagai inti dari pbl tidak di kemukakan dengan jelas, sebaiknya pada awal kegiatan inti pembelajaran di mulai dengan masalah bukan berupa soal cerita (*Problems as the core of pbl not state clearly, preferably at the beginning of the core activities of learning begins with a problem is not a matter of the story*)

O: Dalam pembelajaran yang telah dilakukan tidak kelihatan langkah-langkah pbl yang ada. Pembelajaran masih kontekstual, namun interaksi dalam pembelajaran sudah baik (*In teaching and learning processes that have been there was no sign of pbl steps there. Learning is contextual, but interaction in learning is good*)

P: Proses pembelajaran masih bersifat prosedural, guru/tutor belum mengajarkan anak untuk memahami konsep secara benar (*The learning process is still procedural, teachers/tutors have not teach children to understand the concept correctly*)

R: It would be better if you make them to drive a formula, they draw, cut and measure...to develop their skill

T: It would be much better if students are given real problems and hands-on activities which enable them to find the volume, surface area....

U: In my opinion the problems (exercises) given to students should be related with students daily

experience. Moreover they have to cut, measure the radius the slant height, the diameter....by themselves.

## 5 DISCUSSION OF FINDINGS

### 1. Prior Knowledge

There were two questions under this category. As the analysis of percentage in table 4.2 shows that the majority of respondents (56.52%) for Q 1.1 and 65.21% for Q1.2 rated above neutral. This shows that the majority of respondents argue that this variable (components) of PBL was quite done well. Where as those who rated neutral and below are also a considerable amount of percentage. So here I understand that this stage of implementing the process of PBL is not a major challenge but still needs more improvement in the coming lessons. Moreover, as table 4.3(a) clearly shows the median and mode of the data distribution were both 4 (Agree). This also confirms that majority of the respondents consider prior knowledge not as a big challenge which is of course go in line with the percentage in table 4.1

### 2. Quality of the problem

There were two questions under this category. As table 4.2 shows the majority of respondents (52.17%) for Q 2.1 and 73.91% for Q2.2 rated above neutral. This shows that the majority of respondents argue **Quality of the problem** as a process of PBL was still not a big challenge. However, the rest of responses rated neutral and below should be taken into consideration indicating a need for further improvement. As table 4.3(a) shows that both the median and mode calculated were 4 (Agree). Hence, this both analysis leads me to the same argument that **Quality of the problem** was not badly altered but is still open for improvement. Remember: formulating a good problem would stir the learning process and of course the students will work hard and enjoy solving such challenging problem)

### 3. Tutor Behaviour

Two questions were provided under this category. The percentage in table 4.2 depicts that the majority of respondents (52.17%) for Q 3.1 and 34.78% for Q3.2 rated above the cut off neutral.. Moreover, table 4.3(a) shows that the median

calculated is 3.5 and the modal value is 3. This shows that most participants are neutral on the idea that the tutor has maintained the discussion to the context of the problem which will increase the quality of the problem. Hence **Tutor’s Behaviour** is found to be the major Challenge determining the implementation of PBL in this particular study.

#### 4. Student-Centeredness

This category has two questions. The analysis in table 4.2 shows the majority of respondents(78.27%) for Q 4.1 and 69.57% for Q4.2 are rated above neutral. Based on this data **Student centeredness** was not a major factor(Challenge) during the implementation process. As table 4.3(b) shows both the median and mode are 4. This claims the fact that students have been motivated to be more responsible for their own learning. Hence **Student-centeredness** is not found as a major challenge in my PBL implementation.

#### 5. Team work

There were three questions under this category. The result shows that 60,87%, 86.96%, 95.65% are rated above agree for questions 5.1, 5.2 and 5.3 respectively. This show that **Team work** as a process of **PBL** is not a big challenge. However, the median calculated in table 4.3(b) is 3.5 and the modal value is 4 for the same parameter which in fact shows inconsistency between the percentage and the measure of central tendency. Hence, this research revealed that **Team work** as one of the major challenging parameter in the process of implementing PBL. (Students contribution in group activity is the major part. How much they contribute should be taken into account)

#### 6. Group Dynamics

Under this parameter I had two questions. The result of analysis in the table 4.2 shows that majority of the respondents(56.52%) for Q 6.1 and 60.87% for Q6.2 rated above neutral and it reveals that this variable was not apperad to be a major challenge in the observed lesson activity;however, a considerable portion of responses indicate a need for improvement for better achievement in Group Dynamics (sharing ideas/exchange strategies should be taken into account in considering group dynamics)

#### 7. Ground Rules

More likely as most of the above parameters **Ground Rule** also had two questions. The percentage of respondents rated above nuteral for

question(7.1) was 78.26% and 56.52% for question 7.2. Both results show that respondents argue very positively to the implementation of this parameter in the PBL process;however, the rest of respondents considered this area as an area for further improvement. As table 4.3(b) clearly shows that both the median and modal value is 4 which actually agrees with the percentage already calculated. The conclusion is that the respondents agree that the activity was well organized, ground rules are set and were strictly followed to maintain the organization.

Finally the responses for open-ended question show that most of the participants suggested that some of the stages of PBL were not worked out well and the classroom was mainly teacher dominated. Yes.... Solving open ended problems need the student to be creative, flexible, brings new ideas, as well as different strategies)

## 6 CONCLUSIONS

The main objectives of this small scale research was to answer the following Basic questions. What are the challenges determining the in implementing PBL in grade nine Mathematics classroom? What opportunities does the implementation of PBL brings to both clasrrom teacher and students in the indicated grade level? To answer the above basic questions seven possible facors(variables) were figured out and tested in mathematics classrom to examine the challanges and oportunites(if any) during the implementation process.

As I’ve discussed in Section 5 above, I’ve found that only two of the variables(**Tutor Behaviour** and **Team work**) to be the major challenges and the rest five i.e Prior knowlege,quality of the problem ,Student-centeredness, Group Dynamics and Ground Rules are found to be the mainor challenges in this particular study. I also came to realize that all the seven variables are the real challenges on the ground while implementing PBL; however,the degree of challenge they pose varies depending up on the type of situation on the ground.

Moreover, all the challenges(both major and minor) come up with new opportunities for both students and the teacher(Me) in this study. To mention some forinstance, as the result of one of the major challenge “Tutor Behaviour”, it helped me to see my self as a dominant classroom teacher(teacher-centered approach) so that i had to shift my approach to a more participatory and student-centered paradigm of teaching-learning. The other exceellent opportunity i had was concerning the

other major challenge called “team work”. i.e some of the groups members were boring because of my dominance and a language barrier I have in Indonesian language (Bahasa Indonesia) which helped me to improve my Indonesian language.

## 7 RECOMMENDATION

Based on the findings of this research I have the following recommendations

1. Teachers of Mathematics in the junior secondary school to try out PBL in their classrooms, and should try to formulate good and useful challenging problems.
2. Implementing PBL in Mathematics classroom has great opportunity for both Math teachers and students as they will improve their skill in teaching and learning
3. It is a time for Math teachers to shift from traditional and outdated teacher-centered approach to a more engaging modern teaching model like PBL to improve students' problem solving skill as soon as possible.

Education experts in collaboration with school leadership should pay due attention to scale up Math teachers' knowledge and skill in how to implement PBL at classroom level.

## Penggunaan Newsmaker Dalam Membina Kemahiran Bertutur

Uma Thiruselvam<sup>1</sup>, Sri Nabilah Binte Basri<sup>2</sup>, and Rohaizat Bin Ramlee<sup>3</sup>

<sup>1,2,3</sup>Sekolah Menengah Chong Boon, Pusat Bahasa Melayu, Singapura,

<sup>1</sup>uma\_thiruselvam@moe.gov.sg

**Abstract :** Guru-guru mendapati para pelajar secara umumnya masih belum yakin untuk bertutur lebih-lebih lagi apabila berdepan dengan khalayak. Oleh yang demikian, bangkit satu keperluan bagi guru-guru untuk membina kemahiran bertutur dalam kalangan pelajar. Dalam menyahut seruan Kementerian Pendidikan yang menyokong penyerapan ICT dalam pengajaran, Kajian Pengajaran ini dijalankan dengan tujuan khusus meneliti perkembangan dan respons para pelajar terhadap penggunaan media baru dalam menggalak mereka membina kemahiran bertutur – lebih spesifik lagi untuk membina motivasi dalam menjawab komponen perbualan bergambar bagi kemahiran lisan. Perisian *Newsmaker* telah dipilih berdasarkan ciri-cirinya yang mesra pengguna dan kemampuannya untuk melentur kemahiran menulis, membaca dan membuat penyampaian dalam kalangan pelajar. . Dapatan kajian menunjukkan bahawa pelajar-pelajar yang mengikuti kajian pengajaran ini dapat meraih manfaat dalam membina kemahiran bertutur mereka. Pelajar-pelajar juga dapat melakukan pembelajaran kolaboratif menerusi proses menilai rakan mereka dengan rubrik yang telah disediakan. Menerusi proses penilaian ini pelajar dapat memperbaiki prestasinya berdasarkan teguran rakan-rakannya.

**Kata Kunci :** Pembelajaran berpusatkan pelajar, penilaian rakan sebaya, rubrik, kemahiran bertutur, Newsmaker

### 1. PENGENALAN

Guru memilih tajuk ini kerana kemahiran bertutur merupakan salah satu kemahiran asas yang perlu dimiliki dan dikuasai oleh para pelajar untuk mendapatkan keputusan yang cemerlang dalam sesebuah peperiksaan bahasa Melayu. Hal ini jelas diperlihatkan melalui pemberatan peratusan bagi komponen lisan dalam peperiksaan GCE Peringkat ‘O’ dan GCE Peringkat ‘N’ yang mencecah angka signifikan 20%. Berdasarkan pemantauan rambang yang dibuat oleh guru-guru di Sekolah Menengah Chong Boon dari masa ke semasa, para pelajar secara umumnya masih belum dapat menguasai kemahiran bertutur lebih-lebih lagi apabila berdepan dengan khalayak. Oleh yang demikian, bangkit satu keperluan bagi guru-guru untuk membina kemahiran bertutur dalam kalangan pelajar. Dalam menyahut seruan Kementerian Pendidikan yang menyokong penyerapan ICT dalam pengajaran, kajian ini dijalankan dengan tujuan khusus melihat perkembangan dan respons para pelajar terhadap penggunaan media baru dalam menggalak mereka membina kemahiran bertutur – lebih spesifik lagi untuk membina motivasi dalam menjawab komponen perbualan berdasarkan gambar bagi kemahiran lisan. Perisian *Newsmaker* telah dipilih berdasarkan ciri-cirinya yang mesra pengguna dan kemampuannya untuk melentur kemahiran menulis, membaca dan membuat penyampaian dalam kalangan pelajar.

### 2. PERNYATAAN MASALAH

Guru-guru mendapati pelajar-pelajar Sekolah Menengah Chong Boon sudah memiliki kemahiran

mengenal pasti isi dalam gambar-gambar yang diperlihatkan dalam kebanyakan sesi latihan dan ujian lisan. Akan tetapi, isi-isi yang diberikan pelajar-pelajar tidak disusun dan disampaikan secara teratur. Hal ini berlaku disebabkan para pelajar ini tidak sedar akan apa yang dipertuturkan sewaktu mereka menjalankan latihan atau ujian bagi komponen perbualan berdasarkan gambar. Justeru, dengan menggunakan perisian *Newsmaker*, para pelajar ini dapat merakam penyampaian mereka. Melalui proses mengulang tayang rakaman yang sama, para pelajar ini dapat mengenal pasti kelebihan atau kekurangan yang wujud dalam penyampaian mereka. Dengan berlakunya proses sebegini, para pelajar berfungsi sebagai pengkritik peribadi dan terdorong untuk memperbaiki penyampaian diri sendiri. Bagi pelajar yang kurang mampu menilai diri sendiri pula, penilaian rakan yang dijalankan pastinya dapat membantu dalam mencapai objektif yang sama. Akan tetapi, Kajian Pengajaran ini hanya akan berjaya seandainya para pelajar sudah didedahkan kepada struktur menyusun isi serta penggunaan rubrik penilaian yang sesuai bagi peringkat pemahaman mereka.

### 3. MATLAMAT KAJIAN

Kajian Pengajaran ini dilaksanakan berdasarkan tujuan yang berikut :

1. Pelajar dapat merakam pertuturan ayat-ayat yang gramatis menggunakan sebutan yang baku dengan berkesan.
2. Keberkesanan penggunaan News Maker dalam menggalak pelajar untuk bersikap lebih yakin semasa berbual di khalayak dapat berkomunikasi

dengan lancar dan sudi menyumbang pendapat ketika menjalani penilaian sendiri dan penilaian rakan melalui proses mengulang tayang rakaman.

#### 4. KAJIAN LITERATUR

##### Kajian Pengajaran

Kajian Pengajaran merupakan kaedah yang dipilih untuk memperbaiki kemahiran bertutur para pelajar di sekolah kami. Kajian Pengajaran dipilih oleh kami kerana menurut Stepanek Jennifer (2007), apabila kajian pengajaran dijalankan di peringkat sekolah peningkatan berterusan akan berlaku di lebih daripada satu bilik darjah. Malah, kajian pengajaran juga membantu para pelajar untuk memahami bagaimana tindakan mereka menyumbang kepada pembelajaran pelajar. Menerusi kaedah ini peranan guru turut berubah. Kini, guru dianggap sebagai penyampai, pemudah cara dan perancang pengajaran. Guru juga memperolehi pengalaman pembelajaran yang kongruent dengan perkembangan profesional yang berkesan. Stepanek Jennifer (2007) juga mengatakan kaedah ini juga berbentuk kolaboratif, menyeluruh dan berterusan bertumpu pada bahan subjek, dipandu oleh guru dan menekankan pembelajaran di kelas yang berbentuk aktif dan autentik yang tertumpu pada hasil pembelajaran pelajar. Kajian Pengajaran juga berlandaskan refleksi. Refleksi ini akan memastikan pembelajaran mendalam dan perubahan yang bererti berlaku selepas proses ini. Menurut Lewis (2002), bagi para guru, refleksi membantu mereka untuk mempertimbangkan apa yang telah dilaksanakan dengan lancar dan perubahan yang harus dilakukan untuk memperbaiki kitaran yang seterusnya.

##### Pembelajaran Berpusatkan Pelajar

Beberapa dekad yang lalu pembelajaran pelajar berpusatkan guru tetapi hari ini pembelajaran berpusatkan pelajar pula. Kami merancang untuk mengendalikan pengajaran berpusatkan pelajar agar pelajar kami dapat memperolehi manfaat daripada kaedah pengajaran ini. Fokus pembelajaran berpusatkan pelajar mewujudkan pengalaman pembelajaran yang dapat menarik minat pelajar serta melibatkan mereka dalam pembelajaran. Menurut Quek Choon Lang (2008), pembelajaran berpusatkan pelajar juga memberi pelajar kebebasan membuat pilihan tentang bahan dan aktiviti pembelajaran. Peranan guru pula adalah untuk melibatkan pelajar dalam pelbagai jenis aktiviti pembelajaran.

##### Kemahiran Bertutur

Memandangkan bahawa kemahiran bertutur merupakan komponen yang penting dalam pembelajaran bahasa di Singapura maka usaha harus

diambil untuk mempertingkatkan kemahiran ini dalam kalangan pelajar. Bertutur atau bercakap merupakan kemahiran lisan yang penting dalam situasi formal atau tidak formal. Dr Abbas (2006) telah menyatakan bahawa guru harus mengajar pelajar kemahiran bertutur supaya pelajar boleh menyampaikan maklumat, pendapat, perasaan serta idea yang kritis yang kreatif secara lisan dengan menggunakan bahasa yang gramatis dan sopan. Kemahiran bertutur ditekankan dalam proses kajian kami kerana pelajar kami perlu menerangkan gambar yang diberi dengan mengemukakan pendapat dan perasaan mereka.

##### Penilaian Rakan Sebaya Berpandukan Rubrik

Penilaian rakan sebaya semakin luas digunakan di bilik darjah. Penilaian ini berbentuk formatif. Penilaian formatif bertanggungjawab untuk memberitahu guru dan pelajar tentang pemahaman pelajar. Menurut Chai Ching Sing dan Wang QiYun(2010) menerusi penilaian rakan pelajar melihat diri masing-masing sebagai sumber bagi pemahaman dan memeriksa untuk kerja berkualiti dibandingkan dengan kriteria yang wujud sebelum ini. Penggunaan rubrik dalam penilaian membantu guru untuk fokus terhadap kriteria pembelajaran yang akan dinilai. Brookhart Susan M(2013) menganggap rubrik penting kerana ia menjelaskan kepada pelajar kualiti yang harus dimiliki oleh tugas mereka. Rubrik juga membantu guru untuk mengajar, mengkoordinasi arahan dan penilaian serta membantu pelajar untuk belajar. Oleh itu dalam kajian ini kami menggunakan kaedah penilaian rakan sebaya berpandukan rubrik untuk meningkatkan mutu pembelajaran pelajar.

##### Penggunaan ICT dalam Membina Kemahiran Bertutur

Kementerian Pendidikan Singapura menggalakkan penggunaan teknologi maklumat dan komunikasi (ICT) untuk memperkaya pembelajaran pelajar terutama sekali dalam pembelajaran bahasa ibunda. Lanjutan daripada itu, ramai guru mendapati ICT merupakan alat yang berkesan dalam pengajaran. Menyedari hakikat ini, para guru diberikan peluang untuk memilih alat yang bersesuaian dengan kurikulum atau untuk menyokong sesuatu pendekatan pengajaran dan pembelajaran. Penggunaan ICT sebagai alat untuk mengajar kemahiran bertutur atau komunikasi membantu melaksanakan pembelajaran kolaboratif, meningkatkan penglibatan pelajar dalam pembelajaran secara kumpulan yang bersifat global. Dengan menggunakan ICT dalam pengajaran, pelajar dapat mengindividukan pembelajaran, belajar mengikut kemampuan sendiri, meningkatkan

motivasi dan belajar dengan penyeliaan yang minimum. Oleh hal yang demikian, guru, kini menghadapi cabaran untuk menyediakan pengajaran yang berkesan dan cekap. Namun, tidak dapat dinafikan minat dan kecenderungan pelajar terhadap ICT menjadi daya tarikan kepada pelajar untuk mengikuti pengajaran guru terutama sekali jika ia mengandungi unsur hiburan seperti perisian 'newsmaker'.

## 5. KAEDAH KAJIAN

Reka bentuk kajian ini ialah kajian pengajaran meninjau penggunaan perisian newsmaker untuk meningkatkan pencapaian pelajar dalam Bahasa Melayu bahagian lisan perbualan komponen penerangan gambar. Kajian ini menggunakan kaedah kuantitatif dan kualitatif untuk mendapatkan data kajian. Perisian *Newsmaker* ini dipilih kerana memiliki ciri-ciri unik yang dapat menyuntik unsur hiburan dalam proses pembelajaran. Pelajar diberi pilihan untuk menggunakan ikon-ikon beranimasi untuk disertakan bersama dalam rakaman mereka. Dengan adanya unsur sebegini, para pelajar tidak terikat dengan cara pembelajaran kemahiran bertutur yang konvensional yang lazimnya mendatangkan kebosanan hanya kerana proses yang sama berulang setiap masa. Penggunaan perisian *Newsmaker* diharapkan dapat memberikan kesegaran pada proses pembelajaran dan pada masa yang sama dapat meningkatkan minat dan motivasi pelajar untuk turut serta dalam latihan perbualan lisan. Tambahan pula, penggunaan perisian ini dirasakan serasi dengan kegiatan semasa para pelajar sekarang yang selesa menonton atau merakam *Vlog* (blog dalam rakaman) di alam siber. Penilaian sendiri dan penilaian rakan juga dititikberatkan kerana para guru ingin menggalakkan pelajar supaya berdikari dalam proses meraih ilmu. Proses ini, jika dipraktikkan secara berulang dalam masa pembelajaran, akan menjadi satu amalan atau tabiat positif dalam kalangan pelajar apabila membuat ulang kaji secara bersendiri.

### Subjek Kajian

Sampel kajian terdiri daripada pelajar daripada kelas menengah 3 Ekspres dan pelajar dari kelas menengah 3 Normal Akademik dari Sekolah Menengah Chong Boon. Bagi pihak guru, tiga orang guru Bahasa Melayu yang terlibat. Seorang guru pemantau dan dua orang guru yang mengajar semasa kitaran pertama dan dua.

### Instrumen Kajian

Memandangkan kajian ini menggunakan reka bentuk penyelidikan kajian pengajaran yang menggunakan kaedah kuantitatif dan kualitatif, pengkaji akan menggunakan pelbagai instrumen yang boleh menyokong kajian ini. Instrumen kajian ini terdiri

daripada pemerhatian guru-guru, keputusan peperiksaan semestral pertama (SA1) dan peperiksaan semestral dua (SA2), (ujian pra dan ujian pasca), persediaan mengajar, borang penilaian (rubrik), dialog antara guru dan pelajar (aktiviti pasca) dan refleksi guru-guru dan pelajar-pelajar.

### Pengumpulan Data

Sebelum pengajaran menggunakan perisian *newsmaker* dilaksanakan, pelajar-pelajar akan diberikan ujian pencapaian dalam komponen lisan perbualan bergambar iaitu ujian pra. Tujuan ujian ini adalah untuk mengetahui tahap pencapaian awal pelajar sebelum kajian dijalankan. Pada minggu ke lapan, pelajar-pelajar akan diberikan ujian pasca untuk melihat sama ada terdapat peningkatan pencapaian selepas pengajaran perisian *newsmaker* dilaksanakan dan soal selidik berkaitan tentang tahap penerimaan pelajar terhadap penggunaan peta konsep dalam proses pengajaran dan pembelajaran komponen lisan penerangan bergambar. Para pelajar juga diminta membuat refleksi tentang pembelajaran mereka untuk mendapatkan maklum balas tentang pengajaran menggunakan *perisian newsmaker*.

### Prosedur Kajian

Kajian Pengajaran yang dijalankan melalui dua proses kitaran kajian. Kitaran kajian pertama dijalankan pada 11 Julai 2012. Cikgu Sri Nabilah Basri merupakan guru pelaksana bagi Pengajaran Kajian ini. Dalam pengajaran yang pertama, kajian melibatkan pelajar-pelajar menengah 3 Ekspres. Bagi kitaran kajian yang kedua pula dilaksanakan pada 18 Julai oleh Cikgu Uma Thiruselvam. Kali ini melibatkan pelajar-pelajar 3 Normal Akademik.

Proses pembelajaran ini memuatkan Rancangan Pengajaran Kajian Kitaran 1 dan Kitaran 2. Setiap rancangan pengajaran telah dibincangkan oleh kumpulan kajian pengajaran bagi memastikan pembaikan dilakukan demi menyediakan pengalaman pembelajaran yang menarik, bermakna dan berkesan dalam meningkatkan pengalaman pembelajaran pelajar.

Dalam kitaran kajian yang pertama (kelas 3 Ekspres) guru menayangkan tiga gambar dan meminta respons pelajar berdasarkan beberapa soalan rangsangan. Kemudian, guru memperkenalkan pendekatan L.A.P (lihat, andaian, pandangan) kepada pelajar untuk menyusun isi-isi perbincangan mereka dalam penyusun grafik yang telah disediakan. Pelajar dikehendaki merakam isi yang telah dicatatkan dalam lembaran menggunakan perisian *Newsmaker*. Pelajar boleh menggunakan ikon-ikon yang telah tersedia untuk menambah nilai rakaman penyampaian mereka. Seterusnya pelajar harus mengulang tayang rakaman tersebut dan menilai pencapaian mereka berpandukan rubrik. Kemudian, guru akan

memberikan arahan kepada pelajar untuk bergerak mengikut putaran jam untuk menilai kerja rakan mereka secara kualitatif dan kuantitatif. Borang rubrik yang telah diterap akan dipulangkan kepada pemilik rakaman untuk melihat tahap yang mereka telah capai. Sebagai langkah penutup pelajar digalakkan berkongsi pandangan dan penilaian mereka terhadap prestasi yang ditunjukkan semasa latihan dikendalikan. Pelajar telah menilai rakan mereka dengan jujur dan saksama. Pelajar juga diminta merumuskan pelajaran untuk memastikan objektif asal pelajaran telah dicapai. Semasa langkah terakhir ini guru dalam interaksinya dengan pelajar diberitahu oleh pelajar mereka dapat memperolehi manfaat daripada penggunaan perisian ini.

Dalam kitaran yang kedua guru (bagi kelas 3 Normal Akademik) menayangkan 3 gambar yang berbeza bersertakan dengan senarai kosa kata yang dapat membantu pelajar memberikan respons kepada soalan-soalan rangsangan guru.

Pelajar kemudian diberikan penyusun grafik dan dikehendaki menghasilkan 8 hingga sepuluh ayat yang gramatis berdasarkan gambar yang diberikan menggunakan kaedah L.A.P. Seterusnya pelajar diminta secara bergilir untuk merakamkan isi yang telah mereka catatkan itu. Seperti di dalam kitaran yang sebelumnya pelajar juga digalakkan menggunakan ikon-ikon yang telah disediakan untuk menambahkan mutu kepada penyampaian mereka. Kemudian pelajar diminta menilai rakan mereka dan berkongsi dengan kelas penilaian mereka. Namun,

bahagian ini tidak dapat dijalankan dengan berkesan bagi kelas ini kerana ada pelajar yang tidak memahami kriteria rubrik dan tidak dapat melakukan penilaian yang baik. Ada juga pelajar yang bersikap was-was untuk mengemukakan komen mereka dan memberikan markah yang tinggi kepada rakan mereka. Sungguhpun begitu, secara keseluruhan ramai pelajar yang telah menilai rakan mereka secara jujur dan adil. Pelajar juga mengatakan bahawa mereka terhibur menjalani proses melatih kemahiran bertutur dengan menggunakan perisian ini. Mereka juga gembira kerana dapat bekerjasama dengan rakan untuk memperbaiki kemahiran bertutur secara keseluruhannya.

## 6. DAPATAN KAJIAN

### Dapatan Kuantitatif

Setelah menjalankan Kajian Pengajaran ini sebanyak dua kitaran, persembahan pelajar diukur lagi sewaktu peperiksaan lisan pada akhir tahun. Berdasarkan markah yang diperoleh para pelajar, nyatalah bahawa matlamat yang ingin dicapai untuk komponen Perbualan Berdasarkan Gambar melalui Kajian Pengajaran ini berjaya diraih. 100% daripada pelajar menengah 3 Ekspres telah meraih markah yang lebih baik bagi Peperiksaan Akhir Tahun (SA2) berbanding Peperiksaan Pertengahan Tahun (SA1). 70% daripada para pelajar 3 Normal Akademik juga menunjukkan kemajuan, manakala yang selebihnya kekal dengan markah yang sama.

Jadual 1: Markah bagi Komponen Perbualan Bergambar Menengah 3 Ekspres

Jadual 2: Markah bagi Komponen Perbualan Bergambar Menengah 3 Normal Akademik

### Dapatan Kualitatif

Berdasarkan pemantauan yang dilakukan, guru-guru mendapati pelajar-pelajar yang mengikuti Pengajaran Kajian ini dapat meraih manfaat yang dapat membina kemahiran bertutur mereka. Setelah menonton penyampaian pelajar yang dirakam dengan menggunakan perisian *Newsmaker*, pelajar dapat memberikan komen secara bertulis dan menilai penyampaian rakan dengan memberikan markah. Pelajar-pelajar juga dapat bertukar-tukar pandangan dan yang penting sekali adalah kesediaan pelajar menerima teguran rakan-rakan dalam usaha mempertingkatkan penyampaian yang dilakukan.

Pemantauan guru juga mendapati pelajar dapat memperbaiki penggunaan bahasa dan juga sebutan baku. Di samping itu, pelajar dapat mengenali kekuatan dan kelemahan secara individu. Ada juga pelajar yang dapat merasakan bagaimana pengalman bertugas sebagai seorang pembaca berita baik di radio ataupun di televisyen. Namun, impak yang positif adalah, pelajar berasa lebih yakin untuk menduduki ujian lisan yang akan dijalani. Berikut adalah pandangan dan refleksi pelajar setelah mengikuti kajian pengajaran.

#### Pelajar 1

Pengajaran tersebut telah membantu saya memperbaiki cara penyampaian saya dalam bahasa dan sebutan baku. Pada masa yang sama, saya dapat rasakan apa yang para pemberita lazim lalui.

(Nur Ain, Pelajar Menengah 3 Normal Akademik)

#### Pelajar 2

Saya dapat mengenali kelebihan dan kelemahan saya sendiri apabila mengulang tayang rakaman yang

telah saya sediakan. Saya menjadi semakin yakin untuk menduduki peperiksaan lisan.

(Nor Tahiyatulfiqqah, Pelajar Menengah 3 Ekspres)

### Guru Pengkaji

Kajian ini memberikan pengalaman yang baharu kepada setiap anggota. Guru berasa lebih bersemangat terutama sekali apabila dapat mempelajari daripada satu dengan yang lain. Biarpun anggota pasukan terdiri daripada guru-guru yang mempunyai pengalaman mengajar yang berbeza-beza, perbezaan ini tidak dirasakan kerana setiap guru dapat menyerlahkan pengalaman peribadi yang pelbagai semasa memantau. Proses pencerahan (refleksi) yang dialami guru menjadi kekuatan Kajian Pengajaran ini. Berikut adalah antara sedutan daripada refleksi guru mengenai kajian pengajaran yang mereka jalankan.

Setelah melalui proses Kajian Pengajaran ini, saya lebih bersemangat untuk mengajar kerana semasa menghasilkan pakej bersama, saya dapat mempelajari perkara baharu daripada rakan-rakan setugas saya. Pelajar juga kelihatan lebih yakin untuk membuat penyampaian lisan mereka.

-Cikgu Uma Thiruselvam

Kitaran pertama berjaya dijalankan dengan lancar kerana para pelajar yang terlibat secara umumnya mempunyai kemahiran bahasa yang tinggi. Namun, melalui perbincangan bersama para guru yang lain dan setelah menganalisis profil pelajar yang bakal terlibat dalam kitaran yang kedua, kami sedar tentang peri pentingnya menerapkan pengajaran pembezaan agar kelompok pelajar yang lebih lemah ini dapat meraih manfaat daripada pelajaran yang sama.

- Cikgu Sri Nabilah

### Guru Pemantau 1

Pelajar kelihatan lebih terangsang untuk mengambil bahagian dalam latihan membina kemahiran bertutur. Mereka juga mencerminkan kemampuan untuk mengekspresikan kreativiti melalui penggunaan perisian Newsmaker. Dalam masa yang sama, pelajar mempamerkan kebolehan menilai persembahan mereka sendiri di samping memperbaiki segala kelemahan secara sendiri.

- Cikgu Rohaizat

## 7. PERBINCANGAN

Kumpulan kajian pengajaran melakukan pemerhatian dan pemantauan setiap pelaksanaan pengajaran kajian yang dijalankan. Antara dapatan yang diperoleh daripada pemerhatian dan pemantauan yang dijalankan, guru mendapati bahawa penerimaan dan proses pembelajaran yang dilalui oleh pelajar Ekspres dan Normal Akademik berbeza. Misalnya pada bahagian induksi, para pelajar Normal Akademik masih memerlukan bantuan untuk memahami konsep LAP berbanding para pelajar Ekspres.

Berikut adalah saranan dan dapatan yang diberikan bagi setiap pengajaran kajian yang dilaksanakan.

### Pelajar 3 Ekspres

Secara umumnya, pelajar memahami soalan guru dan dapat menjawabnya dengan tepat. Akan tetapi, pelajar yang berkeupayaan sederhana mengambil masa lebih lama untuk berkongsi pandangan mereka secara spontan. Mereka mungkin sudah membentuk gambaran dalam minda tentang apa yang ingin dikatakan, namun, dihalang oleh kekurangan dalam aspek kemahiran berbahasa – iaitu kurang yakin memilih perkataan yang tepat untuk diekspresikan. Sehubungan itu, para pelajar menengah 3 Normal Akademik perlu dibantu dengan menyediakan senarai kata kunci yang merangkumi jenis-jenis kata nama, kata kerja dan kata adjektif yang relevan bagi setiap gambar.

Guru-guru mengenal pasti, pelajar yang lebih cemerlang tidak mempunyai masalah menulis ayat-ayat kompleks dalam mengekspresikan idea mereka. Namun, pelajar yang sederhana mungkin akan mengambil masa yang lebih panjang untuk melengkapkan latihan yang sama. Oleh itu, bagi kitaran kajian pengajaran yang kedua, arahan yang diberikan kepada pelajar boleh dibezakan. Pelajar dalam peringkat sederhana dan lemah perlu digalakkan menggunakan ayat-ayat ringkas. Akan tetapi, mereka perlu diingatkan tentang kesinambungan daripada satu ayat kepada ayat yang lain dan ini boleh dilakukan dengan menggunakan penanda wacana yang tepat.

Para pelajar tidak mengalami sebarang masalah. Mereka mampu menggunakan perisian ini dengan baik. Mereka juga kelihatan tenang sewaktu membuat rakaman. Ini mungkin disebabkan oleh jumlah pelajar yang kecil bagi kelas ini. Namun, bagi kelas 3 Normal Akademik, jumlah pelajar lebih ramai. Justeru, segelintir pelajar (khususnya yang lemah) pasti akan rasa ragu-ragu untuk menjalankan latihan ini kerana khuatir mereka tidak dapat menyampaikan tugas ini dengan baik. Dalam hal ini, para pelajar perlu dipasangkan dengan adil, di mana pelajar yang lemah atau sederhana akan dipasangkan dengan pelajar yang cemerlang agar mereka boleh saling bantu-membantu sewaktu menjalankan proses rakaman.

Penilaian rakan dijalankan dengan baik. Para pelajar jujur dalam memberikan markah serta penilaian bertulis. Para pelajar yang menerima komen juga bersikap terbuka dalam menerima teguran. Hal ini menunjukkan sumbangan yang positif. Maka, perlu dilaksanakan juga dalam pembelajaran bersama kelas 3 Normal Akademik.

Melalui dialog ringkas antara guru dengan pelajar, jelas bahawa para pelajar 3 Ekspres telah memahami segala latihan yang mereka laksanakan bagi pelajaran ini. Melalui maklum balas daripada mereka juga, latihan menggunakan perisian Newsmaker ini telah memanfaatkan diri masing-masing. Guru boleh menggunakan strategi yang sama untuk menutup pelajaran bagi kitaran kajian pengajaran yang kedua.

### Pelajar Menengah 3 Normal Akademik

Guru-guru mendapati, dengan senarai bantuan yang disediakan, pelajar lebih mudah mengekspresikan idea-idea mereka secara lisan. Penerapan teknik pembezaan ini telah berjaya membantu para pelajar yang lemah dan sederhana untuk membina jawapan-jawapan yang hampir setara dengan jawapan yang dibina oleh para pelajar yang cemerlang. Akan tetapi, masih terdapat seorang dua pelajar yang masih memerlukan sokongan tambahan. Ini kerana pelajar-pelajar ini masih lemah dalam kemahiran-kemahiran yang asas seperti membentuk ayat dan sebagainya. Pelajar-pelajar sebegini perlu diberikan lebih masa untuk menggarap kemahiran untuk bertutur secara spontan.

Para pelajar daripada kelompok yang cemerlang dapat melaksanakan tugas ini dengan baik. Bagi seorang dua pelajar yang lemah pula, mereka masih lemah dalam membentuk ayat-ayat yang baik. Pelajar-pelajar ini perlu diberikan sokongan tambahan pada luar waktu pelajar agar kekurangan mereka dalam kemahiran-kemahiran asas (seperti menulis) tidak akan menghalang mereka daripada berpartisipasi dengan sepenuhnya dalam latihan-latihan yang dijalankan di dalam kelas.

Secara umumnya, semua pelajar dapat menjalankan tugas ini dengan baik, termasuk pelajar daripada kelompok lemah dan sederhana. Namun, strategi berpasangan dan bergilir-gilir menggunakan komputer riba telah memakan banyak masa. Pada masa akan datang, guru mungkin ingin mempertimbangkan penggunaan satu komputer riba bagi setiap pelajar agar masa pembelajaran terkawal.

Segelintir pelajar masih ragu-ragu memberi komen kepada rakan. Oleh itu, markah yang diberikan kepada rakan mereka agak tinggi. Kemungkinan juga pelajar-pelajar ini masih tidak faham kandungan dalam rubrik yang diberikan, maka tidak dapat menyampaikan penilaian dengan baik juga. Namun, secara keseluruhan, ramai pelajar yang berjaya menilai rakan yang lain secara jujur, adil dan saksama. Komen-komen yang mereka utarakan juga relevan seperti yang berikut:

'Kamu kelihatan kurang yakin kerana suara kamu sangat perlahan.'

'Syabas! Penyampaian kamu sangat tenang dan isi-isi kamu baik.'

Melalui dialog ringkas antara guru dengan pelajar, jelas bahawa para pelajar terhibur menjalani proses melatih kemahiran bertutur menggunakan perisian Newsmaker ini. Pada masa yang sama, mereka juga gembira kerana dapat bekerjasama dengan rakan untuk memperbaiki kemahiran bertutur secara umumnya. Secara umumnya, kajian pengajaran ini telah mencapai objektifnya kerana jelas kelihatan minat dan keghairahan para pelajar sewaktu pembelajaran dijalankan.

## Rumusan

Kajian Pengajaran yang dijalankan menunjukkan peningkatan yang memuaskan dalam pencapaian para pelajar. Para pelajar telah membuktikan bahawa dengan pendedahan kepada sofwe *newsmaker* mereka dapat menguasai perasaan malu mereka ketika berbual. Guru-guru yang menyertai Kajian Pengajaran ini telah berjaya menyuntikkan para pelajar dengan semangat ingin mencuba walaupun mereka menghadapi masalah untuk menyuarakan pandangan mereka. Kaedah pengajaran yang menarik dan bukan berbentuk linear yang digunakan oleh guru telah merangsang pelajar untuk terus mencuba dan meningkatkan pencapaian mereka. Suasana pembelajaran yang lebih menyeronokkan membantu pelajar untuk menguasai kemahiran lisan dengan lebih mudah. Peranan guru sebagai fasilitator juga dapat membantu pelajar yang lemah untuk mengikuti aktiviti yang disediakan dengan mudah. Malah, sumbangan rakan-rakan dalam usaha menilai dan memberikan komen-komen yang membina telah menyebabkan pelajar berfikir kritis dan menyedari harapan tinggi guru mengenai persembahan mereka.

Pendekatan yang diambil oleh guru telah membungakan hasil yang diharapkan.

## 8. KESIMPULAN

Dalam kitaran yang pertama menerusi pemantauan para guru didapati pelajar mengambil masa untuk mengemukakan pendapat dan memperkembangkan idea mereka secara bertulis. Ada di antara mereka juga menanya guru perkataan yang sesuai digunakan untuk menggambarkan keadaan. Oleh kerana, kelas ini merupakan kelas di mana pelajar-pelajarnya lebih cerdas maka guru-guru dalam perbincangan mereka bersetuju untuk mengubah rancangan pengajaran untuk kelas 3 Normal Akademik. Oleh itu, kelas 3 Normal Akademik disediakan dengan senarai kosa kata untuk membantu pelajar dari kelas tersebut semasa menjalani aktiviti ini. Proses penilaian sendiri merupakan langkah tambahan untuk kelas 3 Ekspres. Menerusi langkah ini guru-guru dapat melihat kesungguhan dan tanggungjawab pelajar terhadap pembelajaran mereka. Sikap belajar secara sendiri dan kemahiran berkomunikasi inilah yang ingin dilihat dalam diri pelajar, sesuai dengan kemahiran abad ke-21.

Dalam kitaran yang kedua guru-guru mendapati pelajar-pelajar dari kelas 3 Normal Akademik bersifat begitu teruja sekali untuk menggunakan perisian *newsmaker* dalam membina kemahiran bertutur mereka tetapi ada beberapa pelajar yang lemah dan memerlukan bantuan tambahan dari segi penulisan dan penyampaian. Namun suasana pembelajaran di dalam kelas ini begitu meriah sekali kerana unsur humor dalam perisian ini menarik minat belajar untuk mencuba serta meneruskan rakaman mereka. Suasana pembelajaran yang tidak mengancam begini memberikan pelajar motivasi untuk meningkatkan pencapaian mereka dan membina keyakinan mereka untuk menilai rakan-rakan mereka. Pelajar-pelajar juga dapat mempelajari cara-cara untuk mempertingkatkan penyampaian mereka menerusi proses menilai rakan berpandukan rubrik. Rubrik penilaian pula telah memberikan pelajar gambaran akan tahap yang harus mereka capai. Secara keseluruhannya, perisian *newsmaker* ini telah membantu pelajar-pelajar untuk meningkatkan kemahiran bertutur mereka dan memberikan keyakinan diri kepada pelajar-pelajar.

**Proses Pembelajaran**

**Rancangan Pengajaran Kajian Kitaran 2**

**Matlamat Pengajaran**

Pelajar dapat:

1. menggunakan 8-10 ayat yang lengkap dan gramatis untuk menyusun isi.
2. menggunakan sebutan baku sewaktu merakam penyampaian lisan.
3. menjalankan penilaian sendiri dan penilaian rakan berpandukan rubrik yang telah disediakan

**Abstract:** The team bears the intention to develop our students into critical thinkers with good communication skills. The target of our Research Lesson was Secondary Three Express pupils. Sifting out the inability to contend views as an issue pervading our students, the team chose to move temporarily away from the common questions used in argumentative texts and recast the typical debate that has been done at the level into a law case, positioning our students as the Prosecution, Defending Lawyers and the Jury. Topics like “Is abortion murder”, when researched on the internet, would yield much information that the student might not be able to qualify as necessary or not to substantiate their stand. The team aims to train discernment and the competent employment of material in the students. Where students previously have difficulty coming up with points to support a view that they might have adopted less-than-clearly, their case is now fixed for them, and they will, through the lessons, develop the judgement required for them to effectively argue. In order to interest our students in the ‘legal process’ we have enlisted Hansel and Gretel, and made crucial twists with a suggested charge against the children instead, re-presenting them as the antagonists. The students were also provided background information of the characters, allowing endearment to grow for the unlikely ones. With this, the students are weaned from the conventional fairy tale, where the witch is immediately determined ‘wicked’, and challenged to consider the story from a different point of view.

**Keywords:** Argumentative, point

### 1 INTRODUCTION

*Profile and Background Information of our school, students and teachers*

Clementi Town Secondary School is a government school that houses three education streams - Express, Normal Academic and Normal Technical. The school typically admits students with a PSLE aggregate range of 231 to 246 for Express students, 181 to 199 for Normal Academic students and 141 to 156 for Normal Technical students. There are usually 4 Express Classes, 2 Normal Academic and 1 Normal Technical class per level. Our students hail from varied family backgrounds, and are generally competent in conversational English. The English Language Department has a total of 18 teachers, with English Language as their Curriculum Subject (CS) 1 or 2.

Although the students are fairly able to converse in the language, they lack the content in the presentation of a viewpoint and the ability to construct strong arguments. The team had also noticed the current trend of teenagers lapsing into the response of “just because” to questions posed at them, which hinders their development of thinking and subsequently the delivery of a perspective. “Just because”, commonly heard among teenagers, is a phrase employed under the circumstances of two main scenarios:

- a) There truly is no good answer.
- b) The speaker sees no need to explain himself/herself.

However, the students might abuse the term, where they hide behind the phrase and conveniently dismiss the need to articulate their thoughts effectively. This is converse to the application of the

conjunction “because”, which warrants the need for an explanation or reason.

*Broad goal for students and the research team’s aim*

While the students are generally able to cope with the English Language examinations, the arguments they present, as felt by the team, possess much potential to be developed. Hence, our research team had decided to focus on guiding our students to critically appraise information given to them, and we hope that through this research lesson, our students will be capable to construct an effective presentation of their stands. With the steps to treat information critically mapped out for the students, we hope to sift out even more, the issues they face when they are given a discussion question, should they still prove unable to deliver a sound argument.

*Broad goal for teachers and the research team’s aim*

English Language teachers in CTSS guide the students in argumentative writing with the P-E-E-L structure, which should be applied to each paragraph in the essay or speech. The P-E-E-L structure refers to *Point, Example, Explanation* and *Link* and the students craft the argument with a minimum of three paragraphs (not including Introduction and Conclusion). While the department provides the general lesson materials for all teachers across five levels and three streams, the conducting of the lesson inevitably, determines the learning outcomes of the students. The team hence aims to develop too, with this research lesson, the facilitation methods with specific focus on learning environment (on top of the instructional plan) for the proposed Case Preparation Lesson.

**2 OVERVIEW AND LESSON AIMS**

The topic for our English lesson is argumentative writing/speech and the goals of our research lessons are for our students to identify the intent or purpose of the information given, distinguish between facts and inferences drawn from the information provided, make inferences that are consistent with one another and construct defensible, thoughtful and logical conclusions thereafter. In this lesson, students were to work in a group to collaborate on their learning and articulate their decisions effectively. They were also expected to be able to analyse the additional information and discern whether it is useful (defensible, thoughtful and logical) to the

assignment before selecting them and drawing up convincing reasons to justify their selections.

The team had chosen a simple fairy tale, Hansel and Gretel, and suggested that the protagonists, who have been positioned for the readers to be the pitiable children who were bullied and mistreated by the evil witch in the gingerbread house, could be of malicious intent instead. This was done with the aim to wean our students from the comforts of passive reception of information and consider actively, the text from a different perspective – that the witch was in fact, the victim after all. Often, readers automatically adopt the view that the witch in a fairytale would be the antagonist and ‘evil’. However, the team sought to throw the students off-guard and get them to critically consider the possibility of the children deserving what had been done to them, and the witch actually being the one who was misunderstood and had her safety threatened instead.

The team member conducting the lesson first began by introducing legalese to the students. They were then put through a flipped lesson, where they had to read up on the material provided to equip them with the right terms to employ during their ‘court case’, and then take a quiz online to concretise their understanding. The class was then divided into two groups, the Prosecution and the Defence, and then briefed on their roles in class. They were also guided to understand the concept of aggravating and mitigating factors. Subsequently, the students were taught the difference between evidence and information.

*Employing the right environment (setting) to achieve teacher aims*

The team member conducting the lesson also enlisted two different settings for the conducting of the lesson. The first class, 3C1, was made to sit on the left and right of the classroom, with only a spatial divide between the Prosecuting and Defending Teams. The second class, 3D1, had a distinct row of tables dividing the two teams.

## 2.1 Research Lesson Instructional Plan

Table 1. Research Lesson Version 1

Steps of the lesson: learning activities and key questions (and time allocation)	Student activities/expected student reactions or responses	Teacher’s response to student reactions/Things to remember	Goals and Method(s) of evaluation
<p><b>1) Introducing Legalese</b> Students would have read up about the terms online and attempted a quiz. Teacher then checks in on the understanding in class again.</p>	<p>Students may have preconceived notions about how courts function, particularly with regard to criminal charges and proceedings.</p>	<p>Teacher will need to clarify that this is not a civil suit (i.e. one party suing the other). In this case, the Prosecution wins by securing a conviction while the Defence wins by preventing the conviction.</p>	<p>Students should end up with a clear idea of what their task will demand of them. This can be evidenced in their written work at the end of this lesson and the next one.</p>
<p><b>2) Case Brief</b> - Teacher will divide students into Prosecution and Defence and brief them of their roles.  - The concepts of aggravating and mitigating factors will also be introduced. (10 minutes)</p>	<p>Students will need to understand the concept of ‘innocent until proven guilty’.  Students assigned to the Defence may feel that their task is impossible due to their knowledge of the original fairy tale.</p>	<p>Teacher to explain to students that the ‘burden of proof’ lies with the Prosecution who must prove their case ‘beyond reasonable doubt’. The role of the Defence is to show that the Prosecution’s case is not watertight.</p>	<p>Evaluation of whether students have understood what is expected of them will be evident in the arguments that they craft for their written submissions which are due in the next lesson.</p>
<p><b>3) Handling Evidence</b> - Teacher will explain the difference between information and evidence.  - Several examples will be included.</p>	<p>Students will be given a few sample scenarios and tasked with picking on the relevant information as evidence. Students to determine whether the information is useful or not.</p>	<p>In the course of completing the sample exercises, teacher should emphasize the importance of focusing the relevant information, not the most attention-grabbing.</p>	<p>Student ability to select the appropriate information in the samples, as well as their submitted work, will serve as indicators of students’ understanding.</p>
<p><b>4) Group Work</b> - Students will break into smaller groups to discuss their cases.  - Teacher will inform them that there are 5 bonus sources of information that students can earn. (20 minutes)</p>	<p>In their groups, students will need to determine 3 pieces of extra information they would like to call for  Students will need to briefly explain why such information might be useful to them.  Upon receiving their bonus information, students will need to analyse and discern the usefulness of each piece of bonus information to their case.</p>	<p>Teacher will need to evaluate the various requests for information from students, checking for the quality of explanations before releasing the bonus information to the students.</p>	<p>Students’ justification for receiving the bonus information, as well as their analysis of their bonus information can be graded according to the critical thinking rubric to determine the competency of students.</p>

Table 2. Research Lesson Version 2

Steps of the lesson: learning activities and key questions (and time allocation)	Student activities/expected student reactions or responses	Teacher’s response to student reactions/Things to remember	Goals and Method(s) of evaluation
<b>1) Handling Evidence</b> - Teacher will explain the difference between information and evidence. - Several examples will be included. (15 minutes)	Students will be given a sample scenario and a list of information points and potential leads.  Students to determine whether the information is useful or not to their case.	In the course of completing the sample exercises, teacher should emphasize the importance of focusing the relevant information, not the most attention-grabbing.  Teacher should explain explicitly why some of the information is irrelevant.	Student ability to select the appropriate information in the samples, as well as their submitted work, will serve as indicators of students’ understanding.
<b>2) Group Work</b> - Students will break into smaller groups to discuss their cases. (30 minutes)	Students are given all information and will need to analyse and discern the usefulness of each piece of bonus information to their case.	Teacher will collect the various requests for information (for later evaluation) from students.  Once this first task has been completed, the teacher will release the bonus information to the students for the second task.	Students’ justification for receiving the bonus information, as well as their analysis of their bonus information can be graded according to the critical thinking rubric to determine the competency of students.

## 2.2 Observation Guide

Table 3. Observation Guide

Steps of the lesson: learning activities and key questions (and time allocation)	Student activities/expected student reactions or responses	Checklist: Observables based on lesson goals
<b>1) Introducing Legalese</b> Students would have read up about the terms online and attempted a quiz. Teacher then checks in on their understanding in class again.	Students may have preconceived notions about how courts function, particularly with regard to criminal charges and proceedings.	<b>Problem:</b> Clearly define the issue and accurately identify core issue  <input type="checkbox"/> Students raise hands to clarify terms <input type="checkbox"/> Students ask questions pertaining to case
<b>2) Case Brief</b> - Teacher will divide students into Prosecution and Defence and brief them of their roles.  - The concepts of aggravating and mitigating factors will also be introduced.	Students will need to understand the concept of ‘innocent until proven guilty’.  Students assigned to the Defence may feel that their task is impossible due to their knowledge of the original fairy tale.	<b>Problem:</b> Clearly define the issue and accurately identify core issue  <input type="checkbox"/> Students raise hands to clarify concepts <input type="checkbox"/> Students ask additional questions pertaining to case

Steps of the lesson: learning activities and key questions (and time allocation)	Student activities/expected student reactions or responses	Checklist: Observables based on lesson goals
<p><b>3) Handling Evidence</b></p> <ul style="list-style-type: none"> <li>- Teacher will explain the difference between information and evidence.</li> <li>- Several examples will be included.</li> </ul>	<p>Students will be given a few sample scenarios and tasked with picking on the relevant information as evidence.</p>	<p><b>Information:</b> distinguish between information and inferences drawn from information provided</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Students select information by underlining/highlighting</li> <li><input type="checkbox"/> Students raise hands to clarify doubts</li> <li><input type="checkbox"/> Students able to articulate difference between information and evidence</li> </ul>
<p><b>4) Group Work</b></p> <ul style="list-style-type: none"> <li>- Students will break into smaller groups to discuss their cases.</li> <li>- Each group gets all the pieces of evidence and information (where previously they had to earn it)</li> </ul>	<p>Students will need to analyse and discern the usefulness of each piece of information to their case.</p>	<p><b>Information:</b> distinguish between information and inferences drawn from information provided</p> <p><b>Interpretation:</b> Follows where evidence and reason lead in order to obtain defensible, thoughtful, logical conclusions or solutions. Makes inferences that are consistent with one another</p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Students participate in active discussion in their groups</li> <li><input type="checkbox"/> Students able to articulate reasons for choice of information</li> <li><input type="checkbox"/> Students able to write down reasons for choice of information</li> <li><input type="checkbox"/> Students apply close reading of bonus information</li> <li><input type="checkbox"/> Students discuss the merits and demerits of bonus information</li> <li><input type="checkbox"/> Students are able to decide on eventual choice of information</li> </ul>

Notes:

- **Problem:** Clearly define the issue and accurately identify core issue
- **Information:** distinguish between information and inferences drawn from information provided
- **Interpretation:** Follows where evidence and reason lead in order to obtain defensible, thoughtful, logical conclusions or solutions. Makes inferences that are consistent with one another

### 3 POST-LESSON ANALYSIS

For the post-lesson discussion, the team had noted that while the students were interested in the lesson, they were unable to devote enough time to analyse the evidences well. It was observed that the students created information that was not useful to their arguments or there was a lack of development in their arguments. This was a result of the lesson plan having too many activities. As a refinement, the team removed two activities and included them in the lesson prior to the Research Lesson instead. The focus of the lesson then would be the analysis of evidence. The team also made the lesson targets more concise and added another structure to help the students in processing the information when they analyse the evidence given. The students were also not able to present strong arguments as not all teams sought to obtain more evidence. This resulted in the arguments being uneven.

The team had also noticed that the court scene was still not well-presented as each team typically would have a domineering speaker. This was more so for 3C1, who had no specific setting other than a spatial divide between two teams.

Pertaining to the learning environment (setting) of the lessons, 3D1 had been more aware of the ‘argumentative’ nature of their speech with the tables providing the visual divide between both sides (traverse stage setting). 3C1, on the other hand, had difficulty moving beyond just presenting points, and were less able to pick out the flaws in the opposing team’s arguments, where they had the potential to. The students from 3D1 however, tended to turn to the teacher for support.

With regard to the observation checklist, the team had removed some observables and refined them as we noticed that the students did not exhibit the suggested behaviours in the Research Lesson. We had also altered the observables to link them to the lesson targets. We have also added a guided reading to the text Hansel and Gretel, instead of allowing free reading, which might result in the students adopting different versions of the text for the Research Lesson. Although there is a general storyline for Hansel and Gretel, there are different versions available online, including Brothers’ Grimm and Classic Fairy Tales.

The second iteration of the lesson is a clear improvement in the students’ reception and the observers are able to anticipate the students’ behaviours. This resulted in the lesson being more structured and guided. The arguments presented were much more coherent and the case proved to be better analysed than the first Research Lesson. The students were also given all the pieces of evidence instead of making them earn the information which had resulted in uneven starting points, to truly focus on the quality of their argument.

Thus, the team aimed to further refine the lesson plan for the next iteration, and we sought to refine the process by getting everyone in the team to focus on a piece of evidence and students would take turns to present. We also aimed to actively engage the jury with the observation checklist and the evidence provided.

The setting is also altered from 3D1’s traverse stage setting to a thrust stage setting instead, positioning the ‘Judge’ very clearly at the tip of the ‘T’. This revision allowed the students to better immerse in the ‘courtroom’ setting and be very clear of which side of the argument they belonged to. Both classes were also more able to pick out arguments of the opponents. The issue of having a dominant speaker was also resolved with this physical arrangement of the teams.

### 4 CONCLUSION

The team recognises that this Research Lesson addresses the issue of our students not being able to articulate their stands and substantiate their points and the root problem is the lack of discernment in treating information provided to them. The team notes the great interest that the students have displayed with this new approach to argumentative writing and speech, and aims to refine the court case that they would engage in, for future use in English Language lessons in 2015. With time, the team hopes that the development of critical thinking skills would begin from Secondary One, where in Lower Secondary we would aim to train ‘detectives’ in our students, where they would be critical of the information they receive, and in Upper Secondary we would nurture ‘lawyers’, where they would be able to effectively argue the stands that they have adopted, with the careful and clever enlistment of the information they have determined to be useful to them.

**Abstract:** This article describes the effectiveness of using *Hit Bottle Game* to Improve English Vocabulary Mastery of Ninth Graders. Vocabulary acquisition is the largest and the most important facing the language learners. (Swan and Walter as cited by Thornbury.2002) Monotonous teaching English vocabulary often makes students bored and demotivated as the result they are not able to achieve the objective of the lesson. So that teachers must be creative to use interesting technique in teaching English vocabulary. Beside that Cervantes (2009) states that English classes need to be more interactive to keep students interested in the lessons. One of techniques to make teaching English class live up is using games. Games are effective teaching tools and have many positive aspects, including the creation of opportunities for students to communicate in a relaxed, friendly, and cooperative environment (Cervantes 2009). It is believed that using games in teaching English class can create a more motivating instruction which make students more enthusiastic in learning English. In addition, the use games, including traditional games can build students up positive character such as responsibility, respect, competitive, and team-work. This article is aimed to explore the effectiveness of using *Hit Bottle* game inspired by well-known traditional games *Pukul Air* that students have been familiar with the game in order to make easy in practicing the game. In addition, this article also I will report on feedback from my students regarding how they feel about the use of games in the EFL classroom. Based on experiment in our class, the result showed that there was significant improvement in English vocabulary. The students' vocabularies are higher than before. This shows that the implementation of *Hit Bottle* game is effective in improving students' vocabulary. Furthermore, verbal student's feedback gives positive responds and agrees that the game fulfills the five criteria of game design proposed by Hill et all (2013), i.e. enjoyable, engaging, educational, English promoting, and easy to use.

**Keywords:** Hit Bottle, Game, Vocabulary

### 1 INTRODUCTION

This paper describes the effectiveness of using *Hit Bottle Game* to Improve English Vocabulary Mastery of Ninth Graders. In learning a new language, the first thing that learners must do is to master many words of target language (TL). Vocabulary mastery is an important element to understand the new language.

Vocabulary, much more than grammar, is the key to your child understanding what she hears and reads in school; and to communicating successfully with other people. For this reason it is very important for her to quickly build up a large store of words. Research studies have shown the strong links between having an extensive vocabulary and achieving school success. (<http://esl.fis.edu/parents/advice/vocab.htm>)

It is clearly stated that learners who have a lot of vocabularies are capable to use them will be more successful in developing their language skills than those who are poor in vocabulary. For further, Swan and Walter a (as cited by Thornbury, 2002) states that vocabulary acquisition is the largest and the most important facing the language learners. Learners need vocabulary which can support them to produce and use meaningful sentences because vocabularies provide organ of sentence.

However teaching vocabulary at junior high school is not simple tasks. Selecting techniques is very important in presenting class to attract student's attention. Teachers should consider the student's characteristics and material which are going to be taught. Monotonous teaching English vocabulary often makes students bored and demotivated as the result they are not able to achieve the objective of

the lesson. So that teachers must be creative to use interesting technique in teaching English vocabulary.

## 2 DISCUSSION

Interactive activities are needed for English classes to keep students interested in the lessons. What should teachers do if their students get bored and demotivated? One of techniques to make teaching English class live up is using a variety of games that directly involve language production. Games are effective teaching tools and have many positive aspects, including the creation of opportunities for students to communicate in a relaxed, friendly, and cooperative environment (Cervantes, 2009). It is believed that using games in teaching English class can create a more motivating instruction which make students more enthusiastic in learning English.

The advantages using games can be summarized as follows:

1. Games add variety to the range of learning situations
2. Games can be used to change the pace of a lesson and so maintain motivation
3. Games can be used to punctuate long formal teaching units and renew students' energy before returning to more formal learning.
4. Games can give hidden practice of specific language points without students being aware of this
5. Games encourage student participation and can remove the inhibitions of those who feel intimidated by formal classroom situations.
6. Games can change the role of the teacher from that formal instructor to that organizer of activities that students enjoy participating in.
7. Games can increase student communication, and so reduce the domination of the classroom by the teacher.

Games and activities are invaluable to the teacher of a foreign language because they provide an opportunity for students to use their language skills in a less formal situation (Carrier, 1985). In addition, the use games, including traditional games can build students up positive character such as responsibility, respect, competitive, and team-work.

This article is aimed to explore the effectiveness of using *Hit Bottle* game inspired by well-known traditional games *Pukul Air* that students have been familiar with the game in order to make easy in practicing the game.

### Hit The Bottle

Source : Adapted from an Indonesian Traditional Game Called "Pukul Air"

Age : Junior High School

Level Of English Difficulty : Moderately Hard

Number of Players: 5-10

Time for Player : About 20 Minutes

### Lesson Objective

Provided two sets of clue card, players should find a good answer stuck to a plastic bottle/glass by hitting it.

### Material

1. List of words for marking
2. Two sets of clue cards
3. Words stuck on a plastic bottle/glass
4. Stick made of rolled cartoon
5. Rope

### Preparation

1. Divide the players in class into two groups of five-ten
2. Hang 15 words or more stuck on the plastic bottle/glass at a long horizontal rope
3. Put two sets of clue cards on the table between both groups
4. Give a stick to each group
5. Player 1 of each group will be the first executor while the second ones will take one of clue cards
6. The teacher will be a judge

### Rules

Object of the game: to guess and pronounce a word.

1. The second player of each group starts by taking one clue card on the table after instruction using a flute, then discuss it with their group.
2. The first player of each group should run to find the right answer stuck on the plastic bottle/glass by hitting it. He/she is allowed to hit it only once. He/she who is able to hit the

right answer fastest, pronounce and spell it well will get 1 point for his/her group.

3. The first players of each group come back to their groups, give the stick to the second players and stay at the back of the group and the third players do as the second player did in step 1 while the second players do as the first player did and furthermore, do it in turn.
4. The game continuous until the whole jumble words cards on the tables has been finished
5. The winner is the group that gets point more than the other.

A lot of games have a competitive or point-scoring element in them. By making point-scoring, it can determine the winner so that the winner may receive a gift. It can make students actively involved in the activities and more motivated because sometimes students join the games not only for fun but also for prize. The prize or reward, rolled as feedback and reinforcement, will motivate them to continue learning. For example, when one of us presented a game, she gave us a gift. And I felt so happy and encourage learning more.

Using games in way to teach English more interactive is not without problems. Games that make students enthusiastic always make classes noisy. It can disturb other class activity. For example, when I held my games in class, in the middle activities somebody interrupt and asked to be quite. So it needs to be anticipated before starting the game. Another problem is timing. The games very often use much time that spend whole activities of class. This is not good because games is used as compliment of teaching not as main activity. So teacher must be carefully to choose a game in order to use time effectively. Teachers can use games 20-30 minutes. Other problem is deciding game that would be most appropriate and most successful with students at any one time.

### 3 CONCLUSION

In conclusion, using games as complement activities is invaluable to the teacher. Simulation shows that the implementation of Hit Bottle game is effective in teaching students' vocabulary. Verbal student's feedback gives positive responds and agrees that the game fulfills the five criteria of game, that is, i.e. enjoyable, engaging, educational, English promoting, and easy to use.

**Abstract:** Assessment of learning is often a difficult thing for teachers, one hand a teacher must pay attention to each student's competences will be assessed, while on the other hand it should be kept to facilitate the learning process. Some teachers who are not satisfied that the assessment in learning can be done after it by using teacher's memory on students activities, start to find their own strategy that allows to recognize students from their seating arrangement. This paper examines a junior high school science teacher who modifies seating arrangement during 5 months learning to obtain the most optimal seating arrangement that allows her to conduct an assessment in learning. The teacher has been experienced with lesson study since last 4 years ago. The strategy might be internalized from a case study of student activities in the classroom, but teacher sense and competencies could be developed through learning activities of interaction with colleagues in the teacher professional development activities such as lesson study. Field notes for 5 months during her teaching period in a half academic year on 36 students are investigated and analyzed. How teachers' learn in finding most reasonable seating arrangements for recognizing students learn also discussed here.

**Keywords:** Assesment in Learning, seating arrangement, Lesson Study.

### 1 INTRODUCTION

West Java government did dissemination of Lesson Study for 10 regencies in three years starting in 2011 until 2013. This forum found some teacher's problem in learning process, especially in assessment. According to government law no 19, 2005, one of teacher's duty is assessing of learning. Several reasons found related to how hard teachers to doing some assessment process, i.e. the assessment format is too rigid, difficult to be filled, teachers do not have enough time to assessing, and how hard teachers to be facilitator in learning and to pay attention in student's competence assessment at the same time. That is why teachers did assessment after learning process be done rely on their memory. Meanwhile, in science learning, teachers have to doing assessment in learning process. It is useful to help students get the learning purpose. That is why assessment has to be done together or along with, in learning process either after learning be done.

Regarding to this learning way, it is analogous with Curriculum 2013 in Indonesia which is

emphasizing process, so that teachers must doing assessment in learning process. There are three assessment aspect that must be fulfill in learning: knowledge, attitude and skill. Assessment process can be done in learning process including attitude and skill aspect. In learning process, teachers can assessing student's attitude to get student's attitude profile along with conducting them to change the negative attitude (for example: apathetic, passive, rely on the other team members, etc.) to the positive one. In additional, when learning process is going on, teachers can assessing skill aspect too, such as intellectual skill or psychomotor skill.

Teachers do realize there are some difficulties to do assessment process. Therefore, teacher must learning to find a new strategy which is can helping teacher's duty to be easier to do assessment process. This teacher's ability of course cannot be occur by itself, but through long and continuous process in certain vessel, such as Lesson Study. As an impact of dissemination of Lesson Study, teachers is accustomed to always made some daily notes in learning journal form. Based on this learning journal, teacher can find a new simple strategy to

make process assessment easier to do by utilizing student’s seating arrangement

**2 ASSESSMENT PROCESS FORMAT WITH SPECIAL TABLE**

When learning is taking place in the class, generally teacher stand up in the center of the class. He/she try to be able to see, observe, and communicate with the students during learning. From the teacher’s point of view, teacher can understand which student who achieved the competence and who is not yet. Usually teacher will approaching the problematic students and help them. But this condition is really rare to described in teacher’s finding note and be written in process assessment note. The main cause of this condition is the teachers are not adapting yet to write whatsoever during learning process.

This matter has been a case study in State Secondary School of 52, Bandung. The science teacher who had been teaching for the last seven years, and active in Lesson Study community tried to apply the Lesson Study’s habit in their class. She started to sketch the seating arrangement to identified student’s learning characteristic on the science learning journal. The alteration in this note is keep going on but it always describe the student’s seating position in the class.

When the learning is taking place, surely some point of assessment must be filled up based on anything teacher’s found out in the class. Generally, teacher decide which aspect will be assessed along with it rubric, then teacher will preparing an assessment table which is appropriate with its rubric. Just like explained in Table 1.

Table 1. Process Assessment Format in Force Measurement

Assessment Rubric:

Assessed Aspect	3	2	1
Scale reading	Student’s eyes is exactly in front of the scale	Student’s eyes is not properly enough in front of the scale	Student’s eye is forming a big angle with the scale (Parallax)
Stating the result of measuring	The scale measuring is sketched and marked. The result is exactly valid	The scale measuring is sketched and marked, but the result is not enough valid	Students drew dynamometer scale carelessly, the scale measuring is unmarked, the result of reading measurement is wrong

Table 2. Assessment Documentation Type

Name	Scale Reading			Stating the measuring result			Score	Mark
	3	2	1	3	2	1		
ALDI SURYA K.								
ANDI RAMDANI								
ANITA SETIAWATI								
ANWAR SAEPUDIN								
ARFAN HAMID								
And so on..								

Assessment format above at a glance looks like easy to do and ideal. But actually, this format is difficult to apply. Just imagine if there are 30 more students in one class which is the student’s name had already filled on the list. It makes consequence when the teacher doing some observation and assessing, the teacher need to find student’s name on the list while observing him/her, so that the teacher needs more time to fulfilled the format. This matter makes a problem if the assessing process going on learning process on one table which is prepared to be fulfilled to getting student’s profile. Meanwhile in one meeting, the teacher have to assured the

achievement of learning purpose, facilitated the students, and assessed.

The goal research is to describe how teacher find out most appropriate assesment input strategy that allows to recognize students from their seating arrangement as part of her “pushed-out” innovation .

Based on the problem above, teachers need a new strategy to do process assesment, such as attitude assesment, skill process, as well as product assesment in special form. The purpose of this format creating is to help teacher do easier way to filling the assesment data practically just in one paper format for one meeting, and it can be fulfilled in a shorter time along with learning process. Hopefully with this format creation, the teacher can get student’s profile learning, and can be used for whoever need this format without try to finding student’s name in the table of assesment beforehand which is waste more time.

Practically format which is mentioned before means to doing assesment process in the class with sketch of student’s seating arrangement and its “Special Table”. Student’s seating arrangement need to be made because it help the teachers easier to

observing. This sketch is appropriate with the class condition in that meeting. If the seating arranged classically, the sketch drew classically too, then teacher mark the line seating, so that the filling of special table can be observed: which student act active or passive based on the seating line. If the seating arranged as group activity, so the sketch drew appropriate as that condition as well, then mark the group name as necessity. This group seating arrangement sketch help the teacher to observe easily, not only observing the student’s group activities, but also student’s individual activity. Moreover, the special table as mentioned before is containing with some information of assesment aspect and its criteria, along with the student’s name. The teacher named it ‘special table’ because this table can be used teacher’s necessary of assesment for anything: skill process, attitude assesment, or product assesment. The form of assesment process can be seen in appendix part.

How to filled that format?

1. Firstly, make sure the student’s seating position in classically or grouping condition, then draw the sketch, mark the group’s name or line.
2. Make the special appropriate based on teacher’s necessity aspect. It made by teacher’s rubric which is had to be applied.
3. To filling the special table, concern about teacher’s observation aspect. Write down the student’s name, but only the students in 3 category or 1 category. If in one group indicating the same ability for all members, give the checklist mark due to its assesment category. This way make the assesment be more practicable and not wasting much time for assesment in learning.
4. If the raw data in special table had fulfilled, it means assesment process is finished
5. For getting student’s individual assesment, move the data to the process assesment format

The trial of assesment format with the special table above had been done in five months for 6 classes which is consist of 36 students. The result pointed out that, the format is really helping teacher to do assesment process. As a product, this special table also has excellence and weakness reviews. The excellence one is reviewing bellow:

1. Simple, quick, practical, and easy to be fulfilled in the class during learning process
2. Synergy with teacher’s performance
3. Can describe the class’s profile generally
4. Flexible for anything assesment, such as attitude or skill aspect during observation on going

As for the weakness of this format is not describing student's individual score assessment, so that the teacher has to move the data to the basic assessment format.

### 3 CONCLUSIONS

Teachers have to keep learning from the problems which is appeared in learning process. Assessing skill also must be owned by the teachers to do their duty in the class. The assessment process format with the 'special table' can be used by the teachers to help them assessing during learning process.

Assessment process format with special table is a product created from teacher's learning process to do the assessing process easier by using student's seating arrangement. This alteration is important to do as impact of Lesson Study activities for all teachers, especially from dissemination of Lesson Study in West Java, Indonesia.

### ACKNOWLEDGEMENTS

In this very happy occasion, I would like to thanks to principal of Junior High School 52 which give me to opportunity to do research with regard to how to

assess our students by using the new curriculum 2013.

This appreciation also goes to some of lecturer's at Faculty of Mathematics and Science Education especially for team of Lesson Study.

## School Based Lesson Study:

### *An Investigation of Practice, Achievement and Challenges in an Indonesian Junior Secondary School Science Teachers*

by

Doddy Rusmono

*Responses given by students as learners or English Language Learners (ELLs) function as the main theme in learning according to Structuralism. The students here fall into the category of SNED (Students of Non English Department). The responses include activities of reacting to statements, asking questions, questioning, and giving insights. Using English as a medium of responding, ELLs are constrained with linguistic and cultural aspects. The role of instructor as a facilitator is to generate some confidence on the ELLs' part by means of concealing inappropriatenesses while at the same time offering betterments. Source of being inappropriate are varied and complex comprising the mastery of vocabulary, knowledge of grammar, diction, and cultural differences. By merely integrating vocabulary and grammar to communicate, the meaning of expressions might not reach the intended receiver in the target language and, accordingly could end up with being incomprehensible on the receiver's part. Therefore, inappropriatenesses taking place "naturally" have to be appreciated in some way through Interest-Based Approach (IBA) with the wisdom and sympathetic care of Teacher Demeanor (TD). It is indicated that the feeling of being secure in every single session during the activities results in positive outcome on the ELLs' part through active involvement with FIESTA (Fun and friendly, Interactive, Explorative, Systematic, Technology savvy, Autonomous) mode of approach.*

*Key words: responses, inappropriatenesses, betterments, approach, secure*

## Introduction

The teaching of English as a foreign language to SNED (Students of Non English Departments) students as learners or ELLs (English Language Learners) needs certain approach. One of the SNED students groups at a school of *FIP (Fakultas Ilmu Pendidikan - Faculty of Education)* of *UPI (Universitas Pendidikan Indonesia - Indonesia University of Education)* is *Prodi Perpustakaan dan Informasi (Program Studi Perpustakaan dan Informasi - Library and Information Studies)* students. To obtain a positive impact from the learning process through English lectures to the students, for instance, a developed learning method through an appropriate approach is needed. The use of IBA (Interest-Based Approach) from Williamson (2008:16) has a potential positive impact in generating and keeping the ELLs' feeling of secure going. The feeling of secure on the students' part is worth maintaining throughout various kinds of sessions. Azis and Mahyudin (2014:43) put forwards that this condition will be reached when the students see a chance to express their ideas in the target language (English) without seen risks. When mistakes take place, ameliorating action should be triggered. The best way of generating the feeling of secure is by concealing any inappropriatenesses while at the same time offering betterments in a very polite manner. The feeling of secure kept going as the speaking activities at the school take place has a potential of accelerating ELLs' interest to use English while at the same time improving their ability to communicate better with peers and others. The lecturer as a facilitator should make every effort possible to prevent students from being revealed in terms of their mistakes. The effort made to

ensure students' unforced mistakes comes closer to perfection once an element of humour is inserted just to gear a positive impact of effective learning environments. The element of humour should be packed in such a way that the students will naturally respond to it and eventually burst into laughter. A facilitator can adopt a comedian's style of inviting laughter to enliven an atmosphere of cheer with live-warm-friendly learning activity through games, for instance. In an audiolingual method, interactive games are often used to motivate ELLs and set them free from satiation and boredom of routines in their daily practices of speaking in English. Munoz-Bazd's (2005:27) was quoted while saying *"The funny teacher is not a clown figure. He is a serious, conscientious professional who believes in the meaningfulness and effectiveness of having fun while learning"*. Humour is contagious and being released through antology to make it possible for the key points of learning materials to reach students' comprehension. Humour proves to be an effective way of mingling with ELLs (Hansen and Smith, 2002; Williamson, 2008).

Some sort of a second layer to strengthen the generated feeling of secure gained by ELLs is by inserting a degree of honesty on the facilitator's part. Parsons (2013) introduces a term of Teacher Demeanor (TD) to insert the honesty. TD is an approach characterized by repeated smiles with wholeheartedly facial expressions of cheer everytime any kinds of inappropriatenesses "performed" naturally by the ELLs take place. The inappropriatenesses come into existence in their various forms: misspronunciation with locality, choice of words with swerving their

meanings, grammatical usage with less than accurate formulas, expressions with more to eastern styles, and understandings on cultural aspects not yet absorbed as part of atheneness when communicating in English.

Communicating using English by students and some lecturers at the school takes place in a minimum frequency and, in one way or another needs to be spread for betterments. Its kind of expressing their ideas has been pushed generally by an obligatory, a must, a suggestion, pressures, a show (to express rank or standing), and a merely fun or joy. Communicating activities in the School (*Faculty*) of Education using English comprise English lectures, formal oral examination, discussion forum of *DIMBI* (*Diskusi Ilmiah Mahasiswa Berbahasa Inggris* – Students’ Scientific Discussion in English), role playing, individual or group talk, participation at international seminar, debating session, and student’s presentation at the yearly competition of Student Achievement Award. To a lecturer and an observer at the same time, every single word pronounced will be of importance to be appreciated. Results from this observation will eventually be the source of betterments in all aspects of learning in a wider perspective. The facilitator tends to be helpful in assisting the creation of burden-free atmosphere and will keep it going in a continuous mode. As a facilitator with efforts made wholeheartedly, the intention of helping in any way possible and giving appreciation to even mistakenly expressions will always be there. Expressing a statement of adore, for instance, is meant to trigger ideas and a means of generating confidence every time interaction in English takes place. The sign of adoring could be in the form of

an award or it could also be an abstract symbolic utterance for even every small effort made that has something to do with the attainment of learning goal. Hill and Flynn (2006) say that an appreciation (not a praise) given verbally proves to be more effective than an appreciation in the form of presents. Say, for example “*You’re a genius*” or, “*You deserve a Ph.D.*” *Shall we say?* while smiling wholeheartedly, seems so sufficient to the ELLs.

### **Potential of Producing Inappropriatenesses**

Inappropriatenesses (*the mistakes*, that is) often happen without the doer’s being aware. Efforts of generating betterments by the facilitator should always prevent the doer from being exposed to a situation that possibly reveals an embarrassment especially a very personal one. Those activities taking place in a classroom especially, a promising practical strategy should be applied (Dunlap and Weisman, 2007). “*Good morning, class! It’s always nice to be with you again*” might work quite well to start a session. The utterance initiated here functions as a way of throwing a feeling of boredom or a sense of being satiated away. Other than that, an atmosphere of freshness is expected to emerge – all of which should certainly be assisted by nice smile, sparkling eyes, and a little bit attractive gesture. If the facilitator intends to straightforwardly sacrifice himself, he might want to act like a trully comedian. Psychologically, the ELLs feel secure already and as a result they are sure they are freed from any kinds of intimidation. They will see a big chance to have an access to an enlightenment pleasing their hearts and to get rid of hesitation. That way, confidence goes

hand in hand with every single utterance when they feel the need to respond, ask, or even comment on the facilitator's opening session. Freshness created encourages enthusiasm that helps the emergence of confidence and, accordingly generates passionate admiration and interest on the ELLs' part. Enthusiasm is also believed to have a power of encouraging one to do things which were not interesting. In this case, ELLs' interest means a drive which is oriented to their needs. Eventually, the ELLs are motivated to undergo a learning process with enthusiasm. The motivation is not only geared by the ELLs but also by the initiative of the facilitator: willingness to involve wholeheartedly in the learning process for the sake of attaining the goal they wished to reach in the first place. Reaching their goal needs to be guided by way of keeping their feeling of secure going in any activities where English is used. ELLs learn how to communicate by involving themselves thoroughly. Hill and Flynn (2006:2) was cited when saying

*Language is the air we breathe and the water in which we swim. It comes as naturally to us as seeing the sky or digesting our food. It is as vital a part of our name and personality. But what if we suddenly had to breathe different air or swim in different waters? What if we consciously had to think about selecting the words we were going to say, getting them in the right order, applying the correct grammatical rules, and using the correct pronunciation? If we had to think about not only what we say but also how to say it, the language overload would be exhausting.*

How challenging using English when communicating is reflected by the above

citation. ELLs should indeed have vocabularies in a sufficient number and know something about grammatical rules such as the 9BP+3CCC (Cd, Cx, Cdx) and the PoS (Nine Basic Patterns of Sentence plus Compound, Complex, Compound Complex sentences) and the Parts of Speech, for instance, to equip themselves with before actually expressing their ideas in English at any performances at the school. Other than that, ELLs' knowledge of target culture (English, that is) play a great role as coined by Cakir (2006:77) "*Most frequently confronted that students to a great extent know the rules of language, but are not knowledgeable enough about the target culture.*" Both the languages, Indonesia and English – the source language (SL) and the target language (TL) – are a communication tool with two parallel streams which prompt to an awareness of a difference between the languages making it possible for any sociocultural and sociolinguistic constraints to hamper the communication. In the gap between the SL and the TL, there should be a stricture inserted to lessen the cultural barrier so as to make it possible for the communication to take place. As of the vocabulary, it has been proven that a sufficient amount of words would not be the only tool to express oneself to be accepted. Meaning on culturally loaded TL has to be offered to the party one is talking to. Evidence that the cultural difference between two different languages exists is that several languages have specific words for several concepts while other languages need to use several words to convey a specific concept (eastwood, 1982; Allyn, 2013).

In the English learning as a second language (ESL) as in Singapore, for instance,

ELLs are involved in English language in their daily life while in the case of English learning as a foreign language (EFL) as in the case of Indonesia, acquisition and the use of the language depends and is limited to the learning structure in the classroom with all of its impacts (Macau, 2003). According to Fodor (1974), the view which is general and logical in sense is that when ELLs express their ideas in English, they want to have their messages acceptable enough in the right way and not in the "right" way due to being incomprehensible culturally. It is true that one of the eight weaknesses in using a language is when an expression is uttered, emotional tendency and being swerved in nature often happens. An instructor with the capacity of facilitator needs to always make an effort to ameliorate in the light of TD the unforced mistakes done unintentionally by ELLs. TD approach sets ELLs free from the feeling of being intimidated and save their face as well.

Acceptance in the "right" way in the TL is coloured by an element of locality such as mispronouncing words. Jones (1978), an expert in pronunciation, comes to conclusion that *No two people pronounce exactly alike*. According to Jones (1978) differences among individuals exist from various causes such as locality, early influences, and social life of people living around a place forming certain environments. Not to mention individual peculiarities difficult or almost impossible to be discussed. A good example would be the locality as happened in, say, Bandung city of the Province of West Java. People, to be more specific, students of which their Sundanese accent is so strong, pronounce "f" instead of "p" and vice versa. When a word which has a "p" in it is to be pronounced, an "f" is heard such as in a word

of "people" which is pronounced "fifel" instead of "pipel". Students having a session in the classroom often burst into laughter when one student whose locality is so strong has to pronounce the sentence running like *It's very difficult to park my car in this parking lot*. It is exactly what other students with the same locality would pronounce every time consonant "f" or "p" is part of a word. Thus, a student might trigger some laughter when a phrase of *Novia Kolopaking* is pronounced *Nopia Kolofaking*.

### Efforts towards Betterments

Making efforts to make utterances sound as polite as possible will always bring with it some positive impacts. As a facilitator, giving bad remarks on student's language performance should be avoided. Gandi (2009) says it is a must to give remarks on student's work that will have a positive impact meaning that students should be freed from double burdens: linguistic shortcomings and less promising mental achievement. Therefore, if uselessness is what follows after the remarks or, even worse painfulness deep in the student's heart, giving remarks should be halted. Eastwood (1982) echoes that preventing ELLs from comments unlikely bringing positive effects is a brilliant idea. Someone has his own secret in his journey to master English but no one should reveal the secret for whatever reason. In his first three or four years of learning, having difficulties in grammatical structures and how communication works is common. To ELLs, empowering themselves through various opportunities of learning proves to be a certainty. ELLs need to be encouraged to adapt what they are really

interested in with the goals their facilitators are attempting to achieve. Through a cooperative learning technique, for instance, ELLs are offered to interact with each other in group activities to arrive at their learning intensity. Allen (1974:91) mentions some fundamentals as follows:

*The following general principles are self-evident:*

1. *All students want to speak, write and read the normal accepted English today.*
2. *This commonly be achieved by constant practice of existing forms, with some rational explanation of grammatical devices employed, whenever this is possible.*

It is true that basically ELLs want to have their English comprehensible in the TL when communicating. Nevertheless, to even make their English sound English, chances prove to be slim. Chances to practice the living structures used in communicating in a continuous mode seem to be scarce. In other words, a chance to see a room for involving themselves in interactive-communicative activities are sometimes hampered by the atmosphere of communication environments. Let alone when the practices need to be guided by rational explanation about grammatical formulas used. Not to mention the minimum amount of vocabulary they should have. The vocabulary they have to master functions as an important foundation as coined by Nation (2001:171) “ *A solid vocabulary is an important foundation for successfully mastering a new language*”. Alexander (1989) agrees with Allen (1974) that Students should be required to do a certain amount of extra work in his own time. As far as most instructors are concerned, suggestions to use English to communicate outside the classroom have

frequently been given, shown by examples, and even monitored in a tight manner.

A grammatical formula like  $9BP+3C$  (*Cd, Cx, Cdx*) plus *PoS* is abbreviated to make it easy to remember. The abbreviation stands for Nine basic patterns of Sentences plus three compound, complex, and complex-compound sentences. *PoS* stands for Parts of Speech (Noun-Verb-Adjective-Adverb) to enrich their vocabulary using prefix and suffix added to the root word (RW), like in *preRWsuf* (enRICHment). By way of such skill of combining all these elements, ELLs can make an analogy with a formula found in Chemistry. Part of the reason is that how a system in a language works has a little bit something in common with the formula used in Chemistry in terms of treating elements. Language also works with axiom in a light portion, one expert says. Through *Derivative*, for instance, a root word can be added with prefix or suffix and there goes a new word to be used in a sentence with different context and structure. Take *clean* (adjective and verb) as an example, can be enriched by adding *ness* to form *cleanness* (noun) or by adding *ly* to form *cleanly* (adverb). Enriching vocabulary may therefore be a lot easier for the ELLs to do with fun. Derivation helps students to express something the same in meaning but different in structure. With *beautiful* and *beauty*, for example, two sentences of the same meaning can be constructed: *Dwi Retno is the most beautiful girl here* and *Nobody has beauty here but Dwi Retno does*. If it has to be made “parallel” to the axiom in the Chemistry, according to a dictionary *derivative* is derived from something else, or *a word structurally related to another that can in theory be obtained from it and that is often used to verify the structure of the original*

word. There is another way of enriching vocabulary by making a “never-heard-before” word a bit more familiar with the ELLs through Key Word (KW) and Related Word (RW) approach. An example of a KW is *friend* – a word every student is familiar with. This KW has five RWs of similar meaning but not as popular as the KW. The five RWs include *ally*, *companion*, *crony*, *acquaintance*, and *confidant*. To the ELLs falling into the category of beginners, the five RWs could be brand new words and give no clues of how to use them in sentences. Towards the learning process, two factors namely being tough and patience are the key to enliven the spirit to gain more “new” words. Consulting a dictionary could be one way of knowing how to use the words precisely and, eventually would make it plausible for the ELLs to master sufficient amount of vocabulary. In brief, there are supposedly two main things ELLs have to own to get better in communicating their ideas for now namely vocabulary and grammar. Cultural factor is expected to be inserted as they go along with practices and first-hand experiences. The so called culture shock will be part of the facilitator’s task to handle by way of lessening it for the time being.

In a formal discussion taking place in a classroom, there goes an utterance *Hi, guys! How are you?* as an opening by a student to his classmates. The discussion is watched, evaluated, observed and commented by the facilitator. The opening remark has no problem with any incompleteness indeed, especially when the audience understand and is willing to share some nervousness. If the opening remarks had been “flavoured” with some elements of Grammar-Choice of Words-Culture (GCWC), the utterances

would sound a little bit more “delicious” indeed. The student in charge of leading the discussion would probably say something like *“Good morning, my beloved friends. Shall we say? How are you doing today? Feeling well, hopefully. Mmmh, good then!”*. At one chance given to the ELLs to play a role as a moderator, there still goes a student uttering *“Tell me the name before you ask a question, OK?”* as a substitute of probably *“It’s now time for an Q and A session. For anyone of you who is interested in sharing ideas, state your name first before asking a question or giving a response. Make sure the question is a question. Thank you”*. The following dialog reflects ELLs’ a bit less perfect attempt of running a discussion with “Stress at School” as a theme. There are seven students in their first semester majoring in Psychology. Around seven inappropriatenesses are found in the this short discussion.

- Tiara : “Hey how are you?”
- Dian : “Not good. I’m feeling so blue today”
- Dinda : “Why?”
- Dian : “You know what? I love one of our senior”
- Hasna : “Oh”
- Martina : “My”
- Rika : “God”
- Tiara : “Are you serious? Who is he?”
- Dian : “He is one of comission discipline
- Dinda : “ Who?”
- Wyddie : “Samsudin?”
- Hasna : “Darkosim?”

- Martina : "Or Jaenab?"
- Dian : "No! He is FRANDRI"
- Tiara : "How can it be?"
- Dian : "Based on my opinion he's so delicate. His face so sun bright like a diamond. I confessed my feeling to him last night. But damn it. He refused it."
- Rika : "Holy cow! I'm sorry to hear that."
- Hasna : "I knew, that was not easy"
- Dinda : "If I were you. I want never ever ever do that"
- Dian : "So what should I do than? I'm so stress today."
- Wyddie : "I see. Just forget the past. It's gone!"
- Dian : "I knew. I realized it's so ashamed."
- Tiara : "Just take it easy. Everythings gonna be okay."
- Martina : "Anyway, we have class so let us go now."

saying "Where are you?". The student should surely express "Where have you been?". She is not aware that all her friends are there in front of her, clearly seen. Nobody should be sought, whatsoever. "Where are you" denotes that somebody is looking for somebody else because of her being unseen. Another good example of inappropriateness for learning purposes is a short dialog between a student and a lecturer in a classroom. This ELL uses a group of words not common in English because of their being inappropriate. The ELL expresses "The name is also efforts, Sir" to convey a message in English "I was just trying, Sir". Other than making it English the wrong way, the ELL expresses an utterance that would not be acceptable in the native speaker's sense of meaning. To the facilitator, the expression might generate some laughter. That is why Balasko (2006) in Rusmono (2010) says "Students seem to find it difficult to compare and transmit two different systems of language and culture simultaneously". In a classroom session, a dialog using English has been directed to ELLs who have some familiarity with the language but lack in chances to practice it with intensity. The topic of the dialog should be controversial in nature so as to give a room for ELLs to get involved in the atmosphere of a debate (Moore, 1982; Franklin, 1990). A debating session serves as a very useful medium of expressions as coined by Rybold (2006:99) " Debating is a great educational opportunity and people like it because it is fun". Although, in fact, the facilitator guiding the activity should take an ounce of bitterness following the three-credit session.

All parts of the discussion above are performed exactly the same as the script the students write it themselves. The absence of punctuation marks like inverted commas, for example, is unedited and it is done on purpose for the sake of identification. A somewhat similar to the case in terms of GCWC is as follows. One of female students in a group, while opening wide her arms welcoming another group of female students

At a Library Tour (LT) for foreign students conducted in English by ELLs there

still goes utterance like “*Where are you come from? I am very interesting in this library, and Any question?*”. The tour leader of the LT probably wants to say “*Where do you come from or Where are from? I am very interested in the collections held by this library*”. Usually, an offer to ask questions is given in plural and is uttered in a complete form to keep politeness going like “*Do you have any questions? or Are there any questions?*”. Library Orientation (LO) and Bibliographic Instruction (BI) as the materials of the LT could be incomprehensible on the foreign students’ part due to such unEnglish utterances as shown above. To foreign students coming from English speaking countries like The USA and Canada, for instance, technical explanation on how to use electronic searching tools to access the resources could be unclear because of the explanation being not equipped with sufficiently appropriate diction. The following expressions are used by an ELL playing the role of a tour leader of LO and BI:

*Okey guys, this is Multimedia Room. There is place for browsing, searching, downloading, and typing. All facilities this room free for user. And this is postgraduate room. We can access in repository upi for see this collection. Now, we will wend second floor. This library have relict deposits. Okay, this is magazine and France Corner. This room will be relaxing for user. And than user can copy essay, thesis, disertasi and other collection in foto copy room. Free from copy can using preservation of collection.*

All parts of the script above are performed exactly as it is written the way they look. The purpose is to give a good example of how

incomprehensible an LT is conducted. The word *wend*, for instance, is uttered as it is in the written form. “*went*” is probably meant although it should be “*go*”.

At a formal examination of *Ujian Sidang Sarjana* to promote undergraduate students of the level of educational program in the department eligible to graduate, a simple question like “*Are you sure, your offer of applying such technique is promising enough knowing that instructors are usually find it a bit difficult to change their own ways of giving lectures?*” could turn out to be hard for the *examinandus* (the SNED student, that is) to grasp its meaning. The examiner was trying to test the *examinandus*’ knowledge using English to see whether the student can make his qualification meet the actual competency in the Era of Free Trade (and the university’s motto of *Leading and Outstanding*) he is going to face once he has to involve himself in the era of challenge. Answer to the question was *In my experience, teachers want to apply it* sound a bit Indonesian being mistakenly translated into English. Not only the pronoun *it* which does not represent the word *techniques* but also the phrase *In my experience* which is not in parallel with the words *teachers want*. The student would probably wants to say something like *As fas I am concerned, the informants of my research are willing to apply them (the techniques)*. Or, *Yes, I am*

*quite sure. To the best of my knowledge, the respondents show some willingness to apply the techniques. There's no doubt about it, Sir.*

At another chance in a Q&A (Question and Answer) session, a keynote speaker of an international seminar finds it rather hard to get the meaning of a question running like *"What could you relate between title from outside, grades, and behaviour for students?"*. Even though it is hard to draw the common thread from the question, the keynote speaker manages to entertain what is asked by the questioner (ELL, that is). At least, the keynote speaker would interpret *"How would you see any relationships between academic degrees earned from abroad and the behaviour of grading students' work among lecturers?"* before actually answering the question. The following question is short but sounds less accurate *"Can the best teaching method guarantee the best alumni?"*. The gap of diction between a sense of process and a sense of product seems to be too big for the speaker to handle.

Outside the classroom, at an activity of Student English Forum chaired by students (SNED students) of Library and Information Studies, various kinds of introducing oneself is heard. On interesting to note is *"Hi! I am Vinny. I live here in Bandung. Although my English is not very good, but I join this club to have fun"*. There is a possibility that the introduction is translating an Indonesian idea into English without carefully integrating grammatical elements to the expression. It seems like it is meant to minimally fulfill the need for information just to let people know something little about somebody. No signs of

interests are offered in terms of newnesses. No indication is found that the introduction would be continued in a more attractive and interesting way. It is therefore interpreted that no intention of giving signals that the first dialog could bring with it an impression of warmth and invitation to an even pleasing friendship. Vinny would need time and patience to reach a certain level of proficiency so as to have an expression more or less "right" like *Hi, there! My name is Vinny Pindiwiniti but you can call me Vivin. I am interested in joining with this club of conversation just because it looks good the way it is. It also sounds like fun when I see you all together in a harmonious atmosphere – chatting, laughing, and having all possible good times. In my spare time, I go swimming. Sometimes I swim alone, all by myself.* The last statement has every reason to attract interests and thus serves as a good start to build a relationship in a convenient atmosphere. At a glance, the case of mistake as shown above looks trivial, but a closer examination suggests that it inspires one to make some betterments. An alumnus' opening remark in his capacity as a moderator in an international conference needs to be polished because it runs like *"Welcome for Mr. X"*. The preposition used in the remark should not actually be there. Or, a candidate for The Best Educator at a faculty level who speaks in English with difficulty when answering a juror's question. The candidate's competency of English should actually be in the category of "speaking effortlessly" already.

### Conclusion

Making efforts to elevate any good intentions of the ELLs to use their English the proper way will never be futile. The facilitator

approaching them with enthusiasm results in positive responses and more than likely would end up with betterments in various forms. Rooms created for the ELLs to fill the gaps may still be far from being perfect, but at least an initiative has been launched and will hopefully lead to a much more promising future. Giving credits to ELLs for any drives of speaking even in a need-polishing-English proves to be useful. It leads to an emerging self confidence on the ELLs' part and eventually will generate more understandable utterances. Varieties of social, cultural and economic backgrounds will not contribute that much to hampering possibilities and therefore ameliorating constraints to effective learning will be beneficial. Temporary “negligence” to linguistic standards has resulted in a conducive process of learning English as a foreign language. Replacement of the negligence by the facilitator's artificial conduct of enlightenment pushes ELLs to perform with confidence and with the feeling of being not intimidated by risks. Benefits are the ELLs to get since continuous efforts of creating pleasing atmosphere by the facilitator are made. The impact is obvious: an initiative of communicating in English with confidence and risk-free attempts. The impact is potentially promising in terms of developing and implementing innovative instructional programs for the SNED ELLs.

## Decreasing Teacher’s Burden in Designing Fun Learning Through Lesson Study

**Dyah Prasetiani**

*Japanese Language Education Department, Semarang State University,  
B4 Building Kampus Sekaran Gunungpati 50229, Semarang, Indonesia  
[prasetiani.dyah@gmail.com](mailto:prasetiani.dyah@gmail.com)*

**Abstract:** Teacher has a great responsibility in conducting teaching learning activity in a class. Before teaching a class, teacher should make preparation of lesson material and media that will be use in the class. Teacher has to decide what kind of learning technique will use to deliver the teaching materials as well. This important job is not only done once, but every time they have to teach in the class. It means they have to arrange it for a whole semester. This is not an easy job indeed, especially if the teacher never taught the subject before, or if the book and technique that usually use are change in order to get a better education result. This paper is about teacher’s efforts in designing fun learning with quality in speaking subjects, particularly dealing with designing a better lesson plan, lesson material, and media which conducted through Lesson Study. The author tries to describe based on her own empiric and observation data during the process. The aim of this paper is to share information and findings of how Lesson Study could help to decrease teacher’s burdens in designing a better teaching learning. The result of the observation indicates that Lesson Study could help teacher to (1) decrease teacher’s burdens in designing a better teaching learning especially for the teacher who never taught the subject before, because the teacher not work alone (2) help teacher in increasing knowledge of resource books, (3) teacher could learn how to deliver the lesson materials by employing a better teaching technique from colleague or observer, (4) by conducting lesson study continuously, teacher become trained to evaluate a teaching learning process, (5) teacher model and observer should change their role in order to maximize collaborative working. A suggestion coming out of the above findings is Lesson Study could help teacher designing a better fun learning.

**Keywords:** lesson study, designing

### 1 INTRODUCTION

Education is the most important things to build a community. Education aim at improving the quality of education, so can create the human resources that reliable either in the field of academic, socio-personal, or vocational. Many people of Indonesia expect the quality of education in every educational institution be increase. Not only curriculum and facilities, even educators are expected to improve their learning quality.

Therefore in 2005, The Government and The House of Representatives had legalized The Act RI no 14/2005 about teachers and lecturers act. It is mentioned that the teachers and lecturers have to work professionally in order to improve the quality of education. The type of competences referred to this Act includes pedagogic competence, personality competence, socially competence, and professionalism competence.

To improve the professional and qualify educator, teachers who are competent in their field and the high-quality education are require. Various ways can be done to achieve this aim. One of them is lesson study. Lesson study is expected to help the development of teachers in

order to get maximum result for both teachers and students. Why? Because lesson study is an effort to improve the learning process and the result, which is implemented collaboratively and sustained by a group of educators, based on mutual learning principles and building learning community for all those who involved in it.

Through Lesson Study, several student and teacher’s problems in teaching learning, bit by bit can be overcome. Include teacher problem in design a learning.

In carrying out the duties, teacher has a great responsibility in conducting teaching learning activity in a class. Before teaching a class, teacher should make preparation of teaching materials and media that will be use in the class. Teacher has to decide what kind of learning technique will use to deliver the teaching materials as well. This important job is not only done once, but every time they have to teach in the class. It means they have to arrange it for the whole semester. This is not an easy job indeed, especially for the new teacher or if the teacher never taught the subject before or if the book and technique that usually used are changed in order to get a better education result.

As happened on the speaking subject for 2<sup>nd</sup> semester (2 credit). I was given the task of

teaching this subject in last semester (even semester 2013). Based on the evaluation/discussion at the beginning of semester, the lesson material should be changed. Because it requiring to be adjusted with material in grammar subject (6 credit). Consequently, lesson material that should be taught in speaking subject is 20 chapters and must be settled in 14 weeks. It means the materials, media, syllabus, and lesson plans must be renewed. This was a heavy burden for me. I have never taught this subject before. If I have to work alone in preparing and carry out the lesson, can be imagined how complicated it would be? Every week I have to make new media and preparation for teaching alone. I was lucky because my team teaching is native speakers of The Japan Foundation. *Jugyo kenkyu* that we did could overcome these problems. This is called as lesson study.

This paper is about teacher's efforts in designing fun learning quality in speaking subjects particularly dealing with designing a better lesson plan, lesson material, and media which conducted through lesson study. The author tries to describe based on her own empiric and observations data during the process. The aim of this paper is to share information and findings of how Lesson Study could help to decrease teacher's burdens in designing a better teaching learning. Because the teacher usually thinks that the lesson plan, teaching material and media they made was good enough and could delivered smoothly. But sometimes revise is necessary.

## 2 FINDINGS AND DISCUSSION

### 2.1 What is Lesson Study

Lesson study is a simple idea. If you want to improve instruction, what could be more obvious than collaborating with fellow teachers to plan, observe, and reflect on lessons? While it may be a simple idea, lesson study is a complex process, supported by collaborative goal setting, careful data collection on student learning, and protocols that enable productive discussion of difficult issues. (Catherine Lewis, Lesson Study: A Handbook Teacher-Led Instructional Change, 2002).

The point is lesson study is one of the efforts to improve learning, by conducting collaboration with other teachers to design, observe, and do reflection on learning process.

Lesson study is derived from Japan (*jugyo kenkyu*). This activity used by Japan teachers to test the effectiveness of their teaching with the aim to enhance learning outcomes. The idea of lesson study is teacher can collaborated with

other teachers to develop a lesson plan, media, observation, reflection, and revising lesson plan continuously. Because good instructional design, sometimes not necessarily succeed as assumed by the teacher. Depend on the reaction of students.

There are four major purposes that motivate lesson study: (1) to understand better how students learn what you teach. (2) To create usable products for other teachers in your field. (3) To improve teaching through systematic, collaborative inquiry. (4) To build a pedagogical knowledge base in which teachers can benefit from one another's knowledge of teaching. (Bill Cerbin & Bryan Kopp. A Brief Introduction to College Lesson Study)

This complex process should be done continuously because of several reasons they are: (1) there is no excellent education, (2) each student has the right to learn, (3) learning must considering the balance between increasing of thinking ability and manner, (4) learning should be centered on students.

Study the lesson aim to find solutions for the problems of learning as to improve the quality of learning. The study lesson can be done towards lesson material, the learning method, worksheet, the learning media, or assessment. Why study the lesson conducted in collaborated? Because the more input the more quality of learning will improve.

### 2.2 Why Speaking Subject Need Lesson Study

As an institution of higher education which are responsible for generating the output of skilled teacher and able to teach Japanese in high school, Japanese Language Education Department of Semarang State University was trying to improve the quality of learning by improving the curriculum and its content. Include speaking subject for 2<sup>nd</sup> semester.

Actually the speaking subject given to 6 semester (I-VI). But since I only had to teach the speaking subject at basic level students (2<sup>nd</sup> semester), this paper is simply conveys information from observation results towards Lesson Study conducted on that speaking subjects only.

Based on the results of evaluation/ discussion conducted at the beginning of the semester, it is known that the material being taught on the speaking subjects disproportionate to the material on the subjects of grammar, whereas both of these courses use the same textbook, i.e. Minna no Nihongo. This is due to the difference in the amount of credits. Speaking, 2 credits (the material carried only chapters 1-13), while

grammar, 6 credits (the material read by chapters 1-16).

As a result, the remaining 3 chapters haven't taught in the speaking subjects. Therefore, in the next semester, I and my teaching team have to teach 20 chapters (14-33 chapters) in 14 weeks. Until the midterm, we must combine 2-3 chapter becomes 3-5 media and worksheet. This means that the syllabus, lesson plan, material also have to be renew. That is in contrast to a year ago. We have to make preparation in each week through Lesson Study.

Why the new syllabus, lesson plans, material, and media must be renew? During the last two years lesson plan and lesson materials was taken from some resource books. Actually it was good, but at the beginning part, students just practicing utter or repeating a sentence instead of practicing the actual conversation. In addition, due to difference credits. Hence, the material disproportionate to the material on the subject of grammar.

### 2.3 The Process of Lesson Study in Designing Fun Learning

Because of limited time and human resources, lesson study on speaking subject for the second semester only done by the teaching team, which is consist of 2 teachers. One is teaching while the other is observing. We decided to do the role interchangeable. Why? Because we had 3 classes and 2 hours weekly meeting on Thursday. We will be very exhausted if we did the teaching and observing 3 times in a day. And since my partner (co-working observer) determined to seat in another subject course on 15.00 p.m., then we exchanged and determine the schedule as follow:

No	Class	Schedule	Teacher	Observer
1	First class	Thu 7.00-8.40 am	S/D	D/S
2	Second class	Thu 11.00-12.40 am	S	D (optional)
3	Third class	Thu 15.00-16.40 pm	D	-

Fig.1. Lesson Schedule

Thus, lesson study is only done every week in first class. While in the second class is optional. The third class only observed in first 2 weeks, after that, I was taught alone without being observed.

The lesson study process that we conducted is consists of 5 steps as seen in this picture below:

Fig.2. Lesson Study process in speaking subject (modified from Fernandez and Yoshida, 2004: 32)

#### Step 1. Planning

Lesson Study activity start from planning stage, namely design the lesson that centered on students, how the student can participate actively during the learning process. In this stage, teachers collaborate to enrich ideas on developing better lesson plan and media.

By collaborate, both of us choose topics which will be learned in one semester. This topic selected based on current curriculum. Next, we made the syllabus that consist of 1) the learning purpose of speaking for basic level 2) the learning purpose of speaking for the student of second semester, 3) assessment, 4) units, 5) an explanation of how this lesson will perform by teacher.

The teaching order determined by drawing our past experiences, teacher's guide, textbooks, and other resource books. The bottom line, it is important to design a learning which makes student active, happy, not bored, centre on student, and capable of making a simple conversation.

From this collaboration result, both sides got input about source books that suitable to use in speaking subject for basic level, and how to convey the lesson material with a more attractive method. This is an advantage that teacher could get. We finally, assign one book as the main textbook. As for the additional material, we use 3 other books. We also made the conversation text by our self.

After that, we agree to meet again to discuss the lesson plan. We decided that lesson plan made by teacher that will teach. The Following is one of activity schedule for planning stage.

Planning Activities 2 <sup>nd</sup> week	Date	Activities
	7/3/2013 Fri	Teacher who will teach developed preliminary lesson plan, created lesson material & worksheet
	10/3/2013 Mon	Teacher who will teach presented the lesson plan, followed by discussed and received feedback
	11/3/2013	Teacher who will teach revised the lesson plan, lesson materials, and

Tue	prepare to teach the lesson (with help from the team/observer)
13/3/2013 Thu	Teacher taught the lesson. The other teacher observed the class

Fig.3. Planning phase on lesson plan

The example of lesson plan that I made is as follow:

- 1) Instructor: Dyah P
- 2) Subject: speaking (kaiwa shokyu kohan)
- 3) Date & Time: March 13, 2013 (Thursday)
- 4) Semester: 2 / first class / 14 students (4 boys, 10 girls)
- 5) Name of the unit: Te kei, te kara
- 6) The goals of the unit: student can speak with the right expression that appropriate with the situation, and also can make a short conversation.
- 7) Plan for the unit (lesson 16)

**Section 1:** review student's comprehension of last week material by role play. Assess.

**Section 2:** ensure student understanding about “-te-“ and “-tekara-“ patterns. Develop student's mastery by making a short conversation that appropriate with the picture.

**Section 3:** to foster a better understanding of grammar and natural conversation by exercise in pairs, using pictures.

**Section 4:** apply the “-te kara-“ pattern by interview activity

**Section 5:** to exercise student's pronounce by reading a long text of conversation (lesson 16). Work in pair.

The feedbacks obtained are as follow:

- Students may be directly utter the sentence only base on picture they see. They will probably not make a natural conversation. Therefore teacher should give clue so students can say the opening and ending sentence of conversation that fits with the situation in pictures, for example: “sumimasen”, and “iidesune, itsuka isshoni..mashouka” in order to make the conversation becomes more natural.
- Grammatical corrections
- It will be meaning full learning if student can make their own long conversation by modifying the long conversation text with their own words or situation.

So, the **section 5** revised as follow:

To exercise student's pronounce by reading a long text of conversation (lesson 16). And to review what the

students have learned by modifying some words or situations in the conversation text, so it will be easier for students to memorize and then present their own conversation. Work in pair. Student will **get extra point** for the presentation.

The discussion and feedback provide good input for both of us such as: share ideas, corrections on grammar, correction on the content of lesson plan, knowing the strength and the weakness of the lesson plan, knowing how to develop lesson plan becomes more meaningful learning.

### Step 2: Teaching/ Observing the Implementation of a Lesson Plan

The second stage is teaching and observing. Teachers implemented the learning by using revised lesson plan. One of the teacher in the group taught the lesson to students. Other teacher observed. The observer came to the class with the lesson plan in hand, which they use as a tool to guide what they look for in the lesson.

Because the observer got turn teaching in second class, the observer really focused on observed the learning. Especially on student response, as well as the strengths and weaknesses of the lesson plan.

I think this is also the advantage of the exchange of roles between the teachers who teach and observer. In the end, this can help maximize collaboration when designing the lesson plan. Maybe if we work alone in the class, we can't see all the student's difficulties in detail. That's why we need co-worker to observe our teaching learning process, including our technique, material, and media.

### Step 3: Reflection/ Revise

Reflection immediately conducted after complete teaching/ observation. The discussion begins with convey impressions when teaching. The observer then delivered comment on students, such as when students can follow the lesson, when student less able to follow lessons, give advises to add/ reduce/ convert lesson plan and media.

Through this discussion/ reflection activities, teacher who teach could know about student behavior in the classroom in details. Usually, teacher only teach and pay attention to the reaction of some students in the classroom. Not too detailed. Just pay attention to some students he/she knows as smart/not smart, less active/silent during group work. The bottom line, there is an increase in lecturer's ability on observing the learning. The strengths and

weaknesses of lesson plan can also be immediately known and revise and then implemented in the next class.

Feedback obtained are:

- In section 2, the student is difficult to interpret the image, making it somewhat difficult to make conversation and taking time. Teachers should provide many clues.
- Teacher should provide more pictures so the students trained to make conversation. However, the allocation of time for section 2 needs to be added.
- Automatically, section 3 should be more shorts in time by reduce the picture

Based on the feedback above, we revised the lesson plan for the second and third class. This reflection phase always produce the final revision of the instruction. The revision becomes external product that can be used for an extended period of time as long as in accordance with the curriculum, student conditions, as well as the campus environment.

#### Step 4: Re-Teaching

Because the lesson plan had been revised, usually teacher can teach the second and third classes better. Moreover, the teacher has already seen the way to convey the lesson.

Although the lesson plan had been better, there is still possibility of revise again due to several factors. For example, student's responses are different, the amount of students in the class is not the same, the physical conditions of students in first class differ with third class, et cetera. This kind of things usually discussed further in reflection stage.

#### Step 5. Reflection (Optional)

After teaching the new version of lesson plan, we also do reflection/ report optionally. Particularly if there is any problem or change in second and third class. It is possible if it didn't go well because the condition/ response of students are not the same.

In the second week, feedback that obtained by team are:

- Since the amount of students in second and third class are 23 and 25 (more than first class), section 1 take longer time than allocated time. As a consequence, unfortunately, in section 5 only a few students can get the chance to present the conversation. Whereas they got extra points if they present. This problem should be thinks

further to find solution for the next semester.

- Because students already attending the class continuously from 07.00 a.m., students are very tired. As a result, the response of student in third class slower than the first class.
- Moreover, while doing the section 5, students are not very active. These problems should be thinks further to find solution for the next semester.

### 2.4 The Benefit for Teacher

Based on my own empirical experience and observer's notes, the advantages of this kind of lesson study obtained for lecturer are as follows:

- At the beginning, teacher collected knowledge, then working in collaboration. This activity enriched teacher ideas and knowledge about sources book, learning techniques, and media. That could produce a better lesson design than done alone.
- Compare with my last experience in other subject, I did not create the lesson plan by lesson study before. Lesson plans, materials, and media are already available. My job just seat in at first class only, then taught in second class. So, I didn't experience the process of revising the lesson plan.
- Since there is an exchange of role/turn (as teacher and observer), the task of creating a lesson plan and media in each week was performed alternately. Since the lesson plans made by lecturer who will teach, this could decreasing the teacher's burden. Because teacher doesn't have to create lesson plans alone and don't have to make it every week. If lecturer have to make it every week, and also for some other subjects, perhaps they won't have enough time to make a research and community service. Though it includes basic tasks of a lecturer called Tridarma College. Thanks to Lesson Study, this burden can be reduced.

### 2.5 The Impact on Student Learning Activity

The observer noted that the impact on student learning activities are as follows:

- All students pay attention to the lecture and lesson from beginning until the lesson finished.
- During Q & A activities on section 2, only a few students could answer the

questions. But when they work in a pair (do the conversation), all students become active.

Fig 4. How lesson study can change the student

- Most of the students are active during the learning process. The average of their daily activeness is achieved 70 points. It seems impact on their mid-term test, they got good score (the average is 82.65) and in end-semester test their average is 80.48. It can be says that the result test is quite good. Most of the students who active in daily class activity, achieved high score.

The overall process of this study lesson (jugyo kenkyu) has helped reduce the burden of teachers in designing learning. Because no longer work alone. Teacher gets help from team teaching/observer.

If the lesson study process do continuously, and do the exchange role between teacher and observer, then a lecturer will be trained to evaluate a teaching learning process. So they become more sensitive toward student's response and lesson plan that they get involved in design it. Although can't be detail just like the observer did.

### 3 CONCLUSION

Based on the result above, it can be concluded that the result of the observation indicates that Lesson Study could help teacher to:

- (1) Designing better fun learning. Collaboration with the team can help to decrease teacher's burdens in designing

a better teaching learning especially for the teacher who never taught that subject before, because the teacher not work alone.

- (2) Help teacher in increasing knowledge of resource book
- (3) Teacher could learn how to deliver the materials by employing a better teaching technique from colleague or observer,
- (4) By conducting lesson study continuously, teacher become trained to evaluate a teaching learning process,
- (5) Teacher and observer should change their role in order to maximize collaborative working.

A suggestion coming out of the above findings is that lesson study could help teacher designing a better fun learning. Lesson Study can apply in every week. But if it applies in university level, the obstacles in each University are necessary to be consider and look for the solution.

**Abstract:** Dynamic Intellectual Learning (DIL) is one of the adaptive learning models which is an improvement of e-learning system. DIL can lead learner to access the learning content that is suitable with their prior-knowledge. There is a principal distinction between DIL from e-learning system. DIL has a pre-test which is conducted before the learner can access the learning content, after which the system will then provide guidance for learner to access an appropriate material based on the result of the pre-test. After the student finishes accessing the learning content, the learner will be given a post-test by the system to decide whether the learner can access the next level of the learning content or they should go back to the previous learning content. This model is expected to cover the weakness of the conventional learning model, in which the learners study the same material without considering their prior-knowledge. DIL has been implemented in the Psychology of Child's Education course at the Department of Primary School Teacher Education, Ganesha University of Education as a pilot study. The present study involved 44 learners as samples. Based on this study, it was found that the learners have a different numbers of accesses in order to pass the 14 learning contents in one semester. 2.56 % of the learners required 8 times of access, 12.82 % needed 14/15/16/19 times of access while 2.56 % of them needed 23 times of access to be able to complete every material provided. This study demonstrate that not every learner needed 3.5 months (14 sessions face-to-face learning process) to understand all of the learning contents in one semester, compared with that of the conventional learning. The remaining time that these faster learners have after completing the lessons can be employed by the students to master enrichment materials or entrepreneurship skill. The most critical thing in DIL is the instrument which is used to measure the learner's ability to understand each material, so that the system can put the learners into the right learning content.

**Keywords:** Dynamic Intellectual Learning, Prior Knowledge, e-Learning, Adaptive Learning, Learning Model.

### 1 INTRODUCTION

Ganesha University of Education (GUE) is concerned with the development of ICT and its application of learning system as an effort to increase the competence for becoming a center of excellence. This was realized with the establishment of the Department of Information Management (D3) and Information Technology and Computer Education (S1), expected to develop a program of institutional consolidation in the form of utilization of ICT in the education system.

In the future, with the era of globalization, college graduates will not be just competing with the domestic labors but also with the foreign labors. That is a challenge for GUE as one of the higher education institutions for delivering graduates who can compete in the global market. From this perspective, GUE is expected to shift the learning paradigm from faculty teaching into student centered learning by applying

Dynamic Intellectual Learning (DIL) based on ICT which oriented on prior-knowledge of each learner.

DIL will provide an opportunity for users (students) to access a course material in accordance with their respective abilities. The students with better abilities than the others will have the chance to explore the course materials more quickly with the chance to have enrichment afterwards. It means each student will not have to face the same material. The system will immediately analyze the capabilities of each user. It will not be obtained in the conventional learning (face-to-face in the classroom), where the students will get the same course material or treatment despite of their prior- knowledge.

A research has been conducted to develop the prototype of Dynamic Intellectual Learning. However, the model has to be tested both in terms of the system, which concerns about the user interface, the performance and stability of the system, as well as learning content. Apart from the system, testing

should also be done from the model that will be applied. On this study, we focus on implementing the DIL system in order to know the benefit and efficiency of DIL Model.

DIL is the improvement of e-learning system which was widely applied in various educational institutions both formal and informal. DIL is oriented to prior-knowledge of each learner so that it can be accessed without limited by time and space, thus it can provide an opportunity for users to access different materials according to their respective capabilities.

One thing to be noted is that the implementation of e-learning system is not only able to transfer the knowledge from the educational institution to the students, but it can also facilitate the interaction between students and teachers and between students themselves which can build an academic atmosphere and develop critical and analytical thinking to solve problems among the students.

## 2 DYNAMIC INTELLECTUAL LEARNING (DIL) SYSTEM

Dynamic Intellectual Learning (DIL) system is the improvement of e-learning system which is now widely implemented in several educational institutions both formal and informal. DIL will provide the opportunity for learners to explore the course material in accordance with the prior knowledge of each student. In general, implementation of e-learning system does not consider the prior-knowledge of the learner. The steps performed in the DIL method are as follows (Dantes, et.al. 2010).

### 1. Pre-Test

The student has to take a pre-test before they can have the chapter from the learning content. There are some requirements, such as: (1) pre-test consists of questions that represent each chapter; and (2) the pre-test's result indicates if student pass or does not pass that chapter. The purpose of pre-test is to determine the prior-knowledge of student, therefore the system can assign the student to the chapter that suits with his/her capability.

### 2. Choosing the Learning Content

The student can choose the learning content that has been posted. Yet, the system will check whether the student needs to take certain chapter or not.

### 3. Taking the Chapter

There are two conditions in taking a chapter of learning content. First, the student is free to choose the chapter. Second, the student has to take the chapter that has been decided by system, since the student has not passed the test session yet.

### 4. Taking the Test Session

After choosing the chapter which is decided by system, the student has to take the test session before they can exit from the chapter and continue the learning process. From this activity, some possibilities can happen, such as: (1) the student can pass all the chapters; (2) the student cannot pass certain chapters or all chapters. If this is the case, the system will assist them to take the smallest chapter.

The learners are only given the opportunity to repeat the session 3 times. After three attempts, students are no longer allowed to take the chapter and also should not take the related chapter relating to the chapter that they did not pass. In other words, that chapter will be locked. The process of Dynamic Intellectual Learning is illustrated in the following figure.

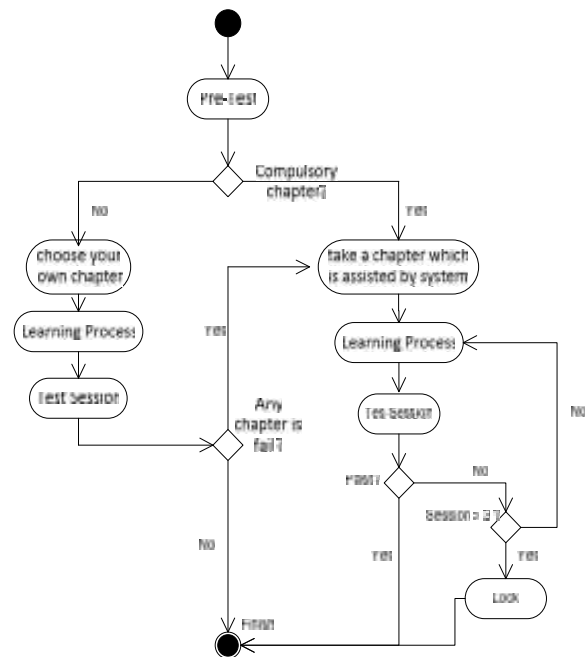

Figure 1. Flow of Activity in Dynamic Intellectual Learning

### 3 RESEARCH METHODOLOGY

This study used prototypical study type which is one of research and development design. This technique was proposed by Akker (1999). The most important thing that need to be considered in developing research is the quality of the learning model or the product. Research population was lecturer and students at Ganesha University of Education, with the Primary School Teacher Education and Guidance & Counselling Department as the departments enrolled as the pilot project of this study.

Dynamic Intellectual Learning System was developed using a prototype methodology. It is one of Software Life Cycle Methodology. The methodology contains of 5 steps, namely: system requirement, system analyst & design, prototyping (model development), evaluation, and implementation.

The instrument used on this study was validated using item test for determining the level of reliability and validity. However, we also need to do the continuous validation both empiric and expert judgements.

### 4 RESULT AND DISCUSSION

#### 4.1 Implementation Of Dynamic Intellectual Learning System

On this study, we focus on implementing of Dynamic Intellectual Learning as an adaptive learning. We used a Psychology of Child’s Education course as a pilot study on implementing DIL system. There were 44 students involved on this research from Primary School Teacher Education Department.

The learning history from each student in using DIL system was recorded. DIL system was implemented starting from August until October 2011. The data gathered from this study were then analysed using descriptive statistic. This study describes the implementation result of DIL system. It can be used as one indicator to know the benefit and efficiency of this system.

From 44 students who enrolled this course, 5 students failed the course while the rest of them passed it. In this study, collaborative method was implemented, in which conventional and DIL system-supported online learning.

A student can be cleared as passing the course if they have taken the entire chapters (14 chapters) and they finish all of them in accordance with the standard requirement needed by each chapter.

### DIL System Implementation

Figure 2. Result of DIL System Implementation (August – October, 2011)

Five students who failed the course during the experiment with different diagnoses. One student stopped at chapter one, because he/she could not continue to the next chapter. One student stopped at chapter 5, two students stopped at chapter 7, and one student stopped at chapter 9. The figure below shows the different achievements among these five students.

Figure 3. Achievements of the failing Students

Achievements of the students who succeeded in passing all of the chapters also varied, along with different number of access to the system (table 1). The number of access needed to finish the entire chapters can be used as an indicator to show how fast the student can master the learning content. It is determined by the student’s prior-knowledge and their intellectual quotient (IQ).

The average of students’ access number in order to understand the learning content was 17 times. The table below shows that only one student can finish the entire chapter within 8 times number of access, while one student needed 23 times of access to finish all of the chapters provided. That means, each student needed different times to understand the learning content.

Table 1. Number of DIL Access for Mastering the Entire Learning Material

No.	number of access	number of Students	Percentile	Remark
1.	8	1	2,56%	Pass
2.	10	1	2,56%	Pass
3.	13	3	7,69%	Pass
4.	14	5	12,82%	Pass
5.	15	5	12,82%	Pass
6.	16	5	12,82%	Pass
7.	17	4	10,26%	Pass
8.	18	1	2,56%	Pass
9.	19	5	12,82%	Pass
10.	20	4	10,26%	Pass
11.	21	3	7,69%	Pass
12.	22	1	2,56%	Pass
13.	23	1	2,56%	Pass

More explanation about the number of access is described in the following diagram.

Figure 4. Number of Access Needed by students to Master the Entire Learning Material

## 5 CONCLUSION

Based on the explanation above, it can be concluded that 39 students (88.64%) finished the entire chapter while 5 students (11.36%) failed from the total 44 students enrolled in the experiment. Each student had a different number of access of learning content. It shows that each student needs different number of time to understand the material. Therefore, each student should be given different treatment for understanding the learning material. The fast learner will spend less time in finishing the entire learning material and thus can proceed to enrichment content.

From 39 students who could finish the entire chapters, only 1 student had 8 access of time which is the smallest number of time to understand and pass all the evaluation on each chapter in this study, while 1 student had 23 times of access as the biggest number of access in this study. The average of number of access is 17 times.

The students who failed in finishing the entire chapters also showed different levels of understanding. Among them, 1 student had to stop at the first chapter, 1 student had to stop at chapter five, 2 students had to stop at chapter seven, and 1 student had to stop at chapter nine.

This result indicates that when a class applies the DIL system to deliver 14 chapters, the class does not need 14 times of classroom meetings like a class applying conventional teaching would.

Thus, by applying DIL system, some students can learn and understand the entire chapters for one semester in less than the allocated 14 meetings. Some students may need more time than the others and this indicates that the DIL system also provides flexibility to the students to access the learning materials according to their abilities. Such flexibility is not available in a class applying conventional face-to-face meeting. For students finishing earlier than their peers, they are not only benefitted from economy of time in mastering the target learning material, but they will also be benefitted by the possibility of learning more through enrichment materials after finishing the required chapters.

**Abstract:** Introductory lesson for topics in mathematics is crucial part for students' learning. Lesson study can strengthen a lesson as it is essential in developing the quality of lessons in mathematics. In addition, productive pedagogy can be a tool to support and further enhance and achieve the goals of the lesson study. This paper presents how the instruction of the Fundamental Counting Principles (FCP), an introductory topic on probability, can be developed and improved in terms of the activities used. Guided by the principles of lesson study and productive pedagogy, the authors aim to carefully reflect on, study and evaluate the effect of these activities to students' engagement and learning of the research topic. This also includes the results, conclusions and recommendations of the graduate students of De La Salle University-Manila, taking up a course on Teaching of Mathematics.

**Keywords:** Lesson Study, FCP, counting principle, probability

### 1 DESIGNING LESSONS IN PROBABILITY

“As with other beautiful and useful areas of mathematics, probability has in practice only a limited place in even secondary school instruction” (Moore, 1990, p.119). Since the late 1950s, there have been strong calls for an increase in the inclusion of probability in the K-12 mathematics curriculum (NCTM, 2000). Probability has come to gain importance as a content area that students need to have experience with in order to be well-informed citizens since its study “can raise the level of sophistication at which a person interprets what he sees in ordinary life, in which theorems are scarce and uncertainty is everywhere” (Cambridge Conference on School Mathematics, 1963, as cited in Jones, 2004).

In the Philippines, for example, the teaching of probability and statistics is part of the mathematics curriculum for elementary and secondary schools. In today's Age of Information, the introduction of these topics into the school mathematics curriculum is viewed as part of basic literacy in mathematics

needed by all citizens (Garfield and Ahlgren, 1988). Batanero and Diaz (2011) summed up the reasons for inclusion of the study of probability in the primary mathematics curricula in many countries in terms of the usefulness of probability for daily life, its instrumental role in other disciplines, the need for basic stochastic knowledge in many professions, and the important role of probability reasoning in making judgments and decisions under uncertainty. Moreover, there are a number of issues and concerns raised by statistics and mathematics educators and researchers which posed challenges in the teaching of probability. One of which is to teach his subject matter in order to enable students to understand and apply it, by creating approaches that are both accessible and motivating (Borovcnik & Kapadia, 2009). As cited by Taylor (2010), another challenge to its pedagogical success is to relate to children and engage them in learning experiences in which they construct their own understanding of probability concepts.

Since it is also at the secondary or middle school level that the basic ideas about elementary probability are consolidated and more sophisticated concepts introduced for the first time, teachers must

be well prepared on how these concepts will be understood by the students in an accessible and motivating manner – starting with the most basic topics which also seemed to be the most crucial part of any kind of learning. As experienced by most of the authors of this paper in their own secondary classes, the Fundamental Counting Principles (henceforth, FCP), as an introductory topic to probability, was taught to students in a formula-based approach; that is, usually the mere multiplication of numbers, which then possibly allows students to do number-crunching. As mentioned by Garfield and Ahlgren (1988), students often tend to respond to problems involving mathematics in general by falling into a “number crunching” mode – plugging quantities into a computational formula or procedure without forming an internal representation of the problem. This student practice then poses a setback on both the teaching and learning processes. Moreover, the concept behind the FCP as such, as the authors believe, was being taken for granted and the students’ learning became susceptible. With this, the authors considered this problem and felt the need to find ways on how to improve pedagogy on the said topic.

Garfield and Ahlgren (1988) reviewed literature related to difficulties that precollege and college students have in understanding probability and statistics and made several recommendations for overcoming these difficulties which include, among others, the following: introduction of topics through activities and simulations rather than through abstractions, motivating students to see useful relations of mathematics to reality, use of visual illustrations and exploratory data methods and the creation of situations requiring probabilistic reasoning that corresponds to the students’ views of the world.

## 2 LESSON STUDY AS COMPLEMENTED BY PRODUCTIVE PEDAGOGY

As stated by Ball (2000), understanding the subject matter is essential for teachers listening flexibly to others and being inventive in creating learning experiences for a variety of students. Furthermore, since students build their knowledge in an active way, by solving problems and interacting with their classmates, we should present future teachers with some activities based on a constructivist and social

approach to teaching (Jaworski, 2001). As stated above, the researchers used problem-based activities, a constructivist approach to address the objectives intended for the research lesson on the fundamental counting principles.

Japanese lesson study has been a popular professional development approach in recent years (Stigler & Hiebert, 1999). They also claimed that this style started in Japan, has now been trending as a method to improve mathematics lesson. Makinae (2010) added that in this method, teachers collaborate to study teaching contents and instructions by observing lessons and discussing about them. Through such an approach, they try to improve the quality of their teaching. In this idea, lesson study can be considered as planning a lesson, observing the lesson together, and then discussing it.

In Japan, Lesson study was well established as a strategy of in-service teacher training by the middle of the 1960s (Fernandez & Yoshida, 2004). On the other hand, in the Philippine setting Ulep (2013) stated that it is an emerging model of continuing professional development for teachers that is school-based and teacher-led. In addition, it can be considered as a professional learning process in which teacher’s works collaboratively to: (1)Formulate goals for student learning and long-term development;(2)Develop “research” lessons to accomplish those goals;(3) Implement the lessons/document observations on lesson implementation;(4) Discuss the pieces of evidence gathered during the lesson implementation and use them to improve the lesson; and (5)Teach and study the lesson again to further refine it.(Ulep, NCSME-UP NISMED, 2013)

To guide the researchers and the research critics in observing and evaluating the research lesson, the authors adapted the notion of *Productive Pedagogies* which was developed by Lingard et.al. (2001). It is a theoretical framework that teachers can use to reflect critically upon their current classroom practice; that is, a vehicle to use as a professional vocabulary around which to have conversations about teaching practice with colleagues and to focus on individual student needs. This scaffold in enhancing teaching and learning outcomes comprises four main dimensions – intellectual quality, connectedness, supportive classroom environment and recognition of differences. Intellectual quality is integral dimension in teaching and learning process. Previous studies indicate that high intellectual quality classroom helps student to perform well academically (Boaler, 1997; Hayes, et.al., 2006; Oakes, Gamoran & Page, 1992). Connectedness

attempts to make school studies to be more 'relevant' which will then provide the students with more meaningful experiences. The supportive classroom dimension supports intellectual quality and connectedness to guarantee the achievement of the learning objectives. There were twenty strategies or pedagogies to support these four main dimensions of productive pedagogy and these strategies were used by the authors as the measures of instruction incorporated in the evaluation instrument made and intended for this lesson study.

In introducing probability by FCP, the research group wanted to come up with a problem-solving approach using the method of lesson study and to support the research group made use of Productive Pedagogies in helping them in observing lessons, and analysing it.

### 3 METHODOLOGY

The research group, who were the authors of the paper, are graduate students taking Master of Science in Teaching major in Math in De La Salle University, Philippines. One of the requirement courses is the *Teaching of Mathematics*, which was taken by the students during the academic year 2013-2014. The said course allotted 42 hrs for lectures, discussion article reading and analysis, and the main project which is the Lesson Study. The masteral students are encouraged to develop inquiry stance which actualized and formalized in the form of a Lesson Study and a research paper, which are major requirements in the said course. There are 29 students attending in the said course, the students were divided into 3, with the last group having 9 members and each would be conducting a LS. The researchers were the last of the three groups to present a research lesson on a chosen topic on mathematics guided by their professor. The fundamental principles of LS described in class and used as a framework for this study are summarized in the doctoral dissertation of the course professor (Elipane, 2012).

With the knowledge of the basic principles of LS at hand, the authors of this paper, who were also the proponents of this study, were able to involve themselves in a series of activities essentially designed for the teacher-researchers to work collaboratively in order to develop an effective lesson intended for the level-8 student-participants, i.e. planning a research lesson, selecting a research topic, implementing it afterwards (data gathering) and analysing the gathered data through post-lesson discussion/reflection.

#### Planning the research lesson

##### *Selecting the Lesson Topic*

Most of the members of the research group were able to teach various topics on probability from the basic and introductory topic to more complex topics, making them decide to have probability as the major field of mathematics to work on. Majority of them experienced some difficulties in teaching the topic on permutation to the more complex topics on probability, one of which is the challenge on how to improve students' learning such as to make the students understand the concepts behind each topic and how to make sense of these learning. The group generally credited these difficulties on the students' misconceptions and vague understanding of the basic and introductory concepts – including of which the fundamental is counting principles.

In the K-12 Mathematics Curriculum Guide that was just released in December 2013, FCP was introduced under Grade 8 Fourth Quarter. (See the illustration below.)

Table 1. This shows a portion of K-12 Mathematics Curriculum

Grade 8 Fourth Quarter – Statistics			
Content	Content Standards	Performance Standards	Learning Competencies
Statistics and Probability	The learner... Demonstrates understanding of key concepts of probability	The learner... Is able to formulate and solve practical problems involving probability of simple events.	Counts the number of occurrences of an outcome in an experiment (a) table, (b) tree diagram; (c) systematic listing; (d) fundamental counting principle.

##### *Selecting the Students*

The research lesson was administered with the participation of the invited students. The research group was able to invite a total of nineteen (19) students from two (2) separate schools. The research lesson was conducted by the month of April, during this time the students were already having their summer break, so the research group had to make special arrangements by inviting willing student participants for study. The group decided to invite students to ensure real outputs from them and better

understand how real students will respond to each element of the lesson. It will also help the research group to identify the kinds of difficulties that actual students may experience and what kind of experiences will support their learning. Eleven students came from Manuel Luis Quezon High School, a public secondary school in City of Manila. The invited students from this school belong to Special Science Program Class, a special program for students who passed the qualifying exam and obtained the general average of 85 and above with no grades lower than 80 in any subject. The said students from this school were 3<sup>rd</sup> year high school which is equivalent to Grade 9<sup>1</sup> for the School Year 2013-2014. Their age ranges from 14 to 15. While the other eight (8) students came from Makati Science High School, a special public secondary school in the City of Makati which offers special science and technology curriculum. The invited students from this school belong to a heterogeneous section. They were Grade 8 students for the School Year 2013-2014 whose age ranges from 13 to 14.

In the present Philippine education system, the school year runs for 10 months. The school year begins between the first and third weeks of June and lasts until the last week of March. This is both for public and private schools. The research lesson was conducted by the month of April, due to this circumstance the research group chose the students from two different year levels but assures that the two sets of students have the same prior knowledge about FCP. The third year high school students from Manuel Luis Quezon High School are still under the former curriculum where in the Fundamental Principles of Counting was not part of their Math curriculum, and Geometry was the focused in this level. On the other hand, Grade 8 students from Makati Science High School are following the new curriculum where in FCP was introduced in the fourth quarter of their previous school year. However, the student's teacher was not able to touch the topic about FCP due to time constraints.

#### Data sources and instruments

Aside from the field/observation notes, video recordings, and records of the discussions during the post-lesson reflections, an evaluation instrument was created for the observers. The observer's evaluation was adopted from the principles of Productive Pedagogy. The Observers' evaluation was designed as a checklist with numerical rating of 1 to 5 with respective descriptive scales as follows: 1- Poorly Manifested; 2 – Fairly Manifested; 3 – Satisfactorily Manifested; 4 – Clearly Manifested and 5 – Notably Manifested. The observers' responses in every

strand of productive pedagogy was summarized by determining the weighted mean and rounding it off to the nearest tenths and be given appropriate descriptive scale.

#### Lesson Planning

As most of the members of the research group already had the experience of a formal teaching on the lesson topic, the group had profound discussions and brainstorming sessions on possible lessons to implement, deciding on utilizing an inductive approach to teaching. In this sense, with the aid of probes coming from the research team, as well as inquiries to be done prior to the lesson, the objective was for the students to have a meaningful learning of the topic, FCP, through problem-solving approach. Examining previously employed lesson plans related to the topic and checking out other researches done, the group was able to write the lesson plan and design different activities appropriate for the students.

Moreover, considering the areas under productive pedagogy, the group had a dry-run performed by the consigned teacher, to anticipate and unlock some possible difficulties that the teacher, or even the lesson itself, may encounter. The mock lesson involved the members of the group to serve as students, yet later to serve as critics for their own groundwork.

#### **Implementation of the research lesson**

The research lesson was conducted with exactly 19 Grade Eight students coming from two different schools. It was observed by the masters' students who were not members of the research team and they were given different areas on productive pedagogies to be observed. The research lesson ran for 80 minutes from 1:30 to 2:50 in the afternoon; however it should originally run in a regular class hour of 60 minutes only. It was recorded through video and observation form.

The teacher started the lesson with the motivational activity entitled “#OOTD: MIX AND MATCH”. The teacher used trending symbol and words nowadays in the title of the activity so that they could get the idea and be motivated as well. The “#” in the title is a hash tag while OOTD means “Outfit of The Day”. The (“#”) a hash symbol popularly known as “hash tag” is a form of [metadata tag](#). Words in messages on [microblogging](#) and [social networking services](#) may be tagged by putting “#” before them. OOTD is also used in fashion blogs. The teacher narrated a situation that every student in

the class could relate to. The students were asked to know the number of ways a boy and a girl can be dressed up with their available clothes. The students were asked first to think on how to solve the problem. Then, the teacher asked the students to solve the problem by modelling it. The students actually wore the wardrobes and took a “selfie” using webcam. This is for the students to see the number of ways they had worn the attires available. The students really enjoyed the activity. They got to experience and solve the problem by themselves. However, before the activity ended, the students recited the idea of using a tree diagram instead to show the number of ways that the attires could be worn. The teacher then conveyed that the number of possible outcomes can truly be shown using a tree diagram. The teacher explained what a tree diagram is and how it is constructed, however he did not give a specific example of using it in order for the students to use their creativity in constructing different forms of tree diagram.

Afterwhich, the teacher proceeded to Activity 2, which is entitled as “OPERATION: COUNT”. In here, the class was divided into four groups. Each group was given a ‘mission envelope’, which contained the problem to be solved and the materials to be used. They were given five minutes to work on the activity. During the activity, the members of the group actively participated and joyfully discussed their ideas with each other. One group found difficulty in solving the problem assigned to them. This is for the reason that the problem they got requires diagramming of 3 events simultaneously unlike of the other groups that requires diagramming of 2 events only. They took time in answering it that’s why they were the last group who presented.

After the allotted five-minute time, the groups were asked to present and explain their answer in front of the class. One group already gave an idea on how to solve the problem easily without the use of tree diagram. After all groups’ presentations, the teacher checked their answer in general. However, the teacher was not able to correct the answer of the last group because the teacher wanted to focus on the easier way of solving which is by multiplication.

To lead the students in discovering the concept of the lesson, the teacher gave guide questions. The teacher elicited students’ answer and lead them to a deeper understanding on what they have done in the previous activities. Subsequently, the students were asked to communicate their ideas on how to tell the number of ways that events can occur simultaneously. Though hesitant to answer, with the teacher’s art of questioning, the students were able

to express their thoughts on the concept. The teacher then revealed the definition of the lesson, Fundamental Counting Principle.

In application of the lesson, the teacher proceeded to the activity entitled “Picture-Picture”, a trending variety show currently in the television. The students were divided according to their original group. The teacher let the students randomly pick a number in order to know whose group is the first and the next one to play. The teacher presented a picture contains objects that needs to be combined. The group was given an illustration board and whiteboard marker. The group was asked to identify the correct number of possible combinations. They were given a chance to discuss their answer, and as soon as they were done, they may write their answers on the illustration board. This activity was done easily by the students. The teacher recorded the time mentally. These procedures went with the other groups as well. When all groups are done, the teacher announced the winner group, the group who has the least time to answer the problem.

Thereafter, the teacher ended the lesson with the activity, “Value in Counting”, in which the students were given set of questions. They were asked to reflect on what did they realize while doing the activities and how will they relate it in real life. Since the students were reluctant to communicate their thoughts, the teacher just asked the students to give one word that they learned in the lesson.

To assess if the students learn, the students were asked to answer the set of multiple choice type of questions orally. Finally, the teacher gave the students an assignment in preparation for the next lesson.

#### **Post- lesson discussion and reflection**

Four categories were harnessed as related to the focus of the study: How to improve and develop teaching of Fundamental Counting Principle (FCP)? The four categories was based upon the four Major Dimensions of Productive Pedagogies which are; (1) Intellectual Quality, (2) Connectedness, (3) Supportive Classroom Environment, and (4) Recognition of Difference.

The observers in the lesson study are grouped accordingly to the categories above to check how effective the activities in students’ learning the concept of FCP.

#### Teacher’s Reflection

Before the observers give their commentaries, the teacher shared his experiences and reflected on

how the lesson went through. Aljay, the teacher informed the observers that the researchers had a dry-run a week before the final presentation to check if the flow of the first activity using realia will be effective for students to easily grasp the concept of FCP. The first activity which he called “Selfie, Selfie” was carry on during the presentation but there are certain problems that occurred during the preparation of the materials so the teacher prepared for a plan B which is to make paper dolls. “We think that the first activity will take too much time, but I believe that we should not be rushing things ahead of time.” commented Aljay. He elaborated that he wanted to make sure that students will get the concept slowly but surely so they pursued the original plan in the lesson plan for the first activity since the problem regarding the materials was solved.

The teacher added that he was so happy that students participated cooperatively in the class even though they came from different schools. He noted that even they are grouped heterogeneously students are able to relate to their group mates through calling their names.

“This is a new set-up of instruction for me; I was not used to giving a lot of activities instead of lectures, I am actually teaching in the college level.” explained by the teacher. He elaborated further that in the college setting, he usually do the talking but in the lesson proper he tried to deviate from his usual routines by asking questions to students.

Dr. Elipane, one of the observers questioned the teacher regarding his comment about rushing things ahead of time as related to learning the concept of FCP. The teacher explained that it is better that students will have a lot of time to think. Another question was asked by Dr. Elipane, he wanted to know how activities can be improved so that it will not take time. The researchers realized that they should go back to the original plan during the dry run wherein only one student should do the activity. Refused to do so, because the idea of the group that most of the students should participate in the first activity. As observed in the final presentation, there is a student who wanted to participate in that said activity that makes it more confusing for the teacher to continue with the plan. Then Dr. Elipane added that the idea of doing the introductory activity by only one student is better. Another idea proposed by one of the researchers to answer the problem is to lessen the task in the activity. The teacher gave two tasks one for the girls and one for the boys, as suggested by Dr. Elipane and some observers it is

better to have one task for both girls and boys and then reconsider the materials to be used.

Other teachers also gave their comments regarding the research lesson. They also suggested on how to revise the lesson plan and the activities.

#### Intellectual Quality

The observer commented that the probing questions on the first part of the activity were very realistic that the teacher elicited realistic responses, since students are able to relate to the activity. “The teacher started with the problem and motivated the students to think.” added the observer. He elaborated that realia helped a lot when students took a picture of them and used real objects in the activity. These aided in the transformation of knowledge. Teachers mentioned that the activities are transformative in a way that students inductively generalized the concept of FCP in their own knowledge. Another observer added, “The teacher was able to bring the students into the real world by just asking, “Do you also have difficulties in choosing what to wear in this day?””. The teacher wants to emphasize that the real scenario has let the students to be involved in the activity.

Some observers noted that the first activity was long enough as an introduction though the connection of the lesson was smooth. Another one suggested that in some question that the teacher asked including the group work activity, the students should utilized the use of board to further enhance their learning. Additional to that Dr. Elipane remarked that the activities lack deep knowledge. He explained that it would be better to revise some of the problems and change it to challenging ones. After giving simple examples, the teacher should integrate challenging questions and examples to develop students’ higher order thinking skills.

#### Connectedness

This dimension focuses on how the activities could be integrated in the real life setting. One observer commented that this particular topic has a lot of real life application. However, Dr. Elipane observed that the millieu are limited on clothing and food. He suggested adding other genres to the examples. Another observer commented that students are really engaged in the activities whenever it is related to real life situations.

Additional commentary was on the integration of the background knowledge – which is the Addition principle, to the concept of FCP. The observer suggested that the two principles should be connected into the discussion of the activities.

One observer remarked was that the values integration part in the latter part of the lesson proper has been a sermon to students. For the observer, he thought that it is better that the values integration should not be given a part in the lesson proper but should come out smoothly during the discussion. Another observer suggested to have journals/ exit card. This comment was given to address the problem since the lesson proper consumes a lot of time; this was the effect when the teacher was not able to elicit responses right away.

Supportive Classroom Environment

Under this dimension, the observers commended the following: (1) the activities, slide presentation are well organized and creative; (2) the lesson was delivered well; (3) the teacher gives encouraging statements and (4) the tasks are clearly presented. On the other hand, observers noted the following: (1) the teacher was not able to use the rubrics in commending the students creative effort on presenting and solving the problems in the activity; (2) the pictures on the activities is not well modified, students will be having a hard time to identify the bracelets from the rings; (3) the tree-diagram was left out in the objective; and (4) the questions should be given one at a time.

Recognition of Difference

Some of the sub-dimensions under this category were not necessary as commented by one of the observers. The observers focused particularly on the following elements; (1) group identity, (2) being inclusive; and (3) active citizenship. The following are noted in the given observers’ evaluation:

- The students were open to study the lesson and participate amidst of their cultures, school and identities.
- The students were able to work and study as a group despite of their schools of origin.
- The students were able to create friendly environment during the activities.
- The teacher was able to create an activity which was very well connected to culture of the new generation such as Selfie and trendy.
- Group works that highly encouraged individual participation regardless of group.

The observer expound further that it is good to use trendy activities so that students can relate to the activity. This linked the generation gap between the teacher and the student. Additional suggestions on the clothing/ accessories use in the introductory activity was given, the observer mentioned that it is

awkward to wear the combination of scarf and headbands as well the combination of caps and necktie, it is much better to use unisex accessories for the activity since its already suggested to lessen the task.

Observers remarked that the students are participative even they came from different schools, which creates friendly atmosphere during activities. At the same time, there was no dominance in the class.

**3 RESULTS AND DISCUSSION**

The accomplishment of the Observer’s Checklist was conducted during the course of the execution of the research lesson itself. There were four types of teacher observation checklists for lesson study based on productive pedagogy, that have been distributed to a specified number of observers stated as follows: intellectual quality- with five (5) observers; connectedness- with five (5) observers; supportive classroom environment- with five (5) observers and recognition of difference – with three (3) observers. The data were collected, classified, analysed and interpreted and thus, presented through tables hereafter. Each category of the productive pedagogy is interpreted using the legend below. The range is computed based on equal interval with the difference of 0.8 for each rating.

Legend: 4.21 – 5.00	Notably Manifested
3.41 – 4.20	Clearly Manifested
2.61 – 3.40	Satisfactorily Manifested
1.81 – 2.60	Fairly Manifested
1.00 – 1.80	Poorly Manifested

Table 1.1 Summary of Teachers Rating Based on Productive Pedagogy (Intellectual Quality)

A. Intellectual Quality	Observers' Numerical Rating					Weighted Mean (WX)	Interpretation
1.Higher-Order Thinking	4	5	4	5	4	4.40	Notably Manifested
2. Deep Knowledge	5	5	4	5	4	4.60	Notably Manifested
3. Deep Understanding	5	5	4	5	4	4.60	Notably Manifested
4. Substantive Conversation	5	5	3	5	5	4.60	Notably Manifested
5. Knowledge as Problematic	4	5	4	5	4	4.40	Notably Manifested
6. Meta Language	5	5	4	5	5	4.80	Notably Manifested
Total	28	30	23	30	26	137	Notably Manifested
	Average (WX)					4.57	

The overall rate of the teachers on the set of categories under intellectual quality has average weighted mean of 4.57 with a standard deviation of 0.15. This indicates that the teachers have closely similar rates on the categories given under intellectual rate because of the homogenous result. Based on the average weighted mean which is 4.57, the teacher exhibits notably manifested intellectual quality under productive pedagogy (Table 1.1).

Table 1.2 Summary of Teachers Rating Based on Productive Pedagogy (Connectedness)

B. Connectedness	Observers' Numerical Rating					Weighted Mean(WX)	Interpretation
1.Knowledge Integration	5	5	5	5	4	4.80	Notably Manifested
2. Background Knowledge	5	5	5	5	4	4.80	Notably Manifested
3. Connectedness to the World	5	5	5	5	5	5.00	Notably Manifested
4. Problem-based Curriculum	5	5	5	5	5	5.00	Notably Manifested
Total	20	20	20	20	18	98	Notably Manifested
	Average (WX)					4.90	

The overall rate of the teachers on the set of categories under connectedness has average weighted mean of 4.90 with a standard deviation of 0.12. This indicates that the teachers have closely similar rates on the categories given under connectedness because of the homogenous result. Table 1.2 also shows that the teacher exhibits notably manifested connectedness under productive pedagogy based on the computed average weighted mean which is 4.90.

Table 1.3 Summary of Teachers Rating Based on Productive Pedagogy (Supportive Classroom Environment)

C. Supportive Classroom Environment	Observers' Numerical Rating					Weighted Mean (WX)	Interpretation
1. Student Direction	4	5	5	4	4	4.40	Notably Manifested
2. Social Support	3	5	5	4	4	4.20	Clearly Manifested
3. Academic Engagement	4	5	5	4	4	4.40	Notably Manifested
4. Explicit Quality Performance Criteria	5	4	4	4	4	4.20	Clearly Manifested
5. Self- Regulation	4	5	5	5	3	4.40	Notably Manifested
Total	20	24	24	21	19	108	Notably Manifested
	Average (WX)					4.32	Manifested

Table 1.3 shows that the weighted averages mean of 4.32, which also indicates that the teacher exhibits notably manifested supportive classroom environment under productive pedagogy. The overall rate of the teachers on the set of categories under supportive classroom environment has a standard deviation of 0.11. This is an indicative that the teachers who were also the observers have closely similar rates on the categories given under the said category because of the homogenous result.

Table 1.4 Summary of Teachers Rating Based on Productive Pedagogy (Recognition of Difference)

D. Recognition of Difference	Observers' Numerical Rating			Weighted Mean (WX)	Interpretation
1. Cultural Knowledge	4	4	5	4.33	Notably Manifested
2. Inclusivity	5	5	5	5.00	Notably Manifested
3. Narrative	5	4	5	4.67	Notably Manifested
4. Group Identity	4	5	5	4.67	Notably Manifested
5. Active Citizenship	5	5	5	5.00	Notably Manifested
Total	23	23	25	71	Notably Manifested
	Average (WX)			4.73	

The teacher exhibits notably manifested recognition of difference under productive pedagogy based on the computed average weighted mean which is 4.73 (Table 1.4). The overall rate of the teachers on the set of categories under recognition of difference has a standard deviation of 0.28. Likewise, this indicates that the teachers have closely similar rates on the categories given under recognition of difference because of the homogenous result.

#### 4 CONCLUDING REMARKS

During the planning stage of the lesson study, the lesson chosen was the Fundamental Counting Principles (FCP) and various activities were created for the instruction. The planning was successfully done for the objectives were met. Although there are some modifications with activities, teaching went smoothly and activities were carried out appropriately. According to students' evaluation (through the use of forms), teaching was effective for they were able to understand the concept of FCP.

The activities were effective in catching students' attention especially Activity 1. The activities were based on real life situations that the students can relate very well. The introduction of the lesson was much easier for the teacher for the lesson was highly connected with the students and creative presentations and interactive manipulative helped a lot. Perhaps it can be concluded that interactive materials can be effectively used as mediator between the mathematical world and real world. It represent abstract concept in the form of more accessible and identifiable knowledge.

The abstraction in Mathematics can be lessened and the concepts transform into a concrete body of knowledge.

Guided by the principles of the Constructivism Theory, it was evident that the students were able to create their own knowledge based on their experiences with the help of interactive learning activities provided by the teacher.

The activities were student-centered that is why it can be observed that the students cooperated very well. The students were highly engaged in the learning process and team work was noticeable. The activities and materials used were very effective in facilitating learning. Since students are so called the “digital natives”, the use of technology in the lesson is very beneficial for the students as well as for the teacher for it captures students’ attention and imagination. It promoted interaction and stimulated discussions among the students that made the learning easy and enjoyable. Teaching with technology transforms the teaching learning process. It allows the students to demonstrate idea through dynamic interactions. The use of ICT in teaching has provided a new face in the process of teaching and learning situation. Lessons are more memorable because students are more engaged and motivated because they can relate with the material that the teacher provided.

Interactive learning actively engages the students. It strengthens the learning situation for both students and teacher. Lectures are transformed into discussions, and students and teachers become allies in the journey of knowledge acquisition. It paves its way for experiential learning. Students are the ones responsible for the creation of knowledge and construct meaning from it. The ultimate goal of this activity is to put the learner in charge of his own learning. Also, through interactive learning activities the teacher can create different learning environments that will arouse the curiosity of the students. The role of teacher changes from main source of knowledge to facilitator. The students are the producers of knowledge rather than consumers. With this, teaching FCP through interactive learning activities would be effective.

Lesson study is very beneficial, for the teacher can see in different perspectives what really transpires in the classroom. Through observations of other teachers, it can be determined if the objectives were met, if the students were engaged during instruction or if there’s a need for revision. Teachers

can discuss among themselves promoting collaborative learning towards the improvement of the lesson. Teachers can learn from each other and they can work together for more productive pedagogical knowledge. It encourages the teachers to think critically and analyse each detail in a learning situation, from lesson planning up to assessment. Also, it creates opportunities for teachers to improve their teaching through feedback and will latter contributes to their professional growth.

During lesson study, teachers were able to collect data in students’ perspective and in a collaborative way through group discussion during post lesson discussion.

Thus, lesson study provides an environment for the creation of refined lesson that would lead to a comprehensive and systematic way of lesson planning with connections among learning goals, execution and reflection.

Based on the evaluation, it can be seen that each activity was assessed for the improvement of the lesson as well as the methods of instruction. Table 2.1 shows the strengths and weaknesses of the conducted lesson study. Also, the teacher will have the chance to improve his strategies, techniques and activities used to be more coherent and aligned with the objectives of the lesson.

The effectiveness of the Lesson study guided by productive pedagogy was beneficial for the improvement of the lesson. The teachers were able to assess the teaching – learning situation using the four dimensions of productive pedagogy. It provided opportunity for the teacher to re-examine his own instruction and how the students responded with the activities presented. Through the post lesson discussion, the following recommendations were given:

- Give more challenging questions that will test the higher order thinking skills of the students;
- Be creative in giving real- life examples such as lottery, route problems, and codes;
- Discuss other methods of counting techniques; and
- Observe the time allotted to the lesson by limiting the learning tasks and implementing time on each task.

## 5 ACKNOWLEDGEMENTS

We would like to give thanks and appreciate the people who worked with us behind this study, and most especially those who continued their love and support to us.

- To **Dr. Levi Elipane** for being our co-author, adviser and encourager.
- To the **students** who participated and their **family** for being an inspiration to this study.
- To the **Rotary Club of Makati** who financially support us.
- To friends and loved ones who has given inspiration during the study.

And praises and glory to our Almighty God who is behind everything.

## 7 APPENDIX– Lesson Plan

### FUNDAMENTAL COUNTING PRINCIPLES

April 5, 2014

Grade 8

#### I. TOPIC: INTRODUCTION TO PROBABILITY

Subtopic: Basic Concepts of Probability – Fundamental Counting Principle

Prerequisite Concepts: Multiplication of Whole Numbers

#### II. OBJECTIVES:

At the end of the lesson, the students are expected to:

- A. **Cognitive:** to apply the principle of counting in various areas of problem solving
- B. **Affective:** to define the Fundamental Principle of Counting
- C. **Psychomotor:** to discover the Fundamental Principle of Counting through the examples

#### III. PROCEDURE:

- A. Daily Routine
- B. Lesson Proper

#### ACTIVITY 1: “#OOTD: MIX AND MATCH”

#OOTD stands for Outfit of the Day is trending activity which involves taking self-picture of the students.

Provision for Integration (Class Activity)

Across the Subject Area: Visual and Logical Intelligence, Cultured-based

Procedure:

1. The teacher will narrate a challenging situation.
2. The students will be asked to think of the ways on how to solve the problem.
3. The teacher will ask the students to give their answers.

A boy and a girl will be going to a school party. They just have a limited number of clothing. They want to know the number of ways they can be dressed up with the clothes available.

#### ACTIVITY 2: “OPERATION: COUNT”

Provision for Integration: Cooperative Learning, Interpersonal & Spatial Intelligence,

Procedure:

1. The class will be divided into 5 groups.

2. Each group will be given a problem to solve.
3. They will show their answer by making/drawing a diagram.
4. The teacher will pick one member of the group to present their answer to the problem.

How many different set of accessories can Carla wear if she has 2 necklace, 2 bracelets, and 2 earrings?

A fast food offers 2kinds of donuts and 5 flavors of ice cream. How many combinations of donut and ice cream can you order?

A store sells 3 pairs of shoes and 3 different bags. In how many different matches of shoes and bag can you order?

A school canteen offers a budget meal which consists of rice and viand. How many different meals can the students order if there are 3 choices for viand (maling, egg, & hotdog)?

Maria bought 2 kinds of yellow fruit, 2 kinds of red fruit, and 1 kind of green fruit. How many groups of different colors of fruits can be put in a basket?

\*Guide Question:

1. In what ways can you determine the answer?
2. What makes you sure of your answer?

#### IV. ANALYSIS:

\* The students will answer the following question:

- How can we count for ways of combination, given more elements to combine?
- What is a fundamental principle of counting?

#### V. GENERALIZATION:

#### ACTIVITY 3: “CONSTRUCT YOUR OWN”

Direction:

1. The students will be asked to construct a rule or principle on how to tell the number of ways that events can occur simultaneously.
2. Then, the teacher will give the Fundamental Counting Principle.

**ACTIVITY 4: “VALUE IN COUNTING”**

Provision for Integration: Values

- **What did you realize while you are doing the activities?**
- **What are those activities all about?**
- **How do you relate it in real life?**
- **What did you learn from the experience?**

Procedure:

1. The students will be asked of the questions below.
2. The teacher will then process the responses of the students.

**VI. APPLICATION:**

Provision for Integration: Visual & Logical Intelligence

**ACTIVITY 5: “PICTURE PICTURE”**

Procedure:

1. The class will be divided into 5 groups.
2. The groups will gather around the hot seat and play one at a time.
3. The picture contains objects that need to be combined.
4. The group must identify the correct number of possible combinations.
5. The group members may discuss their answer, and when done, may write their answer on the illustration board.
6. The group who will have the least time to answer the problem will be the winner.

**VII. ASSESSMENT:**

Read the questions carefully. Write the letter of the correct answer.

1. Ana has 2 blouses, 2 pants, and 2 pair of shoes. In how many ways can she dress up?  
A. 6    B. 8    C. 10    D. 12
2. There are 6 flavors of ice cream and 3 different cones. In how many different single-scoop ice creams could you order?  
A. 9    B. 12    C. 18    D. 20
3. You are buying a new car. There are 2 body styles, 5 colors available and 3 models. How many choices do you have?  
A. 30    B. 10    C. 20    D. 40
4. You went to a restaurant for breakfast. The menu includes pancakes, waffles, or home fries. For drinks, there are coffee, juice, hot chocolate and tea. How many different choices of food and drink can you order?  
A. 8    B. 9    C. 16    D. 12
5. A deli has a lunch special which consists of a sandwich, soup, dessert, and drink. They offer the following choices: How many lunch specials are there?

<b>Sandwich</b>	➔	<b>chicken, ham, tuna</b>
<b>Soup</b>	➔	<b>mushroom, corn</b>
<b>Dessert</b>	➔	<b>salad, pie</b>
<b>Drinks</b>	➔	<b>tea, coke, sprite</b>

**VIII. ASSIGNMENT:**

- Research on the definition of the following terminologies:
  - Event
  - Experiment
  - Outcome
  - Probability
  - Combination
  - Permutation

## IMPROVING STUDENTS’ CREATIVE THINKING THROUGH PROBLEM POSSING IN LEARNING LINEAR ALGEBRA

**Abstract:** The government have set creative element as one of the objective in National Education. The students who has creativity could create brilliant ideas in problem solving. The objective of the research was to improve the students’ creative thinking through Problem Possing in learning linear algebra by using lesson study. Creative thinking is ability to know the kinds of possibility the problem solving. In this case, problem possing seen as a test in thinking creatively, scoring task of problem submission based on the flexibily of the fluency and originality. The indicators of problem possing with creativity namely (1) fluency is achieved when students create a lot of issues that can be solve and share the issues raised (2) flexibily is achieved when students propose issues which has a different way to be solved. (3) Novelty is achieved when the students examine some of the issues raised then express a different issue. The result of the research find out that the ability of students in thinking creatively improved by using problem possing in learning. The indication based on the questions that proposed by the students increasingly varied and problem solving is also done in various ways.

**Keywords:** Creative Thinking, Problem Possing, Linear Algebra, Lesson Study

### 1. INTRODUCTION

The government has set creative element as one of the objectives in National Education as mentioned in Ministry Act number 22, 2006 that is to develop the potential of the learner to be a faithful and pious, well behaved, healthy, scholarly, skilfull, creative, autonomous man, and to become a democratic and responsible citizen.

This is in line with Maslow’s statement (1967) and Giflid (1967) (in Munandar, 2000) that: there are four reasons why creativity is important to be developed namely: (1) by being creative, people can actualize themselves, and self-actualization is primary need in the highest level of human life, and creativity is a manifestation of a fully beneficial individual, (2) creativity or creative thinking as an ability to see various possibilities of solution toward various problems, and as a form of thought which get less attention until today in education especially in school learning that still focuses on knowledge acceptance, memory, and reasoning, (3) getting busy creatively is not beneficial for own self but also give satisfaction to individual; (4) it is creativity that make possible to human improving life level.

Problem possing approach in learning can exercise students to propose questions or problems related to the material learned. In mathematics learning process, problem possing can be viewed as an approach or an objective (Upu, 2003). As an

approach, problem possing relates to the lecturer’s ability to motivate students through challenging formulation of situation so the students can propose mathematics problems that can be solved and result on their ability to solve problem. As an objective, problem possing relates to the complexity and quality of mathematics problem proposed by students.

Creative thinking has been defined by many experts, among others, Baron (1981) (in Munandar, 2000) defined creativity in four dimensions namely: (1) Creativity from personal aspect is creative power potential that exist in every individual, (2) Creativity as a process is a form of thought in which individual find new relations, get answer, new method or ways in facing a problem, (3) Creativity as a support is a strong desire to create, (4) Creativity from product aspect is everything that is created by someone as a result of individual uniqueness in the interaction with environment.

Eventhough creativity can be improved through exercise referring to the development of student’s creative thinking, but the fact shows that school and university have not been able to draw creative graduates. Beside that, tasks of mathematics problem solving given to students tend to be presented in the form of close-ended problem or convergent. Close-ended problem gives strict limitation to students. Close-ended problem entails forcefulness element to answer question based on procedure. Moreover close-ended problem tends to

be discriminative that become the consumption of high-ability student only.

Definition of creative thinking related to mathematics was given by Krulik and Rudnick (1999) who said that creative thinking is the thought which is original, reflective, and produce a complex product. Furthermore Krulik and Rudnick explained that creative thinking involves synthesizing ideas, building new ideas and determining their effectiveness, and also involving the ability to make decision and resulting a new product. This definition sees creative thinking more as a unity in which logical and divergent thinking process exist, support each other and inseparable.

Based on the above description, the objective of this research is to know:

- (1) the students' creative thinking ability before and after problem posing based learning is applied in Linear Algebra subject;
- (2) the significant improvement of the students' creative thinking after problem posing based learning is applied in Linear Algebra subject.

## 2. LITERARY REVIEW

### 2.1 Problem Posing

Literally, problem posing means proposing a question or a problem. Silver (1996:294) suggested the limitation of problem posing as follow:

The term problem posing has been used to refer both to the generation of new problems and to the reformulation of given problems.

Suryanto (1998) explained that:

1. Problem posing is the generation of simple problem or reformulation of the given problem with several changes in order to make it simpler so the problem can be solved. This is happen in the solution of difficult problems, with the definition of problem posing as one of the steps in arranging a problem solving plan.
2. Problem posing is the formulation of problems related to the requirements on the problems that will be solved emphasizing on the proposal of the problem by students.
3. Problem posing is problem proposal from the available information done before and or after the solving activity.

While according to Suharta (2000), problem posing is one of the ways to get the advance in the concept reformation or problem solving. Beside that problem posing becomes an initial intellectual effort functions to stimulate the thought, smash the stiff and narrow perception, open the horizon, and educate.

Silver and Cai (in Upu, 2003) divided problem proposal into three parts, namely (1) mathematical problem, (2) non-mathematical problem and (3)

statement. Mathematical problem is the problem containing mathematical complication and has a relation with the given situation. Mathematical problem is divided into two parts, they are mathematical problem that can be solved and mathematical problem that cannot be solved.

Problem posing in this research is problem proposal based on mathematical situation given, then the problem proposed by the students will be solved by several alternative answers that possible.

### 2.2 Creative thinking

Creative thinking in mathematics refers to the definition of creative thinking in general. Bishop (in Pehkonen, 1997) explained that someone needs 2 different thinking model that complementary in mathematics, that are intuitive creative thinking and logic analytical thinking. This view sees creative thinking more as a intuitive thinking than logic one.

This definition shows that creative thinking is not based on logical thought but more as a thought that suddenly appears, unpredictable, or unconventionally. Pehkonen (1997) viewed creative thinking as a combination of logical thinking and divergent thinking based on the intuition but still in the consiousness. When someone applies creative thinking in a practice of problem solving, the divergent thought that is intuitive produces many ideas. This will be beneficial in finding the solution. This definition explains that creative thinking pays attention on logical thinking and intuitive one to produce ideas. Because of that, in creative thinking two parts of the brain are very needed. The balance between logic and intuition is very important. If placing logic deduction too much, creative ideas will be neglected. Thus, to raise a creativity, the freedom of thinking is needed, not under control or pressure. This view directs more on the second view in the definition of creative thinking.

Krulik & Rudnick (1999) explained that creative thinking is the thought which is original, reflective, and produce a complex product. That thinking involves synthesizing ideas, building new ideas and determining their effectiveness. Beside that, it also involves the ability to make a decision and result a new product. This definition mentions that creative thinking in only intuitive that free from logical thinking and does not mention clearly creative thinking as a synthesis or combination of logical thinking and intuitive divergent thinking. This definition sees creative thinking more as a unity in which logical and divergent thinking process exist, support each other, and inseparable.

Creative thinking in this research is mental activity done by someone to find fluent, flexible, and novel idea. Idea meant here is the idea in solving mathematical problem.

### 2.3 Problem Possing dan Creative Thinking in Mathematics

One of the learning approaches that can enhance students' creative thinking in mathematics is problem solving approach. This is in line with Pehkonen's statement (1997) that learning problem can: (1) generally develop cognitive skill, (2) enhance creativity, (3) apply mathematics, and (4) motivate the students to learn mathematics.

Silver (1997) gave indicator to assess the creative thinking ability of student (fluency, flexibility, and novelty) using problem posing and problem solving. The relation is described in the following table.

Table 1 The relation between problem solving and posing and creativity component

Creativity Component	Problem Possing
Fluency	Students make many problems that can be solved. Students share various problems proposed.
Flexibility	Students propose problems that have different ways of solving. Students use "what-if-not?" approach to solve problem.
Novelty	Students check several problems propose, then propose a different problem.

#### Research Hypothesis

There is a significant improvement of students' learning result after problem posing based learning in Linear Algebra subject.

### 3. RESEARCH METHOD

This research was experimental research with One Group Pretest-Posttest design. The experiment unit was 40 students of Mathematics Education Study Program in the third semester of 2013/2014 academic year. The treatment given was problem posing based learning in Linear Algebra subject. This research was done through Lesson Study. The learning was conducted in four meetings. This research began with pretest and ended with posttest. The research instrument used was open-ended problem solving test. The creative thinking ability of the students through problem posing based learning in Linear Algebra khusus was observed in every lesson by giving problem posing tasks. While to measure the rate of students' learning result, the average of normalized gain was used.

### 4. DISCUSSION

The students' creative thinking ability through problem posing based learning in Linear Algebra subject was observed in every lesson by problem posing task and open ended problem solving given. The improvement rate of students' learning result in Linear Algebra was analyzed using the average of normalized gain. The classification of the improvement of the students' learning result in Linear Algebra subject is as follow:

Table 2 Normalized Gain Classification

Gain Normalization Coefficient	Students	Percentage (%)	Classification
$g < 0,3$	2	5	low
$0,3 \leq g < 0,7$	16	40	medium
$0,7 \leq g$	22	55	high
Average gain = 0,75			high

Based on table 1 above, the average normalized gain of students learning result was 0,75 which categorized as high. It shows that there was a significant improvement of students' learning result in Linear Algebra through problem posing based learning.

Creative thinking in mathematics is a series of activity happen in the student's mental/thought that can be observed through visible behaviour in the form of solving technique of mathematics problem given by referring to: (1) fluency (2) flexibility, and (3) novelty. Fluency in problem solving is defined as student's ability to solve problem by various correct ways. Several answers to the problem are said to be various, if the answers look different but follow a certain pattern, or have same idea. Flexibility in problem solving is defined as the ability of students to solve problem with various different and correct ways. Several answers to the problem are said to be various, if the answers look different but follow a certain pattern, or have same idea. Novelty in problem solving is defined as the ability of students in problem solving that is "uncommon" done by the students in their prior level of knowledge or the answer given has never been got before. Has never been got before means: never been taught by the lecturer, never been learned from book, or internet, dan never been discussed with their friends.

Haylock (1997) stated that creative thinking in mathematics refers to divergent thought and the product resulted reflects the creative thinking of someone. Nohda (in Paduppai, 2005) said that problem posing and open-ended problem can help to develop creative activity and mathematics thinking system of the students through problem solving simultaneously. While according to Shawada (in Becker, 1997), open-ended problem determines three criteria: (a) fluency that is how many solution that can be given by the students, (b) flexibility is how many difference of idea posed by the students, and (c) novelty is in the level of whether the originality of those ideas, in the form of uniqueness, sharpness, and authenticity of those ideas.

Problem posing based learning in terms of improving students' creative thinking ability is that students make many problems that can be solved, then they share the problem to other students. After that, students pose a problem that has different ways of solving, then students check several problems posed, then pose a new problem.

## 5. CONCLUSION

The students' creative thinking ability improved through problem posing based learning. This was proved by the problems posed by the students that were more varied and the problem solving are also done in various ways.

The learning result of the students of Mathematics Education Study Program through problem posing based learning in Linear Algebra subject was classified as high.

## School Based Lesson Study:

### *An Investigation of Practice, Achievement and Challenges in an Indonesian Junior Secondary School Science Teachers*

Leul Mesfin<sup>1</sup>, Nuryani Y. Rustaman<sup>2</sup>

<sup>1</sup>mesleul@gmail.com

<sup>1</sup>Department of Biology, Adwa College of Teacher Education, Mekelle, Ethiopia

<sup>2</sup>nuryani\_rustaman@yahoo.com

<sup>2</sup>Department of Biology Education, Indonesia University of Education, Bandung, Indonesia

**Abstract:**

*In this paper the experience of science teachers on Lesson Study in public school of Indonesia was investigated. Lesson Study, typically defined as teachers' classroom based collaborative research, has a long history in Japan as a shared professional culture with potential for enhancing learning, enriching classroom activities and transforming the school environment. Lesson Study, as an approach to teacher's professional development, has been introduced to Indonesian educators for almost a decade. The purpose of this study is to investigate the practice, achievements and challenges of Lesson Study in Indonesia. The population of the study composed of teachers of laboratorium junior secondary school, Indonesia University of Education (UPI) in Bandung city. Data were collected using questionnaire and focus group discussion. The questionnaire was first developed in English and later translated to "Bahasa Indonesia" to avoid language barrier while responding. In the focus group discussion the principal, vice principal, science department head and school Lesson Study coordinator were involved. The responses collected from both methods were analyzed and interpreted on percentage basis. The findings indicated that Lesson Study is a culture for the school teachers improving knowledge of subject matter and their profession through comments and collaborative work. Also, found that no financial support was provided to the school for lesson study processes except technical assistance of experts from faculty of science and mathematics education of UPI. Negative comments during debriefing and spending more time for preparation and consulting experts are some of the obstruction of this study.*

## 1. INTRODUCTION

Professional development refers to many types of educational experiences related to an individual's work. Doctors, lawyers, educators, accountants, engineers, and people in a wide variety of professions and businesses participate in professional development to learn and apply new knowledge and skills that will improve their performance on the job (Mizell, 2010). It is the systematic maintenance, improvement and broadening of knowledge and the development of personal qualities necessary for the person to sustain their relevance and effectiveness at work throughout their working life (Kennie, 2000).

Continuing professional development is important because it ensures individuals continue to be competent in their profession. It is an ongoing process and continues throughout a professional's career (Kloosterman, 2014). Teachers' knowledge and practices are the most immediate and most significant outcomes of any professional development activities. They are the primary factor influencing the relationship between professional development and improvements in student learning (Guske and Sparks, 2002). Teacher professional development is about teachers learning, learning how to learn, and transforming their knowledge into practice for the benefit of their students' growth (Avalos, 2011). Professional development, if well implemented, is a potentially promising strategy for improving teaching, and ultimately student learning (Loeb *et al.*, 2009).

Teachers are expected to help students develop rich understandings of important content, think critically, construct and solve problems, synthesize information, express themselves proficiently, and demonstrate these understandings and skills on new types of assessments (Borko *et al.*, 2002). Teacher professional development is essential to individual teachers' growth as well as organizational change in schools, both of which are necessary for true educational reform to occur (Sykes, 1996).

In education, the most commonly used forms of professional development as mentioned by (Meyer and Wilkerson) 2011 include short sessions at meetings, one-to-two day school-based workshops on specific topics, or two-to-three-week grant-supported workshops in the summer. However, nowadays a recently emerging and disseminating form of professional development is Lesson Study. Lesson Study is a type of classroom research in which a few teachers investigate teaching and learning in the context of an actual single class lesson. When the teachers complete the study they

document their work in a report that describes the lesson they designed, explains how the lesson worked and what they have learnt about teaching and learning from the Lesson Study experience (Ono and Ferreira, 2010). It is a teaching improvement and knowledge building process that has origins in Japanese elementary education (Cerbin and Kopp, 2006). It had been practiced in Japan since the 19<sup>th</sup> century and became popular after 1960s (Ono and Ferreira, 2010). Also, Moss (2008) stated that Lesson Study is a professional development process that involves joint research and lesson planning under a common goal, where teachers engage with one another in designing, implementing, observing, and reflecting on “research lessons.” In lined with this, Arani *et al.* (2010) added that it is teachers' classroom based collaborative research, with potential for enhancing learning, enriching classroom activities and transforming the school environment.

Lesson Study is a professional development activity that is characterised as classroom-situated, context-based, learner-focused, improvement-oriented and teacher-owned (Ono and Ferreira, 2010). Moreover, it is a case analysis model of learning activity aimed to help develop teachers' professionalism and provide them a chance of mutual learning on the basis of real activities in the class. In Japan, as a development model of teachers the Lesson Study can improve teachers' professionalism and educational quality Subadi *et al.* (2013).

Lesson Study, a professional teacher development process, nowadays spread out and developed in many countries, from its origin Japan, which is the home country of Lesson Study development, to USA and other several countries including Indonesia. In Indonesian context, Lesson Study is a process by which teachers and teacher educators work together to critically improve the quality of classroom practice through planning, observation and reflection cycle based on the principles of collegiality and mutual-learning to develop a learning community suggested by Suratno & Cock (2009). Accordingly, teachers work collaboratively to: (a) formulate specific goals for student learning, and form hypotheses about instructional activities that will support these goals; (b) plan, conduct, and observe research lessons; (c) observe student learning, engagement, and behavior during the lesson; and, (d) discuss and revise the research lesson, and the approach to instruction, based on these observations (Moss, 2008).

### 1.1. Processes of Lesson Study

Lesson Study involves a Plan-Do-See cycle, that is, collaborative planning, implementation and observation, and reflection of teaching and learning processes

aimed to help develop teachers’ professionalism and provide them a chance of mutual learning on the basis of real activities in the class Subadi *et al.* (2013). It is a professional development practice in which teachers collaborate to develop a lesson plan, teach and observe the lesson to collect data on student learning, and use their observations to refine their lessons. It is a process that teachers engage in to learn more about effective practices that result in improved learning outcomes for students (Stepanek *et al.*, 2007). Moreover, Hurd and Licciardo-Musso (2005) added that Lesson Study has the potential for empowering teachers by demonstrating to them their own ability to improve their practice and the learning of their students. This building of efficacy for teachers is one of the great appeals of the lesson study process. The Lesson Study phases are as follows:

### 1.1.1. Planning Phase

Planning a research lesson differs from everyday class preparation in several ways. An obvious difference is the degree to which teachers collaborate with one another in creating the lesson (Cerbin and Kopp, 2006). The planning phase begins with problem identification which includes: the selection of the topic, preparing content and teaching materials, strategy used in teaching as well as mapping out lesson plans. As mentioned by Suratno (2010) at this stage the Lesson Study team collaboratively develops teaching and learning design based on students’ needs and their learning demands.

The process of Lesson Study is initiated by setting a goal. The teachers will work collaboratively on ways to achieve the particular goal. The study of teaching materials is believed to help teachers clarify unclear points and to confirm and strengthen the content knowledge necessary to teach the topic effectively (Baba & Kojima, 2004). Mapping out lesson plans requires teachers to have a good understanding of their learners’ needs, pre-knowledge and misconceptions. Teachers are encouraged to anticipate the challenges learners may encounter in the lesson and to be prepared with appropriate strategies to assist them (Ono and Ferreira, 2010).

### 1.1.2. Implementation (Do) Phase

After the planning phase, a teacher conducts the study lesson based on the plan. The lesson plan is usually photocopied and distributed to each observer. The number of colleagues who observe the lesson varies depending on the purpose of the particular Lesson Study. If it is a Lesson Study by a subject group or a grade level of teachers, the number of teacher observers is usually smaller. On the other

hand, when the Lesson Study is carried out in a large public research meeting, dozens of observers including curriculum experts and tertiary teachers will attend. In each case, the participants will carefully watch what the teacher and the learners do (Ono and Ferreira, 2010). The main focus of the observations is student thinking and learning (Doig and Groves, 2011), with observers, like the teacher, Instead of observing how the teacher teaches, as in typical classroom observations, they focus on how students respond to the lesson, which was designed by the team rather than by the person who happens to be teaching (Cerbin and Kopp, 2006).

Sometimes observers choose to focus on just one or two students for the entire lesson. Observers do not interact with nor “help” the students or the teacher during the lesson, as the purpose is to observe the implementation of the lesson as planned (Doig and Groves, 2011). Moreover, the observers listen attentively and make a note on the lesson plan of the critical remarks and on behaviours of the teacher and the learners in relation to achieving the lesson outcomes. The observational notes on a lesson plan serve as evidence for later discussions in a post-lesson conference or forum (Ono and Ferreira, 2010).

### 1.1.3. Reflection/Post Class Discussion (See) Phase

In most cases, the post-lesson forum or reflection follows immediately after the lesson. If time or schedules do not allow for it, the post-lesson forum may take place later on another day (Ono and Ferreira, 2010). The debriefing can be held in a separate meeting room (hall) or in the classroom where research lesson carried out. However, as suggested by Takahashi and Yoshida (2004) holding the debriefing in the classroom in which the research lesson was held might be a good idea because participants can see the blackboard writing and the materials that the students used during the lesson. In addition, teachers should bring all the resources (such as textbooks, teacher’s manuals, and manipulatives) that they used to develop the lesson, as well as data collected from the lesson (such as observation notes, students’ worksheets and notebooks, and notes from pilot lessons). Moreover, the debriefing session usually begins with an instructor’s short comments on his or her teaching. The instructor addresses how the lesson went, what difficult decisions he or she made during the lesson, and what he or she would like to discuss with participants.

All observers are encouraged to contribute to refining and improving the lesson by asking for clarification, recognising the strengths or good aspects and identifying the challenges. Comments on the challenges should

ld be accompanied by suggestions and alternatives (Ono and Ferreira, 2010).

In summary, Lesson Study consists of cycles of instructional improvement in which teachers work together to: formulate goals for student learning and long term development; collaboratively plan a ‘research lesson’ designed to bring to life these goals; conduct the lesson in a classroom, with one team member teaching and others gathering evidence on student learning and development; reflect on and discuss the evidence gathered during the lesson, using it to improve the lesson, the unit, and instruction more generally; and, if desired, teach, observe, and improve the lesson again in one or more additional classrooms (Lewis, 2009). It emphasized collaborative research on classroom activities, and enhanced the possibilities for teachers to reflect upon their own practice from multiple perspectives (Arani et al., 2010).

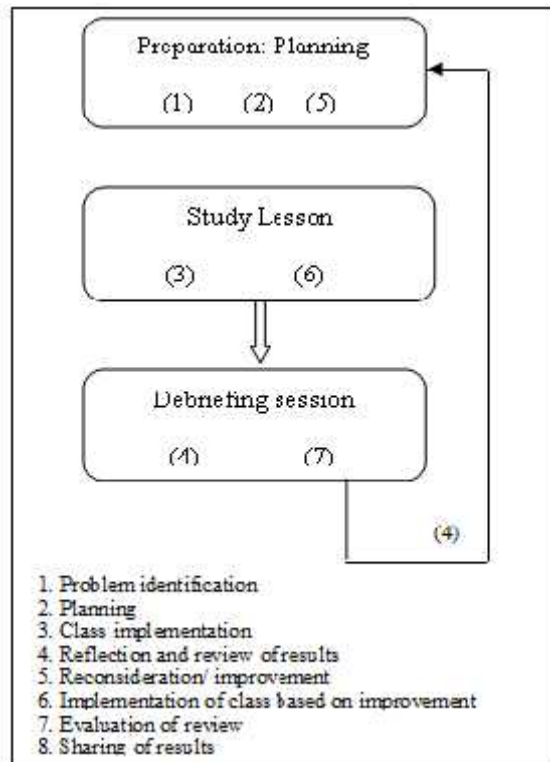

Figure 1. The processes of pedagogical training adopted from Stigler & Hiebert (1999)

The above Figure -1 shows, Lesson Study is a cyclic process which consists of different steps. The first stage consists of steps (1) to (4) and the results of the reflection in step (4) leads us to the second stage, step (5) to (7) which is improvement stage and the cycle continues until the best lesson is produced and finally it will be shared as in step (8).

## 1.2. Merits of Lesson Study

Lesson Study is an excellent form of CPD (continuing professional development), which has the potential to make real improvements to teaching and learning that are sustainable and not just short-term gains. This is, in part, due to the fact that the teachers are dealing with their own classrooms and their own students rather than theoretical situations with virtual students, the model used for much CPD work in the past two or three decades (Burghes and Robinson, 2009). It values us as professionals and allows us to use our collective talents and experiences to increase student achievement through increasing our knowledge as professionals. It is not another new program, but a tool that helps teachers to be effective learners themselves (Hurd and Licciardo-Musso, 2005). In lined with this Heidema and Mitchell (2005) stated lesson study as a model for teacher’s professional development used to improve the learning experience teachers give their students. It is a structured, learning strategy grounded in classroom practice to improve student’s learning and teachers collaborate over a period of time to research, design, implement, test and improve conceptual grounded lessons to promote and enhance students learning of specific concepts and content.

To summarize, Lesson Study serves as an ongoing method to improve instruction through careful observations of students and their work (Lewis, 2002). Moreover, (Lewis, 2004) stated that in successful Lesson Study initiatives in the United States, teachers benefited from increased knowledge of subject matter, increased knowledge of instruction, increased ability to observe students, stronger collegial networks, stronger connection of daily practice to long-term goals, stronger motivation and sense of efficacy, and improved quality of available lesson plans.

## 2. METHODOLOGY

The population of the study included teachers of laboratorium junior secondary school of UPI (Indonesia University of Education) in Bandung city. Data were collected using questionnaire and focus group discussion. The questionnaire consisted of 15 items, and was first developed in English and later translated to “Bahasa Indonesia” to avoid language barrier while responding. The questionnaire deals on perception of teachers on Lesson Study processes and the impact of Lesson Study on teachers. It was also administered by all science teachers of the school. In the focus group discussion data collection method, the principal, vice principal, science department head

and coordinator for Lesson Study program were involved. Moreover, data collection instruments such as camera and audio recorder were used to secure flow of ideas and to minimize loss of participants' response. Both cases were designed to seek information about the practice, achievement, and challenges of science teachers on Lesson Study. The response collected from both these methods were analyzed and interpreted on percentage basis.

### 3. RESULTS AND DISCUSSION

The data were collected through personal visit. Teachers and administrators of the school were very cooperative. The data have been presented in the form of Tables.

Table 1. Demographic information of respondents

Description	f	%
Sex		
Male	2	50
Female	2	50
Age		
18-25	2	50
26-34	1	25
35-43	1	25
44-52	-	-
If any	-	-
Educational background:		
Certificate or diploma	-	-
Bachelor degree	2	50
Master's degree	2	50
If any	-	-
Experience as science teacher:		
0 - 5	2	50
6 - 10	1	25
11 - 15	1	25
16 years and above	-	-

Demographic characteristics' of respondents of the laboratory junior secondary school science teachers of UPI was assessed as follows:

Of the total 4 science teachers of the school 2(50%) were males and the remaining 2(50%) were females. With regard to age composition 2(50%) have 18 - 25 years, 1(25%), 26 - 34 years and the remaining 1(25%) lay in the range of 35 - 43 years. With respect to their qualification 2(50%) of the respondents were with first degree and the rest 2(50%) were with master's degree levels of education. Moreover, 2(50%) of the respondents were 0 - 5 years, 1(25%),

6 -10 years and the rest 1(25%) were 11 - 15 years of experience as science teacher (table 1).

Table 2. Questionnaire related to the practice, achievement and challenges of lesson study and the respondents response.

Description	3	4
1. The Lesson Study contributes to my teachers' professional development.	25%	75%
2. Improving knowledge of subject matter and pedagogy.	25%	75%
3. The Lesson Study has improved my understanding of students' learning.	75%	25%
4. The Lesson Study has improved my perceptions on collaborative work practices to design lessons that engage students with their learning.	25%	75%
5. Experiences and knowledge gained during the Lesson Study is very valuable and important in order to make me a better science teacher.	25%	75%
6. Lesson Study played an important role in improving my teaching skills.	50%	50%
7. Inspiring for improvement of my class.	75%	25%
8. More sensitive to observe student activity.	75%	25%
9. Inviting colleagues to observe lesson.		100%
10. I learnt a better way to teach the topic	50%	50%
11. I have a deeper understanding of how students learn science content in the lessons.	75%	25%
12. My teaching has improved after taking part in lesson study.	50%	50%
13. I learnt that Lesson Study can be implemented and are sustainable in my school.	75%	25%
14. Improving awareness of student's difficulties.	75%	25%
15. Develop own lesson plan.	50%	50%

The questionnaire for this study (Table -2), was adopted and modified from four previous Lesson Study and Learning Study researches such as the research done by White and Southwell (2003) on Lesson Study: A Model of Professional Development for Teachers of Mathematics in year 7 to 12, research done by Lo (2009) entitled the Development of Learning Study Approach in Class Room Research in Hong Kong, a research conducted by Fernandez (2005) entitled Exploring 'Lesson Study' in Teacher Preparation and a research by Suhaili and Khalid (2011) on Mathematics Teachers' Perception of Lesson Study as a Continuous Professional Development Programme. Teachers selected one of the 4- point

scale options (Likert -type scale) (Agreement scale: 1= strongly disagree, 2= disagree, 3=agree, 4=strongly agree). Besides, the results of their choice were assessed below.

As we can see from the data gathering sheet (Table - 2), majority (75%) of the respondents strongly agreed that Lesson Study contributed to their professional development. In lined with this, as mentioned by (Daring Hammond, 1997; Daring Hammond and Ball, 1998; Yoshida, 1999 cited in Lewis *et al.*, 2004) Lesson Study create a condition of Strongly collegial networks and can help teachers build a community of practice in which teachers routinely share resources and ideas as they participate in research lessons. Group of teachers collaborate over a period of time to research design, implement, test and improve conceptually grounded lessons to promote and enhance student learning on specific concepts and content. Hence, discussions giving critical feedback on Lesson Study members’ lessons and student learning help them to develop a conducive environment for individual teachers to gain knowledge about ways to improve their own teaching (Heidema, & Mitchell, 2005).

Majority (75%) of the respondents stated that Lesson Study play a great role in improving their knowledge of subject matter as well as in understanding of students’ learning. During the Lesson Study cycle teachers discuss the essential concepts and skills that their students need to learn, compare the concepts’ treatment in existing curriculum and consider what students currently know and how they will respond to the planned lesson. As they engage in these activities they naturally generate many questions about the subject matter. The group can often answer such questions; if not, teachers look to outside resources (Lewis *et al.*, 2004). Hence, exchange of ideas among group members enable to develop knowledge of the subject matter. They also added that during the research lesson, one member of the Lesson Study group teaches while others collect specific data on what students wrote and said, how students used the material, what specific supports encouraged understanding and what obstacles to learning arose during the lesson. Therefore, what teachers learn during Lesson Study applies to areas beyond the particular lesson which increase understanding and knowledge of instruction. Moreover, Lesson Study creates a safe environment in which colleagues can collaborate. It has the potential for empowering teachers by demonstrating their own ability to improve their practice and the learning of their students.” This building of efficacy

for teachers is one of the great appeals of the Lesson Study process (Hurd, 2005).

Most of the respondents strongly agreed that collaborative work practice strengthens their understanding on designing a lesson that engage students actively participate on learning. According to Department for Children, Schools and Families (2009) Lesson Study group members by considering the learning needs of the class to be taught collaboratively designs an innovative lesson or sequence of lessons that uses the techniques to be focused upon. The planning has detailed and specifies resources, teaching approaches, intended pupil activity, anticipated pupil responses and outcomes. Besides, one teacher assigned to teach the lesson and the rest of the group observes closely the way pupils react, how effectively they learn and make progress and how well the design of the lesson meets pupils’ needs and engages them in learning.

Burghes and Robinson (2009) argued that Lesson Study encourages all teachers in a department or school to collaborate in supporting and learning from each other which help them to develop awareness on what good teaching is. It also encourages creativity, willingness to take risks, try out new ideas and to share these experiences. Eaker *et al.* (2002) mentioned that through a culture of collaboration, teachers in professional learning communities work together to set goals, plan lessons, and use results - focused data to reflect on and improve their teaching practice as part of their commitment to optimal student learning. Moreover, Lesson Study values us as professionals and allows us to use our collective talents and experiences to increase student achievement through increasing our knowledge as professionals (Hurd and Licciardo-Musso, 2005).

Accordingly, majority (75%) of the respondents strongly agreed that the experience and knowledge they gained through Lesson Study made them better science teachers. in addition to this half (50%) of the respondents strongly agreed that Lesson Study played an important role in improving their teaching skills. It is an activity that can encourage the formation of a community of learning (learning society) that consistently and systematically self-improvement, both at the level of individual and managerial (Lasut, 2013). As stated by Lewis (2000) Japanese teachers mentioned many effects of research lessons on their own professional development, including feedback on their own teaching and new ideas gained from watching other teachers. Research lessons help them see their teaching from various points of view. A lesson is like a swiftly flowing river; when you are teaching you must make judgments instantly. When you do a research lesson, your colleagues write down your words and the

students' words. Your real profile as a teacher is revealed to you for the first time. Findings from Japanese study on teacher candidates also suggest that Lesson Study provides opportunities to build professional learning communities, to deepen understanding of curriculum and pedagogy, and to develop habits of critical observation, analysis, and reflection (Melville and Chassels, 2009). Moreover, Lewis (2004) added that Lesson Study helps to develop instructional expertise. It builds understanding of instruction - of how lessons can be honed and modified to better reach children. This expertise seems to be built both during the lesson planning, as teachers anticipate student responses and hone questions they will ask, and also as a result of teaching the lesson, when teachers reflect on the lesson's activities, visual aids, worksheets, key questions, and so forth. Finally, Cerbin and Kopp (2006) conclude that lesson study encompasses the full complexity of teaching and learning in the context of a single class lesson. Essentially, teachers have opportunities to question, explore and reflect on every phase of the teaching and learning process.

According to this study majority (75%), of the respondents also agreed that Lesson Study inspired them to improve their class as well as made them more sensitive to observe their students activity. In lined with this, Japanese teachers believe that time spent studying their lessons will subsequently improve their teaching. Furthermore, they believe that the most effective place to improve their teaching is in the context of a classroom lesson (Stigler & Hiebert, 1999). Besides, Cerbin and Kopp (2006) stated Lesson Study as an evidence-based approach to teaching improvement. In the best cases, teachers get important insights into how their students learn from the lesson, where they get stuck, what changes take place, and how they interpret ideas. We believe that observations of classroom thinking can provide the kind of data that is directly applicable to making improvements in the lesson.

All of the respondents strongly agreed that they invited their colleagues for the lessons they prepared and get comments which help them to improve their teaching which was difficult to invite as well as to be observed by their lesson study members at the beginning of Lesson Study introduction into their school as mentioned in the focus group discussion. In lined with this, research in mathematics on Lesson Study in Brunei school Darussalam, Suhaili and Khalid (2011) mentioned that it was a common practice in Brunei for teachers not to open up their classes to allow other teachers to observe their lessons.

The aim of inviting colleagues is similar to observation in Lesson Study implementation phase which is to observe the progress of the implementation of the lesson. According to Doig and Groves (2011) the main focus of the observations is student thinking and learning with observers making detailed notes of students' solution strategies. Sometimes observers choose to focus on just one or two students for the entire lesson and they do not interact with nor “help” the students or the teacher during the lesson.

Majority (75%) developed a deeper understanding on how students learn science content and they agreed Lesson Study to be implemented and sustainable in their school. During a series of meetings in research lessons, teachers had to think carefully about the object of learning, critical features, questions, activities and approaches to be used. Also, they obtained feedback on their own teaching and new ideas from watching how their colleagues taught the same topic through research lessons which was likely to lead for improvement (Lee, 2008).

Half of the respondents strongly agreed that their way of teaching has improved after taking part in Lesson Study and able to develop their own lesson plan. Developing a lesson plan is one of the key steps in Lesson Study and their frequent meeting and collaboration might play a great role for their improvement. Lewis *et al.* (2004) stated that Lesson Study is rich in possibilities for improving current mathematics and science instruction by citing results from a successful teacher-led lesson study initiative, and showed benefits of Lesson Study including knowledge of instruction and improved quality of available lesson plans. Also, they conclude that lesson study goes far beyond simply improving a lesson—it challenges teachers to improve their classroom instruction. Moreover, White & Southwell (2003) suggested that Lesson Study is a model of professional development designed to assist teachers to produce quality lesson plans and gain better understanding of student-learning

Figure 2. Graphical representation of questionnaire results

The questions from questionnaire survey and the respondents response is presented by the graph on Fig. 2 above. As we have seen from the Table -2 on Page (8) and the above graph (Fig. 2) the respondents' response laid only on agreed and strongly agreed options. This indicated that Lesson Study has a positive relationship with professional development of the school teachers. They collaboratively Plan, Do and See the research lesson. Consequently, they shared knowledge and skills during the Lesson Study processes as it was mentioned by (Lewis, 2009).

Baba (2007) stated Lesson Study, a process in which teachers progressively strive to improve their teaching methods by working with other teachers to examine and critique one another's teaching techniques. Besides, according to the information gathered from focus group discussion (FGD), the school considered the implementation of Lesson Study compulsory for continuous improvement of teacher professional development since 2010. Moreover, the school has regular schedule for Lesson Study implementation and at least one teacher from all subjects became a teacher model each month.

The implementation of Lesson Study in the school was financially supported by Faculty of Mathematics and Science Education (FPMIPA) of Indonesia University of Education. However, starting five years ago the school has no external financial support source. It exists independently by itself along with the school's parent's council. Moreover, the school teachers' even some times spent their own money for implementation of Lesson Study such as preparation of teaching learning material and transportation (if held out of class days).

Though financial support from FPMIPA is halted, it is now supporting the school by providing experts that give guidance or consultation to teachers related to how to choose appropriate method or strategy to teach, how to manage the classroom during Lesson Study implementation and on how to conduct efficient teachers' reflection.

The focus group discussants identified the following as major obstacles that impede the implementation of Lesson Study in their school. These include:

1. All the school teachers did not get the necessary knowledge from experts regarding with pedagogical aspects and the essence of Lesson Study so that it cause some misconceptions and confusion.
2. During reflection (see phase), the observers directly tends to give negative comments without considering the positive (good) aspects. This is considered as big problem especially for teachers who implement Lesson Study for the first time.
3. Require more time for preparation; teachers spend time in finding most appropriate teaching media and doing consultation with experts regarding lesson plan preparation as well as to discuss with their peers on the subject area topics.

4. Teachers seem to be looked well in front of camera unlike that of teaching naturally as in normal situation. Because there are lots of observers, model teachers focus on their appearance for every single moment to be looked great which affect the learning process not to proceed as expected.

Initially the school teachers considered Lesson Study as a means for judging teachers and to compare and create differences among them instead of improving teachers' profession and students learning. Also, they suggested that Lesson Study would be effective as all teachers get the proper training before its implementation regarding the process, importance, on the way to give comments during reflection as well as where the comments to focus which strengthen awareness and understanding of teachers. Moreover, Lee (2008) stated that to make Lesson Study successful and a pleasant experience for school teachers, it has to be made clear to teachers that the aim of classroom observation is not to assess teacher effectiveness in a particular lesson.

Similar to this, a study by Lee (2008) a Hong Kong case on benefits and concerns of Lesson Study teachers mentioned that it is time consuming. They spent a lot of time on numerous pre meetings, meetings and clerical works as well. Besides, they suggested that huge labor power is concerned during the whole process. Moreover, a Singapore case of Lesson Study by Cheng and Yee (2011) indicated that teachers felt similarly constrained by time when implementing the cycles required of lesson study.

Lesson Study has plenty of advantages as mentioned by various scholars. To mention some: increasing knowledge of subject matter, increasing knowledge of instruction and building strong collegial networks (Lewis, 2004; Lee, 2008). One of the discussants in the focus group discussion stated lesson study as follows:

*Lesson Study is main asset since it improves teachers' thinking to be brave and active. Also, lesson study helps students to learn in collaboration which strengthen student-centered method of teaching.*

In Lesson Study teachers collaborate to design and implement a lesson. Hence, their discussion with each other and comments from observers during reflection makes them develop courage besides their knowledge gain and this might help teachers to find solutions when students ask unexpected questions out of the lesson they teach or for which the teacher do

not give focus. A study by Suhaili and Khalid (2011) on mathematics teachers' perception of lesson study, teachers commented that Lesson Study would be useful for teachers as lesson study exposed teachers to student centred rather than teacher centred teaching methods. It allows students to think in their own way and express their ideas to teachers and other students.

Lesson Study is a teaching improvement and knowledge building process that involves teachers working together to improve learning and be useable by other teachers. Also, another discussant mentioned as:

*Lesson study is really important to develop an experience through collaboration among teachers and improve your teaching method by observing the way how other teachers teach during lesson implementation and through comments from reflection.*

Through four detailed case studies Burghes and Robinson (2009) suggested that Lesson Study encourages all teachers in a school to collaborate in supporting and learning from each other and to regard problems as difficulties to be overcome, not as barriers to development. It also develops personal skills in being able to give and take constructive criticism without causing or taking offence, rather seeing it as a means to professional learning and fosters creativity, a willingness to take risks, try out new ideas and to share these experiences with colleagues.

This study is consistent with the study by Suhaili and Khalid (2011) in which teachers stated that lesson study is a professional development model that provides them with valuable and meaningful experiences and knowledge which were built during the process of reflection and collaboration with their peers and the 'knowledgeable others'. Moreover, in Lesson Study teachers obtained feedback on their own teaching and new ideas from watching how their colleagues taught including, teaching approach, teaching activity design and teacher-student interaction. This was likely to lead to demand for self and peer improvement (Lee, 2008).

Lesson Study is also important for modification of teaching and improves several weaknesses from comments given by other teachers during reflection. As one of the discussants suggested that lesson study enables them to produce good research papers and achieve local seminars or conferences related to pedagogy.

Lesson Study creates fertile ground for teachers to participate in local seminars or national conferences related to their profession which helps them to exchange knowledge and ideas like content based seminars which provide teachers with an opportunity to reflect and engage with peers in subject matter study and deepen their content knowledge. They also participate in seminars that deal on how to improve students' achievement, assessment methods and text book evaluations. In general, it helps teachers in participating in international conferences such as WALS (world association of lesson studies) where a lot of scholars from different countries collected and present their research which focuses on ensuring quality of education. Hence, the school teachers enroll and even present their work and get constructive comments that enables them to enhance and build their professional capacity.

#### 4. CONCLUSIONS

This study has found that lesson study has a positive relationship with the teachers' professional development. It improves knowledge of subject matter and their profession in general. Hence, the lesson study processes provide opportunities for colleagues to discuss freely and build their capacity to help them improve students' learning. It is a teaching improvement and knowledge building process through designing, implementing, observing, and reflecting research lessons.

The government and school authorities should play a significant role in creating awareness regarding the essence and importance, lesson study processes and allocating enough time for the teachers to meet and discuss so that lesson study will be a promising potential for better improvement of teachers' professional development as well as students' learning.

#### 5. ACKNOWLEDGMENT

I wish to express my most sincere gratitude to JICA (Japanese International Cooperative Agency) for the opportunity in capacity building training and presenting my work in WALS conference. For the entire period of stay, JICA supported me with all of my expenses.

My special thanks go to Professor Nuryani Y. Rustaman and Dr. Ari Widodo for their constructive comments and exceptional guidance of the paper. their constant help made this work possible.

I extend special thanks to Dian Henderiana, and Resick Kusumah, JICA staff members Indonesia University of Education for the moral support, assigning translator and for their kindly help in using access of internet, printer, photo copy and stationary materials as well, which has been helpful in this work.

I would like also to extend my sincere thanks to Mohammad Dika, for his help in translation of result obtained from questionnaire and focus group discussion.

Evidently this work would not be possible without the necessary data. Therefore, great thanks to the administrative and school teachers of laboratorium junior secondary school Indonesia University of Education for their cooperativeness and providing the necessary information.

**Abstract:** Teacher Performance Assessment (TPA) employed by principal basically should be considered as peer assessment, concerning that principal is a teacher as well with additional certain tasks to manage schools. But, its implementation tends to be a one-way assessment from a superlative to the subordinate. Principal's sight on TPA, which is more focused on how teacher's teaching, does not provide enough space for teacher to give feedback or self reflection on his/her teaching. In fact, a self reflection of teacher could give a balance point of view on principal assessment. The research is aimed to describe a case of a certain secondary school where the principal using teacher self reflection as part of TPA by his own initiative. Having experienced with school wide lesson study during last 8 years, the principal decided to use this new approach as he is keen on to hear from the side of teacher in term of self reflection about students learning. To avoid a sporadic and unstructured self reflection, teachers are welcome to see the video or read its transcript to analyse the lesson. Samples are collected through two videotaped learning activities which assessed by principal using certain assessment format designated by board of education. Transcripts are made and gave to teachers after learning to be a reference for self reflection. Teachers convey on teaching and learning aspects should be improved, while principal wrote suggestion and mark on his assessment rubrics. The discussion applied comparing and classifying both approach in term of finding each focus. Self initiative to adopt self-reflection method as part of TPA might be another impact of collegiality of school wide lesson study.

**Keywords:** teacher performance assessment, self-reflection, school wide lesson study

### 1 INTRODUCTION

A principal in Indonesia is teacher with additional task to manage a school (The National Education Minister's Rule no. 28 Year 2010 about the employment of teacher as Principal). A principal must have five competencies, those are personality competency, managerial competency, entrepreneurship competency, social competency, and supervision competency. Supervision competency is one of the competencies which directly support an improvement of teachers' professionalism, in which the principal is responsible for planning, implementing, making a follow up of the result of supervision.

Class supervision, employed by the principal, is designed to enable teachers to improve the teachers' competence in managing teaching and learning

process well. The class supervision stresses on how teachers develop their professional competencies rather than asses their performance. That is why, method to optimize the class supervision should be organized systematically.

### 2. USING TEACHER SELF REFLECTION (TSR) ON TEACHER PERFORMANCE ASSESSMENT (TPA)

To obtain expected objective of supervision, the class supervision should facilitate an active interaction between teacher and principal. But, its implementation tends to be a one-way assessment from a superlative to the subordinate. Principals' sight on TPA, which is more focused on how

teachers’ teaching, does not provide enough space for teacher to give feedback or self reflection on his/her teaching. In fact, a self reflection of teacher could give a balance point of view on principal assessment.

Based on the statements above, in this paper the principal tries to find out the best way to carry out the class supervision using teacher self reflection. With an effective interaction between teachers and principal, it is hoped that the class supervision is not just judging the teachers’ methods in teaching, but to motivating the teachers to create more effective teaching and learning process in order to gain learning objectives. Teacher Self Reflection can develop the teachers’ self awareness in what they have done in managing the class, their strength and their weaknesses. At the same time, the teachers try to find out the better method to teaching in the future.

During the 8-years experience with School-based lesson study, principal of Lembang State Secondary School decided to uses such approach in conducting the class supervision to assess teachers’ performances. The principal listens more to the teachers’ self reflection related to the students’ learning. The objective of this research is to describe a certain school condition, in which the principal uses Teachers Self Reflection as part as Class Supervision to assess teachers’ performances. On the other hand, it is expected to be an inspiration for other principals who are interested in this case to implement and to develop model of class supervision in their schools to improve teaching and learning process.

### **3. THE STEPS OF USING TEACHER SELF REFLECTION ON TEACHER PERFORMANCE ASSESSMENT**

Before the class supervision based on schedule provided, principal asks teachers to submit their lesson plans and students worksheets which they will use in the class, and describe briefly the activities they will carry out in the class. The teacher teaches, while the principal observes that teaching and learning process. During the teaching and learning process, all the teacher and students’ activities are taken video by someone else. Several days after the class, the teachers are required to watch the video of their class activities, then she/he makes self-reflection to what they have done in their classes. Meanwhile, the principal makes some notes of the teaching and learning process using supervision-instrument. Researchers also make video transcripts as teacher and principals’ reference. Teachers and principal discuss the result of both sides. The principal ask the teachers to tell about their self reflection first. The discussion between the teachers

and the principal takes place intensely. The teachers convey their points of view of what they have done in their classes. They (principal and teacher) tell about the teaching and learning processes, which are good and which must be improved. The principal also tells his opinion about teaching and learning process. With the intensive discussion between both sides, it makes comprehensive and constructive understanding teacher performance assessment. So the result of assessment is more authentic and accurate. The teachers also realize what aspect must be retained and must be improved in the next lesson.

### **4. PROCEDURE**

In this research, the writer took two samples of teaching and learning video, those are Science and Social Science subjects. After the class observation of the two subjects, each teacher is required to watch their videos and also read the video transcripts. The data are taken from the teacher self reflection, principals’ notes of the observation and also the result of their discussion between each teacher and principal. The researcher obtained the result of teacher self reflections and the principal’s notes of the assessments. The researchers compare between the teacher self reflection and the principal’s assessment. The comparison is classified into the aspects of teacher performance assessment, as follow:

- a. Introduction: Apperception and Motivation, The delivery of Competencies to gain and delivery of activities to do to the students.
- b. Main Activity: Lesson mastery, The implementation of interesting strategy, The implementation of scientific approach, The use of leaning resources and learning media, Students’ participation, The use of good and correct language.
- c. Closing: Closing the class

## 5. RESULT

a. The assessment of Natural Science Teacher Performance :

Table 1. Teacher Performance Assessment in Natural Science Lessons

Assessment Aspects		Principals' notes	Teachers' Self Reflection
<b>Introduction</b>			
<b>Apperception and Motivation</b>			
1	Correlating the lesson with students' experiences or previous lesson	Relating to the plant classification	Asking the students previous lesson and let them tell animal classification based on their knowledge.
2	Asking question to students	Yes	Asking the students if they wanted to be scientist (liked exploring)
3	Telling students about lessons' benefit	The teacher did not tell before discussing	- The way to classify animals based on morphological characteristic - Telling the objective of animal classification in the end of the discussion
4	Demonstrating something related to theme or topic	Through the video	Showing video about animals' life and the benefit for humans' life
<b>Telling students about goal of competencies and activities</b>			
1	Telling the goal competencies	Yes, the teacher did	To classify animals
2	Telling the activities that will do during the class	It is mentioned explicitly	The students are required to work in group of 8.
<b>Main Activities</b>			
<b>Lesson Mastery</b>			
1	Lesson organization based on the learning objectives	Yes	Trying to use video and pictures of animals to gain the objective of learning.
2	Relating to the lesson material with other relevant knowledge, science development, technology and real life	Relating to the classification of plants and the students' previous knowledge	Explaining the benefit of invertebrata animal in industry and medicines.
3	Discussing lesson material with correct methods	As the same as the steps stated in the lesson plan	Discussing the lesson material based on what the students have done
4	Discussing the lesson material systematically (from the easy to difficult, from the concrete to abstract)	Discussion begins from the students' knowledge	Discussion begins with the classification based on the students' knowledge
<b>Implementing educative strategy in teaching and learning</b>			
1	Organizing learning process based on goal competencies	Yes, it is in line with the competence to achieve	Relating the lesson material to the value of God's greatness (KI.1) But it is not stated in detail.
2	Facilitating exploration, elaboration, and confirmation activities.	The students observe video, the pictures, open the references, make conclusion.	Beginning with asking the students, showing video to observe, dividing pieces of animal pictures to classify, and confirming the students' works.
3	Organizing the systematic learning process	Yes	Beginning with apperception, motivation, exploration, elaboration, confirmation, test.
4	Class mastery	Some students do not participate actively	Almost all students participated actively, but some students did not concentrate on the tasks and the teacher reminded them.
5	Implementing contextual learning process	Using the material around the class	Based on the available infrastructure and the students and teacher's need and ability

6	Arising students' positive habits in the learning process	Praying, Cooperating, Self confidence	Cooperating, correcting each other to develop their social care
7	Appropriate with the time allocated	Yes	Yes
<b>Implementing Scientific Approach</b>			
1	Giving the “Why” and “How” questions	Only a few	Although the teacher says why and how, the most propose question is what. This purpose is to trace students' mind and to lure so that it can be expressed
2	Motivating the students to ask	Not much	Give chance for the students in the end of every segment (introduction, main activities, and closing). Students propose many question when the teacher went around to each group, exploration and elaboration
3	Facilitating the students to do the experiment	Shown the picture	Give various media of animal pictures for try to classify into each group
4	Facilitating the students to observe	Shown the picture	Give more animal pictures for being observed their characteristic
5	Facilitating the students to analyze	Group discussion	Discussing in group, digging resource books to strengthen the analysis
6	Asking the students to think logically and systematically	Catechizing	Giving a sequence question, what-why-how
7	Facilitating the students to communicate	Learning group	Give chance to the group to communicate the work's result and it is appraised directly by other group, can give information or not from that presentation
<b>The use of learning resource/ learning media in the learning process</b>			
1	Using learning resources	Not clear	Using all of media from LCD, blackboard, picture that has been prepared before by teacher, and students' book
2	Using learning media.	Yes	Showed to the student and used it for learning resources
3	Resulting interesting impression	Yes, most of student involved	Do not know whether there is interesting things or no fo the students
4	Activating the students to use learning resources	Yes	students use available learning resources actively
5	Activating the students to use learning media	Lack in using media	Students use media that are prepared by teacher and blackboard to communicate result of study
<b>The students' involvement in the teaching and learning process</b>			
1	Facilitating students' active participation through teacher's interaction, students , and learning resources	Yes	Students interacted with teacher, friends, and learning materials
2	Responding the students' participation positively	Yes	Response and service students that need to be helped
3	Open-ended to the students' responses.	Yes	Give some warning to the students who disturb learning process
4	Showing comfort interpersonal relation	Yes	Students who consult privately are serviced overtly
5	Causing the students' cheer and enthusiasm	Yes	some students seen lack spirit for learning
<b>Using correct and appropriate language in learning process</b>			
1	Using clear and fluent oral language	Remains some incorrect word	Still mixed with the local dialect for response students' answer
2	Using good and correct written language	Yes	Divided blackboard into several parts to fill as many as needed
<b>Closing</b>			
<b>Closing the lesson</b>			
1	Making reflection or summary by involving the students	Yes via students' discussion result	Give a special mark in the blackboard as important things of students' work that will be a summary
2	Giving oral or written test	Yes via worksheet	Written test, besides from students' worksheet
3	Collecting the students worksheet for portfolio	Yes	Result of students' work are collected for being graded
4	Give feed-back of the lesson by reinforcement and giving the task	Yes	Clipping task about the use of animal for life

b. The assessment of Social Science Teacher Performance :

Table 2. Teacher Performance Assessment in Social Science Lessons

Assessment Aspects	Principal’s Note	Teacher’s self reflection
<b>Introduction</b>		
<b>Apperception and Motivation</b>		
1 Correlating the lesson with students’ experiences or previous lesson	Start with catechizing previous lessons	Teacher asks student about material that has been studied last week.
2 Asking question to students	Still lack	
3 Telling students about lessons’ benefit	delivered	Delivered implicitly
4 Demonstrating something related to theme or topic	Yes	Teacher demonstrated rain process’s experiment
<b>Telling students about goal of competencies and activities</b>		
1 Telling the goal competencies	Delivered by using projector	Delivered in the beginning of learning process
2 Telling the activities that will do during the class	Given in previous task	Tells that the activity will be done in group and ask the representative of each group to come forward.
<b>Main Activities</b>		
<b>Lesson Mastery</b>		
1 Lesson organization based on the learning objectives	Yes	
2 Relating to the lesson material with other relevant knowledge, science development, technology and real life	Yes, related with the daily needs of water	Related with good habits of drinks, dew, weather, etc.
3 Discussing lesson material with correct methods	Yes	Discussing the component and phenomena in demonstration
4 Discussing the lesson material systematically (from the easy to difficult, from the concrete to abstract)	Yes	Teacher explain steps of rain process demonstration directly
<b>Implementing educative strategy in teaching and learning</b>		
1 Organizing learning process based on goal competencies	Yes	Yes
2 Facilitating exploration, elaboration, and confirmation activities.	Yes, start from observing, opening the references and concluding	Yes
3 Organizing the systematic learning process	Yes	Yes, appropriate with lesson plan
4 Class mastery	Some students still lack in involvement of learning process	
5 Implementing contextual learning process	Using learning materials around environments	Using available tools
6 Arising students’ positive habits in the learning process	Praying, Cooperation	Students are remembered to be patient while doing experiment, use the water wisely, etc.
7 Appropriate with the time allocated	Yes	
<b>Implementing Scientific Approach</b>		
1 Giving the “Why” and “How” questions	Need to increase	
2 Motivating the students to ask	Still lack	
3 Facilitating the students to do the experiment	Water-cycle simulation	Students did not do the experiment (just like plan) because of lack hot water.

Assessment Aspects		Principal’s Note	Teacher’s self reflection
4	Facilitating the students to observe	Yes by demonstration	Yes
5	Facilitating the students to analyze	Yes	
6	Asking the students to think logically and systematically	Yes, after observing, each student makes a conclusion	
7	Facilitating the students to communicate	Group, but need to be monitored for the effectiveness of teamwork	
<b>The use of learning resource/ learning media in the learning process</b>			
1	Using learning resources	Yes	Yes
2	Using learning media.	Using projector	Yes
3	Resulting interesting impression	Yes	Students are reminded not to waste water
4	Activating the students to use learning resources	Still lack	Students are involved to bring tools and materials for experiment, prepare the class, and read the question in power-point.
5	Activating the students to use learning media	Students are involved in using projector	students are stimulated to observe phenomenon and assemble experiment set
<b>The students’ involvement in the teaching and learning process</b>			
1	Facilitating students’ active participation through teacher’s interaction, students , and learning resources	Teacher-students catechizing, group discussion	Teacher ask students to help her to do experiments, etc.
2	Responding the students’ participation positively	Yes	Say thanks to students because of their helps
3	Open-ended to the students’ responses.	Yes	indirectly judge incorrect students’ answer
4	Showing comfort interpersonal relation	Yes	answer a unique students’ question by using daily language that related with students
5	Causing the students’ cheer and enthusiasm	Yes	
<b>Using correct and appropriate language in learning process</b>			
1	Using clear and fluent oral language	Yes	
2	Using good and correct written language	Yes	
<b>Closing</b>			
<b>Closing the lesson</b>			
1	Making reflection or summary by involving the students	Yes by using worksheet	Students are asked to present their answer in worksheet as a summary of material that studied in that day
2	Giving oral or written test	Using worksheet	
3	Collecting the students worksheet for portfolio	Yes	students are asked to collect their task
4	Give feed-back of the lesson by reinforcement and giving the task	Yes	give task for next meeting

## 6. Discussion

Based on the result of principal assessment and teacher reflection, the data that has earned can show as follows:

- a. Natural Science Learning Process :

Table 3. Discussion of Natural Science Lessons

Assessment Aspects	Explanation
	<b>Introduction</b>
<b>Apperception and Motivation</b>	The result of assessment and teacher’s reflection show that all aspects are almost the same, except for learnings’ benefit was not delivered in the beginning of learning process but in the end after learning process has been finished.
<b>Telling students about goal of competencies and activities</b>	Both of teacher and principal agree that learning competences were delivered in the beginning of learning process, but the activities to do were not delivered although the teacher executed activities’ steps that suit with lesson plan.
	<b>Main Activities</b>
<b>Lesson Mastery</b>	Principal assessment and teacher reflection tell the same result that teacher showed a good Lesson Mastery.
<b>Implementation of educative learning strategy</b>	Principals’ assessment and teacher’s self reflection indicate the same thoughts that teacher’s learning process implementation appropriate with the goal competency, doing the activities that consist of exploration, elaboration and confirmation components, and implementing the systematically. Teacher can handle the class, implement contextual learning, arise positive custom, and the process finish in exact allocation time. But, there are some students that did not involve in the learning process well.
<b>Implementation of scientific approach</b>	Principal assume that the teacher still lack in giving “why” and “how” questions, and also in luring students to ask. In the other hands, teacher believes that she has made effort in giving “why” and “how” question. But, after discussion with the principal, both of them are aware that is so hard to make students ask critically because they still in VII grade and teacher is claimed to make students ask critical question continually. In other aspect, both of them have the same assessment result, such as facilitating students to try by using pictures, facilitating them to observe and analyze pictures, giving some questions to the students to think (logic and systematic thinking process) by catechizing about those pictures, and presenting students activities to communicate discussion result with their teammates.
<b>The use of learning media / material resources</b>	Teacher is competent in using lesson materials, but she did not assert student to find out from other references. Teacher show her skill when using media, making interesting impression, but students’ involvement is not enough in using other media such as LCD and computer to deliver their observation result so that it can be more interesting.
<b>Involving the students in learning process</b>	The same observation results tells that teacher grow active participation of students and responds it, open-ended with the students, show comfort interpersonal connection, made students enthusiastic and cheerful during learning process.
<b>Using correct and appropriate language in learning process</b>	Some oral language still incorrect and mixed with local dialect.
	<b>Closing</b>
<b>Lesson’s closing</b>	The same perception between teacher and principal refers that teacher has reflected or made conclusion with the student, gave oral or written test via worksheet that has been made, collected result of students’ worksheet as portfolio, and gave feed-back by giving instruction for next activities and task.
<b>Additional note of Teacher’s reflection result</b>	<ul style="list-style-type: none"> <li>- Based on teacher-student catechizing, the teacher still dominate learning process.</li> <li>- The teacher has difficulty in stimulate student to ask actively (braveness of VII grade students to ask and deliver their opinion still need to be improved)</li> </ul>
<b>Additional note from principal</b>	<ul style="list-style-type: none"> <li>- Teacher can stimulate the students to ask by showing the picture or video. After that, they were asked to propose questions about that. Teacher can give a reward for student that ask and tell their opinion.</li> </ul>

b. Social Science Learning Process

Table 4. Discussion of Social Science Lessons

Assessment Aspects	Explanation
<b>Introduction</b>	
<b>Apperception and Motivation</b>	Both principals’ assessment and teacher reflection agree that <ul style="list-style-type: none"> <li>- Learning process must be started by discussing or asking about the last material</li> <li>- Learning process did not give many challenge question</li> <li>- Teacher told the learning objectives</li> <li>- Teacher demonstrated an experiment related to raining process</li> </ul>
<b>Telling students about goal of competencies and activities</b>	Both principals’ assessment and teacher reflection agree that the teacher shows competencies that have to achieve by student after learning by projector and was mentioned by teacher in learning process
<b>Main Activities</b>	
<b>Lesson Mastery</b>	Both principal’s assessment and teacher reflection show that <ul style="list-style-type: none"> <li>- Learning material appropriate with the objectives of learning process</li> <li>- Teacher connect the material with students’ daily life such as using water</li> <li>- The systematical lesson material was given from easy to hard, from concrete to abstract.</li> </ul>
<b>Implementation of educative learning strategy</b>	Both principal’s assessment and teacher reflection show that <ul style="list-style-type: none"> <li>- Learning process is in line with the competencies that the students must have</li> <li>- Learning process consists of observing, collecting references, making conclusion and reinforcement</li> <li>- Learning process did well based on lesson plan</li> <li>- There was some students who attend the class passively</li> <li>- Renewal good habits such as praying before starting lesson, having good interaction in group, being patient while doing the experiment, being thrift in water usage</li> <li>- Learning finished on time</li> </ul>
<b>Implementation of scientific approach</b>	Teacher reflection <ul style="list-style-type: none"> <li>- Teacher still lacks of giving why and how question, and not enough in luring student to ask</li> <li>- Students were asked to observe the demonstration</li> </ul> Principal’s assessment <ul style="list-style-type: none"> <li>- Students were given a chance to analyze, to give reason, to communicate their result.</li> <li>- Teacher is still doubt to give notes during activities.</li> </ul>
<b>The use of learning media / material resources</b>	Teacher uses learning resources, media, projector, and blackboard well so it makes experiment become interesting. In principal opinion, teacher did not let student engage to use learning media so much. While in teacher opinion showed in teacher self reflection, student was participated in using media such as helping teacher prepare the experiment.
<b>Involving the students in learning process</b>	Both principal’s assessment and teacher reflection show that <ul style="list-style-type: none"> <li>- Teacher made student be active participate the lesson by interaction in teacher, student and material</li> <li>- Teacher gave positive responses in students’ participation</li> <li>- Teacher was open-ended to accept students’ response</li> <li>- Teacher showed comfort interpersonal relationship</li> <li>- Teacher made class was very interesting</li> </ul>
<b>Using correct and appropriate language in learning process</b>	Principals’ assessment show that teacher’s speech and teachers’ note were good and clear, although there was local

Assessment Aspects	Explanation
<p><b>Lesson’s closing</b></p> <p><b>Additional note of Teacher’s reflection result</b></p> <p><b>Additional note from principal</b></p>	<p>dialect. In this aspect teacher did not give their opinion</p> <p><b>Closing</b></p> <p>Both principal’s assessment and teacher reflection show that</p> <ul style="list-style-type: none"> <li>- Teacher let student reflect and conclude the lesson agreed with work sheet student made</li> <li>- Teacher evaluate lesson with group work sheet and give next task (home work)</li> </ul> <p>Doing learning which is students-oriented or students-centered is not easy, teacher must keep her practice to make lesson design that engaging student actively, furthermore for beginner class.</p> <ul style="list-style-type: none"> <li>- Point another student to comment her/his friend’s answer so that students pay attention to the discussion</li> <li>- Give reward to student who ask question or give their opinion for motivate student being active and confident</li> </ul>

## 7. CONCLUSION

Based on the research that have done, we can conclude that:

- a. Generally, teachers' self reflection and principal assessment show the same tendency of assessment result.
- b. When there are different opinion between principal and teacher, the interesting discussion occurs and gets conclusion that has been agreed by both of them for the better next lesson.
- c. Discussion between teacher and principal was more interesting because both sides were given chance to deliver each notes.
- d. Teacher performance assessment in lesson implementation by using the result of teacher self-reflection gives more comprehensive and constructive result to repair the next lesson.
- e. Teachers involved in assessing their own lessons actively, so that the assessment not occurs unilateral and teacher feels not being judged by principal
- f. The assessments' result which has been agreed can more propulsive for teacher to repair the lessons.
- g. Teacher has comprehensive knowledge during implement the learning process aspects.

## 8. ACKNOWLEDGEMENTS

This research paper is made possible through the help and support from everyone, including: family, friends, and in essence, all committee members of WALS 2014. Especially, please allow me to dedicate my acknowledgment of gratitude toward the following significant advisors and contributors:

First and foremost, we would like to thank Prof. Christine Lee, the chair of WALS for her most support and encouragement. She kindly read our paper and offered invaluable detailed correction on theme and gramatical of our paper.

Second, we would like to thank Pak Sumar Hendayana and his team of Indonesian Lesson Study from Indonesia University of Education for their support and encouragement in organizing lesson study in Lembang State Secondary School and in doing this research paper.

Third, we would like to express our gratitude to the chief of Education Department of Bandung Barat Regency for the support and facility in organizing every activity in Lembang State Secondary School. And We would thank all the teachers of State Lembang Secondary School for their enthusiasm efforts in implementing Lesson Study in the school.

Finally, we sincerely thank our families, and friends, who has advised and supported. This paper would not be possible without all of them.

## Penggunaan Pembelajaran Terarah Secara Kendiri Dan Pembelajaran Kolaboratif Dalam Penulisan Karangan Naratif Dengan Menggunakan Simpulan Bahasa Untuk Murid Darjah 4

Suriana Mohamed Bakri

*Sekolah Rendah Kranji, Pusat Bahasa Melayu Singapura  
hesheam\_hashim@moe.edu.sg*

**Abstract:** Simpulan bahasa merupakan satu peninggalan nenek moyang kita yang merupakan ungkapan yang telah mantap dan mempunyai maksud yang khusus. Sehubungan dengan itu, kertas kerja ini membincangkan bagaimana penggunaan Pembelajaran Terarah Secara Kendiri (SDL) dan Pembelajaran Kolaboratif (CoL) dapat memperbaiki gaya penulisan murid agar membantu perkembangan dalam menyatakan idea mereka dengan menggunakan simpulan bahasa. Kajian ini menggunakan kaedah Kajian Pengajaran untuk mengumpul dan menganalisis data. Disebabkan karangan naratif memerlukan idea yang kreatif, maka unsur kreativiti dan aspek gaya bahasa dalam penulisan juga perlu diberi keutamaan dalam proses latihan. Oleh itu, murid perlu didedahkan cara menulis karangan naratif menerusi latihan yang sistematik dan model penulisan yang sesuai. Dapatan kajian menunjukkan bahawa lebih ramai murid menggunakan simpulan bahasa dalam penulisan karangan mereka secara berkesan.

**Kata kunci:** Kajian Pengajaran, Simpulan Bahasa, Pembelajaran Terarah Secara Kendiri (SDL), Pembelajaran Kolaboratif (CoL), Karangan Naratif

### 1 PENGENALAN

Simpulan bahasa merupakan sebahagian daripada peribahasa yang merupakan susunan kata-kata yang dipilih khas, rapi, teratur dan mempunyai pengertian atau makna yang tertentu. Peribahasa dicipta oleh orang-orang Melayu dahulu hasil daripada pengalaman dan kehidupan seharian mereka. Menurut Tatabahasa Dewan Edisi Ketiga (2009), kata majmuk yang mendukung kiasan dianggap sebagai simpulan bahasa. Abbas Mohd Shariff (2006) pula menjelaskan simpulan bahasa mengandungi nilai yang membayangkan kehalusan budi.

Di peringkat Darjah 3 & 4, murid diajar aspek peribahasa yang merangkumi simpulan bahasa dan murid diberikan senarai simpulan bahasa yang perlu dipelajari. Murid sudah mula menulis karangan berperenggan dalam Darjah 3. Di peringkat ini, murid juga perlu tahu bagaimana untuk menyusun dan menulis ayat-ayat secara kronologi agar dapat dilihat kesinambungan dalam cerita/karangan yang ditulis. Ini penting dalam proses penulisan murid. Murid dikehendaki menulis ayat-ayat yang lengkap dan bermakna bagi menyatakan keinginan mereka dalam penulisan karangan. Selain itu, penggunaan simpulan bahasa dalam karangan bertujuan untuk memperindah bahasa dan juga menimbulkan daya tarikan. Karangan murid akan lebih menarik sekiranya simpulan bahasa yang digunakan menimbulkan unsur gaya dalam penulisan. Untuk menggunakan

simpulan bahasa dengan baik, murid hendaklah betul-betul memahami simpulan bahasa itu dan mengetahui tempat dan ketikanya simpulan bahasa itu sesuai digunakan.

Bagi menghasilkan penulisan karangan jenis naratif yang baik, murid bukan sahaja dituntut untuk mengolah sesuatu cerita dalam bentuk penulisan, malah mampu menerbitkan ayat-ayat serta ungkapan yang menggunakan perkataan dalam gaya bahasa yang indah dan menarik. Di samping itu, aspek susunan urutan cerita dan kerelevanan peristiwa juga akan menjamin kejelasan cerita dalam karangan jenis naratif. Penulisan karangan memerlukan kreativiti bagi menghasilkan nilai estetik serta menggunakan gaya bahasa yang tersendiri.

Penggunaan simpulan bahasa dalam penulisan karangan adalah penting untuk melengkapkan kemahiran menulis bagi seseorang murid di mana pembelajaran dan penghayatan simpulan bahasa itu sendiri bertujuan untuk meningkatkan keupayaan berbahasa dalam kalangan murid. Kemahiran berbahasa ini pula akan diteliti dalam konteks kebolehan murid menggunakan simpulan bahasa dalam aktiviti seharian dan penulisan. Hasil penulisan tentunya akan menjadi lebih indah dan bermutu sekiranya dimuatkan dengan simpulan bahasa yang tepat dan sesuai.

## 2 PERNYATAAN MASALAH

Secara am, murid menghadapi kesukaran memahami makna peribahasa. Berdasarkan keputusan peperiksaan akhir tahun 2012, pencapaian bagi komponen peribahasa ialah 74%. Berdasarkan analisis item bagi kohort murid Darjah 3 (2012), hanya 74% murid yang lulus bagi bahagian simpulan bahasa. Murid masih keliru akan penggunaan simpulan bahasa dalam ayat. Lazimnya, murid tidak dapat menggunakan simpulan bahasa yang sesuai mengikut konteks.

Murid didapati kurang minat dan usaha untuk mempelajari dan memahami makna peribahasa. Bagi keputusan karangan pula, 85% pelajar lulus dalam komponen ini dan hanya 10% murid sahaja yang memperoleh markah 15 dan ke atas bagi markah penuh 20. Murid dinilai dari segi isi dan penggunaan bahasa bagi penulisan karangan bergambar (empat gambar bersiri). Dalam penggunaan bahasa, murid digalakkan menggunakan frasa berbunga, peribahasa, penjodoh bilangan dan aspek-aspek tatabahasa yang lain yang boleh menjadikan hasil karangan murid lebih baik. Aspek penggunaan simpulan bahasa yang kurang diberikan perhatian oleh murid semasa menulis karangan menyebabkan kualiti penulisan juga kurang menarik.

Jabatan Bahasa Melayu telah melakarkan pengajaran berdasarkan pendekatan Pembelajaran Terarah secara sendiri (SDL) dan Pembelajaran Kolaboratif (CoL) bagi mengenengahkan aspek bahasa (pengajaran simpulan bahasa) dan nilai murni.

## 3 TUJUAN KAJIAN

Penulisan yang menggunakan simpulan bahasa juga dapat menjamin wujudnya nilai estetik dalam penulisan murid. Bagi pihak guru pula kajian ini diharapkan mampu memberikan gambaran pencapaian dan tahap kemahiran murid menggunakan simpulan bahasa di dalam penulisan karangan mereka. Melaluinya juga guru dapat membuat persediaan yang lebih baik semasa mengajarkan karangan naratif kepada murid.

Kajian ini bertujuan untuk mengenal pasti:

1. keberkesanan penggunaan simpulan bahasa dalam penulisan karangan naratif murid Darjah 4; dan
2. keberkesanan penggunaan simpulan bahasa dalam memperbaiki gaya penulisan dan pengembangan idea murid.

## 4 KAJIAN LITERATUR

Penggunaan pendekatan SDL dan CoL dalam kajian ini sejajar dengan matlamat ICT iaitu:

1. menggalakkan integrasi ICT ke dalam kurikulum sekolah;
2. memudahkan keberkesanan penggunaan ICT dalam pentadbiran sekolah;
3. menyediakan kakitangan sekolah dengan pembangunan ICT untuk menyokong integrasi ICT ke Program Pendidikan dan fungsi-fungsi pentadbiran sekolah; dan
4. memberi pelajar pendedahan kepada ICT di luar kurikulum sekolah.

Antara ciri-ciri utama SDL yang dikenal pasti ialah pemilikan dalam pelajaran, pengurusan dan pemantauan pembelajaran secara sendiri, dan lanjutan dalam pelajaran. Ciri-ciri utama CoL pula termasuk proses kerja berkumpulan yang berkesan dan kebertanggungjawaban individu dan kumpulan pembelajaran.

SDL merupakan suatu pembelajaran yang berkesan kerana dapat menjadikan murid lebih bersedia dan bermotivasi untuk belajar. CoL pula melibatkan sekumpulan murid yang berusaha bersama ke arah mencapai prestasi dan matlamat yang sama. Dengan kata lain, SDL dan CoL dapat membantu guru meningkatkan keberkesanan pengajaran dan pembelajaran dalam bilik darjah.

SDL dan CoL disokong oleh Kementerian Pendidikan di bawah inisiatif “*The ICT Connection*”. Menurut Gibbons (2002), pembelajaran terarah secara sendiri atau SDL melibatkan usaha peribadi dalam aktiviti yang mencabar dan membina kemahiran dan pengetahuan sendiri untuk menempuh cabaran dengan jayanya.

Barkley (2002) pula menjelaskan bahawa pembelajaran secara kolaborasi ialah aktiviti yang melibatkan murid bekerjasama secara berpasangan atau kumpulan menyelesaikan sesebuah masalah atau mencapai objektif pembelajaran yang sama.

## 5 KAEDAH KAJIAN

Kajian ini dijalankan menggunakan pendekatan Kajian Pengajaran sebanyak dua kitaran. Penghasilan kajian ini dilaksanakan di dalam bilik darjah dan setiap pasangan murid diberikan sebuah komputer riba. Murid sudah diperkenalkan dengan simpulan bahasa yang akan digunakan dalam kajian ini. Hasil kerja yang diharapkan ialah pelajar dapat menghasilkan karangan naratif berdasarkan gambar bersiri empat yang mengandungi sebanyak mungkin simpulan bahasa yang telah dipelajari.

Sebelum menjayakan kajian ini, murid sudah tahu menulis karangan naratif yang berperenggan.

Ini termasuk bentuk, bahasa dan struktur sebuah karangan naratif.

Reka bentuk kajian ini menggunakan pendekatan kualitatif dengan menggunakan data yang diperoleh melalui cara pemerhatian, respons murid dan analisis karangan murid.

Perbincangan berkaitan penggunaan simpulan bahasa diberikan sebelum aktiviti menulis karangan dimulakan. Masa yang diperuntukkan untuk menulis karangan (dengan menggunakan sekurang-kurangnya 80 patah perkataan) tersebut adalah 40 minit.

Setiap karangan diperiksa dan dianalisis untuk mengenal pasti bilangan simpulan bahasa yang digunakan dalam karangan dan kesesuaian simpulan bahasa yang digunakan dalam ayat atau teks. Statistik berbentuk peratusan digunakan untuk menyatakan kekerapan penggunaan simpulan bahasa dalam penulisan karangan. Pemarkahan juga diberikan di mana markah penuh bagi bahagian isi atau kandungan karangan ialah 8 dan bahasa pula ialah 7 markah.

#### Subjek Kajian

Kumpulan sasaran bagi kajian ini ialah murid bahasa Melayu Darjah 4 (4ML2). Secara umum, tahap keupayaan murid adalah sederhana. Sebanyak 23 orang murid dipilih sebagai sampel kajian. Mereka diminta menuliskan sebuah karangan berbentuk naratif berdasarkan empat gambar bersiri.

#### Instrumen Kajian

Keberkesanan kajian ini dipantau melalui penggunaan rubrik, respons murid menerusi “*Social Learning Wall*” dan perkongsian pendapat di laman linoit.com, markah yang diperoleh melalui Permainan iFlash dan karangan naratif. Dapatan daripada yang disebutkan di atas boleh dinilai secara kualitatif. Rubrik yang digunakan mempunyai lapan bahagian yang cuba menyelidik pemikiran dan pembelajaran murid bagi setiap langkah/aktiviti semasa pembelajaran dijalankan (lihat lampiran 3).

#### Prosedur Kajian

Sebelum kajian pengajaran dijalankan, guru terlebih dahulu mendedahkan kepada murid simpulan bahasa yang ingin diajar. Murid juga dikehendaki memahami makna dan penggunaan simpulan bahasa seperti hati emas, ada hati, ambil hati, besar hati, keras hati dan murah hati. Langkah-langkah pengajaran adalah seperti berikut.

#### Induksi

Guru menayangkan klip video di mana murid dikehendaki menyatakan nilai-nilai murni (contoh: kasih sayang, tanggungjawab, balas jasa, tabah/cekal) yang terdapat dalam klip video tersebut. Secara tidak langsung apabila murid dapat menyatakan nilai-nilai murni tersebut, murid juga dapat mengaitkan nilai tersebut dengan simpulan bahasa yang sesuai. Murid juga digalakkan

memberikan simpulan bahasa lain yang tidak terdapat dalam senarai yang diberikan.

#### Langkah 1 (kerja berpasangan) – hasil pembelajaran (SDL)

Untuk mengukuhkan lagi pemahaman murid tentang simpulan bahasa tersebut, guru menayangkan simpulan bahasa, makna dan contoh ayat kepada murid dalam bentuk titik kuasa. Sebagai aktiviti pengukuhan, secara berpasangan murid mencuba permainan interaktif simpulan bahasa yang direka cipta sendiri menggunakan perisian *iFlash Game* melalui komputer riba yang disediakan. Murid hanya diberikan satu peluang untuk menjawab soalan dan perlu juga mencatatkan pencapaian mereka dalam borang yang diberikan.

#### Langkah 2 (kerja berpasangan) – hasil pembelajaran (SDL & CoL)

Guru memuatnaikkan teks bacaan ke laman linoit.com dan kemudian murid membaca petikan itu. Selepas membacanya, murid dikehendaki memberikan sekurang-kurangnya satu simpulan bahasa berserta maknanya yang berkaitan dengan petikan tersebut. Kemudian, murid memberikan refleksi atau respons peribadi tentang petikan yang dibaca melalui “*Social Learning Wall*” yang boleh didapati melalui *MCOonline*.

Soalan rangsangan yang diberikan adalah seperti yang berikut:

1. Apakah perasaan kamu setelah membaca petikan itu? Jelaskan.
2. Adakah kamu akan melakukan perkara yang sama? Mengapa?

#### Langkah 3 (kerja kumpulan) – hasil pembelajaran (CoL)

Guru membahagikan murid kepada 4 kumpulan. 4 gambar bersiri ditayangkan terlebih dahulu agar murid mengetahui dan faham akan jalan ceritanya. Kemudian, setiap kumpulan diberikan sekeping gambar yang berlainan yang diambil daripada 4 gambar bersiri yang ditunjukkan. Dalam kumpulan masing-masing, murid mengarang cerita dalam satu perenggan berdasarkan gambar yang diberikan dengan menggunakan sekurang-kurangnya 2 simpulan bahasa yang telah dipelajari. Sejurus itu, secara berkumpulan murid melihat hasil kerja rakan mereka melalui aktiviti Lintas Galeri. Murid digalakkan menilai dan membetulkan kesalahan yang dikenal pasti, sekira ada, serta memberikan pendapat tentang hasil kerja tersebut. Guru kemudiannya merumuskan dapatan hasil kerja kumpulan.

Aktiviti Susulan (kerja individu)

Berdasarkan 4 gambar bersiri yang sama, murid menulis karangan dengan menggunakan sekurang-kurangnya 4 simpulan bahasa yang telah dipelajari. Aktiviti ini dijalankan dalam waktu kurikulum pada hari berikutnya. Guru kemudiannya, memeriksa dan menilai hasil karangan murid serta mengenal pasti data-data yang diperlukan seperti jumlah simpulan bahasa yang digunakan serta penggunaannya dalam ayat/teks dan pemarkahan bagi menilai isi dan penggunaan bahasa dalam karangan itu sendiri.

**6 DAPATAN KAJIAN DAN PERBINCANGAN**

Daripada data yang dikumpulkan melalui penggunaan rubrik, didapati lebih ramai murid telah menggunakan simpulan bahasa dalam karangan naratif yang dibina. Dibandingkan dengan penulisan karangan yang sebelumnya, pelajar yang mendapat markah rendah juga cuba menggunakan simpulan bahasa dalam penulisan karangan. Lebih ramai murid yang sederhana menggunakan simpulan bahasa secara berkesan dalam penulisan karangan mereka. Sila lihat **Carta 1** bagi perincian dapatan mengenai penggunaan simpulan bahasa dalam penulisan murid.

Carta 1: % Murid yang Menggunakan Simpulan Bahasa dalam Karangan Naratif

Pendekatan kajian pengajaran yang dijalankan telah membuahkan hasil yang positif dari segi pencapaian murid dan pengajaran guru. Daripada pemerhatian yang dijalankan, pelibatan murid didapati lebih aktif dalam proses pembelajaran. Hal ini dapat diteliti dengan lebih lanjut dalam **Lampiran 1**.

Selain daripada itu, kami dapati kajian ini juga menunjukkan bahawa dengan menggunakan simpulan bahasa yang sesuai dengan konteks atau jalan cerita serta pembinaan ayat yang gramatis dapat menambah nilai penulisan karangan naratif murid. Ini menjadikan lebih ramai murid yang mendapat markah yang lebih tinggi setelah menjalani kitar 2 dalam kajian pengajaran ini.

**7 KESIMPULAN**

Kesimpulannya, subjek kajian masih belum begitu mahir dalam menggunakan simpulan bahasa yang melambangkan nilai estetik dalam penulisan karangan mereka. Implikasi kajian ini terhadap kurikulum adalah wujudnya keperluan dan kepentingan mengajarkan aspek simpulan bahasa dalam penulisan karangan primari pertengahan. Penggunaan simpulan bahasa dalam karangan naratif dapat meningkatkan lagi mutu penulisan murid.

Berdasarkan dapatan kajian, beberapa cadangan boleh dikemukakan untuk tujuan memperbaiki mutu penulisan karangan naratif murid. Pendedahan secara eksplisit mengenai penggunaan simpulan bahasa dalam karangan perlu diberitahu kepada murid. Untuk tujuan tersebut guru perlu memberikan maklumat berkaitan simpulan bahasa dengan menggunakan teknik dan kaedah mengajar yang lebih sesuai. Guru boleh memberikan senarai simpulan bahasa yang boleh digunakan semasa menulis karangan. Walau bagaimanapun, murid perlulah memahami maksud simpulan bahasa terlebih dahulu sebelum menggunakannya dalam penulisan mereka. Oleh sebab dalam penulisan naratif memerlukan idea yang kreatif, unsur kreativiti dalam penulisan juga perlu diberi keutamaan. Oleh itu, murid perlu didedahkan kepada model penulisan yang sesuai dan cara penulisan karangan naratif menerusi latihan terbimbing dan sistematik. Hal ini pasti membantu pembelajaran murid.

Fon putih tukar, spacing dibaiki.</li> </ul> <p><b>Langkah 2.2</b></p> <ul style="list-style-type: none"> <li>• Rubrik murid diperbaiki.</li> <li>• Murid lebih bertenaga dan dapat dilihat keceriaan murid dengan kerja pasangan interaktif.</li> <li>• Murid berbincang dan dapat berikan sebab mengapa jawapan itu dipilih.</li> <li>• Murid dapat menjawab soalan dan melengkapkan aktiviti dalam tempoh yang diberikan.</li> </ul> <p><b>Saranan</b></p> <ul style="list-style-type: none"> <li>➤ Guru berikan contoh di layar. 'Print Screen' contoh arahan permainan dan sebagainya.</li> </ul>	<p><b>Langkah 2.1</b></p> <ul style="list-style-type: none"> <li>• Murid lebih terlibat.</li> <li>• Ada murid yang bekerja secara berpasangan untuk memastikan jawapan mereka betul.</li> <li>• Sikap saling membantu dapat diketengahkan.</li> <li>• Murid tidak buang masa untuk menghantar respons mereka.</li> </ul> <p><b>Saranan</b></p> <ul style="list-style-type: none"> <li>➤ Tunjukkan teks di skrin utama agar murid dapat baca dan tulis komen mereka.</li> <li>➤ Guru memberi komen selepas aktiviti ini agar ada kesinambungan.</li> </ul> <p><b>Langkah 2.2</b></p> <p><b>Saranan</b></p> <ul style="list-style-type: none"> <li>➤ Peruntukkan masa yang lebih panjang kerana murid perlu berfikir tentang sebab dan akibatnya.</li> <li>➤ "Social Learning Wall" digunakan selepas itu agar tidak mengelirukan murid.</li> </ul>

**Langkah 3:**

- Murid boleh berikan idea tetapi kosa kata terhad dan hadapi kesukaran menuliskan idea.
- Murid ada selitkan pengalaman mereka.
- Murid dapat memperbaiki dan menambah idea rakan, berikan arahan dan bergilir-gilir berikan idea.
- Murid komen ayat rakan.

**Saranan**

- Guru tayangkan gambar karangan secara keseluruhan.
- Perkataan/frasa diberikan untuk setiap gambar.
- Lanjutkan masa kerja kumpulan dari 10 minit ke 15 minit.
- Tunjukkan kriteria/panduan sebelum menjalankan ‘*Gallery Walk*’.
- Adakan rubrik untuk ‘*Gallery Walk*’.

**Langkah 3.1**

- Murid dapat mengenalpasti dan memperbaiki kesalahan rakan.
- Guru menunjukkan gambar dan merancah murid menulis cerita.

**Saranan**

- Murid harus diberikan masa yang lebih.
- Murid sentiasa diingatkan menulis simpulan bahasa yang terdapat dalam gambar.

**Langkah 3.2**

- Ada murid yang boleh mengenal pasti kesilapan penggunaan simpulan bahasa dalam kumpulan lain. Penggunaan ‘*murah hati*’, ramai murid kurang pasti akan penggunaannya. Keliru dengan ‘*hati emas*’.
- Murid dapat menyarankan cara memperbaiki ayat. Contoh: Tidak boleh mulakan ayat dengan ‘*kerana*’.

**Saranan**

- Guru mengajar semula simpulan bahasa dan menekankan tentang makna ‘*murah hati*’.
- Guru boleh berikan alternatif simpulan bahasa lain yang boleh digunakan.

**Data Rubrik - Kajian Pengajaran 2013**

Langkah 1.2 (Kerja Pasangan)	1. Murid dapat menjawab soalan dengan betul. (Permainan iFlash)					Ya	Tidak

**Abstract:** This paper discusses the evolution of a mathematics research lesson in a Lesson Study (LS) cycle. The lesson was aimed to develop primary five pupils' concept of volume of three dimensional (3D) solid shapes. The lesson was developed by a LS group that made of five primary mathematics teachers attached to a Chinese primary school located in a semi-rural area. Data collected for analysis include video recordings of the whole LS process: refining lesson plan-first teaching-reflection-revising lesson plan-re-teaching-second reflection. Preliminary analysis revealed that the research lesson was a challenging lesson that the teacher attempted to develop pupils' understanding of an abstract concept such as volume. In the first teaching, the teacher tried to concretise the concept by using concrete objects, such as Rubik's cube, but she failed to make the pupils understand that volume is the amount of space in a 3D object. Through active discussion and reflection with peer support, the lesson was revised and re-taught to a second group of pupils. Analysis of the re-teaching indicated that the teacher's explanation was better understood by the pupils after revising the teaching strategies. However, the dismantling of the Rubik's cube still failed to bring out the idea of volume as the amount of space occupied in a cube. Nevertheless, the evolution of the mathematics lesson was explicitly connected to the result of discussion and reflection in the Lesson Study process. The process had provided not only reflective teaching, but also peer support for these teachers to explore new teaching approaches, and enhance their own conceptual understanding.

**Keywords:** Lesson Study, research lesson, teaching of volume.

### 1 INTRODUCTION

Exploring the teaching and learning process became the focus of recent studies. This can be due to the fact that pupils' learning is inseparable from the teaching and learning process. Furthermore, to improve the pupils' learning, the teacher's pedagogical practices hold the key to enhance the pupils' learning. Thus, this study was conducted to analyse the pedagogical flow of the research mathematics lesson through the implementation of Lesson Study (LS) process in three primary schools. Pedagogical flow can be defined as the teaching and learning process that comprises of four main components: teacher, pupils, content, and classroom resources. This study was part of the larger project which aimed to improve the mathematics and science teachers' teaching practices through the LS process in seven primary schools in Malaysia.

In this paper, we focused our discussion on a group of five mathematics teachers from one of the project schools who had undergone a LS cycle. The main aim of this paper was to discuss the evolution of a research mathematics lesson in a LS cycle.

More specifically, this paper analyse the changes or differences (if any) between the initial and the refine research lesson.

### 2 LITERATURE REVIEW

#### 2.1 Pedagogical Flow

Pedagogy is a complicated term to be defined. As defined by Murphy (1996), pedagogy is an art that related to “interactions between teachers, students and the learning environment and learning tasks” (p.35). While Watkins and Mortimore (1999) mentioned that pedagogy is “any conscious activity by one person designed to enhance the learning of another” (p.3). Thus, pedagogy can be defined as activity that interconnected between teachers, pupils, content and learning environment to improve pupils' learning.

The term flow can be defined as the experience flow (Csikszentmihalyi, 1990) whereby the teacher conducted a lesson follows his/her experience. On one hand, according to Oxford Advanced Learner's dictionary (2010), flow can be defined as a

“continuous movement” (p. 595). In this study, it refers to the continuous process of teaching and learning during a particular lesson. By joining these two definitions, flow can be defined as the teaching and learning process that comprises of teacher’s flow of experience in conducting it.

Furthermore, Schmidt et al. (2002) proposed three key dimensions in characterising the pedagogical flow as such: “the complexity and representation of a lesson’s content, how the content is presented to and encountered by students, and how the teacher and students interact around the lesson’s content” (p.83). Meanwhile, Hiebert et al. (2003) examined the elements of mathematics lesson structure such as: the time devoted on mathematics, the types of activities used, the objectives of various lesson segments, the interactions during the lesson, the role of homework and other factors that influence the lesson flow.

Therefore, from the review of these studies, the pedagogical flow can be defined as a continuous teaching and learning process that consists of a series of activities which comprises of four main components: teacher, pupils, content, and classroom resources.

## 2.2 Lesson Study

Lesson Study (LS) was a professional development practice originated from Japan since Meiji period (Baba, 2007; Lewis, Perry & Murata, 2006). The term Lesson Study was translation of Japanese term *jygyou kenkyuu*, where *jygyou* means: “instruction, lessons, or lesson”; and *kenkyuu* means: “research or study” (Lewis, 2000, p.3). A LS group is formed by a group of teachers to study their own lesson collaboratively (Baba, 2007; Fernandez, 2002; Lewis at al., 2006). Sometime, the LS group may invite knowledgeable others for example, expert teacher from other school or educator from university to join them for discussion, observation and reflection (Fernandez, 2002; Lewis & Tsuchida, 1998). A lesson which is collaboratively planned, conducted, observed and reflected by the LS group known as research lesson (Lewis, 2000). Research lesson is actual lesson that conducted in a real classroom situation (Lewis, 2000). Through observation of real happening lesson, this provides the teachers opportunities to observe the effect of pedagogical practices towards the pupils’ learning (Chiew & Lim, 2005). Hence, as suggested by Lewis at al. (2012) LS is one of the programmes that can provide three types of support need for improving teaching practices: high-quality instructional

resources, practice-based professional learning and collaboration between colleagues.

## 2.3 Theoretical Framework

This study was framed by the activity theory (Engestrom, 1987), which mainly used in analysing dynamic human activity. The pedagogical flow of a mathematics lesson in a classroom could be known as a dynamic activity system. As defined in the earlier section, pedagogical flow comprised of four interrelated components: teacher, pupils, content, and classroom resources. The theoretical framework underpinned this study was shown in Figure 1. The teacher and the pupils both could be the subject in the activity system. In introducing and developing a concept, the teacher used variety tools and sign for example, teaching material, classroom resources and language to present and to represent the particular concept. Then, the teacher assigned certain tasks (object) to the pupils to be completed either individually or in groups. At the same time, the rules could be mathematical rules of the mathematical concepts involved and the classroom rules enacted by the teacher. Moreover, the community involved were the teacher-pupils interaction and the pupil-pupil interaction during the lesson. The division of labour were consisted of the teacher’s role and the pupils’ role. Hence, through this theoretical framework the analysis of the pedagogical flow of the research lesson could be done.

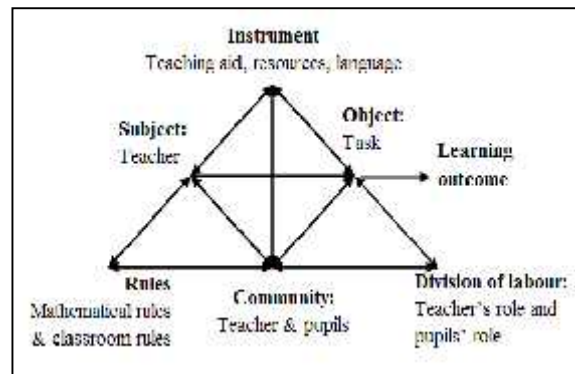

Figure 1. The theoretical framework of the study (adapted from Hardman (2007, p.66))

### 3 METHODOLOGY

#### 3.1 Participants

This study was part of a larger project which involved seven primary schools and 45 mathematics and science teachers. Seven mathematics LS groups and six science LS groups were formed corresponding to the project. Within this paper, our analysis was focused on one of the LS groups which consisted of five mathematics teachers from a Chinese primary school (school P), located in a semi-rural area of North Malaysia.

#### 3.2 Data Collection

Qualitative data were collected mainly through video recordings of the whole LS process which included the phase of: refining lesson plan, first lesson observations, first post-lesson reflection, revising lesson plan, refine lesson observation and second post-lesson reflection. Figure 2 shows the process of data collection.

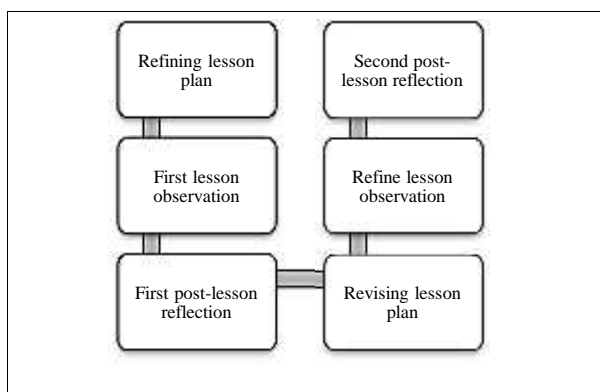

Figure 2. The process of data collection

#### 3.3 Data Analysis

In this study, the focus of our analysis was on the pedagogical flow of two video-recorded lesson observations. However, two video-recorded post-lesson reflections were supportive data for this study. The teacher’s pedagogical flow is defined to include teacher’s activities and pupils’ activities. The detailed descriptions for each coding category for teacher’s and pupils’ activities are as shown in Table 1 and Table 2 respectively.

Table 1. Coding categories in the teacher’s activities

Categories	Description
Classroom management	The teacher does managerial activities to make sure the lesson can be carried out properly. For example: to pay attention, to keep quiet.
Desk instruction	The teacher walks around to check pupils’ work or to guide pupils during individual seatwork or group discussion.
Checking answer	The teacher checks the pupil’s written answer with the class.
Explaining	The teacher explains (develops) the mathematical concepts and gives related examples.
Questioning	The teacher poses question(s) that related to the content, to the whole class or individual pupil; and pupil(s) give oral answer (s).
Revising	The teacher revises previous lesson or pupils’ prior knowledge.
Summarising the lesson	The teacher summarises the lesson of the day.
Uses of resources (blackboard/ whiteboard/ smartboard/ concrete object/ worksheet/ workbook/ textbook)	The teacher uses any tools or resources during the lesson. The resources can be resources in the classroom for example: blackboard, whiteboard and smartboard. Moreover, it can also the any teaching aids (concrete object) or task (workbook, worksheet or textbook) assigns to the pupils.

Table 2. Coding categories in the pupils’ activities

Categories	Description
Group work	The pupils work in pairs or small groups.
Individual seatwork	The teacher assigns exercise for students to try out individually in the classroom.
Presentation	The pupil(s) present their answer in front of the class after group discussion or individual seatwork.
Reading the question or answer	The pupil(s) read out word problem, question or answer during the lesson.

Table 1 indicates that teacher’s activities were categorised into eight main activities while Table 2 shows the pupils’ activities were classified into four main activities. Based on these categories, the two video-record research lessons were coded using NVivo 10, software for qualitative data analysis.

## 4 FINDINGS AND DISCUSSION

### 4.1 First Research Lesson Observation and Reflection

The lesson was aimed to develop primary five pupils' concept of volume of three dimensional (3D) solid shapes. The first teaching was conducted in a Grade 5 class which had 16 pupils. In the first episode, the teacher, Madam T began the lesson by assigning two pupils to toss a dice to decide who was going to answer the questions. The questions included: What is the name of the 3D shape? How many surface areas of a cube? Then, she presented two examples of cube (concrete object) to the class and repeated the similar questions to the whole class. Later, she posted the answer on the smartboard. This served as a revision of the pupils' previous concept on 3D shapes.

In the second episode, Madam T invited the pupils to name any daily life object that is in the shape of cube. From the hint given by her, a pupil gave the answer Rubik's cube. Then, she posted a picture of Rubik's cube on the smartboard and required the class to state how many small cubes were needed to form the Rubik's cube. Subsequently, she assigned a pupil to fill a model of Rubik's cube with small cubes (concrete object) in order to obtain the answer. Again, Madam T posted the answers on the smartboard as in Figure 3. She further posed questions to the class regarding the surface area and the formula of area as revision, and followed by the formula of volume.

Figure 3. The teacher posted the formulae for area and volume on the smartboard

In the next episode, Madam T presented to the class two cuboids of different sizes (concrete objects) and asked them to compare which one had

the greater volume. She assigned two pairs of pupils to fill the base of the two cuboid models with small cubes (concrete objects) first to find out the area of the base. Then, one representative of the pairs with the teacher's guidance presented their answer for the area of the base. Next, Madam T asked the pupils to fill in the height of the cuboid model and presented their answer. Finally, they were required to fully fill the model to obtain the volume. However, the findings show that Madam T encouraged one of the pupils to fill in only the base and the height of the cuboid and obtained the volume of the cuboid by calculation. This could be due to the constraint of lesson time. After the pupils' presentation, Madam T posted the answers on the smartboard (abstract).

In the fourth episode, Madam T gave instruction to the class to build as many models as possible with the volume of  $60\text{cm}^3$  (concrete objects) by using the small cubes given to them in pairs. Then, they were required to write the multiplication of the volume involved (abstract). She explained to the class how to build the model by presenting the examples of cue and cuboid (concrete object) at the same time posing questions to the whole class to confirm that they understood her instruction.

Madam T then distributed 100 pieces of small cubes to each of the pair. She conducted desk instruction-walked from pairs to pairs to guide the pupils and to check their model. The pupils were actively engaged in the activity as in Figure 4.

Figure 4. The pupils built the model in pairs

In the sixth episode, most of the pupils were able to work in pairs to build at least two models with teacher's guidance for the first model built. Madam T posted the possible combinations of multiplication that could be obtained by the pupils on the smartboard. She illustrated two examples of the models built by pupils on the blackboard as in

Figure 5. While illustrated the examples, the teacher posed questions to the whole class and the pupils responded.

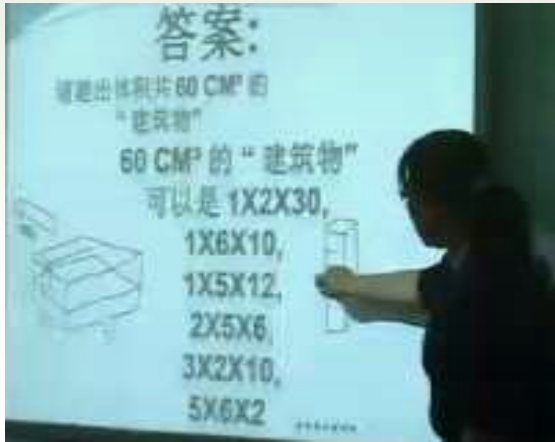

Figure 5. The teacher posted the possible equations and illustrated examples

In the seventh episode, Madam T told the class that volume was the space occupied by an object and volume was not area as summary of the lesson. She assigned individual seatwork to the class. The pupils were required to complete a worksheet by themselves in the class. The teacher conducted desk instruction while the pupils were in seatwork.

Next, Madam T posted a photo of the model built by a pair of pupils. She then posed questions to the whole class and the pupils responded. The questions included: “Who built this model?” and “What is the multiplication of the volume involved?”. The teacher further posted another four photos and posed the similar questions to the whole class and the pupils responded. Then, she assigned two pupils to come to the front to present their model one after another. The teacher guided their presentation by posing questions about the multiplication of the volume to and the pupil responded.

In the last episode, the pupils continued with individual seatwork while Madam T conducted desk instruction to check the pupils’ work. She then ended her lesson by asking the class to complete the worksheet at home.

A post-lesson reflection was conducted within the LS members and researchers after the lesson observation. Through the reflection session, two of the LS members found that the first episode involved only two pupils and the third episode involved two pairs of pupils as in the following transcript. They suggested that the activities shall involve more pupils or the whole class:

Mr. Y: [The activity] involved only two pupils to fill in [the small cubes] one after another. [We] can involve more pupils.

Madam M: Me too found that [the activity] involved the particular pairs of pupils, the rest of them did not have [the chance] to try.

Besides that, another two LS member found that many of the pupils could not understand the concept of volume. This could be observed from hands-on activity whereby the pupils needed the teacher’s guidance and took longer time to build their first model. They mentioned that this might due to the fact that the teacher did not fully emphasise on the concept of volume. Furthermore, Madam T herself realised that the flow of the lesson was too rush as she mentioned during the reflection, “[I was] going too fast”. Thus, they suggested there is a need to keep revising a few times the concept of volume before the hands-on activity.

#### 4.2 Refine Research Lesson Observation and Reflection

The refine lesson was conducted in another Grade 5 class which had 17 pupils in the following year. In the first episode, the lesson began by the teacher, Madam T posed questions to the class and individual pupils responded. The questions posed mainly about their experience of moving from the old school building to the new school building. The shape and space of the school building had changed. Then, she posted pictures of different types of buildings to the class by using a smartboard as in Figure 6. Meanwhile, she posed questions regarding the shape of the building to the whole class and the pupils responded.

Figure 6. The teacher posted pictures of different types of buildings.

Then, the teacher asked the whole class to name the 2D shapes that they had learnt before. This

served as a revision of the pupils’ prior knowledge about the 2D shape. She presented a Rubik’s cube and a tissue box to the class. Meanwhile, she posed questions to the class about the shape of the two objects and the pupils responded.

In the third episode, Madam T divided the pupils into four groups with four to five pupils in a group. The pupils were required to complete the task in group to find out: the number of sides, the number of surfaces, length, width and height of the two concrete objects (Rubik’s cubes and tissue box). Madam T conducted desk instruction to check the pupils’ work and guided the pupils. Most of the pupils engaged actively in the group work as in Figure 7, whereby they took turn to complete the task. For example, counted the number of sides, surfaces and measured the length, width and height of the objects.

Figure 9. The pupils work in groups

Next, one representative from each group came to the front and presented the card written with the answers to the class. Madam T checked the written answers with the class by posing questions to the class or individual pupil. At the same time, she used the Rubik’s cubes and tissue box when checking the answer and the pupil(s) responded. Besides, she used the tissue box to explain that the length of a cuboid was depended on the position of the cuboid. From the card presented by the pupils, all the four groups were able to obtain the correct answers.

In the following episode, in order to find out the volume of the Rubik’s cube (concrete object), Madam T assigned the pupils in pairs to dismantle the Rubik’s cube layer by layer. She conducted desk instruction while the pupils dismantled the Rubik’s cube to guide the pupils.

Then, the teacher checked the answer of the number of units in first layer with the class by posing questions to the class. She invited four individual pupils to give their answer and she posted the answer on the smartboard for the first layer. The

process of the pairs dismantling the Rubik’s cube, the teacher posing questions and posting answer on the smartboard was repeated for the second layer and third layer and the total volume of Rubik’s cube.

In the seventh episode, Madam T revised the formulae of area and volume by using the example of the Rubik’s cube. She presented the Rubik’s cube (concrete object), at the same time posted the formulae of area and volume and the picture of Rubik’s cube on the smartboard (see Figure 8) to emphasise the concept of volume.

Figure 8. The teacher posted the formulae of area and volume at the same time presented the Rubik’s cube to the class

In the next episode, Madam T distributed a box of small cubes to each of the pair. She explained how to build a model by using the small cubes started from the base and followed by the height. Then, she tried to emphasise that one small cube was equal to one cubic centimetre ( $\text{cm}^3$ ) twice orally to the pupils. She emphasised again how to build the model and let the pupils worked in pairs.

Later on, from the observation the pupils were actively engaged in building the model in pairs (see Figure 9). Madam T conducted desk instruction to check the pupils’ work and to guide the pupils. During desk instruction, she kept reminding the class for a few times to build the model started from the base and followed by the height.

In the tenth episode, Madam T assigned a pupil to present their completed model in front of the class. Madam T guided the pupil’s presentation by posing questions to her and she responded. Through the presentation, the teacher tried to emphasise that the unit of first layer and the whole volume were  $\text{cm}^3$ . The teacher then assigned another representative for the guided presentation.

Figure 9. Pupils tried to build the model (building) in pairs

After the guided presentation, Madam T tried to emphasise the unit of volume with three pairs of pupils during desk instruction. At the end of the model building session, most the pupils were able to build at least one model and wrote the multiplication involved.

In the final episode, Madam T distributed worksheets to the class as individual seatwork. The pupils were required to complete the worksheet from section A to G individually in the class. The teacher conducted desk instruction to check the pupils' work and to guide the pupils. At the end of the session, she assigned a pupil to come to the front to explain why he had chosen the particular answer for section G. She guided the pupil by posing questions to him and he answered. Then, Madam T gave instruction to the class to complete the worksheet at home and she ended the lesson.

Second post-lesson reflection was conducted right after the refine lesson observation. Madam T herself found that the emphasis on the concept of volume still insufficient. During the reflection, she said, *“They still cannot get the concept one unit is one cubic centimetre. I did not emphasise, I did not emphasise [the concept]”*. Besides, she found that filled in a box with small cubes could be a better choice of concrete object than dismantled the Rubik's cube. However, due to some technical problems, she was not able to get the teaching material that she wanted to use.

The refine lesson consisted of more pupils' involvement with one session of group works and two sessions of pairs work. One of the members commented that too many pupils' activities conducted. Yet another LS member said through the first group work session, they identified that the pupils' prior knowledge on width and length and the number of sides was weak.

In addition, two of the LS members found that some of the pupils still did not fully understand the concept of volume. In the second pairs work session, most of the pupils build their first model with the teacher's guidance. A LS member suggested the teacher could have guided the whole class in the beginning of the activity before she let them to build the model by themselves.

Hence, the findings above show that through active discussion in the first post-lesson reflection, the LS group had refined the lesson. The comparison of the pedagogical flow of the first research lesson and the refine research lesson was as shown in Figure 10. In the first lesson, the teacher had a short revision by posing questions about the 3D shapes to individual pupil and the whole class. Then, she tried to concretise the concept by using the Rubik's cube and two transparent cuboids of different sizes. However, the activity of filled in the space of concrete objects involved only a few pupils. The teacher posted the formulae of area and volume on the smartboard (abstract) each time after filled in the concrete object with small cubes. Through the pairs work session of building the model, the LS group found that pupils still cannot understand that volume is the amount of space in a 3D object.

Nevertheless, in the refine lesson the teacher began the lesson by posing questions related to pupils' daily life experiences about moving from old school building to new school building. She had spent longer time in revision of 2D shapes and 3D shapes by posing questions related to the shape of different types of building and a group work session. She then assigned pairs work to the class to dismantle the Rubik's cube (concrete object) in order to identify the volume of the Rubik's cube. This served as development of the concept of volume. She posted the formulae of area and volume on the smartboard (abstract) and spent longer time in explanation. In addition, the teacher repeatedly explained how to build a model by using the small cubes before the group work session. However, the dismantling of the Rubik's cube and longer time spent in explanation still failed to bring out the idea of volume as the amount of space occupied in a cube.

Figure 10. The pedagogical flow of the first lesson and refine lesson in school P

## 5 CONCLUSIONS

In brief, through analysis of the first lesson observation revealed that the research lesson was a challenging lesson. The teacher attempted to develop pupils' understanding of an abstract concept such as volume. Through observed the teaching and learning process, focused on pupils' learning and understanding and teachers' reflection, the refine research lesson taking care of the weakness, ambiguity, and even the use of concrete object. For examples, gave daily life examples orally and graphic, revision of the pupils' prior knowledge on 2D and 3D shapes, increased the pupils' engagement in the activities and more types of concrete objects used during the lesson. All these changes had make the refine lesson became more effective. Yet, in the LS members' opinion, the refine lesson was still not a perfect lesson for them.

Furthermore, the evolution of the mathematics lesson was explicitly connected to the result of discussion and reflection in the LS process. A good lesson really takes time to refine. Anyhow, the LS process provides a platform for the teachers to discuss, to observe a real happening lesson (what they plan), to realise what the problem that they face during the real lesson, to aware of the pupils' learning abilities, to magnify the proper use of classroom resources, and to reflect their own teaching practices. The results of this study show that the process had provided not only reflective teaching, but also peer support for these teachers to explore new teaching approaches, and enhance their own conceptual understanding.

## 6 ACKNOWLEDGEMENTS

This project was made possible with funding from the Research University Grant of University Sains Malaysia, Penang, Malaysia. The authors would like to thank the principal, the mathematics teachers and their pupils from the participating school.

**Abstract:** This paper aims at clarifying the current status and issues of lesson study being implemented recently in Bangladesh. The lesson study has been introduced under the PEDP (Primary Education Development Program), in order to improve the quality of lessons and teachers' competence. The training for the lesson study was conducted for this introduction, and some model schools and public primary schools have already started it. However, there is no system in place to ensure its quality, and besides there is no data available to confirm its quality. Despite all the efforts, effects of the lesson study, that is the improvement of the quality of the lesson, are not known. The promoting and inhibiting factors to this situation are not certain. In this paper, the case of the lesson study in the experimental school attached to Primary Teacher Training Institute in Rajshahi, Bangladesh, which has been regarded as a model case, is taken up. More specifically a thorough participatory observation of lesson study for about half a year was conducted, and their activities were analyzed. The analysis focuses on changes of the lesson, especially children's activity and teacher's role during the lesson, between the beginning and the end of this period. In addition, the factors for changes or no-changes with a focus not only on the lesson but also on the subject knowledge, skills and belief of teachers were analyzed, with particular consideration to the issues pertaining to this early stage of implementing lesson study and the formation of professional community.

**Keywords:** Bangladesh, participatory observation, effects of the lesson study, daily lessons

## 1 INTRODUCTION

In recent years, lesson study has been introduced in Bangladesh in order to improve the quality of lessons and teachers' competence. It has already started in some model schools and public primary schools. Until now, it has been promoted as a policy for the quantitative expansion of lesson study. However, there is no system in place to ensure its quality, and

besides there is no available data to confirm its quality, that is improvement of the quality of lessons and teachers' competence. Therefore actually the effects of lesson study are not certified.

How lesson study is practiced in various regions is an important indicator as the purpose of lesson study that is the improvement of the quality of lessons and teachers' competence. At some schools, it is recognized as an effect of lesson study that the

quality of lessons, teachers’ competence and school environment has been improved continuously. On the other hand, at many other schools practicing lesson study becomes the purpose itself or concerned teachers just implement it mandatorily, because of the lack of recognition of the effect of lesson study. In those schools, lesson study may not sustain.

To solve this problem, it is necessary to improve the quality of lesson study by analyzing the impact on quality of lessons and clarifying the promoting and inhibiting factors at the lesson study. The quality of lesson study is measured by how it contributed to the improvement of quality of lesson or teachers’ competence. The higher quality of lesson study is expected to make the concerned personnel feel the improvement of teaching. It would also motivate them engaged in lesson study, resulting in the larger positive impacts.

Lesson study is still in infancy in Bangladesh. It is necessary to organize the effects and issues of lesson study, and to analyze the factors, because now lesson study is recognized all over the nation and its difference on the status of implementation in each school started to appear. It will contribute to expand lesson study in effective manner and improve the quality of lessons and teachers’ competence as the ultimate goal of lesson study.

In this paper, we take up the lesson study in an experimental school which is attached to Primary Teacher Training Institute (PTI) in Rajshahi, Bangladesh, as a model case. We analyze that effectiveness of lesson study to improve the quality of lessons and teachers’ competence, what are the inhibiting factors if lesson study has not been able to improve them.

## **2 THE CURRENT STATUS AND ISSUES OF EDUCATION IN BANGLADESH**

Although the net enrollment rate of primary school is more than 90% in Bangladesh, graduation rate is still low; it remains in about 60%. It is considered that low graduation rate of elementary school in Bangladesh is significantly related to the quality of lessons. In fact, Bangladesh government has implemented various policies improve the quality of teaching, increasing the graduation rate. However, the following problems remain unsolved about the quality of lessons in Bangladesh.

### **2.1 Insufficiency of teachers and classrooms**

There are issues of quantity which have to be discussed before focusing on issue of quality of lessons in Bangladesh. One is a chronic insufficiency of teachers and classrooms in many schools. The other is the lack of teachers’ actual head-count in schools caused by their leaving to get training. In order to cope with such situation, many schools adopt two-parts system, resulting in another problem of insufficiency of the number of classes.

### **2.2 Insufficient subject knowledge and pedagogy knowledge by unlicensed teachers**

Since license is not required to be obtained to become a teacher in Bangladesh, a large number of teachers in Bangladesh are not equipped with neither sufficient subject knowledge nor sufficient pedagogy knowledge. In order to ensure above competence, a training of a year and half is mandatory for the teachers after getting enrolled as a teacher. Despite the opportunity of learning, consciousness of learners

tends to be low because of its mandatory manner, and then, the effect of leaning opportunity is not sufficiently realized.

### **2.3 No experience of child-centered teaching**

It is said that teachers' attitude and values for the lesson is based on their individual experience in lessons on childhood. However, currently many teachers in Bangladesh, who teach in front of students, have never taken the lessons in child-centered approach. Therefore, even they receive training about child-centered teaching, it is difficult to apply child-centered teaching appropriately to their daily lessons.

### **2.4 Luck of teachers' professionalism caused by working environment and social status**

Insufficient working environment and teachers' social status also effect on the quality of teachers, resulting in weak professionalism as a teacher. Therefore, their willingness to improve the quality of their lessons is also weak. Even taking a lot of training, teachers often neglect to pay efforts to prepare for daily lessons on the excuse of no time or insufficient environment in school.

### **2.5 Relationships with colleagues and mismatch of majors**

There are the management system of seniority and top-down at schools in Bangladesh. Actually, such a top-down structure is effective as quickly and reliable way. But on the other hand, adverse effect is also occurred on the formation of individual sense of purpose for improvement of daily lessons. In addition, subject teacher system is adopted, expertise of teachers greatly affects their subject knowledge.

However, many teachers often are in charge of a different subject from their expert, and then it is a factor of reducing motivation and quality for the subject which is not their major.

It is necessary to solve these problems for improvement the quality of lessons. Therefore various approaches have been taken in Bangladesh. For example, there are various training for teachers. But participation to training becomes the purpose in itself because training is required, and it is posed new issue that the learning effect is reduced. Another example, the guidebook, where specific teaching plan and materials in math and science subjects are described, has been distributed to elementary schools nationwide for the dissemination of child-centered teaching. However we can see few teachers using this guidebook on a daily basis. This can be considered as a factor that consciousness of trying to improve lessons is low.

In other words, it is one of the crucial points for the improvement of the quality of teachers and lessons that teachers improve their professionalism and proactively work on improvement of lessons in the current environment. Not only technical issues such as subject knowledge and teaching methods, but mental issues such as teacher's practice and motivation are also needed to be solved. And it is lesson study introduced in Bangladesh in recent years that respond to the issues.

## **3 LESSON STUDY INTRODUCED IN BANGLADESH**

Lesson study has been introduced in earnest in Bangladesh from around 2011. It has mainly been introduced at experimental schools attached to PTI and model schools. Currently, training for not only elementary school teachers but principals and PTI or

URC (Upazila Resource Center) instructors has also been implemented, the method is spreading across the country.

In this section, we confirm its background, method and current state about the lesson study introduced in Bangladesh

### 3.1 Background

Lesson study has been introduced in Bangladesh with the goal to ensure better teaching and learning through developing teachers professionally.

Education of Bangladesh is facing some issues, such as low achievement in quality education, high dropout rate, absenteeism, inefficient teaching and learning in the classroom, improper assessment system, extreme centralized administration etc. In order to solve these issues, lots of approaches have been taken, with focusing on realization of high quality education. And this is grounded in the following idea. That is, high quality of teacher is the pre-condition of ensuring high quality teaching to the students. And for ensuring quality teacher, teacher education is an important area.

Bangladesh government at present has given emphasis on continuous professional development of teachers. Lesson study is a process in which teachers can be engaged to learn more about effective practices that should result in improvement on learning of the students in future. Through lesson study, teachers can reflect on their prepared lesson plan and conducted classes and collaborate or share ideas with colleagues for improvement of teaching and learning. In Bangladesh, teachers are still not familiar with like them. In this regard, lesson study practice should contribute a lot to change teachers' consciousness or attitude.

Lesson study has been considered to be an

appropriate approach in Bangladesh in terms that primary school teachers can practice to develop themselves professionally and continuously.

As the purpose like the above, lesson study has been introduced since several years in Bangladesh, and now, it is implemented in a lot of elementary schools.

### 3.2 Method

Lesson study in Bangladesh is constructed in accordance with the concept that aims the sustainable and voluntary improvement of teachers through the Quality Teaching Cycle (QTC) which consists three cycles (1)Plan, (2)Do, (3)See.

One teacher creates the lesson plan, and discuss on the base of it with colleagues in “Plan”. They implement and observe the lesson which is based on the discussed lesson plan in “Do”. They make feedback the lesson in order to improve the lesson in “See”. By repeating these three processes, it is aimed to sustainable development of teachers' professionalism.

Lesson study, which is generally implemented in Bangladesh, is not to be set its theme and issues at first in one. They mention the good points and improvements with focusing on the lesson of the teacher, and discuss what other methods can be considered, and how they can make a better lesson.

And also in Bangladesh, there are instructors of PTI or URC as persons who promote the lesson study in accordance with the government's education policy. They are in a position to carry out the training for the teachers, coordinate the lesson study in own initiative. These instructors have much knowledge than the general teachers and are in a different position. Their participation in the lesson study contribute to make sense of unity in the area beyond the framework of the school and to deepen of the

discussion in lesson study. However, if their authority becomes too large, it can be occurred that the most important element such as autonomy and collaboration between colleagues would be not function well.

### 3.3 Current state

Lesson study introduced in Bangladesh in the above background and method, is currently being spread through PEDP3 (scheduled to end in 2012 - 2017).

There are several elementary schools which realize the improvement of the quality of lessons and teachers' competence as effects of lesson study, and are continuing to actively practice. On the other hand, there are not few schools where lesson study itself becomes a goal and mere facade, or it has taken just a few times but not is continued due to not realizing its results and effect.

It has been released from just novelty or interest to the lesson study by increasing training and schools implementation. Therefore lesson study introduced in Bangladesh is faced a new phase. It advances to a next step, which continuous implementation of lesson study and improvement of quality of lessons and teachers' competence, from previous step that aims just implementation.

In the next section, we clarify the migration factors to each stage and each issues of implementation status in lesson study. Then, we show the position of the experimental school attached to PTI in Rajshahi as a model case in Bangladesh. We clarify common issues which lesson study is currently facing in Bangladesh.

## 4 THE POSITION OF THE EXPERIMENTAL SCHOOL ATTACHED TO PTI IN RAJSHAHI IN LESSON STUDY OF BANGLADESH

It has been several years since lesson study has been introduced in Bangladesh. The difference on the implementation status of each elementary school can be seen little by little. At the same time, the issues are seen in each school. In order to organize these issues, we classified the implementation of lesson study in Bangladesh into four stages. Then, we will clarify the factors or issues in each stage to proceed to the next stage.

### 4.1 Stage1: They do not implement lesson study

Stage1 is that they do not implement the lesson study. It means schools which are not currently carried out lesson study. It is not only schools that have never implement it because they do not know itself or doing method or no opportunity to lesson study, but also schools that are not subsequently carried out because they could not get the effects and significance even they tried once before.

In order to advance to stage2 from stage1, it is necessary that Recognition and understanding for the lesson study and opportunities and environment to implement.

### 4.2 Stage2: They implement obligatorily lesson study

Stage2 is that they implement obligatorily the lesson study. It means schools which carry out it continuously or intermittently by external motivation. It can be seen a lots in model schools and

experimental schools attached to PTI where the top instruct to do it or submit report. Although they are continuing implementation, the participants often have not got the effects or significance yet and have conducted reluctantly lesson study.

In order to advance to stage3 from stage2, it is necessary to change the teachers' awareness for lesson study and daily lessons.

#### **4.3 Stage3: They implement voluntarily lesson study**

Stage3 is that they implement voluntarily the lesson study. It means schools in which participants get the significance and work actively to lesson study by internal motivation. On the other hand, there are not few schools in which participants feel forward and sense of achievement from implementation of lesson study itself. In this case, although voluntary continued, there is a high possibility that the improvement of lessons is not accompanied.

To stage4 from stage3, it is necessary to change the teachers' behavior for lessons and improve teaching skills and knowledge through lesson study.

#### **4.4 Stage4: Their quality of lesson is improved**

Stage4 is that their quality of lesson is improved. It means school in which lesson study affect on not only a change participants' awareness for lessons, also the teachers' competence, as a result, it can be confirmed that improvement of the quality of lessons and teachers. In this stage, through involving the changes of teachers' awareness and the changes of quality of lessons with each other, it can be said that lesson study contributes to the sustainable improvement of the quality of lessons.

It is the most important and most difficult issue to migrate to stage4 from stage3. Because the ultimate goal of lesson study is the improvement of the quality of lessons, but it is difficult that lesson study contribute directly to the goal under educational background and ability of teachers in Bangladesh.

In the above process of improvement of lessons through the lesson study, we have written that the change in the quality of lessons comes after the change of teachers' awareness. But they are synergetic exchanges each other in lesson study. While the change of awareness affects the improvement of teaching skills, teachers' awareness and activeness also improve through recognizing the improvement of their own teaching skills.

However, lesson study, which is implemented currently depending on the situation of each school in Bangladesh, hardly leads to improve the quality of actual lessons, in spite of giving certainly effect to the change awareness of the participants. In the experimental school attached to PTI in Rajshahi, the effect that teachers have realized is limiting about improvement the quality of lessons yet.

It is necessary to improve the quality of lesson study in order to break the current situation. We have to clarify what lesson study affects teachers and lessons, the factor of this change is, or factor of still unchanged aspects is. We explore issues and possibilities of lesson study in Bangladesh through analysis on their activity at the experimental school attached to PTI in Rajshahi.

This is an important proposition for all other stage. The inhibition factor to implement lesson study is that they cannot find the sufficient effect more than its cost. And it is caused by that the way is not shown enough to the improvement of the quality of lessons as the goal of lesson study. It is necessary to show

properly how lesson study affect the quality of lessons and what factors are required for it, in order to encourage more schools which are still on the stage1 or 2 to implement lesson study.

For further development of lesson study, it's being required to promote the improvement of the quality of lessons through it. It has finished the stage to just implement. As a result of this, we will get the possibility of lesson study that is really appropriate and necessary for this country.

## **5 LESSON STUDY AT THE EXPERIMENTAL SCHOOL ATTACHED TO PTI IN RAJSHANI-THE ENVIROMENT AND METHODS**

### **5.1 Environment**

PTI assumes a role as center of education in the province in order to ensure teachers' competence. As the main work, the trainings are conducted of one year (gradual migration to year and a half from 2013) for unlicensed teachers and also of subject content and curriculum for teachers.

Experimental schools are attached in all of the PTI and used to acceptance of teaching practice, observation for lessons and so on.

In the experimental school attached to PTI in Rajshahi, five teachers take charge of about two hundred children on 1<sup>st</sup>-5<sup>th</sup> Grades, and run the school under subject teacher system. There is no difference between the experimental schools and general elementary schools in aspect of qualities of the school environment and teachers.

In PTI Rajshahi, number of instructors is large, and also three people have received training about lesson study in Japan. In other words, it can be said

that there are relatively many resource persons who understand well about the lesson study in PTI Rajshahi. And in the Future, it would increase number of such resource persons who receive training in overseas to Lesson Study in PTIs across the country.

The positions of the instructors and the experimental school teachers, who participate in the lesson study in PTI, are not equivalent. Because instructors are usually in a position to carry out the training for teachers, and the experimental school teachers are also receive the training. So here, the hierarchical relation between them is established.

Lesson study in the experimental school attached to PTI in Rajshahi has been carried out in two subjects that are science and math. The following two teachers are mainly in charge of the subjects.

One teacher is in charge of mathematic. He has teaching experience for 12 years including at a general elementary school. His charged subject almost matches with her major, and it can be said that his subject knowledge is relatively high. Another teacher is in charge of science. He has experience for 5 years at this experimental school. He is also in charge of English, the knowledge and awareness for science is relatively low.

In this paper, we analyze by focusing on not only the lessons but also the subject knowledge, skills and behavior of two teachers at observation of Lesson Study in the experimental school.

In the next subsection, we mention method of the lesson study carried out at the experimental school attached to PTI in Rajshahi.

## 5.2 Method

### 5.2.1 Determination of the date

It is aimed at implementing once a month. Implementation date is discussed and determined by instructors and experimental school teachers after finishing the last of lesson study.

### 5.2.2 Decision to teachers and lesson's unit of implementation

It is implemented on the two subjects: mathematics and science. The teachers, who are in charge of these subjects, are often chosen as practitioner. Grades and lesson's unit at lesson study is determined in view of the progress status of the curriculum by the practitioner.

### 5.2.3 Preparation of the lesson plans

The practitioner prepares the lesson plan by himself with referring to the guidebook. The PTI instructor who is in charge of such subject advices, and they improve it toward lesson plans meeting.

### 5.2.4 Lesson plans meeting (Plan)

It is carried out about one week before implementation date of the lesson. Participation in it is not particularly required, so only persons who are interested in it participate.

In the meeting, the practitioner read the lesson plans first, and then participants say their opinions in order. It takes thirty minutes to discuss each subject. Many specific advices about the activities and processes of lessons come up from them. And then, the lesson plans is improved by using those opinions as a reference.

### 5.2.5 Improvement of the lesson plans

Based on the opinions in the lesson plans meeting, practitioners improve the lesson plans again and prepare the materials as needed.

### 5.2.6 Observation and implementation of lesson (Do)

The practitioners make the lesson based on lesson plans, and others observe. They observe and take notes on their own while. They don't intervene in the lesson as a rule. Photos and video are taken here for record, not used in review meeting after lessons.

### 5.2.7 Review meeting after the lesson (See)

The review meeting is immediately carried out after the lessons.

The practitioners deliver feedback about the lesson first, and then the observers express the opinions that are improvements and good points one by one. It takes forty minutes to discuss.

In PTI in Rajshahi, the lesson study has been started continuous implementation from March 2014 and till now. It been implemented five times on the subjects of science and mathematics.

In the next section, we analyze the factors of the changes or no-changes about teachers and lessons through participatory observation of this five lesson studies and daily lessons for about a half year.

## 6 THE CHANGES OR NO-CHANGES AND ITS FACTORS THROUGH THE LESSON STUDY

The purpose of lesson study is improvement of the quality of lessons. We divided into four perspectives to analyze the changes and no-changes and its factors

of lesson study, daily lessons focused on children's activities, and teachers' behavior at the meeting about lessons.

In terms of the changes in the quality of lessons through the lesson study, it undergoes a process of that firstly quality of lessons and teachers changes in some way in the lesson study. Then, these changes affect the daily lessons. Thereafter, three types of case can be appeared. First one is the changes in lesson study will be the changes in daily lesson. Second is, the changes in lesson study will not be change in the daily lesson. And third is, no-changes in the lesson study will be no-change in the daily lessons. It is the following the table1 that summarizes it.

Table 1. The changes or no-changes in lesson study and daily lessons.

1. The changes in lesson study.
2. The changes in daily lesson same as in lesson study.
3. The no-change in daily lessons against change in lesson study.
- 4 The no-change in lesson study nor daily lessons.

Field	Changes or no-changes	
lesson study	1, changes	
Daily lessons	2, changes	3, no-changes
	4, no-chages	

We analyzed the effect of lesson study through the four perspectives. And we clarified the factors of the changes or no-changes.

Table 2. Time of children's activity in the lessons of lesson study

It is the time excepting teachers' explanation such as

manipulation the materials or solving problems.

	Mathematics	Science
First time	15 minutes	12 minutes
Second time	11 minutes	No implementation
Third time	17 minutes	15 minutes
Fourth time	18 minutes	11 minutes
Fifth time	21 minutes	19 minutes

Table 3. The teaching materials used in the lessons of lesson study

	Mathematics	Science
First time	ICT, Poster paper	Glass, ice, water
Second time	Poster paper	No implementation
Third time	sticks, poster paper	photographs, pictures coping textbook
Fourth time	Clock, scissors, Papers, poster paper,	Water, bucket, scrap of paper, fan, glass
Fifth time	Rulers, picture coping textbook, pens, candles, majors	Candles, picture coping textbook, water, matches, papers

Table 4. The contents of teacher's questions in the lessons conducted in lesson study (In March and August, Mathematics)

1<sup>st</sup> topic: subtraction, in March  
 First let's read this table together.  
 Today we will study the subtraction of 5digit - 5digits.

"82425-57236" we will solve this problem in the calculation by writing.

When the number of lower is larger than the number of the above, how would you calculate?

What is the result of calculate "15-6"?

What is ten's digit then?

Do you need to rent a number from the place of 1000 in place of the 100? Why?

Can you solve this problem? Let's solve.

What do you say each of the numbers?

Which is the largest numbers in these three numbers?

Subtracting subtrahend from minuend, what comes out?

If the number of minuend is blank, how do you calculate the number?

Now, let's solve this problem.

How did you calculate the number of minuend?

Then, if the number of subtrahend is blank, how do you calculate the number?

Make into groups, solve these problems.

How did you calculate these problems?

What's the blank in this issue?

Finally, please solve these problems.

3<sup>rd</sup> topic: multiplication, in August

How many people are there sitting in one of the bench now?

There are three benches in a group, How many people in total?

How did you count it?

Then how many people in five benches?

How did you count it?

Counting one by one or going plus one by tree, Which is better?

There is a way to simplify that adding the same number.

What is it?

Which is better it or addition?

When you simplify this calculation  $(3 + 3 + 3 + 3 + 3)$ ,

how can you write?

In this calculation, how many "3" are there?

Then, how can you write as multiplication

When addition of lot of the same numbers, How do you have to calculate?

How many dealt stick? Calculate it.

There were five bundles of three stick. Which number to multiply is?

In the picture of textbook, how do you write the formula?

How many sticks are there on the dish in the picture? How many these dishes?

What does this picture show you?

How many apples?

How many?

How do you write a formula?

Please solve the exercises.

Table 5. The opinions at review meeting after the lesson in lesson study (in March and August, Mathematics)

1<sup>st</sup> topic: subtraction, in March

A: The introduction was interesting, so children were concentrated.

Although the goal of lesson has been achieved, the time was not enough. So he should give the homework. It was extended 15 minutes.

B: By group work, children were able to participate in the lesson.

It was good to use teaching materials such as ICT and poster paper. However, it was better if there are more.

Children have understood well, it is better to secure the more time for question as evaluation.

C: At group work, it was good that children have discussion.

Such as ICT and poster paper, it was good that there was a lot of teaching materials.

Teacher praised variously, children were able to

concentrate on the lesson.

By not always standing in front but seeing back of the classroom, it is possible to determine whether the children are concentrating.

When he checked the answer of the problem, since he let the all say at once, and he did not know who was wrong.

D: Because it was too much time at the opening of the class, time of the problem as evaluation was not enough.

E: Because the teacher was in front most of the time, he should be more attention to the situation of children.

The poster paper was small, I was hard to look it from behind.

You should give the opportunity for the children to ask questions, Such as "why is this so?"

F: First, starting from 1-digit subtraction, you should gradually give more difficult problems.

You should proceed with the lesson with repeating the questions and answers.

No time for the last exercises. It is possible to know whether the children really understand it in this time.

G: You had prepared the teaching materials very well.

When you had given children questions which lead same answer, children's concentration was lost.

I think that it is the reason why there was no time for the last that introduction and group work was long.

3<sup>rd</sup> topic: multiplication, in August

A: Although he was using the actual materials, but only used once. You should use it more.

During group activities, the work has been individual activities.

You should use the semi-concrete materials after the concrete materials.

B: It was good to confirm the existing knowledge first.

You should use more various concrete materials, not

only use bench in the introduction.

In the introduction teacher was talking most of time. It is better to increase more children activities.

Not only the stick, but it was needed a lot of teaching materials.

There were no semi-concrete materials.

You should give more various numbers for multiplication.

Way of saying for multiplication was incorrect.

C: You should present not only correct way such as  $3 + 3 + 3$ , but also wrong way such as  $3 + 4 + 5$ .

You have given the same problem for all groups, the method of Each Child Learning has not been introduced.

D: All of Children were not able to participate in the lesson. You should use more teaching materials.

One of the groups finished their work early, there was a time they did not have anything. You should direct more attention for them.

E: The lesson was beyond the scheduled time.

There are many problems which lead same answer, so that the opportunities for children to think were few. You should give more problems for different answers.

While the group works, you concentrated in one group, and you were not able to take attention all groups.

Way of writing figures of four was different.

F: Using a simple number, it was easy to understand.

G: Process of the lesson was little confused.

Homework has not been given, did not need it?

H: The order of the problems was good. Such as " $3 + 3 + 3$ ", " $3$  is  $3$  times" and " $3 \times 3$ "

Table 6. Result of the survey for teachers.

Question	Mathematics	Science
What is a good lesson do you think?	Lessons which give opportunity for child to think.	Lesson using materials. There are many

	Lessons which properly achieve the goal.	children's activities in the lesson. Lessons which give opportunity for child to think.
What are good points of lesson study?	The details about the lesson become clear.	The quality of lessons improves. I get much experience.
What is the hard thing in lesson study?	The time is not enough.	Preparation of teaching materials
What has changed through the lesson study?	I was able to adapt my technique in correctly lessons. I became to take lesson through various questions.	I get used to lessons doing experiment. Children's activity has increased.
What has changed on the daily lessons?	As with in Lesson Study, I was able to adapt my technique correctly to lessons.	I began to prepare for class before. I began to see the guidebook.
Are there any differences between daily lessons and lessons of lesson study?	Children and I are concentrated In Lesson Study, but in daily lessons, children do not.	In the daily lessons, there is other work and no time, so the lower quality of lessons than Lesson Study.
Are there any improvements about way of lesson study?	Particularly nothing.	Take much time to do one Lesson Study
Has subject	It is increased.	I don't know.

knowledge increased through lesson study?	But we need to study more.	
---	----------------------------	--

In addition to the materials written in the above, we have also observed from diverse perspective of another Lesson Studies, daily lessons and teachers' behavior outside of lessons for half a year. So now, we describe the changes or no-changes and its factors in four aspects which have been identified from these observations.

## 6.1 The changes in lesson study

### 6.1.1 Increase of children's remarks and activity

According to table 2, we can see that children's remarks and activity has increased as compared with the early days. The teacher uses questions and conversations from the introduction, and tries to receive many comments from children. In addition, he secures the time of group work and announcement of children focusing on children's activities in the lessons. The longer time of children activities, children can participate in lessons with more interest.

In recent years in Bangladesh, the child-centered learning has been advocated, and much training has been implemented. As a result, teachers gain idea that lesson of child-centered learning is good for children. And according to responses of the survey, they also believe that it is important to provide more opportunity for children to think, that is to increase asking question and time of children's activities, in order to achieve the child-centered learning. And it is difficult issue for them how to ensure it in the actual lessons. The lessons do not proceed as expected of teachers,

because of increasing the lesson by increasing children’s activity. Actually, the previous lesson has exceeded the determined lesson time in lesson study. Through the practice of such experiences, they have become able to expect children’s response and to secure the time for children’s activities.

### **6.1.2 Enhancement of teaching materials**

The quality and quantity of teaching materials has been improved. It means in past days, teacher has just used only the textbook or poster paper transcribed from it. But now he prepares teaching materials and pictures such as stick and candle, and also the experimental tool and properly usage of it in science lessons. They can use concrete objects in introduction, then use semi-concrete objects in a lesson.

The importance of the use of teaching materials has been emphasized, as the guidebook has been distributed across the country. Therefore, teachers understand that learning effect increases by using the teaching materials. However, it is burden for them to use the teaching materials in the actual lessons, they hardly prepare and use it. Therefore, they could not realize the importance of teaching materials, and could not understand how can take advantage of it.

They actually take advantage of it in lesson study, and understand more deeply about the importance of teaching materials or how to use them. As a result, they more often and more effectively use teaching materials.

### **6.1.3 Increase of preparation time for lessons**

The teachers have become to take more time to prepare for the lesson in lesson study. The good lesson is not made by just taking long time. But, they

take time to prepare lessons, in order to improve the quality of lesson and use many materials. In the survey, they said that no time for preparation. By accumulating the created materials or repeating practice, teachers will be able to prepare more effectively in shorter time, and it will be further improvement of quality.

Factors of the change their behavior include following, first, their awareness of trying to make good lesson increase each time of lesson study. And they feel that preparation is needed to realize good one from their own experience. As a result, the change in commitment for their lesson has appeared to increase by time.

### **6.1.4 Diversity of participants’ remarks in lesson review meeting**

In the lesson review meeting of the first lesson study, there were many contents to praise the lesson, and the pointed improvements had been fixed. However, the participants’ viewpoints to observe lessons have increased, and they have become to give various opinions by continuing implementation. On the other hand, it was also observed to have decreased the proportion to point out the good points. In regard to lesson plans, the amount of information and the visibility was improved. Through these changes, they have become to expect the lesson situation and it also contributes for improvement of the quality of lessons such as the planned allocation of time or the good deployment of lesson.

Initially they had not done lively exchange of views, because such as relationships with colleagues and less opportunity to discuss with colleagues about lessons. By keeping on the practices, the viewpoint and their relationships have improved, and they have become to present the improvements from various

angles. Practitioners also came to be able to explain the intent and reason of their own lessons.

## **6.2 The changes in daily lesson same as in lesson study**

### **6.2.1 Increase of children’s remarks**

Increase of children’s remarks in lesson study can be also seen in the daily lessons. Previously, remarks of teachers, but currently lessons are progressed through teacher’s questions and children’s answers. Although children’s activities are still little, it can be seen willingness for child-centered leaning.

In case of daily lessons, it is difficult to ensure long time for children activities, because teachers must consider the curriculum and the tests. However, they are pointed out it by participants or feel the effect on their own in lesson study, they has become able to draw children’s opinions even unconsciously in daily lessons. In addition, children themselves are also accustomed to give opinions, and the remarks content in lessons has increased through lesson study.

### **6.2.2 Increase of preparation time for lessons**

The examination time has also increased in daily lessons. We have also confirmed that they take in hand the guidebook for daily lessons. As survey has revealed, awareness of the preparation for lesson has changed, so the time to see textbooks or guidebook has increased.

The distributed guidebook, that is external elements, respond to internal motivation of teachers through lesson study. As a result, they also began to see the guidebook for daily lessons. They had not able to realize its effectiveness. However they desire to give good lessons in lesson study, and create the lessons by using the guidebook which they do not

hand usually, and get a successful experience with it. They gradually have got into the habit of consulting the guidebook when they are in trouble or wondering for lessons through lesson study.

## **6.3 The no-changes in daily lessons against the changes in Lesson Study**

### **6.3.1 Enhancement of teaching materials**

In daily lessons, it is still a little to use the materials actually. In the observation, we could hardly see the teaching materials for daily lessons. Through training and lesson study, they understand the importance of teaching materials. However, it is hardly used in daily lessons. It is said that they consider a burden to prepare it from the survey. They feel the busyness of daily operations in elementary school because a shortage of teachers. Therefore, preparation and study for teaching materials, for which they have to take much time, is not performed unless special.

In addition, they have recognized that teaching materials are just using the experiments or concrete materials. However, it can be also an effective teaching materials that blackboard and textbooks. Now they have understand the effectiveness of teaching materials through lesson study, if they become able to use textbooks and blackboard effectively that are not need to prior preparation, they would improve the quality of daily teaching.

## **6.4 The no-changes in lesson study nor daily lessons.**

### **6.4.1 Contribution for children to the opportunity to think about teachers’ question**

Remarks and activities of children have certainly

increased in advocating the child-centered learning. However, it cannot be say that it really gives the opportunity for children to think. It is still just questions which predetermined the answer. These questions are not that children think with their existing concept or their own experience. And teachers only correct wrong answers which children give.

This regard, it not be noted in the lesson review meetings, not only practitioner but observers don't have insufficient understanding about opportunity for children to think. It is due to the lack of such experiences to them. They need to discuss and understand what kind of questions or activities can give the opportunity for the children to think.

#### **6.4.2 The contents of the lesson review meeting**

It is related with the above, the contents of the lesson review meeting don't contribute enough to improve the quality of teaching. From the table 5, although opinions are described by each of participants, any opinions are quick afterthought, and almost are from subjective view with weak proof and don't include activities' intention and effects. They don't discuss what causes are, and what will eliminate it.

As the factor, it is considered that awareness of the participants is low and they have no knowledge to do sufficient discussion. Also in the survey, they have said that there is no dissatisfaction and improvements with regard to the content of the lesson review meeting. In some practice of other schools, it is seen that active discussions took place from him when even one person with high competence was being in participants. But such resource persons are few.

#### **6.4.3 Participators' subject knowledge and the knowledge of teaching materials**

We cannot see the improvement of participators' subject knowledge. From the survey, teachers also are aware of this. In terms of teaching materials, they have not reach to consider the contents such as what children think and gain from it. Understanding of the subject knowledge and the knowledge of teaching materials is not improved through review meeting, as current status.

It is difficult for lesson study to contribute directly to this issue. Change of consciousness through the lesson study affects the self-study for subject knowledge. However, improvement of subject knowledge has not been recognized for the participants as a purpose of lesson study. They don't discuss with focusing on a limited part of the lesson in the lesson review meeting, so understanding and awareness of subject knowledge is not increased.

These above are the changes and no-changes and its factors which we have see through the observation of daily lessons and lesson study. A sense of resistance to child-centered activities and the preparation of lessons have become low. The time to prepare for daily lessons has also increased and it can be said that the quality of lessons have changed. The consciousness has changed, and the behavior has changed through the lesson study.

On the other hand, there is the issue that they cannot discuss the essence of the lessons in the lesson study, nor gain deeper understanding of the subject knowledge and the knowledge of teaching materials. The current approach of lesson study is not enough to contribute directly to improve the knowledge or understanding of teachers.

From the analysis of the changes and no-changes of

teachers and lessons, in order to improve the quality of lessons through lesson study, It can be said that following factors are necessary; (1) The change of awareness to preparation for lessons. (3) Sharing the purposes of the lesson study. (2) Sufficient Subject knowledge of participants.

These are facing some issues that will be solved, other issues that will be not solved by continuing to this method of lesson study. Participants have to notice the issues, and improve the method and awareness of lesson study. It will lead to improve the lessons in Bangladesh.

## **7 CONCLUSION: POSSIBILITIES AND ISSUES OF LESSON STUDY IN BANGLADESH**

Through the observation of lessons and teachers' behavior for half a year, we have analyzed the changes and no-changes in lesson study and daily lessons through lesson study in the experimental school attached to PTI in Rajshahi. The effect of lesson study is not appeared in a short time, it is required continuous implementation and observation. And the effects are not only in the lesson study. In this regard, we have observed by focusing on daily behavior of the teacher, and have clarified various the changes and no-changes for half a year.

Lesson study is recognized exclusive of daily lessons, because practitioner do special prepare and make utmost effort for it. So it is issue that is able to do in lesson study, but cannot in daily lessons. However, the impossible in lesson study is also impossible in daily lessons. We need to understand it and should improve the quality of the lesson in lesson study at first, and to find the teachers' competence through evaluating the lessons. It is possible to contribute to improve the awareness and the ability

of realize it through best practice for the teachers in lesson study. The understanding changes into actual behavior by continuance of successful experience, and it bring good influence in the daily lessons.

In order to further enhance the effects of lesson study, it is necessary to improve the quality of discussion in lesson study. The discussion should be contributed to improve participants' knowledge and understanding. However, the content in discussion is superficial and not been conscious the relation of the before and after.

To solve it, it is necessary to re-recognize the importance of the lesson plans meeting; that is “Plan”. The themes and issues of each lesson study are not set first in Bangladesh. Therefore, they only modify the teaching plan in lesson plans meeting (“Plan”). Because of not recognizing the importance at lesson study in the experimental school attached to PTI in Rajshahi, the number of people to participate is less. However, the sense of purpose of all participants is unified by setting the theme and issues. It is possible to constructive exchange of views by implementing and observing based on it. In the practice of once a month, it is difficult to have the connection of before and after for lesson study. Therefore, it is important to have proper connection within one lesson study, such as confirming in “See” which considered in “Plan”.

The atmosphere to cooperate with colleagues at school level has been grown by lesson study. Lesson study have contributed that the ability of teachers cultivated by national level training is exhibited or sophisticated as specific practices in individual school level. In the future, lesson study compensates for the weakness of the national training, that is practice in actual lessons, and the national training play the part which lesson study cannot

compensate such as subject knowledge, these will be able to elicit more effect each other.

In this paper, we have observed and analyzed only in the experimental school attached to PTI in Rajshahi, but lesson study is implemented across the country. Comparing with other practices is required to explore the match method of lesson study for this country.

Lesson study introduced in Bangladesh is still in developing status. Lesson study introduced from other country would become more suitable form for Bangladesh by continuing its own practices. Therefore, meta-improvement of lesson study by practitioners in Bangladesh is indispensable. In order for lesson study in Bangladesh to contribute to improve the quality of teaching, it is important to accumulate the record, to accumulate practices and overcome the issue.

## 8 ACKNOWLEDGMENT

This paper could not be realized, if there was not a sincere commitment to lesson study at the experimental school attached to PTI in Rajshahi, our research target. Also, for JOCV (Japan Overseas Cooperation Volunteer) and JICA (Japan Overseas Cooperation Agency) experts and staff of JICA who have cooperation in this paper, we would like to thank them to provide us with this precious opportunity.

**Abstract:** The present study is aimed at improving students’ activity and learning achievements in the course of counselling for children with special needs through the enhancement of learning system by means of lesson study. The samples in this present study were 40 students in the Department of Guidance and Counselling, Ganesha University of Education (GUE). The data of the students’ activity were collected through non–test rubric instrument which include the following indicators: 1) Visual Activity, 2) Listening, 3) Writing, 4). Drawing, 5) Oral Activity, 6) Mental Activity, and 7) Emotional Activity. The data about the students’ learning achievement were collected through the learning result tests which include the following indicators: 1) the right of the children with special needs to enrol in suitable educations as prescribed in the amendment of the 1945 Fundamental Constitution or the UUD 1945, 2) the physiology, psychology and sociology of the children with special needs, 3) The career expectations of the children with special needs, and 4) the contribution of the products of technology enriched with local wisdom for supporting the career expectations of the children with special needs. The study demonstrates that through cooperative learning, students’ learning activity is quantitatively amplified by 3.44 (in likert scale) while the students’ learning achievements increase from 75.89 to 83.45. Further, the present study also shows that there are improvements in the lecturers’ competence in designing, observing, learning process, and the quality of the learning process due to the intensified interactions of the students within the groups while promoting the growth of learning communities among the lecturers which allow lecturers to share their knowledge. Moreover, the present study also indicates that the learning model encourage the students’ character building through the edification of local wisdom values and entrepreneurship.

**Keywords:** learning activity; learning achievement; cooperative learning; local wisdom; lesson study.

### **1 INTRODUCTION**

Cooperative learning was implemented to improve the students’ learning community, because factually the students’ learning behavior can be classified into 3 groups, those are 1) the active learning group in learning process, 2) the group which is sometimes being active or sometimes being inactive in learning process, and 3) the inactive learning group in the learning process. The facts showed that from the whole learning process, only 30% from the total students that could maintain their learning activity into high criteria, good in face-to-face activity in the classroom, independent in finishing the tasks, even in field skill test. Research data from Center of Research, Ganesha University of Education (2013) also obtain the result that AQ (Adversity Quotient) of the GUE students were in low criteria. This condition cannot be postponed anymore; there should be a

solution implemented to fix this. One of the solutions which can be used to fix the process of learning system. Three components which basically need to be fixed in the learning system are: 1) students’ learning process, 2) claim of students’ learning success quality by the improvement of learning tools/content, 3) lecturers’ competency in carrying out the learning process. The three components can be achieved by managing the learning more effectively.

Besides, learning management assessment becomes a very important factor in learning. This learning assessment is the term in lesson study. The implementation of cooperative learning by Think Pair Share, Jigsaw, Project, Two Stay Two Tray techniques, can be planned into 4 cycles with the steps like plan, do, see, reflection which are oriented in learning act (lesson study). Therefore, by the research in improving students’ learning activity by

using cooperative learning model can help the students' success in learning and can improve their competency as the next counselor.

The purpose of this research is to improve the students' learning activity and students' learning result in lesson of children with special needs (ABK).

Learning activity is the activity which is done by an individual by making use of his/her intellectual ability, emotional, maximally in doing the learning activity (Sadirman, 2007:6). Meanwhile, Sujana (2002:28) stated that learning activity is the process which is marked by the changing in one self.

Basically, learning is doing, no learning if there is no activity. That's why activity is an important principle in learning and teaching interaction. In learning activity, there are some principles that oriented into psychological view that is based on old psychological view, that learning is dominated by teachers' activity while modern psychological view, learning is dominated by students' activity. Therefore, learning activity is the whole students' activities in learning process, start from physical activity into psychological activity.

Therefore, activity is an important principle in learning interaction, means that in learning needs the presence of activities. Without activity, the learning process cannot be happened. It is said as it is because activity in learning can give continual effect in the improvement of cognitive, affective, or psychomotor aspects.

Learning activity along the learning process is one indicator about the students' pretension for learning. The indicator that can be used to observe the students' learning activity are (a) students' enthusiast in following the learning activity, (b) the interaction between teacher and student, (c) the interaction between student and student, (d) group's cooperation, (e) students' activity in group discussion, (f) students' skill in using the media or tools, (g) students' participation in concluding the material. Other than these indicators, Hamalik (2001:34) stated that the basis in using the activity in learning process can contribute into some things like (a) students search their own experiences and directly experience it; (b) do by their own selves will develop all the students' personal aspects; (c) develop the harmonic cooperation among students; (d) students learn and work based on their preferences and ability; (e) develop class discipline normally and learning situation become democratic; (f) tighten the school and society relationship, and relationship between parents and teacher; (g) learning is carried out realistically and concrete so that develop understanding and critical thinking and avoid verbalism; (h) learning in school become life like the activity in social life. Based on these indicators, it is created potentially the students' community situation by cooperative learning.

Furthermore, Dierich (in Hamalik, 2007:55), classified learning activities into 8 groups, those are: (a) visual activity, that is reading, seeing pictures, observing experiment, demonstration, exhibition, and observing the people work or play; (b) oral activity that is proposing a fact or principle, connecting an event, asking a question, giving suggestion, giving opinion, interview, discussion, and interruption; (c) listening activity that is listening a material presentation, listening to conversation or group's discussion, listening to game, and listening to radio; (d) writing activity that is writing story, writing report, examining an essay, copy material, making summary, doing test, and filling in questionnaire; (e) drawing activity that is drawing, making graphics, chart, map diagram, and pattern; (f) motor activity that is doing experiment, choosing the equipments, doing exhibition, making model, organizing game, dancing, and gardening; (g) mental activity that is reflecting, remembering, problem solving, analyzing, factors, seeing, relationships, and making decision; (g) emotional activity that is interest, differencing, bravery, calm, and others. The activities in this group are in all activities and filling in to one activity to the other activities.

Based on the reviews, it can be concluded that learning activity is the series of activity that was done by the students by making use all the intellectual , emotional maximally in joining the learning so that it will change the learning habits and improve himself psychological and physically.

In this research, students' learning activities were focused into 8 learning activity as following: (a) visual activity was done in students in group to produce a plan of tool based on product that can be used to special needs students, (b) oral activity, was observed by sharing into group when they presented the product (from ideas presentation, then plan, do, reflection, result presentation), and the benefit of the product, (c) listening activity was done by students' sharing in presenting the product into a group discussion, (d) writing activity, was done when the students made a report, (e) drawing activity was done when the student made product's design which is resulted based on the needs of special needs student, (f) motor activity was done when the event of finishing product, (g) mental activity was done in the high critical thing in presenting the ideas, defending the ideas, doing reflection of product, (h) emotional activity was done by the formation of attitude, emotional which happened in group works or result's presentation.

## 2 RESEARCH DESIGN

The type research which was done is Action Research in classroom, with cycle approach of plan, do, see, and reflection.

The research samples were about 40 people of the fifth semester students of Guidance and Counselling department. The data about students' learning activities were collected by using non-test rubric that is rubric which follows the indicators; 1) Visual activity, 2) Listening Activity, 3) Writing Activity, 4) Drawing Activity, 5) Oral Activity, 6) Mental Activity, 7) Emotional Activity' meanwhile, the students' learning result for the special needs students were collected with the test result which consist of 1) special needs student's right to get education based on UUD 1945, (2) physiology, psychologies, and sociologies problem that faced by the special needs students, 3) expected career which is faced by the special needs students, 4) Contribution of technology based on the local wisdom for the ABK that support their expected careers. The research data was analyzed by using the descriptive statistic analysis.

## 2 RESULT AND DISCUSSION

Research findings showed that by cooperative learning, students learning activities improved quantitatively (in scale five) obtained the mean of 3.44. And the improvement result of each indicator reached the increase as follows.

(1) Visual Activity, in four cycles showed the increase in the mean scores in cycle I = 3.95, in cycle II = 3.98, in cycle III = 4.05, and in cycle IV = 4.10

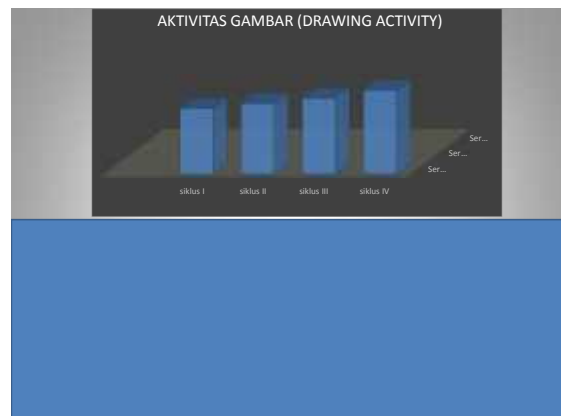

(2) Listening Activity; in four cycles showed the increase of mean scores in cycle I = 2.95, in cycle II = 3.08, in cycle III = 3.12, and in cycle IV = 3.15

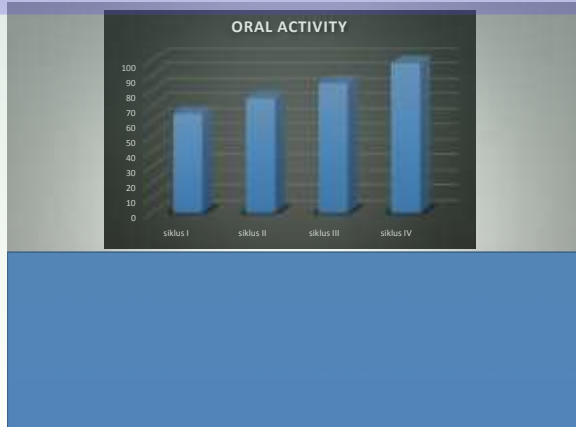

(3) Writing Activity, in four cycles showed the increase in mean score in cycle I = 2.98, in cycle II = 3.15, in cycle III = 3.45, and in cycle IV = 3.80

(4) Drawing Activity, in four cycles showed the increase of mean score in cycle I = 2.80, in cycle II = 2.95, in cycle III = 3.08, and in cycle IV = 3.20;

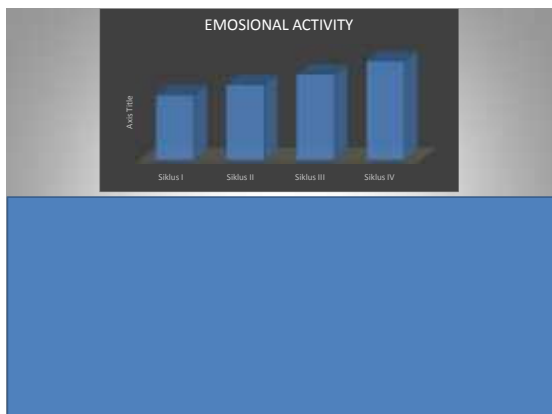

(5) Oral Activity, in four cycles showed the increase of mean score in cycle I = 3.0, in cycle II = 3.2, in cycle III = 3.3, and in cycle IV = 3.5;

(6) Mental Activity, in four cycles showed the increase of mean score in cycle I = 3.0, in cycle II = 3.4, in cycle III = 3.7, and in cycle IV = 3.8;

(7) Emotional Activity, in four cycles showed the increase of mean score in cycle I = 2.1, in cycle II = 2.2, in cycle III = 2.4, and in cycle IV = 2.5;

Thus in research findings also showed the increase of students' learning achievement with the ratio of mean score before cooperative learning = 75.89 and after cooperative learning = 83.45.

Research findings altogether can be said as significantly increasing. All the activities aspects experienced improvement from cycle I to the next cycles, with producing a product that contributes to the life of children with special needs according to this lesson study. The local wisdom value and entrepreneurship products become the focus of the

development of all the students' activities. However, the emotional activities improvement showed the slowest improvement and having the lowest score of improvement than the others activities. Based on the assessment rubrics, it was obtained the findings that students' emotional quotient by toleration, appreciating someone's opinions, cooperation and respecting each others become findings that need to be focused to be improved in the next meeting.

### 3 CONCLUSIONS

Based on the explanation above, it can be concluded that: (1) the occurrence of lecturer's competence especially in designing the learning, doing learning observation, and doing learning innovation, (2) the occurrence of learning quality's improvement, from conventional learning which was dominated by the lecturer into the learning that gave chance to the students to interact with other students in groups, (3) prompt the formed of learning community among the lecturers especially those in one family altogether plan a learning. This was different with before implementing the lesson study, it was rarely seen a sharing among the lecturers, or among the junior and senior which sit together to discuss the learning plan, and (4) the development of students' character building by the edification of local wisdom values and entrepreneurship. It is as the commitment to enlarge the implementation of lesson study.

## How PLC Helped Improve The Learning And Teaching Of English In SK Seremban 2B That Lead To The Improvement Of Students' Academic Results

Surekah C. NAIR<sup>1</sup>

<sup>1</sup> Seremban 2B Primary School, Negeri Sembilan, Malaysia  
[surekah@gmail.com](mailto:surekah@gmail.com)

**Abstract:** PLC was first introduced in SK Seremban 2B in 2012. Since then the overall teaching and the learning process among teachers have improved tremendously. This presentation will focus on English because it is our most challenging subject. In our 2013 UPSR (a national examination for Year 6 students, children of 12 years old) showed that English was our weakest subject among the 5 subjects that the students sat for. The March 2014 monthly examination showed a 10.2% improvement in pupils test results. We are hoping for better results in our mid-year and final exams. In this presentation, I will be sharing teacher's comments, tips and video presentation of my teacher's classroom teachings. I will also share information on how teachers work as a team to improve the school standards, vision and mission. SK Seremban 2B is a Cluster School under the Ministry of Education of Malaysia. We have won many awards in national and international arenas. We are one of the many schools in Malaysia chosen as a school on the bench marking list.

**Keywords:** PLC, English, SK Seremban 2B,

### 1 INTRODUCTION

SK Seremban 2B achieved their Cluster status in the year 2013. The statues bestowed to a school that show a good track record in both academics and co curriculum. Being such, the school has a challenge to make sure that the CGPA of the school's English result is maintained above 1.90 in the UPSR. Students sit for 5 papers and English is one of them. In 2013, the CGPA for English was the lowest at 2.03. That got both administrators and teachers alike seeing red. The statues can be revoked if the results do not improve for the next three years. In order to maintain the Cluster statues, the school must be in the Band 1 category. Meaning all subjects maintains their CGPA above 1.99.

Professional Learning Community (PLC) was introduced to SK Seremban 2B early 2012. It was on a trial basis whereby the officer wanted to get some feedback. A team of 5 teachers were called upon for this purpose. Videos were shown and explained in depth. The teachers were impressed and they started with peer coaching. They moved on to video critique and walkabouts. It started with much enthusiasm but other elements in the day to day life of a teacher got the better out of them. The ideas fell short and the whole project took on to a standstill. That year, the result was a CGPA of 1.90 for English.

In December 2013, during the first panel meeting for the academic year of 2014, it was again decided that the PLC concept must be carried out with much gusto to improve the results in 2014. At the time of submission of this paper, the 2014 UPSR results have not being released. It is been decided that to attain a good result cannot be the burden of only the Year 6 teachers but a culture of positive teaching and learning must start as early as Year 1

### 2 METHODOLOGY

There are 981 non-native speakers of English aged between 7 to 12 years old in the school. In the Malaysian education system, these children will study from Year 1 to Year 6. These children will then sit for a centralised assessment examination known as UPSR (*Ujian Penilaian Sekolah Rendah*) in Year 6. CGPA for 157 students, in 2012 was 1.90 and in 2013 were 2.03 for English in the UPSR result. On an average each year there are at least 8 failures and 40 students who achieve a minimum of grade C which is equivalent to less than 40% in score.

Research also shows that the children's economical background varies into several categories. 30% are from the very affluent group.

30% are from the middle income group and 40% are from the lower income group. Many parents from the lower income group are either with basic qualification themselves or none at all. Though many children get extra tutorial help, the lower income has minimal help. Study shows that most of the failures are from the lower income category. Here the parents speak little or none at all in English with their children. Most cannot help their children with their homework or projects. They neither have the time nor mean to do so.

In a total of 56 people in the teaching force, there are 8 non-native speakers of English teachers. All of whom are trained in various teacher training colleges in Malaysia. 1 with a Masters degree, 6 with a Degree in English and 1 college trained. On an average these teachers will teach 3 or 4 classes of English amounting to 630 or 840 minutes per week. School starts at 7.40 am and ends at 1.30pm. In addition, each teacher holds on average 5 to 6 important portfolios in co curricular activities. School starts on a Monday through Friday. Every afternoon, the Muslim students attend religious classes from 2.30 pm till 5.00pm. Every Wednesday evening sports practice from 5.00 to 6.00pm. This is also known as 1M1S – 1 *Murid* 1 *Sukan* policy. Which means each child must partake in at least 1 game.

### 3 DISCUSSION

During the last English panel meeting of SK Seremban 2B in October 2013, The panel members decided collectively that serious actions had to be taken to curb the issue of falling grades in English.

The following questions were tabled:

1. Why can't the students pass the exams in Year 6 after 6 years of learning English?
2. Are the children learning?
3. Are the teachers teaching?
4. Are the teaching methods attracting or distracting the students?
5. What is the real reason behind these failures?

The field notes carried out by teachers have shown that the teaching and learning process has to change. The teacher has to pay close attention to students who fall behind. The teacher cannot give individual attention to a child in a class of 43 – 45 students per class. The younger they are the more challenging it would be for the teacher. The

following actions have been taken to curb the problems. As stated:

1. The teacher teach not train the student to answer essay based questions
2. Teach grammar not rote learning.
3. More aural oral exercises are needed to teach language.
4. The use of IT is encouraged but only interactive ones. The more the better.
5. Back to basic concept must be implemented. The manila card has a better impact then buying ready to use material prepared by suppliers.
6. Homework must be objectively given and corrected as soon as possible.

To do all those above, the limited time and burden on a teacher in a day is a real challenge. The teachers have realised that they cannot do it alone. Help is needed. So the whole of 2014, a new approach was adopted by all English teachers. For the first 3 months, teachers were teaching per normal. At the end of March, after reviewing the first test, they deliberated and assigned a partner. No doubt it was a burden as the teachers concern had to sacrifice their free time but nevertheless, they wanted a change more than anything. It was difficult at first but gradually they were adapting to the changes. Having more than one teacher at a time meant more learning issues were tackled early.

The weaker students were gathered in the afternoon after prayers, and given extra coaching before they went off for their religious classes. Teachers were discussing more about each child and their progress during panel meetings. The minutes of each meeting got longer as more ideas were thrown in as discussion got very intense.

English Progress Report 2014 Seremban 2B Primary School

Year/Level	No. students	1st Term (March)	Mid Term (April)	2nd Term (August)	Final (October)
Year 1	130	130 81.53%	135 84.62%	148 90.77%	157 90%
Year 2	126	141 87.7%	152 94.44%	180 95.19%	181 94.44%
Year 3	137	128 94.16%	161 95.41%	182 95.80%	182 95.80%
Year 4	170	143 81.6%	170 97.1%	177 98.24%	178 97.53%
Year 5	134	140 90.3%	153 91.8%	178 95.9%	180 97.1%
Year 6	130	170 87.7%	170 88.77%	175 90.45%	178 96.77%

Table 1: Number of student passing above 40% and its percentage.

## 4 CONCLUSION

Teaching individually has become a thing of the past. Teachers are opening their doors to ideas and critiques, and critiques are being more constructive. Teachers are learning to work as a team. Each child is being evaluated from the time he or she starts school. Each teacher has learned to be responsible for every child. The concept has been adopted by all other subjects too. The teachers are being more professional in their approaches of teaching. Students are enjoying learning. Evaluation is not only via standardised assessment but also through other methods such as projects and oral test. A child's confidence is raised so that he or she has the ability to receive knowledge.

**Abstract:** An urgent drive to reform Indonesian education has encouraged a movement of biology teachers in Malang Municipality in order to plan an activity that provide some chances for them to ‘sharpen the saw’, to love each others, and to take care of each others – i.e. a lesson study. It is a descriptive survey-based research. It is conducted by two biology teachers using an inquiry-based learning approach and a combined approach of inquiry and *PBMP* pattern in the classrooms and 34 other biology teachers observing them. The teaching strategy employed is an inquiry-based learning approach and a combination of inquiry-based approach and *PBMP* pattern (*PMBP* – Thinking Empowerment by Questioning). In pedagogy, an inquiry-based learning approach has been frequently discussed although there are only few reports about its implementation combined with *PBMP* pattern. Since Indonesia has executed Curriculum 2013 starting from July 2013, it is very necessary to conduct a lesson study in order to support the implementation of the learning approaches. The research has also found out that the two learning approaches have given valuable experiences to those biology teachers inexperienced in implementing them. A lesson study can become the best means of modeling the teaching strategies with which teachers are not familiar. Therefore, it is necessary to develop school-based lesson studies (*LSBS*). It is even better to implement a participation-based lesson study by encouraging teachers’ awareness of ‘sharpening the saw’, loving each other, and taking care of each other in order to improve professionalism among biology teachers in Malang Municipality.

**Keywords:** Curriculum 2013, scientific approaches, teaching strategy, participation-based lesson study.

### 1. INTRODUCTION

The Minister of Education and Culture Rules and Regulations No. 59 of 2014 on Curriculum 2013 of Senior High Schools states that the curriculum is designed to fit our national and social conditions to anticipate students’ present and future needs. Moreover, we need to consider the internal and external challenges and paradigm shift and the curriculum governance needs to reformulate the 21<sup>st</sup>-century competences needed by the students to meet a highly competitive life in the future, a civilized era of information- and digital-technology-based social constellation. The competence reformulation is expected to shift our paradigms and behavior into high-concept- and high-touch-based paradigms and behavior which require us to change our ways to acquire knowledge and skills and to reinforce attitudes in order to equally develop soft skills and hard skills.

Therefore, Curriculum 2013 is designed with the following characteristics: 1) it is to develop balance between spiritual and social attitudes, curiosity, creativity, teamwork and intellectual and

psychomotor abilities; 2) a school is part of the society that gives planned learning experiences in which students apply what they have learned at school to the society and use the society and environment as their learning sources; 3) it is to develop attitudes, knowledge, and skills and to apply them in any possible situations at school and in the society; 4) it is to provide more time to develop a variety of attitudes, knowledge, and skills; 5) competences are presented in the form of core competences explained in more details in the subject basic competences; 6) the class core competences become the organizing elements of basic competences on which all basic competences and learning processes are developed to reach the basic competences.

To implement Curriculum 2013, it is important for us to reinforce a variety of aspects. To do so, biology teachers in Malang Municipality need to take their parts. Michael G. Fullan as quoted by Suyanto and Djihad Hisyam (2000) suggested that “educational change depends on what teachers do and think...” It means that reforming our educational system really depends on what teachers do and think.

Therefore, it is extremely necessary for biology teachers as members of Biology Teacher Forum (*MGMP – Musyawarah Guru Mata Pelajaran*) in Malang Municipality to participate in the educational reform in Indonesia, especially in Malang Municipality.

Curriculum 2013 put a stress on scientific approaches. *MGMP* is a teacher forum to actualize a variety of educational activities. Applying a lesson study in *MGMP* is one of the activity agendas for actualizing learning practices. Some schools have worked together to discuss learning practices in *MGMP*. However, they haven't had any activities modelling the learning approaches leading to scientific approaches. Although Indonesia has implemented Curriculum 2013 since the academic year 2013/2014 to refine Curriculum 2006, biology teachers in Malang Municipality have understood little about the scientific approach. Therefore, it is necessary to provide a means of applying biology learning strategies based on a need to develop competences and the characteristics of biology materials, and the designs of alternative learning approaches. The most appropriate means to provide the activities is a participation-based lesson study. Moreover, it is the best forum to disseminate the implementation of Curriculum 2013 putting a stress on scientific approaches.

It has been earlier suggested that scientific approaches are required in the learning of Curriculum 2013. Some teacher trainings have been held by the government. These activities are to disseminate and to reinforce the implementation of Curriculum 2013. However, there are no special trainings discussing a variety of learning approaches. Furthermore, there are only a small number of studies about how the students learn through a variety of learning approaches leading to scientific approaches as well as about the strengths, weaknesses and obstacles in implementing the scientific learning. The learning other than those recommended as alternative learning approaches by the government haven't come into view. That is why we need *MGMP* to discuss those different topics. The forum is very important for teachers to improve their professionalism. Masaaki Sato (2007) suggested the same thing in Susilo and friends (2010) that *MGMP*-based lesson study can improve teachers' professionalism. Although teachers can learn by themselves, they have limitation. Therefore, it is necessary to give teachers more chances to learn good practices of learning strategies and teaching techniques from each other through *MGMP*. They rarely get the chances to learn at their schools. It results in the need to optimize participation-based lesson studies for biology teachers in *MGMP*. Considering this idea, the writers conducted a participation-based lesson study for biology teachers of senior high schools in Malang

Municipality by applying scientific approaches with *PBMP* pattern in implementing Curriculum 2013.

## 2. METHOD

It is a descriptive survey-based research. The writers conducted a survey in two classes that were holding open classes on 14 September 2013 in SMA Negeri 8 Malang. The activities were initiated by Biology Teacher Forum in Malang Municipality and based on the participations of biology teachers there. The scientific approaches were employed with two learning approaches i.e. inquiry-based learning approach and a combination of inquiry-based learning approach and *PBMP* pattern. The inquiry-based learning was modeled by Ms. Naning and a combination of inquiry-based learning approach and *PBMP* pattern was modeled by Ms. Lilik Triani. Both are biology teachers of SMA Negeri 8 Malang assigned as one of those target schools of Curriculum 2013 in the first year. There were 34 observing teachers both from public and also private schools in Malang Raya (Malang Municipality, Malang Regency, and Batu Municipality). The main topic being taught was Natural Diversity, including in-site and ex-site conservations. The instrument of the survey was an observation sheet containing the following questions: 1) 'Have all students really studied today's learning topic?,' 2) 'What is their learning process like? (with real facts and supporting reasons), Which students couldn't follow the class today?' (with real observed facts and the students' names), 3) 'Why could the students not study well? What are the causes and what are the alternative solutions?,' 4) 'How did the teacher encourage those passive students to study?,' 5) 'What lessons did you get from observing today's learning?,' and 6) 'What are the interactions like – between students in one group, between students in different groups, between students and the teacher, between students and their learning sources/media, between students and the environment?.' The next step describing the implementation of scientific approaches with inquiry-based learning approach and a combination of inquiry-based learning approach and *PBMP* pattern. Inquiry-based learning approach has the following syntax : 1) presentation of phenomena, 2) observation, 3) statement of the problem, 4) statement of the hypothesis, 5) data gathering/information exploration/finding, 6) data analysis/association, and 7) conclusion. As for a combination of inquiry-based learning approach and *PBMP* pattern, it has the following syntax: 1) presentation of phenomena, 2) do: prepare, observation, statement of the problem, statement of the hypothesis, data gathering/information exploration/finding, data analysis/association, 3)

consider, 4) think, 5) evaluate, 6) conclusion, and 7) direction.

### 3. DISCUSSION

Lesson study support the implementation of Curriculum 2013. Curriculum 2013 has only been implemented for two years in Indonesia, needing more dissemination. The scientific approaches consist of those activities of observing, questioning, gathering data, associating, and communicating or *5M*. Only few teachers have understood the learning approaches. They need real models and to see the teaching practises in person. The scientific approaches can be implemented using a variety of such learning approaches as inquiry-based learning approach. Only few biology teachers in Malang Municipality have understood inquiry-based learning approach. Based on Minister of Education and Culture Rules and Regulation No. 65 of 2013 on the Standard of Process, the learning approaches implemented in Curriculum 2013 are scientific approaches. The approaches are implemented in a constructivist inquiry-based process. The implementation results in the increasing curiosity, observation skills, analysis, and communication. It is very necessary to implement this kind of learning to prepare the young generation mastering basic concepts through biology learning. It means that an essential learning is needed to prepare them to be able to master the basic knowledge of biology and its application. Since teachers have only understood little about inquiry-based learning and other innovative learning approaches as models of scientific approaches, they need to see the approaches being modeled and the best way is to have a lesson study. In the Handbook of *MGMP*-based and School-based Lesson Study (2009) there are three parts: Plan (planning), Do (implementing and observing) and See (reflecting). These three parts enable teachers to ‘sharpen the saw’, love each other and take care of each other in learning practices. Therefore, a lesson study is appropriate to model a variety of learning practices.

To prepare collectively the lesson plan can give valuable experiences to those implementing the curriculum, especially Curriculum 2013 and encourage teachers to observe and discuss the learning practices. Teachers will have a good chance to understand each other about new things they haven’t mastered, especially the scientific approaches. Furthermore, to conduct a lesson study will help to faster disseminate the scientific approaches. In conclusion, a lesson study is an appropriate means of supporting the implementation of Curriculum 2013.

Next, the Minister of Education and Culture

Rules and Regulations No. 59 of 2014 Attachment III states that biology subject has a vital purpose i.e. to develop an awareness of the complexity, regularity, and beauty of natural diversity and bioprocesses, and the application of biology, as well as of natural environmental problems, to care about nature as it is a real example of action based on the students’ religions to show the greatness of God the one and only. The students’ biology knowledge consists of factual, conceptual, procedural, and metacognitive knowledge in concrete and abstract domains. Moreover, biology helps them to increase their awareness of technology beneficial for individuals, society, and the environment and of the importance of managing and conserving the nature for the sake of society. We can give experiences to the students in applying scientific methods and about worksafety through observations and experiments, hypothesis testing, data gathering and in having written and oral communication of the experimental results in order to develop their scientific paradigm the live the 21<sup>st</sup> life. It is the duty of biology teachers to develop students’ hard and soft skills in biology equally to provide them with collaborative, communicative, creative and innovative skills and media literacy through inquiry-based, problem-based, and project-based learning. It is also necessary for biology teachers to develop students’ positive attitude toward biology, i.e. is to make learning biology the students’ need, and to encourage them to use biology as a means of problem solving in their personal and social lives. Therefore, biology teachers need to realize the importance of learning biology and Curriculum 2013 makes biology one of those specialized subjects of science and mathematics. By become a specialized subject, biology is expected to reach its goals.

According to Istamar and Ibrohim (2008), a lesson study is a case analytical method in the learning practices. It is conducted in the form of open class that can give valuable experiences to peer teachers by observing and having some reflection on the learning practices. It helps to improve teachers’ professionalism in their teaching practices. A lesson study benefits the teachers who conduct the teaching practices and becomes a forum to learn from each other about real teaching practices in the classrooms. Peer teachers observed different things related to the learning practices and recorded their observations in the observation sheets. It would be useless if they didn’t collectively observe and study the practices for the sake of learning and then make the activities as their habits. A lesson study will be the right means of doing so, especially in *MGMP*.

*MGMP*-based lesson study will unite the teachers in improving their professionalism. The regular teacher forum gives chances to biology teachers to meet, question, discuss, find solutions and

model the learning practices. It creates personal and social relationships among them. The Handbook of *MGMP*-based and School-based Lesson Study (2009) also suggest that *MGMP* is a means of encouraging the improvement of teachers' professionalism and was formerly founded to become a model of teachers' training in 1993, a continual project on Teacher Work Reinforcement (*PKG – Pemantapan Kerja Guru*). *MGMP* formerly known as *PKG* gives many benefits to teachers. However, some *MGMP* activities have provided more administrative experiences than practical ones, making teachers less observant and have fewer reflections on the learning practices as allegedly the *MGMP* main activities. It is expected that *MGMP*-based lesson studies are developed since they help teachers to 'sharpen the saw', love each other, and take care of each other to improve their professionalism by observing and discussing the learning practices.

Describes the results of learning practices in the form of students' real behaviors during inquiry-based learning and a combination of inquiry-based learning and *PBMP* pattern. Students generally had studied that day's learning topic at the class with inquiry-based learning. It is evident from the students' firmness to answer the teacher's questions about in-site and ex-site conservations and Wallace and Weber lines and from the concentration and enthusiasm they showed when they were watching a video. Only some students hadn't studied the topic, which is evident from the fact that some group members were passive and didn't respond the teacher's questions and that they didn't concentrate on the video (they sometimes seemed to look at other directions). The same things happened at the class with a combination of inquiry-based learning and *PBMP* pattern. Students generally had studied, which is evident from the fact that they were able to answer the teacher's questions during the introduction; they paid attention to the teacher's explanation, articles and their worksheets; all students had seriously done their worksheets; almost all students actively discussed with the group members (only some students were passive). Students at the second class studied well because they had comfortable seats and had brought articles and *PBMP* worksheets with them before the class started. It means that they had understood what they were going to study. They had studied because they were motivated by the learning sources from the *Kompas* articles and a video that attracted their attention. This kind of learning prepares the students physically and physiologically to study. The same statement is written in Attachment IV of Minister of Education and Culture Rules and Regulations No. 81A of 2013 on the learning general guidelines that learning activities are designed to give learning experiences involving mental and physical processes through interactions

between students, students and teachers, environment and other learning sources in order to reach Basic Competences – *KD*. Thus, learning process has started since a teacher prepares students physiologically and physically even before it comes to the main activities of learning.

It is formerly suggested that students generally had studied and only some of them hadn't studied well. There were six students having not followed that day's learning at the first class with inquiry-based approach. Their reasons are varied from being more interested at the cellular phone, having not understood the benefits of studying, having not been motivated to study, finding difficulties to study in a noisy classroom, not having courage to give his/her opinions, and not having a habit of asking questions. Furthermore, a member of Group 3 didn't actively participate in the group discussion in the second class. Next, two members of Group 4 sometimes talked to the other members while the teacher was explaining the learning materials but they stopped immediately and directed their attention back to the teacher's explanation. A member of Group 4 discussed something different from the learning topic but the other members kept leading him/her to go back to the right topic. Then, all members of Group 6 had similar opinions (they took examples from their friends' opinions and didn't have their own opinions). A member of this group had had an article but he/she only lowered his/her head and didn't read it. Another member covered his/her article with a piece of paper and another one didn't write his/her observation results on the video although the teacher had informed in the beginning of the class that the observation results would be scored. The reasons why those students hadn't studied are that they didn't have a reading habit; the articles under discussion were not so interesting; some students didn't have prior knowledge, making them unprepared to acquire the materials; they had not been motivated to follow the learning or to join the group discussion; there were so many exercises to do in their *PBMP* worksheets that they got bored and decided to chat with the other group members. Teachers get a valuable lesson related to classroom management from this class. Thus, teachers need to better manage their learning to involve the students more in studying.

The following are some solutions to the problems in the two classes: 1) to give particular attention to those students unprepared to study, 2) to give more encouragement to those students not actively participating in the learning, 3) to accommodate each student's unique learning style, 4) to explain in the beginning of the class about the benefits of materials they are going to study, the learning objectives, the learning strategies, the assessment rubric, including the use of worksheets,

5) to train the students' questioning skills in the learning, 6) teachers always give questions to passive students, 7) teachers involve the students to participate in the question-answer session, 8) teachers encourage the students to be active through questions, 9) teachers play audio videos to get more attention and enthusiasm from the students, 10) teachers motivate the students to have a group discussion and visit each group, 11) teachers approach the students not participating in the learning, 12) teachers invite all members of a group to give their opinions in the group discussion, 13) teachers encourage the students to do scientific activities as written in *PBMP* worksheets, 14) teachers visit each group, 15) teachers show and mention the name of groups less active, and 16) teachers understand each student's unique learning style. Teachers need to respond quickly to the learning situations by using those solutions to make some improvements. They have to understand each student's characteristics in designing their lesson plans. Minister of Education and Culture Rules and Regulations No. 81A of 2013 on the implementation of Curriculum 2013 suggests that to reach the required qualities as designed in the curriculum documents, the learning activities have to base on the following principles: (1) to be student-centered, (2) to develop students' creativity, (3) to create a pleasant and challenging atmosphere, (4) to contain values, ethics, aesthetics, logics and kinesthetic, and (5) to give different learning experiences by applying various strategies and methods of fun, contextual, effective, efficient, and meaningful learning. This kind of learning will keep the students from not participating in the learning. It is a solution to the problems of teaching in the classrooms. Moreover, Iskandar (2011) suggested that the learning essence is that individuals discover and transfer information in order to make it their own information and knowledge through the learning process. That the students actively discover their own knowledge is the ideal goal of the learning objectives set by teachers. Therefore, teachers implement a learning approach to reach their learning objectives and to provide the students with skills and to avoid problems from taking place in the classrooms.

Teachers get many valuable experiences from the lesson studies. The activities are to improve teachers' professionalism. The valuable experiences mentioned by the observers illustrated that teachers get real examples of learning practices from open classes. Videos encourage thinking processes although a video with less coverage may create difficulties in motivating students to question the video content continued by data gathering, data analysis, and conclusion. Thus, teachers need to carefully choose a video as a replacement to real objects which students will observe. They can use

videos as phenomena sources to activate students' minds to come up with some questions. Inquiry-based learning approach and a combination of inquiry-based learning approach and *PBMP* pattern give valuable experiences to the observers related to the implementation of learning syntax. Teachers can directly observe the strengths and weaknesses and how the students study through this activity. The learning approaches with syntax obviously help teachers to direct the learning processes. Various learning sources will give motivations and varied learning experiences. Next, positive reinforcement will increase the students' enthusiasm to study. Then, preparing IT equipment before class will help the learning to run smoothly. These are valuable experiences acquired by observing the learning practices. Besides that, the learning practices will become real examples of implementing scientific approaches with inquiry-based learning approach and a combination of inquiry-based learning approach and *PBMP* pattern. Thus far teachers haven't fully understood the differences between the learning objectives and Competence Achievement Indicators – *IPK*. Minister of Education and Culture Rules and Regulations No. 59 of 2014 on Curriculum 2013 suggested that the learning objectives are formulated based on the Basic Competences/*KD*, using observable and measurable Operational Terms and cover attitudes, knowledge, and skills. They are formulated to meet *IPK* with sentences containing the following 4 elements: A (*audience*), B (*behaviors*), C (*conditions*), and D (*degrees*). *IPK* is formulated after the learning objectives are formulated. Teachers' confusion to tell the differences between *IPK* and the learning objectives can be solved through open classes. Thus, lesson studies give many experiences to teachers on things they haven't known before. To choose articles appropriate for the materials under discussion will really help to present phenomena that will be studied. It is another valuable experience for the observers. It is not easy to choose the most appropriate article/learning media fitting the learning objectives and approaches. The students' freedom to give their opinions at the class implementing a combination of inquiry-based learning approach and *PBMP* pattern is dominant comparing to those at the class implementing inquiry-based approach. *PBMP* worksheets can manage students' thinking pattern (paradigm) to become logical and systematical through questions in the stages/phases of ponder, evaluate, and think. This learning practice is very valuable for teachers. Thus, it is necessary to continue doing these activities through *MGMP*.

Indonesia has executed Curriculum 2013 since the academic year 2013/2014 as an improvement of Curriculum 2006. The learning in this curriculum put a stress on the use of scientific approaches. The scientific approaches encourage students to think

critically, systematically, logically, and carefully, and to develop students' courage to communicate with other members of the group, to focus students to understand concepts and to improve interactions between students, and to train students to associate concepts. The most appropriate learning to realize these is inquiry-based learning approach. According to Kristiani (2005) the benefit of implementing inquiry-based learning approach is that teachers may encourage students' curiosity to know something, motivate students to be willing to continue doing activities until they discover their own answers to questions, learn to solve problems independently, and have critical thinking skills. The questions will be answered through scientific processes. According to Eanes (1997), a good technique to question will effectively help to develop understanding. Moreover, it is also suggested that good questions with the right use will not only help students to understand the content of materials but also help to guide them into critical and elaborative thinking about the content. Therefore, questioning techniques can develop not only understanding but also higher-level understanding. Kristiani (2005) insisted that inquiry-based learning approach needs a learning strategy with scientific methods and give chances to have more meaningful learning. The same thing was suggested by Eanes (1997) i.e. “.....by helping students understand the relevance of the learning to their own lives and experience, the value of the learning becomes more obvious.” This kind of learning is found when students are trained to discover concepts using their logical thinking pattern with inquiry-based learning approach. Then, according to Iskandar (2011) recently the term 'inquiry' becomes important because inquiry is the main strategy in the education of sciences. Yanger (2009) in Iskandar (2011) suggested that inquiry is the 'key' to conduct an investigation/examination in sciences. Next, Nurhadi (2003) stated that inquiry-based learning approach triggers students' curiosity to know something, motivate students to be willing to continue doing activities until they discover their own answers to questions, learn to solve problems independently, and have critical thinking skills. Thus, considering its many strengths, inquiry-based learning approach needs to be disseminated among biology teachers through lesson studies.

The results of the research on inquiry-based learning approach have showed its strengths. Other learning approaches may also have their own strengths such as *PBMP* pattern. It has strengths although teachers know little about it. Corebima has developed a learning approach proven to improve students' thinking skills known as *PBMP* (Thinking Empowerment by Questioning ) (Corebima, 2005b). In its implementation, Zubaidah (2001) suggested that *PBMP* can be collectively planned by students

and teachers. Teachers become catalysts in creating questions. Those questions planned in *PBMP* are divergent and open-ended questions in student worksheets to construct the students' understanding. These kind of questions encourage students to develop their reasoning to solve a question as a problem. The questions delivered are interrelated questions, guiding the students' thinking patterns. It helps the students to become independent learners. Then, independence is one of metacognitive indicators. Therefore, *PBMP* can develop students' metacognitive and reasoning skills and their thinking processes. According to Corebima (2000a, in Zubaidah, 2001), *PBMP* or TEQ = (*Thinking Empowerment by Questioning*) is a learning pattern with no informative series of interrelated questions written in *PBMP* worksheets. Then, Crown (1989, in Zubaidah, 2001) suggested that critical thinking skills can be developed through various activities such as creating questions. Questions will trigger students' responses to support their thinking processes. *PBMP* learning suggested by Zubaidah (2001) is similar to the scientific learning idea suggested by Bunce (1996), i.e. help them to think, help them to formulate questions, help them to find answers to the questions. The important thing to highlight is that there is the word 'help' and not 'make' or 'tell'. It means that the students are the ones that study and teachers will only help them to study. It is evident that students are expected to be independent and be able to control their own learning processes. These skills are metacognitive skills. The effects of *PBMP* learning are that the students master biology knowledge and understand the scientific processes better than those students taught with traditional learning approaches. The effects correspond with what Crown (1989) suggested that critical thinking as an indicator of high-level thinking skills can be developed through such activities as questioning or inquiry-based learning approach. This discovery process helps students to get the best possible scientific knowledge and to understand scientific processes. Inquiry-based learning approach and *PBMP* pattern have similar characteristics. Combining the two approaches will reinforce the thinking independence. Thus, a combination of inquiry-based learning approach and *PBMP* pattern an innovative learning strategy necessary to disseminate. Considering that the combined approach has been insignificantly studied, it needs to be modeled in order to observe the combined syntax becoming the new learning syntax. Through these open classes, teachers get the real picture of the implementation of innovative learning syntax as one of alternative learning approaches in Curriculum 2013.

Metacognition is one of those SKL/Competence Standard for Graduates in

Curriculum 2013. According to Flavell (1999), metacognition is to think about thinking that includes metacognitive knowledge and experiences. Furthermore, Hacker (1998) in Downing (2009) added a part that he called metacognitive skill. Metacognitive skill is influenced by the learning strategies reported by the former researchers (Paidi, 2008; Warouw, 2009; Kristiani, 2009; Danial, 2010; Sepe, 2010; and Bahri, 2010). Thus, we need to choose the learning that gives chances to students to empower their thinking abilities including their metacognitive skills in order to provide them with the best possible conceptual understanding. Kauchak & Eggen (2007) suggested that metacognition, critical thinking and content knowledge or understanding on topics are interrelated elements in learning. Inquiry-based learning approach and a combination of inquiry-based approach and *PBMP* pattern will give experiences to students to develop their metacognition. It is relevant with the Competence Standard for Graduates in Curriculum 2013 i.e. to have factual, conceptual, procedural, and metacognitive skills in sciences, technologies, art and culture with a broad knowledge of humanism, nationalism, and civilization in relation to causes and effects of phenomena and events. Therefore, Inquiry-based learning approach and a combination of inquiry-based approach and *PBMP* pattern is relevant with the goals of Curriculum 2013.

#### 4. CONCLUSION

1. Lesson studies play a strategic role in drawing a real picture of the implementation of learning syntax about which teachers have understood little.
2. The two learning approaches presented have given valuable experiences to biology teachers unexperienced with their implementation.
3. Lesson studies are really appropriate to model the learning approach about which teachers have understood little in the implementation of Curriculum 2013.

In conclusion, it is necessary to develop school-based lesson studies (*LSBS*) and to encourage participation-based lesson studies by developing teachers' awareness of 'sharpening the saw', loving each other and taking care of each other in order to reinforce pedagogical skills and learning strategies among biology teachers.

#### 5. ACKNOWLEDGEMENTS

We thank the following people who have supported us in writing the paper.

1. The advisor and the chairperson of *MGMP* in Malang Municipality: Ms. Ninik Kristiani (Principal of SMA Negeri 8 Malang as the advisor of Biology Teacher Forum-*MGMP*), Ms. Dewi Indahsari (biology teacher of SMA Negeri 1 Malang as the chairperson of Biology Teacher Forum-*MGMP* in Malang Municipality).
2. The model teachers: Ms. Naning and Ms. Lilik Triani (Biology teachers of SMA Negeri 8 Malang).
3. Observers from public and private senior high schools in Malang Raya.
4. Teachers of SMA Negeri 8 Malang who have participated to make the implementation of lesson studies run well.
5. Lecturers of Malang State University who have guided the lesson studies in SMA Negeri 8 Malang.

<sup>2</sup>Biology Education Study Program University of Riau – Pekanbaru, Indonesia

<sup>3</sup>Biology Education Study Program University of Riau – Pekanbaru, Indonesia

**Abstract:** Lesson Study in Biology Teachers Forum as a mean to support qualification, should be carried out in accordance with National Education Standards, especially Standards of Content, Process, and Evaluation. The aim of this study was to describe the Technological Pedagogical Content Knowledge (TPCK) of preservice and inservice biology teachers in Pekanbaru, Riau, Indonesia, through Lesson Study. The sample of this study was 22 preservice teachers from Biology Education Program University of Riau and 33 inservice biology teachers from Biology Teachers Forum. This study was conducted based on stages in lesson study, which are plan, do, and see. The focus of this study was preservice and inservice teacher that can apply TPCK. The questionnaire consists of 35 items from 7 subdomains. The subdomains are Technological Knowledge (TK), Pedagogical Knowledge (PK), Content Knowledge (CK), Technological Pedagogical Knowledge (TPK), Technological Content Knowledge (TCK), Pedagogical Content Knowledge (PCK) and Technological Pedagogical Content Knowledge (TPCK). The questionnaire items are valid and reliable. The finding showed that mentoring senior high school preservice and inservice Biology Teacher through Lesson Study: (1) to increase understanding of curriculum and teaching materials, (2) to improve the quality of learning, (3) to increase ability to evaluate and assess learning outcomes, (4) to increase ability in scientific writing and classroom action research. To conclude, the preservice and inservice biology teachers' TPCK was good, which can support to achieve standard of content, process and evaluation biology learning.

**Keywords:** Inservice, preservice teacher, technological pedagogical content knowledge

### 1 INTRODUCTION

Teachers are professional educators with primary tasks of educating, teaching, guiding, directing, training, assessing, and evaluating students of early childhood, primary, and even secondary education. Professional teachers will create a high quality of educational process and outcomes in order to create smart and competitive nation, who are faithful, noble, healthy, knowledgeable, skilled, creative, independent, and becoming responsible and democratic citizens (UU RI No.14 Year 2005). To be a professional teacher, everyone is required to have ability in developing competence within him.

Rapid development of science and information technology in this globalization era has become a challenge for teachers to overcome it by upholding professionalism. With this condition, teachers have to be able to adapt responsively. Responsive means that teachers have to master technology, especially those which are related to education (Kunandar, 2011). Therefore, teachers are not only supposed to develop their pedagogical knowledge or content knowledge, but also technological knowledge so that teaching and learning process can be in accordance with the times.

According to Mulyasa (2012), the use of information technology in education is to make learning activity easier and more effective.

Seeing these conditions, an effort is needed to develop teachers' quality and professionalism. Professionalism development can be done through developing knowledge that can support their profession. One of useful knowledge frameworks for developing teachers' competence is *Technological Pedagogical Content Knowledge (TPCK)*.

*Technological Pedagogical Content Knowledge (TPCK)* is a conceptual framework which shows correlation among three kinds of knowledge that should be mastered by teachers, which are technological, pedagogical, and content knowledge. This TPCK have to be mastered by teachers so that the learning process can run effectively and efficiently. TPCK framework is developed by Mishra and Koehler (2006) and is the development from Shulman's (1986) conceptual framework about *Pedagogical Content Knowledge (PCK)*. In general, TPCK comprises of 3 main components, namely content, pedagogic, and technology. The interaction of the 3 components then form 7 knowledge components, which are *technological knowledge (TK)*, *pedagogical*

knowledge (PK), content knowledge (CK), technological pedagogical knowledge (TPK), technological content knowledge (TCK), pedagogical content knowledge (PCK) dan technological pedagogical content knowledge (TPCK), as shown in figure 1.

Figure 1. Framework of *Technological Pedagogical Content Knowledge*

(Source: <http://www.matt-koehler.com>)

Strengthening this TPCK can be done by both preservice and in-service teachers through lesson study. According to Hendayana (2006), lesson study is teachers' professional development model through collaborative and sustainable learning which is based on collegiality and mutual learning principles to build learning community. Widodo (2011) also adds that the main principle of lesson study is gradual improvement of learning quality through learning from his own and other people's experience in doing learning activity.

GPA	2,80	>2,80-3,20	>3,20-3,60	>3,60-4,00
Percentage	0%	9,1%	72,7%	18,2%

## 2 RESEARCH METHODOLOGY

The objects of this study were 22 pre-service Biology teachers from Biology Study Program of Riau University, PGMIPA-U class (Leading Mathematics and Science Teacher Education class) and 33 Biology teachers who joined Biology Teachers Forum of Senior High School in Pekanbaru. The procedure of this research was carried out based on steps in lesson study, which were plan, do, and see. Activity of plan, do, and see upon Biology Teachers Forum of academic year 2012/2013 in Pekanbaru was done in 2 cycles with two subject matters, which were excretion

and coordination system. Activity can be seen in table 1.

Table 1. *Plan, Do, and See* Activity of High School Biology Teacher Forum in Pekanbaru (see APPENDIX )

Activity of plan, do, and see upon the subject of Program Development in Biology Learning by Biology students was conducted in two cycles with two subject matters, which are virus and plant tissues. Activity can be seen in table 2 (see APPENDIX)

Instrument used in this study was questionnaire adapted from Schmidt *et al.* (2009) and Sahin (2011). The questionnaire comprised of 35 items to measure seven domains of TPCK. Result of validity test through Pearson Correlation showed that all item is valid. To test questionnaire reliability through alpha cronbach's test, 0.935 was obtained. The data of this study was analyzed descriptively.

## 3 FINDINGS AND DISCUSSION

### 3.1 Profile of Pre-Service Biology Teachers in Pekanbaru

Based on the collected data, profile of respondents is presented in following tables

Table 3. Profile of Pre-service Teachers based on Score of Several Subjects

No.	Score	Subjects		
		BM	BID	MT
1.	A	54,5%	36,4%	22,7%
2.	A-	0%	50,0%	36,4%
3.	B+	0%	13,6%	40,9%
4.	B	45,5%	0%	0%
5.	B-	0%	0%	0%
6.	C+	0%	0%	0%
7.	C	0%	0%	0%

Notes:

BM: Biomultimedia;

BID: Biology Instructional Design;

MT: MicroTeaching

Table 4. Profile of Preservice Teachers based on GPA

Table 5. Profile of In-service Teachers based on Educational Background

Education	Education Field		Sum
	Biology Education	Pure Biology	
DIII	1 (3,0%)	0 (0,0%)	1 (3,0%)
S1	27 (81,8%)	2 (6,1%)	29 (87,9%)
S2	3 (9,1%)	0 (0,0%)	3 (9,1%)
Sum	31 (93,9%)	2 (6,1%)	33 (100,0%)

Table 6. Profile of Teachers based on Teaching Experience and Certification

Teaching Experience	Certification		Sum
	Done	Not Yet	
10 years	3 (9,1%)	1 (3,0%)	4 (12,1%)
11-20 years	8 (24,2%)	2 (6,1%)	10 (30,3%)
21-30 years	14 (42,4%)	0 (0,0%)	14 (42,4%)
>30 years	5 (15,2%)	0 (0,0%)	5 (15,2%)
<b>Sum</b>	<b>30 (90,9%)</b>	<b>3 (9,1%)</b>	<b>33 (100,0%)</b>

Table 7. Profile of Teachers based on Age, Training, and Computer Course

Age	Training		Computer Course		Sum
	Ever	Never	Ever	Never	
35 years old	0 (0,0%)	2 (6,1%)	2 (6,1%)	0 (0,0%)	2 (6,1%)
36-45 years old	2 (6,1%)	9 (27,3%)	3 (9,1%)	8 (24,2%)	11 (33,3%)
46-55 years old	8 (24,2%)	7 (21,2%)	4 (12,1%)	11 (33,3%)	15 (45,4%)
>55 years old	4 (12,1%)	1 (3,0%)	2 (6,1%)	3 (9,1%)	5 (15,2%)
<b>Sum</b>	<b>14 (42,4%)</b>	<b>19 (57,6%)</b>	<b>11 (33,3%)</b>	<b>22 (66,7%)</b>	<b>33 (100,0%)</b>

As seen in table 3 and 4, pre-service Biology teachers have good record for the three subjects. None of them gets C. In other words, all pre-service Biology teachers graduate with good mark. Likely, for their GPA, none gets GPA less than 2.80. Meanwhile, the respondents from in-service teachers also have sufficient qualification, especially in terms of educational background, teaching experience, and certification. In term of educational background (Table 5), almost all of them meet minimum academic qualification (only 3.0% have not met the qualification) and come from respective field of study. In term of certification (Table 6), most of them (90.9%) have had teaching certificate. Based on these profiles, it implies that both Pre-service and in-service teachers in Pekanbaru have relatively good

qualification. It indicates that both pre-service and in-service teachers will have capability to apply *Technological Pedagogical Content Knowledge (TPCK)*.

### 3.2 TPCK of Pre-Service and In-Service Bioogy Teachers

#### 3.2.1 Technology Knowledge (TK)

*Technological knowledge* is a knowledge about technology in which by having this knowledge will help us to use and learn the technologies available (Jordan, 2011). This is a basic knowledge to utilize and operate various technology products. In case of digital technology, it includes operating system, hardware, and ability to use software, such as word processor, *spreadsheet*, *browser* and *e-mail*.

Based on data analysis, the *TK* profile obtained of pre-service and in-service Biology teachers in Pekanbaru is presented in table 8.

Table 8. *TK* Score of Pre-service and In-service Biology Teachers in Pekanbaru (see APPENDIX)

Mean *TK* score of pre-service Biology teachers in Pekanbaru is at very good criteria (Table 8). It shows that the ability of pre-service Biology teachers in technology is sufficient, especially in using programs and internet. Meanwhile, the mean *TK* score of in-service Biology teachers in Pekanbaru is at enough criteria (Table 8). It implies that teacher's ability in using technology still needs to be developed. The lowest score is on statement of knowing how to overcome computer technical problems with less criteria. It implies that teachers seem to be unable to overcome technical problems, like installing programs, removing programs, and any other technical problems on computer.

The highest mean of both pre-service and in-service Biology teachers have is on the statement of storing data on digital media, with very good criteria. Data and information available nowadays are mostly in form of digital data, thus it requires people to have ability to store these data in digital media, such as *flashdisk*, *CD*, *memory card*, and *DVD*.

Pre-service and in-service Biology teachers in Pekanbaru also have a good awareness to follow the development of available technology. It was considered important, for the technology always develops time to time. Mishra and Koehler (2006) state that as the technology continues to evolve, the technology knowledge also continues to change along with it. Various technologies will inevitably change and may even disappear within the coming years. Therefore, the ability to learn and adapt to new technology is a very important thing.

#### 3.2.2 Pedagogical Knowledge (PK)

*Pedagogical knowledge* is teacher's knowledge about the various implementation, strategies and methods to support students' learning (Koehler et al., 2014). Pedagogical knowledge is in line with pedagogical competence on the UU RI No. 14/2005 about Teachers and Lecturers. Indonesian Government Regulation No. 19/ 2005 explains that pedagogical competence is teacher's ability to manage learning consisting of understanding students, planning, learning implementation, evaluating learning outcomes and actualizing potential of all students.

Based on data analysis, the PK profile obtained of pre-service and in-service biology teachers in Pekanbaru is presented in Table 9.

Table 9. *PK* Score of Pre-service and In-service Biology Teachers in Pekanbaru (see APPENDIX)

Mean PK score of both pre-service and in-service Biology teachers in Pekanbaru is at good criteria (Table 9). It means that both pre-service and in-service Biology teachers in Pekanbaru have already had a good pedagogical knowledge and have been able to implement it in teaching and learning process. However, total PK score of in-service teachers is higher than the score of pre-service teachers, which can be seen in the item of able to manage and control the class well.

Ability to manage and control the class has the highest mean score on the biology teacher, with a very good criteria. This shows that teachers have confidence in managing and controlling the class. According to Margunani and Fatimah (2007), classroom management is one of teacher's primary tasks. Classroom management is intended to create a conducive learning environment for students in order to achieve the objective of effective teaching. Meanwhile, for pre-service teachers, score of the ability to manage the class is the lowest of other items, but has been at good criteria.

The lowest mean obtained from in-service biology teachers is at the item of using various learning strategies, but still at good criteria. Learning strategy mastery is an important part of teachers, especially mastery of learning strategy that emphasizes students to actively seek knowledge independently and takes into account their uniqueness and prior knowledge (Arnyana, 2007)..

This good criteria of pedagogical knowledge of in-service Biology teachers in Pekanbaru is supported by the finding that 93.9% of them are from Biology Education. Having a Teachers Training major as their educational background indeed gives a positive contribution towards their pedagogical competence. Teachers Training major has equipped its graduates with a number of teaching competency, such as pedagogical competence, which is a characteristic of Institute of Educational Personnel (LPTK).

### 3.2.3 Content Knowledge (CK)

Content knowledge is a knowledge of concepts, theories, ideas, organizational frameworks, knowledge of evidence, as well as the practices and approaches to develop such knowledge ( Shulman, 1986).

Based on data analysis, CK profiles obtained of pre-service and in-service Biology teachers in Pekanbaru is presented in Table 10.

Table 10. *CK* Score of Pre-service and In-service Biology Teachers in Pekanbaru (see APPENDIX)

Mean CK score of pre-service Biology teachers in Pekanbaru is at good criteria (Table 10). It implies that these pre-service and in-service teachers already have a good confidence in terms of Biology knowledge. Overall, there is no significant difference among each score from each item except in the item of following seminars or activities related to Biology which has lowest score of all. It implies that participation of pre-service and in-service teachers in activities aimed to develop their knowledge still needs to be improved.

For the item of using latest sources (such as books, journals) to enrich Biology repertoire of pre-service teachers is at very good criteria. It shows that compared to in-service teachers, pre-service teachers are more active in exploring new sources, like books and journals to develop their knowledge. According to Arnyana (2007), teachers must master the teaching materials in their field thoroughly. To be able to do so, teachers must have a habit to browse library and other sources independently.

### 3.2.4 Technological Pedagogical Knowledge (TPK)

*TPK* is a knowledge of how various technologies can be used in teaching and the use of these technologies can change the way teachers teach (Schmidt et al., 2009). Harris et al. (2009) added that TPK in general is a teacher's understanding in order to be able to use the technology for pedagogical purposes.

Based on data analysis, TPK profiles obtained of pre-service and in-service Biology teachers in Pekanbaru is presented in Table 11.

Table 11. *TPK* Score of Pre-service and In-service Biology Teachers in Pekanbaru (see APPENDIX)

Mean TPK score of pre-service Biology teachers in Pekanbaru is at very good criteria, while TPK of in-service teachers is at good criteria (Table 11). Lowest mean obtained from teachers is on item of using internet facility to communicate with students and is at enough criteria. It shows that teachers have not yet using internet facilities to communicate with their students optimally.

According to Yaumi (2011), the use of communication media such as the internet has built a

new model of interaction in learning these days. Interaction between teachers and students is not only done through face-to-face interaction but also performed with the communication media. With this information technology, teachers can provide service without having to deal directly with students.

### 3.2.5 Technological Content Knowledge (TCK)

TCK is a knowledge of the interrelationships between technology and content (Koehler et al., 2014). This knowledge invites teachers to understand that the use of a particular technology can change the way they understand the concept of a particular content (Schmidt et al., 2009).

Based on data analysis, TCK profiles obtained of pre-service and in-service Biology teachers in Pekanbaru is presented in Table 12.

Table 12. *TCK Score* of Pre-service and In-service Biology Teachers in Pekanbaru (see APPENDIX)

Mean TCK score of pre-service and in-service Biology teachers in Pekanbaru is at good criteria (Table 12). It means that pre-service and in-service teachers have been able to integrate technology knowledge and Biology content knowledge. In other words, teachers are already using technology in learning and developing their respective subject. However, the lowest mean is at the item of knowing computer applications related to Biology. It shows that teachers are still lack of knowledge regarding computer application related to Biology. In fact, there are various of such applications. For example, there is a 3D human anatomy (Google Body Browser) to learn anatomy of human body, Geographic Information System (GIS) to learn biodiversity, internet-based Biology Experiment simulator, (<http://phet.colorado.edu>), *virtual lab*, and so on. These applications can be used to help teachers to understand the concepts and application of Biological science. However, based on the findings of the research, Biology teachers in Pekanbaru are limited to use Google search engine only to help them find references in the form of texts or images.

### 3.2.6 Pedagogical Content Knowledge (PCK)

PCK is the prevailing pedagogic knowledge for teaching specific content. This knowledge includes to know what teaching approaches fit the content and also to find out how the content elements can be arranged for better teaching (Mishra and Koehler, 2006). Shulman (1987) argues that PCK also includes the understanding of what makes a particular material is easy or difficult to learn.

Based on data analysis, PCK profiles obtained of pre-service and in-service Biology teachers in Pekanbaru is presented in Table 13.

Table 13. *PCK Score* of Pre-service and In-service Biology Teachers in Pekanbaru (see APPENDIX).

Mean PCK score of pre-service teachers is at good criteria, while score of in-service teachers is at very good criteria (Table 13). It shows that these in-service teachers have applied PCK well, especially in preparing their own lesson plans and in selecting approaches and learning strategies appropriate to the biology material. This shows that the biology teachers in Pekanbaru have already had confidence in designing their own learning by observing the strategy and the characteristics of the material to be taught.

Teachers are supposed to have adequate PCK, because pedagogical knowledge and knowledge itself can not be separated in the learning activities. Savas (2011) argues that it is impossible to teach a subject without content or pedagogical knowledge, as well as to implement pedagogical knowledge without content or subject matter. Therefore, PCK is considered very important to be mastered by the teachers.

### 3.2.7 Technological Pedagogical Content Knowledge (TPCK)

TPCK is a knowledge needed by teachers to integrate technology into the teaching of a particular material. Teachers must have an intuitive understanding of the complex interactions between the three basic components of knowledge, namely PK, CK, and TK, by teaching a particular material using pedagogical methods and appropriate technology (Schmidt et al., 2009). TPCK has advantages over previous concepts, the PCK, such as in developing instructional design, learning models and strategies, assessment system, as well as in curriculum design, in which all of this is integrated with ICT. Thus, TPCK contributes significantly to changes and learning paradigm (Muslim et al., 2012).

Based on data analysis, TPCK profiles obtained of pre-service and in-service Biology teachers in Pekanbaru is presented in Table 14.

Table 14. *TPCK Score* of Pre-service and In-service Biology Teachers in Pekanbaru (see APPENDIX)

Mean TPCK score of pre-service and in-service teachers in Pekanbaru is at good criteria (Table 14). That is, both pre-service and in-service teachers have been able to apply TPCK well. This is particularly noticeable in the item of selecting learning strategies and technology which are relevant to Biology material to be taught in the classroom. This item of the statement has the highest mean and is at very good criteria.

Item of Applying different learning strategies and using varied computer applications in learning Biology has the lowest mean of the other items. It can also be seen in the response of the open questionnaire, in which the teachers generally only utilize Microsoft Powerpoint in biology learning. Varied learning strategies and technology can increase students'

interest that then will have an impact on learning outcomes.

Overall, description of the ability of Pre-service and In-service Biology Teachers in Pekanbaru in applying TPCK is presented in Figure 2 below.

Figure 2. Mean Score of TPCK Sub domain of Pre-service and In-service Biology Teachers in Pekanbaru

In general, based on Figure 2 it can be seen that

the mean of TPCK sub domain of pre-service teachers is better than is the in-service teachers, especially at TK subdomain. This is because generally students are very familiar with technology products. However, there is a mean of TPCK subdomain of pre-service teachers which is lower than in-service teachers, they are at PK and PCK subdomain. It might be due to the teaching experience, in which in-service teachers must have longer teaching experience so that their pedagogical knowledge can be developed adequately. Meanwhile, the pre-service teachers' teaching experience is limited to microteaching, so the development of pedagogical capabilities still needs to be improved.

For respondent teachers, TK subdomain is relatively low compared to the mean of the other subdomains and classified in enough criteria. It is followed by TPK, TCK and TPCK subdomain (Figure 2). It can be concluded that the subdomain that contains elements of the technology is still relatively low compared to the subdomain that does not contain elements of technology. This shows that teachers' competence in the field of technology still needs to be developed.

The factor of age and participation in computer courses are related to technology knowledge of these teachers. At the beginning of the study, the result of interview done towards teachers who are members of Biology Teacher Forum (MGMP) of High School in Pekanbaru showed that age was one of the factors affecting the ability of teachers to master the technology. This is in line with what was found by Kazu and Erten (2014), that there is a significant relationship between age and TK. When getting older, the teacher is usually no longer familiar with the various technologies and their interest in technology is also declining.

Subdomain which has the highest mean score is PCK and it is classified in very good criteria. This is followed by PK and CK subdomain with good criteria. This shows that Biology teachers in Pekanbaru already have confidence in pedagogical competence and have a good mastery of Biology materials. One of supporting factors is the latest education of these

teachers, in which around 97.0 % already meet the minimum academic qualification and even of 11.1 % has had master's degree. Furthermore, around 93.9 % of teachers are those whose educational background is Biology Education, of which it is becoming one of the factors that strongly support the pedagogic competence and mastery of the biology teachers. The rest, as much as 6.1 % of teachers have the

educational background of Biology (non-education) and none has come from outside the field of respective subjects. In other words, the overall Biology teachers in Pekanbaru have adequate and appropriate competence in term of the respective subject.

In general, the ability of the biology teachers in Pekanbaru in applying TPCK is at good criteria. It is presumed so based on educational background, certification and teaching experience of the teachers, which are in general at good qualifications. In terms of educational background, most biology teachers in Pekanbaru are already highly qualified and also none comes from outside the education field of respective subject, namely the biological sciences.

Furthermore, in term of the certification, 90.9 % of teachers claimed to have passed the certification. Professional teacher is an absolute requirement to create high quality of education systems and practices. Mulyasa (2012) states that one of the indicators of teacher certification standards is a teacher mastery of the competency standards in field of learning technology.

Teaching experience is also one of factors that contributes to the ability of teachers in applying TPCK. Most of biology teacher in Pekanbaru (57.6 %) have the experience of teaching for more than 20 years. Hosseini and Kamal (2013) found that there is a significant effect of teaching experience to TPCK. The longer the teaching experience, the higher the TPCK they have.

In the TPCK framework, teachers are not only required to develop pedagogical knowledge or content knowledge, but they are also required to find out how to present the subject matter with the appropriate teaching and learning strategy and is able to utilize the technology so that the learning activity can run effectively and efficiently. In the 2013 curriculum, each subject teachers are also required to integrate ICT in every lesson. In addition, Muslims et al. (2012) argue that TPCK framework is also in line with the demands of 21st century learning in which the mastery of ICT to be a prerequisite for teachers.

TPCK that a teacher has is also expected to be developed continuously in order to accelerate the

achievement of the National Education Standards, especially for Standard of Process, Content and Evaluation. Standard of Process, as stipulated in the Regulation of the Indonesian Minister of Education and Culture of the Indonesia No. 65/2013, includes planning the learning process, the implementation of the learning process, as well as evaluating the learning process to improve the efficiency and effectiveness of the achievement of the competence of graduates. To improve the efficiency and effectiveness of learning, we need to use ICT. Ingram (in Cholis Sadijah, 2009) states that by using ICT, learners can immediately focus on learning. Thus, teachers can use more time to facilitate and discuss with learners because generally, ICT-assisted learning has been prepared well in advance.

#### 4 CONCLUSIONS

Overall, it is known that TPCK of pre-service and in-service Biology teachers in Pekanbaru is at good criteria. Thus, they have been able to organize ICT-based learning which will create an effective and efficient learning for the fulfillment of the National Education Standards, especially in terms of standards of content, process and evaluation.

**Title: Reflections of the Teacher Implementers**  
**Types of Paper: Research Paper**  
**Strand: Issues about Leading Lesson and Learning Study**

JAZIMAH MUSA<sup>1</sup> NOR AZURA ABDULLAH<sup>2</sup>  
*Ministry of Education, Brunei Darussalam<sup>1</sup>*  
*University Brunei Darussalam, Brunei Darussalam<sup>2</sup>*

**Abstract** :Lesson Study of 2014 in Brunei Darussalam focuses on Year 1 and Year 4 primary mathematics and there are 12 schools involve with this lesson study project. In Brunei Darussalam, lesson study for primary mathematics has been carried out, in small and big scale, since 2009. One of the components in the project is teacher reflection. This important exercise for teacher implementers requires them to reflect on their own teaching so that they can develop awareness and learn to think and reflect on their classroom practices. Furthermore, it hopes to help teachers to improve their classroom practices in the next cycle of lesson implementation. Four questions were asked to help the teacher implementers to focus their reflections, namely, how do they feel about their lesson, what their students have learned, which tasks or activities were most or least successful and what are their consideration for the next lesson. The nature and common themes in these reflections will be further explored in this study.

**Keywords:** Reflection; Lesson Study; Primary Mathematics

**1 INTRODUCTION**

In Brunei Darussalam, Lesson Study for primary mathematics has been carried out, in small and big scale, since 2008. Lesson Study is in fact under literacy and numeracy initiatives, one of the Ministry of Education’s grand initiatives in realising the vision of ‘Quality Education towards a Developed, Peaceful and Prosperous Nation’. In 2014, there are 12 government schools involved in this Lesson Study project and one of the components in this project is teacher reflection. This important exercise for teacher implementers requires them to reflect on their teaching so they can engage in reflective practice in order to develop awareness and learn to think and reflect on their classroom practices. Furthermore, it hopes to help teachers to improve their classroom

practices in the next cycle of lesson implementation.

**2 LITERATUR REVIEW**

In Lesson Study, one component for teacher professional development is the reflection of teachers on their instructional strategies. This is because in Lesson Study, the lessons are reiterated in few cycles and reflection is crucial between each cycle to develop a more effective lesson. Thus the main objective for teachers to exercise reflective thinking is to develop their professional growth in terms of reasoning of their practiced instructional strategies and their success on pupils’ learning outcomes.

A reflective professional invests time in thinking through his own actions and judgement in his professional work. He thinks back at a difficult situation in the classroom and looks at the situation from a variety of angles. He engages other teachers in discussing practical issues and generates knowledge and insights into everyday problem (Ng P.T, 2005). One way to cultivate

teacher’s reflective thinking is through thinking out loud what they think and write their thoughts in terms of journal writing.

In this study, researchers will study the components of reflection done by the teachers. The study will based the components on Lee (2000 & 2005) model that includes attitudes, process, content and depth.

The criteria to assess the depth of reflective thinking are as follows:

Recall level (R1): one describes what they experienced, interprets the situation based on recalling their experiences without looking for alternative explanations, and attempts to imitate ways that they have observed or were taught.

- Rationalization level (R2): one looks for relationships between pieces of their experiences, interprets the situation with rationale, searches for “why it was”, and generalizes their experiences or comes up with guiding principles.
- Reflectivity level (R3): one approaches their experiences with the intention of changing/improving in the future, analyzes their experiences from various perspectives, and is able to see the influence of their cooperating teachers on their students’ values/behaviour/achievement. (Lee, 2005, p 703)

### 3 METHODOLOGY

The Lesson Study program has been implemented in Brunei Darussalam since 2008. Teachers involved are yearly briefed on what is required of them to present towards the end of the year to the Ministry of Education.

They are guided throughout the year, monitored and given feedback for further improving their pedagogical skills. For purpose of this study, a total of 9 teachers from year 1 and year 4 had participated. The samples selected were those who have been actively involved as the implementers of Lesson Study as well as the pioneer in this program, hence purposive sampling was applied in this study. They were regarded to be well acquainted with the system of Lesson Study. All the participants were given a list of checklist on what to include in their reflections. They were asked to document their reflections of their lessons in the form of a journal. It consisted of 4 main areas encompassing their affection of their lessons, the knowledge gained by their students out of the lesson, the most and least successful activities conducted in class and what would they do differently to make the lesson become more effective. The documented journals are used by the researchers to gauge how far the implementers had reflected on their classroom practices. In this study, a total of 18 artefacts were obtained from the implementers. Based on the instruments used to collect the data, this study was more qualitative in nature as there it will be organised by using thematic analysis: looking at the patterns, themes, categories and regularities (Cohen, L et al., 2007)

This study involves 9 mathematics teachers teaching Year 1 and Year 4 of which 4 of them have less than 10 years teaching experience and the rest have more than 10 years of teaching experience. The teachers have different highest qualification ranging from A’Levels, Diploma in Primary Education, and Bachelor of Arts in Primary Education. A teacher may have more than 1 journals submitted.

### 4 LIMITATION

Based on researchers experience with the teachers on getting their reflections, only 9 out of 24 teachers wrote their reflections. Thus teachers seemed reluctant to share their reflections. Dewey (1958) suggested that teachers must be open-minded, responsible and wholehearted in the sense that teachers need to see things at different perspective, taking into account any consequences for their actions which can impact their students personally, intellectually and socially, and being committed to it wholeheartedly. Furthermore written reflections assumed to be difficult. This is because during post lesson interview, the teachers could express their thoughts better.

## Findings

From the data analysis that we have gathered, reflection journal contents consist more on recall than rationalization and reflectivity as shown in Table 1 below.

Participants	Journals	Frequency of recall	Frequency of rationalization	Frequency of reflectivity
9	18	18	13	16

Table 1: Teachers and frequency of different depth on reflective thinking

### *Recall*

Most teachers stated that they have achieved the lesson objectives. But it does not reflect much on the Lesson Study theme itself which should focus more on developing the four main skills; thinking, communication, problem solving and reasoning skills.

Example

Teacher A: Overall of my lesson, about 60% of my lesson objectives are achieve

Teacher B: For me, the lesson still went well and my objectives were achieved. Teacher E:

During this lesson, the objectives have been achieved.

### *Students Behaviour*

Teachers described students affective domain in terms of feelings, emotions and attitudes that they have observed during the lesson.

Example:

Teacher C: During the group work activity, pupils were very cooperative to each other. Pupils like colourful objects/pictures.

Teacher D: Pupils like the fishing shape games.

Teacher H: Pupils were happy to use different types of multiplication method in solving the problem.

### *Students Knowledge*

Teachers interpreted and described what their students have learnt in the lesson based from what they have observed.

Example:

Teacher A: My pupils are able to understand the concept of adding the numbers without regrouping.

Teacher C: Pupils are able to match the shapes to the correct pictures. For the time being, pupils were able to see and tell the name of the shapes immediately by showing the objects. Teacher E: They can find the answer in three ways that was bar model, repeated addition or column method.

### *Teachers' Pedagogical Knowledge*

Teachers explained how they deliver the lesson by recalling back on their experiences. Example:

Teacher A: The video showed to the pupils on addition was very clear and make pupils understand the concept better.

Teacher B: By using concrete materials the pupils were so excited to participate.

Teacher C: When I showed concrete objects to pupils, they could see the shapes immediately. I showed them the name of the shapes on a card and stick it on the board. Pupils can see it clearly and read it out with teacher

### *Classroom Management*

Class control and time management were main issues and concerns experienced by teachers. Example:  
Teacher A: I managed to handle my lesson but unable to control the class as they were very active and playful.

Teacher H: I didn't have enough time for a proper plenary at the end. Most pupils worked well during the group activity but some were off task, playing with the teaching aids.

### *Rationalization*

There is not much on rationalization done by teachers when reflecting on their lessons. They focused more on these two components; students behaviours during the lesson activity and students knowledge through the lesson activity.

### *Students behaviours during the lesson activity*

Teachers described students affective domain and interprets with rationale of why such behaviours shown during the lesson.

Example:

Teacher B: Pupils really enjoyed doing the group activity. I use a real picture for every problem.

Teacher D: Only 1 group need to practice more guided practice because they are not working together during the activity.

Teacher F: I tried ask/pose open ended questions so that the pupils active in giving response instead of close ended responses.

### *Students knowledge through the lesson activity*

Teachers explained only on procedural knowledge. It does not extend to conceptual knowledge in which there is no explanation on the mathematical processes on how the students were able to do it.

Example:

Teacher A: Pupils easily get ideas on how to add the numbers using the counters.

Teacher D: They make many mistakes in independent practice because they are asked to draw the base 10 blocks and subtract by cancelling.

Teacher G: My pupils had learnt a lot from this lesson. They showed varieties of methods to solve the multiplication problem and they willingly presented their ideas with others.

### *Reflectivity*

Based on the transcripts, teachers mostly reflected on their classroom management in terms of class control and time management.

Example:

Teacher A: I would like to improve my class control.

Teacher E: I will change the members of the group so they can work as teamwork. Teacher F: Time management needs improvement.

Teacher H: I will manage my time properly in the future and prepare extension sheet for pupils who have finished their work early.

Teachers also reflect on their pedagogical content knowledge such as improving their questioning techniques, more concrete materials, give clear and simple instructions.

Example:

Teacher A: I would like to improve on my questioning techniques.

Teacher B: I would give a clear and simple instruction during the group activity. I would try to give them more useful material that they can use together.

Teacher E: I will give them more challenging questions for group activity.

Teacher F: Improve on questioning techniques, pose open-ended question. I need to practice more on posing effective question so that my pupils able to communicate effectively, allow them to think and improve their problem solving skills.

## 5 DISCUSSION

Based on the findings, teachers recall on students behaviours, students’ knowledge, their pedagogical content knowledge and classroom management; rationalised more on the lesson’s tasks activities; and deep reflection on classroom management and pedagogical content knowledge such as improving their questioning techniques, more concrete materials, give clear and simple instructions. Teachers’ rationalisation thinking was only focused on the procedural knowledge of the students. Focusing teachers’ professional development towards having an understanding of children’s mathematical thinking promotes teachers to teach concepts and problem solving rather than procedural skills to the students (Fennema et al.,1996). Reflectivity was done mostly on their instructional presentations. Most teachers concern with the changes to be made to their instructional practices such as classroom management and pedagogy. Nothing specific was mentioned on the lesson tasks or the cognitive aspect towards children’s learning.

Based on the forms and functions of teachers reflections (Danielowich, 2007) originally based on Van Manen’s Level of Reflectivity, the reflections done by the teachers are still at technical level of reflection. Although the depth of teachers reflection ranging from recall to reflectivity but the content of the reflections very much on “teacher management of time, space and students behaviours in classroom, content and proses of lesson structure.”

Teachers practising technical reflections would change the means of teaching just to reach the given learning outcomes defined by authorities in

education. In order to go beyond these limitations, teachers are encouraged to reflect interpretively by focusing on students’ learning needs and balance it with the nation’s prescribed curriculum.

## 6 RECCOMENDATION

Teachers need training and practice in articulating their thoughts and feelings. In this case, teacher should be given different opportunities to reflect and think critically through different range of activities. As Thomas (2004) mentioned in his book that one of the components of ‘The Farell Model of reflective practice’ suggests that teachers can engage in a range of activities that facilitates reflection such as through group discussions, classroom observations and journal writing. Thomas (2004) also added that reflective teachers have choices, and reflection is only half of the equation; the other half is action. Once teachers come to understand the how and why of what they do and have done, they can then take steps that will carry them along the path to better teaching.

Justification on reflections is required for teachers to change the way they evaluate their lesson, making it a real reflection instead of comments. Smyth (1987) proposed some series of questions for teachers to think when doing reflection; What do I do as a teacher? What does this mean to me? How did I come to be this way? How might I do things differently? These set of question will give opportunity to teachers to reflect on their theories, values and beliefs that constitutes good teaching which will make them aware of what they need to do to improve and meet the school’s standards.

**Abstract:** The main focus for this lesson study was to explore ways of leveraging on Information and Communication Technologies (ICT) (i.e. 10’M platform) to improve Primary 1 students’ writing skills in sentence construction. The first lesson plan was carefully crafted through setting meaningful and thinking questions pitched at the students’ level. During the post-conference, it was articulated that the pedagogical structure of the 10’M programme was not applied. The programme required 50% of teacher teaching time and 50% of student-centred activity. Suggestions to include rubric and peer evaluation, assign different ability tasks for students were made to further enhance the second lesson. These refinements were made to ensure self-directed learning and collaborative learning. A refined lesson plan was drawn up looking into discussion via blog and providing differentiated tasks for the different ability group, henceforth maximised the use of 10’M platform. All the students benefited from the second lesson plan. A comparison of results showed that the lower ability and middle ability group students’ command of language in terms of vocabulary exposure were greatly enhanced. The higher ability group were also able to write better in the second lesson. Therefore, 10’M programme is an effective platform to support the teaching and learning of writing for students.

**Keywords:** ICT, writing skills, blog, rubric, peer evaluation, differentiated, real time

### 1 INTRODUCTION

The origin of ‘Lesson Study’ was from Japan where is more common known as “*jugyokenkyuu*”. Lesson study is a process where teachers engage in professional conversations to continually improve the quality of the experiences they provide for their students. Teachers think about their students and identify important gaps between the aspirations they have for them and the results that they are actually achieving (Makoto Yoshida). The process of studying deeply into the issues revolving around a lesson plan will help a team of teachers to improve their teaching through collaborative efforts. It is with such aim that a lesson study team was formed in St Anthony’s Primary School since 2013.

The team consisted of 2 Malay Language teachers who were teaching both the upper and lower primary students. The lesson study mentor, Educational Technology Department (ETD) Officer Dr Suryani Atan, briefed the team members of their roles and what was expected in a lesson study and acted as the knowledgeable other in giving guidance to the lesson study team on issues related to professional practices.

### 2 PROBLEM IDENTIFICATION

Based on the Malay department End of Year Review in 2012, the department found that students were unable to construct grammatically correct sentences. A lack of necessary vocabularies and influence of English Language sentence structure were identified as the root causes for this concern. As such, the department would like to resolve this issue by developing the writing skills early among primary 1 students.

### 3 RESEARCH AND IMPLEMENTATION

The decision to leverage on ICT was based on the remarks made by Ms Ho Peng, Director-General of Education and Chair of the Mother Tongue Language Review Committee. She noted that ICT will play an increasingly larger role in the teaching and learning of mother tongue languages (Koh, 2010). “Children in fact connect very readily and easily with ICT. So,

I think in terms of teaching and learning in the classroom, we really need to use ICT to engage the next generation,” said Ms Ho.

10’M Aksara is an online portal specially designed by ETD for schools to leverage on in the teaching and learning of Malay Language. The features of the 10’M portal include provision of reading passages and inclusion of discussion and evaluation platform which are found suitable to enhance the learning of the students. These affordances of an array of ICT tools also enable group work and collaboration with peers in an online learning environment. However, 10’M Aksara is not just a portal. It is a complete programme that includes professional development of the teachers and a pedagogical structure that promotes 50% teacher teaching time and 50% student-centred time.

Putting fluency first requires that we allow our students to ease into new, unfamiliar forms. It means offering students many opportunities to read examples of the forms they will eventually write (Dawn Latta Kirby and Darren Crovitz, 2013). Providing many reading passages for the students will enable them to model the grammatically correct sentences found in the passage. This helps students to recognise the correct sentence structure. 10’M Aksara provides readily crafted passages pitched at the different level. These passages come with beautiful illustration to excite the young readers. New vocabularies found in the passages provide more model sentences for students to consolidate and enhance understanding on the correct usage of vocab. It also allows ample time for online reading and self-construction of knowledge.

After reading the passage, students were encouraged to give their thoughts and opinions on the passage read (the characters, the ending and etc). Students are able to utilise the blog in the 10’M portal for online discussions with peers and teacher. As students engaged themselves through online conversation, this enhanced their confidence in typing their thoughts and putting it into words. Thinking in group encouraged students to communicate effectively as independent learner and it allows for collaborative learning. All these features on 10’M Aksara provide many varied forms of language input and chances for students to practice before they start writing.

After much scaffolding was done, students were asked to type their sentences online using the given word. Submission of tasks online as well as peer and teacher’s feedback provided room for immediate response in real time between students and teacher.

With the many features available on 10’M portal, it is thus a great ICT tool for teachers to leverage on in the teaching and learning of language.

#### **4 STAGES OF LESSON STUDY JOURNEY**

The following are the stages in a lesson study cycle the team members went through:

- 1) Planning
  - Discussed with ETD officer, Dr Suryani Atan
  - Trained students on how to use 10’M portal in Term 1
  - Drew up first lesson plan
  - Refined lesson Plan with inputs from teacher observers and ETD officers
- 2) First lesson cycle.
- 3) First lesson post-observation conference.
  - Refined lesson plan based on inputs from post-observation conference
- 4) Second lesson cycle.
- 5) Second lesson post-observation conference.
  - Analysed result and consolidated learning.
- 6) Analysis of Data
- 7) Reflection of lesson study cycle by team members
- 8) Generating the report
- 9) Planning the next steps

#### **5 PLANING**

The team took into consideration several factors listed below when crafting the lesson plan.

Lesson study would only begin in Term 2 as students had just entered the primary education and they needed time to adjust to the school system. As the Primary One class comprised of students with mixed ability and they were new to 10’M Aksara portal, teacher must not set too many tasks in one lesson. Teacher would make use of features of 10’M portal eg; reading passages resources, rubrics and evaluation to promote self-directed and collaborative learning. The lesson plan should be carefully crafted with meaningful and thinking questions, pitched at different levels to provide students with different ability with a sense of achievement.

The class was divided into ‘higher ability’ group, ‘middle ability’ group and the ‘low ability’ group. This was done to facilitate teachers who came into the lesson as ‘observers’ for focus observation on the thinking processes of the different ability-groups. Seating arrangement plan of the three ability groups for the class were drawn up and shared with the observers so that they could attached

themselves to a particular group for the observation lesson.

## 6 POST OBSERVATION CONFERENCE ON THE FIRST LESSON CARRIED OUT

The team made the following observation of the first lesson conducted. Teacher used songs to introduce adjectives aroused students' interest thus enticed students' active participation.

On the other hand, in the lesson, students used only 1 tool in the portal for typing their sentences. They did not use the other features found in the portal to do peer checking and peers evaluation. The team also observed that students needed more scaffolding on adjectives used to describe a person. Students do not have enough time to gather more information about their friends before organizing their thoughts. Based on these points raised, the lesson plan for the second lesson was revised.

### Refinements of lessons include the following:

1. The instructional objectives were re-written to make them clearer.
2. More model sentences would be provided and discussed to enable students to understand what was expected in the written assignment.
3. Teacher would assign differentiated tasks for students. That implied designing more guided activities for the LA group and encouraging more students from the LA and MA to ask questions to clarify queries.
4. E-book in the 10'M Aksara portal would be assigned to provide student with more vocabulary and reading at their own pace.
5. Simple rubrics would be uploaded for peer evaluation in next lesson.
6. Lesson to include use of the other tools available in the 10'M portal: rubrics, evaluation and reading material.
7. Blog in the portal would be used for group discussion prior to the lesson.
8. Teacher needed to point out mistakes such as spelling errors and punctuation during class discussion.
9. Time management could be improved by not planning too many activities for each lesson and plan with the aim to maximise the use of the portal.

## 7 POST OBSERVATION CONFERENCE ON THE SECOND LESSON CARRIED OUT

A much better lesson was conducted taking into consideration points mentioned above. For the second cycle, the lesson were able to achieved the 10'M programme requirement of 50% student centred activity and 50% teacher teaching time. Additional tools in 10'M Aksara and appropriate differentiated tasks were assigned. Group discussions were carried out where students identified mistakes made in sentences. Students were able to complete their tasks on time as they were more familiar with the array of tools available on 10'M Aksara. Lesson objectives were met. Students enjoyed the lesson and looked forward for such lesson in future. However, there were still rooms for improvement.

### Refinements of lessons include the following:

1. Instead of assigning written assignment using Grammar tool in the portal, teacher should use the writing tool in 10'M Aksara as the writing tool has editing functions that enable students to correct their mistakes after receiving feedback from teacher and peers.
2. Students still lacked confident in using blog. More opportunities would be provided for students to use the blog tool in future class discussions.
3. Higher ability student lacked the concept on 5W1H in elaborating the writing content. More scaffolding would be needed in future lessons.

## 8 RESULT ANALYSIS

The results from the Primary 1 Malay students were collated and analysed. The summary was put together as a report.

### Lower Ability Students

Lower ability group comprised of 4 students. In the first lesson, students were not able to construct proper sentences hence in second lesson, tasks was simplified to suit their ability. Students were only required to fill in the blanks by selecting the appropriate vocabulary to fit the sentence structure. After the second lesson, students were able to construct at least two simple sentences using the vocabulary taught to them earlier.

### Middle Ability Students

Middle-ability group comprises of 4 students as well. After the first lesson students were able to construct 3 simple sentences. They were able to use some of the vocab taught earlier in the lesson. However, they were still weak in using affixes. After the second lesson, students have been exposed to many model sentences hence they have better grasp on the sentence structure. They improved on their grammar component especially on affixes. They were able to write more grammatically correct sentences within the time given.

### Higher Ability Students

Higher-ability group comprises of the other 4 students. Unlike the LA and MA group, students were assigned to construct five sentences based on the guided questions. Students were able to construct simple grammatically correct sentences but lacked the confidence to use better vocab in their sentences. After more practices and scaffolding, students performed better after second lesson. They were able to write at least three complex sentences using most of the vocab taught earlier. They were also able to write their sentences in appropriate sequence to form a story.

## 9 REFLECTION OF ALL LESSON STUDY MEMBERS

All team members wrote personal reflections on the Lesson Study Journey. All agreed that it had been a most meaningful learning for the student. We also agreed that vocabulary and understanding basic sentence structure are very important in expressing thoughts and feelings, contributing ideas and relating a story through writing. All teachers had an enriching journey.

## 10 WHERE DO WE GO FROM HERE?

The team is ready to embark on a new Lesson Study on Comprehension Skills and collaborative work planned for the students. Better questioning from the students could also be encouraged to make them be more involved in critical thinking and be an independent thinker.

## 11 CONCLUSION

The Lesson Study carried out was one of the highlights of the roles of teachers as researchers in the classroom. It was a refreshing change of role which allows in-depth sharing and collaborating of Malay teachers with ETD officers. It is with the common expectations and goals of the lesson in mind that we come up with meaningful activities to improve the learning of the students. It has been a meaningful journey that also helped us to become more effective teachers in delivering quality education.

## 12 ACKNOWLEDGEMENT

Many people have directly or indirectly contributed to the success of this Lesson Study Journey. First, we would like to express our appreciation for the support of our school leaders, Ms Christina Teo, Mdm Cheryl Teo and Mr Jeffrey Aw. We were selected to share on our insights on the findings of the lesson study conducted. We were given the opportunity to showcase 10'M lesson study journey at the 10'M Seminar in 2013 and Lasallian Learning Fest in June, 2014.

## Innovative Learning for Entrepreneurship Using Lesson Study for Vocational School

Widiyanto<sup>1</sup>

<sup>1</sup>Economic Education, UUNNES., Indonesia  
spawiro@gmail.com

**Abstract:** One the purpose of Vocational High School is to create the new entrepreneur, meanwhile the teacher in vocational school mostly focus in how to prepare the graduate as a labor. The entrepreneurship subject only as one of the subject in theory not in practical. The other side the student also lack in motivation to be entrepreneur. The preparation for this subject also have many problems such, the materials, the competence of the teacher and also the equipment. Through the lesson study the group of the teacher will be drive to prepare the equipment of learning (syllabus, Lesson Plan, Modul etc). This article has objective to design the group of teacher to make equipment of learning and also to practice it. Using the observation and FGD the design will be provided. The design has some function for the entrepreneur teacher such as preparation the material, have experience to practice, and make a model entrepreneur teacher

**Keywords:** Lesson Study, Vocational High Scholl, Entrepreneur

### 1 INTRODUCTION

The histories tells that if the small entrepreneur having a middle society class which is claimed by some countries, the entrepreneur had contributes a big support to the countries economic growth. The role of small entrepreneur in the economy growth are: (1) fastest economic growth process, like in Japan; (2) work field creation in America since second world war (D.L Birch; 1979 in Widiyanto, 2008<sup>i</sup>). In Indonesia small entrepreneur plays a greater role, in such a way that small entrepreneur was able to provide 99 % job opportunities, in real case small entrepreneur had absorb 63,57% of the unemployment people and only 36,43 % were taken by big industry (Widiyanto, 2008)<sup>ii</sup>.

SMK is the vocational school in senior high school level have three objectives for the graduate i. e: becoming a competence worker, and also a successful entrepreneur, and preparing the student to pursue in university studies (Depdikbud, 1997).<sup>iii</sup> problems remained in the present reveals that in the year 2013 only few graduates join in entrepreneurship and only 25% of which represent a graduates from SMK who wants to be a entrepreneur (Widiyanto, 2010)<sup>iv</sup>.

There are many challenge for the teacher in teaching entrepreneurship, the following are: (1) the lack of entrepreneurship experience; (2) there is no ready book in entrepreneurship as a material, especially material which covers theory and practice; (3) the motivation of the student in entrepreneurship learning is weak; (4) there is no best practice learning

models for entrepreneurship education; (5) entrepreneurship is a character education and implanting the character is a hard effort. (Widiyanto: Yulianto, Arief., 2013)<sup>v</sup>

The problem in teaching entrepreneurship character not only because of teacher is not has person who able be modeled as a idol. For fill the lack of idol teacher who able to be used as a model so the teacher need using Lesson study. As mention by Ibrahim (2010) <sup>vi</sup> Lesson study is a model of coaching profession through study of educator learning collaboratively and sustainably is based on the principle of collegial thing and mutual learning. Lesson study is carried out in three stages, namely plan (plan a), do (implement), and see (reflect) that these forces cycle and sustainable basis. Lesson study is one manifestation of the development of community learning (learning community). In short, the lesson study aims to improve the quality of learning through assessment of learning. According to the definition by Ibrahim its clear if the lesson plan is not the learning methods or action research, but how to make model of teacher to increasing the process of learning. Lesson study instead of learning methods, nor is it a learning approach. Actually, Lesson study is a model of coaching (coaching) professions educators through the study of learning collaboratively and sustainably is based on principles of mutual help in the kolegialitas learn to building a learning community. According to Walker (2005) Lesson study is a method for teacher professional development.

Lewis (2002) suggest there are six phases in the beginning to implement the lesson study at school. Stage 1: Forming a group lesson study, which among others include the activities of recruiting members of the group, devise a specific time commitment, scheduling meetings, and agreed to the rules of the group.

Stage 2: focus on lesson study, with three main activities, namely: (a) agree on the theme of research (research theme) long-term goals for students; (b) select the scope of the material; (c) selecting the unit of learning and an agreed goal. Phase 3: plan a learning plan (Research Lesson), which covers the activities conducted studies on existing learning, cultivate our learning instructions, requesting input from experts in the field of study from the outside (a lecturer or other experienced teachers). Stage 4: implement the learning in the classroom and observe it (observation). In this case study conducted by one of the members of the Group and the other being the observer. The Observer is not allowed to do the introduction to the course learning to teachers and students. Stage 5: discuss and analyze learning, which have been implemented. Discussion and analysis should include grain: Reflections by instructors, group member, background information, presentations and discussion of data from observational learning results, general discussion, comments from outside experts, a thank you. Stage 6: reflect on learning and plan the next steps. At this stage group members are expected to think.

According to discuss the theory in phenomena above the purpose of this study are described such as : (1) investigate the learning process of entrepreneur characteristic and the equipment assessment need ; (2) to find the model of learning to create a professional entrepreneur teacher; (3) to design the model of lesson teacher in creating professional entrepreneur teacher

## 2 METHODS

The lesson study is not only the research, but also the training methods to be a professional teacher. So the methods in doing be a entrepreneur teacher using R and D paradigm for create an effective design. The step of lesson study requirement can be used in methods to formulate the design.

To make a design we need some information so the data information wittl be collect through observation technique and then for the design using FGD for collecting data and both create the data. The data analyzing for this research is using triangulation methods.

The object of this research is the member of MGMP for entrepreneurship SMK Semarang city with the number of membership is 25. All of the

member invited to participate in this lesson study program. The Instrument of this research is questionnaire and interview.

## 2 FINDINGS AND DISCUSSION

Stage 2: focus on lesson study, with three main activities, namely

The entrepreneurship learning process had been done in Semarang City still conventional, as a education system the learning process can be divide in to three aspect:

First, Input are consisted of teacher, student, materials, and equipment. The teacher still lack in entrepreneurship experience, they have knowledge from the material books only, beside it they don't have any idea to make link between theory entrepreneurship and reality, so when they are stand up in front in the class they feel confuse and unbelieve in his/her self, so if they continue to teach only the cognitive domain able to be taught, the other domain untouchable; Student no motivation to be an entrepreneur, they don't have good motivation and low of self reliance; As long as now there is not enough good material for entrepreneurship learning, some of them only talking about theory not in practical. The equipment also not enough even is not existing.

Second, the process of learning , is not running in active learning or creative learning, just direct instruction or one way communication. So the student no have impression during the learning process.

Third, output in line with the input and process, the output also not create the student be an entrepreneur, some of SMK claimed not more than 5 % the graduate be an entrepreneur.

The good model for professional entrepreneurship teacher according to the response of the teacher, 100 % they need a teacher model as a guide in entrepreneurship teaching. They also need a book or practical reference to teach the student in entrepreneurship practice.

The design for lesson study using the step in lesson study process, but need be packaged and be managed as follows: preparation, implementation, finalization. The design can be drawn as below:

Figure 1. Design The Innovative Learning

### 3 CONCLUSIONS

The need of entrepreneurship learning process need the teacher models for increasing the quality of graduate. It will be fulfill if the teacher like to make a group and using the lesson study methods in increasing the professional teacher

## Pengembangan Media Pembelajaran Gerak pada Tumbuhan melalui Kegiatan *Lesson Study Club* di Kabupaten Pasuruan untuk Meningkatkan Keterampilan Sains dan Berpikir Kritis Peserta Didik

Trinil Windayati<sup>1</sup>, Ustadi<sup>2</sup>

<sup>1</sup>Guru SMPN 2 Bangil, Kabupaten Pasuruan

<sup>2</sup>Guru SMPN 2 Pandaan Kabupaten Pasuruan

**Abstrak:** Untuk meningkatkan kualitas pembelajaran di Kabupaten Pasuruan, Pemerintah Daerah melalui Dinas Pendidikan memilih *Lesson Study* sebagai strategi pengembangan profesi pendidik, sejak tahun 2006 sampai dengan 2012 bekerja sama dengan JICA. Kegiatan tersebut berlanjut dengan pembentukan *Lesson Study Club* (LSC) untuk lebih mengefektifkan kegiatan pengembangan profesi guru menjelang pelaksanaan kurikulum 2013 pada tahun pelajaran 2014-2015. Dari kegiatan LSC tersebut penulis mampu mengembangkan media pembelajaran gerak pada tumbuhan berupa LCD *Power Point* setelah beberapa kegiatan Plan yang dilaksanakan mulai bulan April 2014 sampai Mei 2014. Hasil media *Power Point* yang kami buat meliputi : (1) Menampilkan tayangan dalam bentuk gerak mengatupnya daun putri malu (*Tigmo Nasti*) dan membelitnya sulur markisa ke anjir (*Tigmo Tropi*), dengan demikian siswa diharapkan mampu membedakan pengertian gerak tropisme dan gerak Nasti. (2) Menampilkan gambar perbedaan fototropisme (bunga matahari) dan fotonasti (bunga *Mirabilis jalapa*) untuk lebih mengarahkan kerangka berpikir peserta didik. (3) Soal-soal evaluasi berupa visualisasi gerak sulur markisa, mengatupnya bunga venus saat ada serangga. Penyampaian materi gerak pada tumbuhan dengan menggunakan media LCD *Power Point* bisa meningkatkan keterampilan berfikir kritis peserta didik kelas VIII D di SMPN 2 Bangil. Hal ini ditunjukkan dengan 85 % kelompok yang dibentuk mampu membedakan pengertian gerak tropisme dan gerak nasti dan 90 % siswa bisa menjawab pertanyaan evaluasi. Dari hasil diskusi refleksi saat LSC tersebut, disarankan menggunakan Media LCD Powerpoint untuk meningkatkan keterampilan sains dan berpikir Kritis peserta didik apabila, di Lingkungan Sekolah mengalami kesulitan menyediakan media alaminya.

**Kata Kunci :** *Lesson Study Club*, Media Pembelajaran, Keterampilan Sains, Berpikir Kritis

### 1. LATAR BELAKANG

Untuk meningkatkan kualitas pembelajaran di Kabupaten Pasuruan, Pemerintah Daerah melalui Dinas Pendidikan memilih *Lesson Study* sebagai strategi pengembangan profesi pendidik, sejak tahun 2006 sampai dengan 2012 bekerja sama dengan JICA, Kegiatan tersebut berlanjut dengan pembentukan *Lesson Study Club* (LSC) untuk lebih mengefektifkan kegiatan pengembangan profesi guru menjelang pelaksanaan kurikulum 2013 pada tahun pelajaran 2014-2015.

Pembelajaran akan berhasil apabila didukung dengan perencanaan (*lesson design*) yang baik dan penentuan media pembelajaran yang mendukung tercapainya tujuan pembelajaran di kelas. Hal tersebut yang mengilhami pelaksanaan *plan LSC* yang terjadwal di SMP Negeri 2 Bangil, pada tanggal 23 Maret 2014 untuk materi gerak pada tumbuhan kelas VIII.

Pemilihan media *power point* untuk penyampaian materi gerak pada tumbuhan karena kami telah mencoba video gerak tumbuhan yang diunggah dari *You Tube* dan setelah kami diskusikan cukup mewakili pemahaman konsep untuk membedakan gerak tigmotropisme dan tigmonasti. Video tersebut disajikan dalam bentuk *power point* untuk lebih komunikatif dan interaktif

dengan siswa. Kemudian ditinjau pula dari karakter siswa Kelas VIII D yang akan dibuat *open class* adalah siswa yang tergolong pasif dan kurang motivasi belajarnya, sehingga rata-rata hasil belajarnya rendah. Dengan pemakaian media tersebut diharapkan mampu meningkatkan keterampilan Sains dan berpikir kritis siswa di kelas VIII D SMPN 2 Kabupaten Pasuruan.

### 2. RUMUSAN MASALAH

Berdasarkan latar belakang masalah tersebut di atas maka dirumuskan masalah sebagai berikut : Apakah pemanfaatan media *power point* pada materi gerak pada tumbuhan mampu meningkatkan keterampilan sains dan berpikir kritis peserta didik di kelas VIII D SMPN 2 Bangil Kabupaten Pasuruan ?

### 3. TUJUAN

Penelitian ini dilaksanakan untuk memperoleh gambaran yang jelas tentang peningkatan keterampilan sains dan berpikir kritis peserta didik kelas VIII D SMPN 2 Bangil Kabupaten Pasuruan melalui pemanfaatan media pembelajaran dengan program *power point*.

#### 4. DEFINISI ISTILAH / OPERSIONAL

- a. Media program *power point* merupakan salah satu *software* yang dirancang secara khusus untuk mampu menampilkan program multimedia dengan menarik, mudah dalam pembuatan, mudah dalam penggunaan dan relative murah karena tidak membutuhkan bahan baku selain alat untuk penyimpanan data (*data storage*).
- b. Keterampilan sains adalah keterampilan ilmiah yang dimiliki oleh siswa melalui pengamatan, membuat data dan menganalisisnya kemudian mengkomunikasikan hasil analisisnya kepada teman.
- c. Berpikir kritis adalah kemampuan untuk berpendapat dengan cara yang terorganisasi. Berpikir kritis merupakan kemampuan untuk mengevaluasi secara sistematis bobot pendapat pribadi dan pendapat orang lain. Selanjutnya berpikir kritis adalah kegiatan menganalisis ide atau gagasan ke arah yang lebih spesifik, membedakannya secara tajam, memilih, mengidentifikasi, mengkaji dan mengembangkannya ke arah yang lebih sempurna (Cece Wijaya, 1996. dalam <http://www.kajianteoris.com/2014/02/pengertian-kemampuan-berpikir-kritis.html>).

### 5. KAJIAN PUSTAKA

#### 5.1 Media Pembelajaran

Media berasal dari kata latin dan merupakan bentuk jamak dari kata *medium* yang secara harfiah berarti perantara. Jadi media merupakan perantara atau pengantar terjadinya pesan dari pengirim ke penerima pesan. Media adalah alat, metode dan tehnik yang digunakan dalam rangka lebih mengefektifkan komunikasi dan interaksi antara guru dan siswa dalam proses pembelajaran di sekolah. Juga dapat didefinisikan sebagai segala bentuk dan saluran yang digunakan orang untuk menyalurkan pesan atau informasi.

Media pembelajaran merupakan segala sesuatu yang dapat digunakan untuk menyalurkan pesan dari pengirim ke penerima sehingga dapat merangsang pikiran, perasaan, kurikulum dan minat serta perhatian siswa demikian rupa sehingga proses belajar terjadi. Media pembelajaran adalah segala sesuatu yang dapat untuk merangsang masa pikiran, perasaan, perhatian dan kemauan siswa sehingga mendorong terjadinya proses belajar pada diri siswa.

Mengacu pada pendapat di atas, maka media pembelajaran merupakan segala sesuatu yang dapat

digunakan untuk menyampaikan pesan berupa materi pelajaran dari sumber kepada penerima dalam kegiatan pembelajaran sehingga terjadi perubahan pada anak didik, dimana penggunaannya mengacu kepada kurikulum atau tuntutan materi pelajaran.

#### 5.1.1 Program *microsoft power point* Sebagai media pembelajaran

Program *Ms power point* adalah program aplikasi keluarga *Ms Office* yang biasa digunakan sebagai media pembelajaran dengan berbantuan computer. Pada program ini terdapat fasilitas untuk menganimasikan sebuah objek, sehingga objek tersebut dapat muncul, bergerak, berpindah dan menghilang. Sederhananya pemanfaatan fasilitas animasi ini yang membuat *Ms power point* banyak digunakan dalam berbagai presentasi, termasuk dalam pembelajaran di kelas.

### 5.2 Keterampilan Sains

Keterampilan sains merupakan proses atau tahap yang melalui :

#### a. Proses Berpikir

Proses berpikir merupakan proses mental yang kompleks. Raghunatan dalam Yuwono (2013) Mendefinisikan berpikir sebagai aktivitas mental tertinggi manusia. Semua restasi dan kemajuan manusia hanyalah produk pemikiran. Evolusi budaya, seni satra ilmu pengetahuan dan teknologi semua adalah hasil pemikiran. Proses berpikir bukan merupakan proses yang sederhana dan mudah untuk diuraikan. Arends (2008) mengungkapkan bahwa deret ide dan kata-kata membingungkan sering digunakan untuk menggambarkan cara orang berpikir.

Gambaran proses intelektual secara abstrak dari proses berpikir dalam berbagai definisi adalah: 1) berpikir adalah proses yang melibatkan operasi mental seperti induksi, deduksi, klasifikasi dan penalaran; 2) berpikir adalah suatu proses simbolis yang yang mewakili (melalui bahasa) objek nyata dan peristiwa serta menggunakan representasi untuk menemukan prinsip-prinsip penting dari benda-benda dan peristiwa; 3) berpikir adalah kemampuan untuk menganalisis, mengkritik dan mencapai kesimpulan berdasarkan inferensi dan penilaian.

#### b. Berpikir kritis

Beberapa definisi berpikir pada uraian di atas menunjukkan bahwa tindakan yang benar harus didukung oleh cara berpikir yang benar. Salah satu cara berpikir yang benar adalah berpikir kritis (*critival thinking*). Sebagaimana diungkapkan oleh Facione dalam Yuwono (2013) “*At one level we all*

know what "critical thinkin" means – it means good thinking, almost the oppite of illogical, irrational thinking". Berpikir kritis secara sederhana merupakan "good thinking", tetapi tentu saja berpikir kritis lebih dari hanya sekedar berpikir yang baik. Menurut Anderson, L.W & Kratthohl (2011) tiga tingkatan teratas dari taksonomi Bloom (analisis, evaluasi dan mencipta) bisa digunakan untuk mendefinisikan pengertian berpikir kritis. Kadang-kadang ditambahkan juga dengan dua level berikutnya (komprehensif dan aplikaksi). Namun definisi tersebut memiliki kerancuan, tingkat-tingkat tersebut ternyata tidak berurutan secara hirarki. Masih ada overlapping antara satu tingkatan dengan tingkatan yang yang tepat lain. Definisi tepat dan menjauhkan dari kerancuan sebagaimana yang dikemukakan oleh Ennis (1993) adalah "Critical thinking is reasonable reflective thinking focused on deciding what do believe or do". Definisi ini melibatkan semua kemampuan kognitif yang dimiliki seseorang yang belum tercakup pada definisi sebelumnya.

Lebih jauh Facione dalam Yuwono (2013) menyatakan bahwa berpikir kritis adalah berpikir yang memiliki tujuan (titik pembuktian, menafsirkan apa arti dari sesuatu, pemecahan masalah), nemaun lebih penting dari itu yaitu untuk menggunakan berpikir kritis untuk sebuah kerja sama dalam menyelesaikan masalah.

IPA dan berpikir kritis sebenarnya merupakan satu kesatuan. Valentino (2000) menegaskan bahwa berpikir kritis merupakan salah satu dari keterampilan IPA disamping keterampilan proses IPA dan keterampilan penalaran. Oleh karena itu di dalam pembelajaran IPA tiga keterampilan tersebut harus dilatihkan kepada peserta didik. Pembelajaran IPA yang tidak melatih keterampilan berpikir kritis berarti telah kehilangan maknanya.

## 6. METODOLOGI PENELITIAN

### 6.1 Jenis penelitian

Penelitian ini merupakan penelitian kualitatif diskriptif, dengan bantuan Observer dari peserta LSC. Dari data yang masuk kita dapat mendiskripsikan keterampilan sains siswa dan berpikir kritis peserta didik kelas VIII D saat pembelajaran dengan menggunakan media multimedia *power point*.

### 6.2 Subjek penelitian

Subyek penelitian ini adalah kelas VIII D SMP Negeri 2 Bangil Tahun pelajaran 2013 - 2014. Siswa di kelas tersebut terdiri atas 40 siswa dengan 18 siswa dan 22 siswi, kelas ini menghadapi banyak

sekali permasalahan di pelajaran IPA. Selain kelas tersebut bukanlah kelas unggulan, dari keterangan wali kelas didapatkan informasi bahwa kerjasama antar anggota kelas hampir tidak ada. Kemampuan Prestasi Belajar rata-rata kelas inipun sangatlah rendah.

### 6.3 Teknik analisis data

Penelitian ini adalah penelitian diskriptif, sehingga data yang didapat dari observer dimanfaatkan untuk mendiskripsikan kondisi keaktifan siswa. Dari data yang masuk, maka akan dianalisa oleh guru yang nantinya akan dilanjutkan dengan rekomendasi wali kelas maupun pihak BP/BK.

## 7. PROSEDUR PENELITIAN

Tahap-tahap yang ditempuh dalam guruan ini mencakup 1) tahap pendahuluan (pra tindakan), 2) tahap tindakan, dan (3) tahap refleksi dan kegiatan tindak lanjut. Rincian kegiatan dari tahap-tahap itu adalah sebagai berikut:

### a. Tahap pra tindakan (perencanaan pembelajaran)

- 1) Mengujicoba media pembelajaran yang meliputi:
  - a) Komunikatif, mampu menjadi mediator antara guru dan siswa dan tidak bermakna ganda, baik tayangan video gerak, pertanyaan aperepsi maupun pertanyaan evaluasinya
  - b) Jelas baik gambar maupun suaranya.
- 2) Menjelaskan awal tentang pembelajaran yang akan dihadapi. Kelas VIII D belum pernah digunakan untuk *open class* LSBS, maka sebelum tindakan dilakukan terlebih dahulu memberikan informasi tentang adanya beberapa observer yang akan ikut dalam pembelajaran. Kemudian pembentukan kelompok, kelompok dibagi atas dasar kemampuan akademik siswa. Tiap kelompok terdiri atas 5 siswa, Karena jumlah siswa ada 40, maka ada 8 kelompok.

### b. Tahap tindakan/pelaksanaan pembelajaran.

Pelaksanaan OC dilaksanakan pada hari Sabtu 17 Mei 2014 pukul 09.00 WIB sampai pukul 10.20 WIB dengan melibatkan anggota LSC, Satu siswa tidak hadir karena sakit, sehingga kelompok 4 hanya 4 anak, pembelajaran diawali dengan meminta tugas yang sudah dilakukan siswa yaitu foto keadaan daun asam saat pagi dan sore, dari tugas ini kemudian ditayangkan gambar yang telah dipersiapkan di media *Power Point*.

Tampilan pertama berupa Apersepsi dengan menampilkan gambar Daun Lamtoro di saat ada cahaya dan ketika tidak ada cahaya, seperti gambar di bawah ini :

**GERAK PADA TUMBUHAN**

12:11:12 PM

12:11:18 PM

Kemudian Tayangan Video gerak tigmonasti, dan tigmotropi seperti gambar berikut !

Ketika disentuh

Mengatup

Ketika sulur menyentuh kayu/anjir

Sulur membelit Kayu/anjir

Setelah siswa berdiskusi dan menemukan perbedaan gerak tigmonasti dan tigmotropi siswa mempresentasikan hasil diskusinya ke depan kelas setelah mengklarifikasi hasil diskusi, guru meminta siswa untuk menulis hasil klarifikasi dan membuat kesimpulan.

Pada akhir pembelajaran siswa menjawab soal-soal dari tayangan slide sebagai berikut :

Termasuk gerak apakah pada bunga pukul 4 (*Mirabilis jalapa*) pada gambar di bawah ini ?

**PERHATIKAN ARAH MEKARNYA BUNGA !**  
Kemanakah Arah gerakannya ?

**BAGAIMANA ARAH GERAKNYA ?**

**BERUPA APAKAH RANGSANG PADA SULUR TUMBUHAN TERSEBUT ?**

Dari tayangan slide video, perlu di tayangkan sampai 3 kali karena siswa masih belum mampu membedakan antara gerak tigmonasti dan tigmotropi setelah tayangannya diperlambat, akhirnya siswa mampu memberikan pernyataan perbedaan kedua gerak tersebut, setelah diberi arahan apa rangsangannya dan kemana arah gerak tumbuhan tersebut.

**c. Diskusi refleksi setelah pembelajaran**

Saat diskusi refleksi pembelajaran diperoleh beberapa masukan dari observer yang antara lain :

- a. Penggunaan media *Power Point* sangat membantu proses pembelajaran gerak pada tumbuhan mengingat sudah sangat langkah tersedianya tumbuhan putri malu (*mimosa pudica*)
- b. Tayangan jalannya membelitnya sulur markisa begitu jelas menunjukkan arah gerakan yang menuju ke arah rangsang, yang dalam kehidupan nyata tidak tampak.
- c. Dengan tayangan 2 gerak pada tayangan tersebut mampu menumbuhkan rasa ingin tahu siswa dan mulai memikirkan jawaban dengan menghubungkan data yang diperoleh dari tayangan tersebut sehingga diperoleh pernyataan perbedaan antara gerak nasti dan gerak tropisme.
- d. Dengan media yang tepat mampu membantu pencapaian tujuan pembelajaran, hal tersebut dibuktikan dengan hasil ulangan siswa yang 90% mampu menjawab pertanyaan.

## 7. KESIMPULAN

Penyampaian materi gerak pada tumbuhan dengan menggunakan media LCD *Power Point* bisa meningkatkan keterampilan berfikir kritis peserta didik kelas VIII D di SMPN 2 Bangil. Hal ini ditunjukkan dengan 85% kelompok yang dibentuk mampu membedakan pengertian gerak tropisme dan gerak Nasti dan 90% siswa bisa menjawab pertanyaan evaluasi.

Dari hasil refleksi saat LSC tersebut, disarankan menggunakan media *power point* untuk meningkatkan keterampilan sains dan berpikir kritis peserta didik apabila, di lingkungan sekolah mengalami kesulitan menyediakan media alaminya.

**Abstract:** The quality enhancement program of Junior High School and Islamic Junior High School (called PELITA) has been undertaken in 7 provinces (Banten, West Java, Yogyakarta, East Java, West Sumatra, South Kalimantan, and North Sulawesi) under the support of the Ministry of Education and Culture and JICA in 2009-2013. The objective of the PELITA program is to strengthen the central and local governments' capacities in undertaking LESSON STUDIES and PSBM all over Indonesia. The target of the PELITA program is to cover 1,385 schools in 7 provinces. This study of the impact of the program aims to obtain information about the progress of the lesson studies targeted in the PELITA program, obtain information about learning quality enhancement in nurtured schools, give suggestions and recommendations to targeted provinces based on the results of the study and strengthen networks between partner universities in Indonesia. The PELITA impact study was undertaken in 5 provinces, namely Sumedang Regency in West Java, Pasuruan Regency in East Java, North Minahasa Regency in North Sulawesi, Banjar Baru Regency in South Kalimantan and Padang City in West Sumatera. Data were obtained from questionnaires distributed to teachers, students about MGMP (*Subject Teacher Forum*) activities and teachers' commitment in carrying out teaching learning activities and undertaking academic tests to students in science, mathematics, Indonesian and English. This PELITA study shows that teachers' commitments in PELITA-implemented areas are higher than those without it. In addition, the results of students' academic tests in PELITA-implemented areas are similarly higher than those in areas where PELITA is not implemented. Thus, it can be concluded that the PELITA program is embodies a model that can improve teachers' performances in making their students learn. The result is that students academic competencies have improved in the subjects of science, mathematics, Indonesian and English.

**Keywords:** Lesson Study, Teachers' Commitments, Teachers' Performances, Students' Academic

### 1. INTRODUCTION

The Quality Enhancement Program of Junior High School (JHS) and Madrasah Tsanawiyah (MTs) (PELITA Program) had been administered to 7 provinces (Banten, West Java, Yogyakarta, East Java, West Sumatera, South Kalimantan, and North Sulawesi) under the endorsement from the Ministry of Education and Culture and JICA in the years of 2009-2013. The overall objective of this program is to improve the quality of JHS and MTs through Lesson Study conducted in 4 regencies dan 2 cities in 6 provinces (Sumedang Regency in West Java, Bantul Regency in Daerah Istimewa Yogyakarta, Pasuruan Regency in East Java, North Minahasa Regency in North Sulawesi, Banjar Baru City in South Kalimantan, and Padang City in West Sumatera) and through PSBM in Banten Province. The aim of PELITA Program is to strengthen both central and local governments' capacity in administering Lesson Study and PSBM throughout Indonesia. The target schools of the PELITA Program are 1.385 schools in 7 provinces. The PELITA Program was stopped in February 2013 but the Lesson Study program has been continuing in the target regions/cities under the local government endorsement. MGMP (subject teacher meeting) based Lesson Study was administered to 4

to 8 clusters in every regency/city. The regular meeting of MGMP was given to Mathematics teachers (e.g. on Wednesday) and to Science teachers (e.g. on Saturday). The trained facilitators led the MGMP to plan, provide, observe, and make a reflection on the lesson practiced. Besides MGMP based Lesson Study, school-based lesson study was also implemented in most schools under the needs of appreciation and support from the school principles. All subject teachers participated in the school-based lesson study. Groups of subject teachers did the planning session to prepare the lessons for MGMP days. For example, Monday was for Indonesian language teachers; Tuesday was for English teachers; and Wednesday was for Mathematics teachers. Open lesson involved all teachers or groups of teachers in the schools, conducted on Saturday after school or based on class schedules. A discussion after the open lesson was administered right after the lesson was delivered. The closest universities (UPI in West Java, UNY in Yogyakarta, UM in East Java, UNP in West Sumatera, UNIMA in North Sulawesi, and UNLAM in South Kalimantan) gave technical supports to the PELITA Program. Members of faculties from the university counterparts worked together with the teachers to plan, provide, observe, and make a reflection on the lesson practiced. It

was concluded that lesson study was effective and efficient in developing the quality of teacher professionalism. Teachers were motivated to promote college students' active learning to take advantages of local materials.

Consequently, students enjoyed the learning process since they did not necessarily memorize facts or mathematical formula. The school principles and supervisors were facilitated to monitor teachers' performance. The university counterparts also gained benefits from the implementation of lesson study in schools, since the members of the faculties also got real experience from the schools as an input to improve the pre-service program. However, students' comprehension still needed improvement. Therefore, there is a need to conduct a study to investigate the impact of PELITA Program to gain information related to the continuation of the post-PELITA Program. Each university counterpart plays a vital role to maintain the program and is responsible for administering a study about the impact of PELITA Program in the year 2013, 2014, and 2015. The results of the study are expected to lay a foundation for future research about collaborative study between university counterparts, possibly presented in the symposium of the World Association Lesson Study (WALS) conference in November 2014 in Indonesia.

## 2. OBJECTIVES

- To gain information about the improvement of lesson study in the targets of PELITA Program
- To gain information about the learning quality improvement of the target schools
- To give suggestions and recommendations to the target provinces departing from the results of the study
- To strengthen the networks between the university counterparts in Indonesia

## 3. METHODOLOGY

### 3.1 Populations and Samples

The populations of the study include 5 provinces with the following population and samples:

Table 1 Sample Distribution Of The Impact Study Of Pelita Program

Province	Region/City	DM	MTs	Total population	Total sample (20%)	Control group	Qualitative sample
West Java	Bandung Regency	21	22	430	41	20	1
West Java	Bandung Regency	22	120	261	22	10	10
West Java	Bandung Regency	21	22	430	41	20	1
Local Universities	Bandung City	10	0	26	7	31	4
Local Universities	Bandung Regency	0	7	17	14	10	4
Total		219	244	764	129	90	20

### 3.2 Data Collection Technique

The data collection was conducted both quantitatively and qualitatively. The quantitative data consisted of two components as follows:

- Questionnaires for the Local Education Officials, School Principals, teachers, and students in the target schools.
- Academic Tests for the target and control Cities and Regencies, given to students of JHS and MTs covering the subjects of Mathematics, Natural Sciences, English, and Indonesian Language.

The qualitative survey consisted of the observation of school situation and the observation of the instructions of Mathematics, Natural Science, English and, Indonesian Language.

### 3.3 The Number of Respondents

The respondents in every area included the School Principals, Local Education Officials, teachers, and students. The selected respondents fulfilled the criteria of the required data. The number of respondents for the questionnaire (Q), Academic Test (AT), and Learning Observation (LO) is elaborated in table 2.

Table 2a. The Number of Respondents in Each JHS/MTs

Methods	Target	Control	Total
Questionnaire (Q)	Teachers	1	1
	Students	20	20
Academic Test (AT)	Students	40	40
	Teachers and Principals	11	11
Learning Observation (LO)	Teachers and Principals	1	1
	Students	20	20

Table 2b. The Number of Respondents for Local Education Officials

Method	Respondents	Target City/Regency	Control City/Regency
Questionnaire	1st Deputy of District Education Office (1)	1	1
	2nd Deputy of the Language Subject (1)	1	1
	3rd Deputy of Natural Science Subject (1)	1	1
	4th Deputy of Mathematics (1)	1	1

### 3.4 Data Collection of the Impact of PELITA Program

- Questionnaires: teachers, school principals, students, and supervisors (Education Officials)

- b. Academic Test for students: Mathematics, Natural Science, Indonesian Language, and English
- c. Observation: School situation and learning observation

Quantitative and qualitative data were collected for this study. The quantitative data were gained through test instruments and questionnaires. The academic test was given to the students of grade IX of JHS/MTs covering the subjects of Mathematics, Natural Science, English, and Indonesian Language. The test was particularly intended to measure the students' competence standard on reasoning.

The academic test was given to the students of grade IX as depicted in detail in table 3.

Table 3. Academic Test Instruments

Type of Questions	Total of Questions	Percentage	Total	Test Materials
Multiple Choice (MC)	30 items	100%	30 items	School based Curriculum, 2013
Science	15 items	50%	15 items	Curriculum, 2013, grade VII, VIII
Mathematics	15 items	50%	15 items	Curriculum, 2013, grade VII, VIII
MC for Indonesian Language	20 items	100%	20 items	School based Curriculum, 2013, grade VII and VIII
MC for English	10 items	100%	10 items	School based Curriculum, 2013, grade VII

All instruments were developed by UPI Team. The Academic Test Instruments were also developed by UPI Team and had been pilot tested to two schools in Bandung City.

## 4. DISCUSSIONS

### 4.1 An Analysis of the Impact of the Pelita Program in Five Provinces on Learning Quality as Compared to Control Schools

This study of impact analysis was conducted in 5 provinces, namely Sumedang Regency in West Java, Pasuruan Regency in East Java, North Minahasa Regency in North Sulawesi, Banjar Baru Regency in South Kalimantan, and in Padang City in West Sumatera. Data were obtained from questionnaires distributed to teachers, students on the Teachers' Professional Development Networks (MGMP) activities and teachers' commitments in undertaking learning and teaching as well as students' academic tests on science, mathematics Indonesian, and English.

#### 4.1.1 MGMP Participation

Teachers' participation in MGMP activities in areas that have implemented the PELITA program is shown in the following figure.

Figure 1. Teachers' Participation in MGMP activities

The above figure indicates that teachers' participation in MGMP activities in PELITA-implemented areas are higher amounting to 64.40% compared to teachers in areas where PELITA is not implemented, namely 53.85%. This indicates that the PELITA program has improved teachers' participation in MGMP activities.

#### 4.1.2 The Quality of MGMP Activities

In terms of the quality of MGMP activities, a question was posed to teachers as follows:

From MGMP activities that you have attended (if you have taken part in them), what is the quality of MGMP activities in terms of content (materials), method, and organizing? Mark in appropriate columns.

	Agree	Disagree	Fair	Good	Very good
Content (materials) of MGMP activities					
MGMP Method of activities					
Organizing of MGMP activities					

Teachers' responses in the experimental group and control group are presented in figure 2 as follows:

Figure 2. The Quality of MGMP Activities from Teachers' Perspective

Fifty five percent of teachers in PELITA-implemented areas said that the content of MGMP activities is better than that in areas where PELITA is not implemented. Only 35 % of teachers said that the content aspect is good in those areas without PELITA. Similarly, as for the method aspect and organizing aspect, 56% and 54% of teachers

respectively said that they are good compared to those where PELITA is not implemented.

### 4.1.3 The Impact of MGMP Activities

To reveal the impact of MGMP activities as perceived by teachers, the following question was asked:

Choose the appropriate statements about the **impact of MGPM activities** (by crossing the corresponding number (s) ). You may choose 3 answers at the most If you choose **others**, write down specifically what you mean.

(4)	They help teachers to master knowledge on their subjects they teach.
(3)	They equip teachers with innovative and useful teaching and learning methods.
(1)	They bring up real issues dealt with by teachers in the class.
(1)	They provide opportunities to teachers to exchange ideas and experiences.
(1)	They motivate teachers to improve teaching and learning quality.
(3)	They help teachers to enhance their academic competencies (such as in researching and writing scientific articles).
(2)	They help teachers to understand the connections between daily learning and the goals of education in the long term.
(1)	OTHERS (specify...)

To the question posed, the teachers' responses are as follows.

Figure 3. MGMP's Impact according to Teachers

Teachers in the PELITA-implemented areas said that the impact of MPMP is that they can learn innovative methods (52.85% and exchange ideas (48.40%). In areas where the program PELITA is not implemented, the percentages are lower, namely (44.40%) and (38.24%) respectively. Similarly, other aspects such as knowledge enrichment and motivation enhancement are on average higher in percentage than those in areas where PELITA is not implemented.

### 4.1.4 Participation in Lesson Studies

Subsequently, this study aims to discover the participation levels of teachers in attending Lesson Studies. Following is figure 4 which presents the participation levels of teachers in Lesson Studies.

Figure 4. Teachers' Participation in Lesson Studies

Sixty four percent of teachers in PELITA-implemented areas participated in lesson studies and only 24.40% of teachers in areas where PELITA is not implemented took part in Lesson Studies. This shows that the level of teachers' participation is higher in Pelita-implemented areas than in areas where PELITA is not implemented.

### 4.1.5 Lesson Study Quality

The question posed related to Lesson Studies' activities is as follows:

From the Lesson Studies' activities that you have attended (if you have been involved), what is the quality of the Lesson Studies' activities in terms of **Plan, Do, See** and its organizing? Mark in appropriate columns.

ACTIVITIES	Poor	Fair	Good	Very Good
Planning in Lesson Studies Activities				
Doing in Lesson Studies Activities				
Seeing in Lesson Studies Activities				
Organizing in Lesson Studies Activities				

Teachers' Responses are shown in figure 5 as follows:

Figure 5. Lesson Studies' Activities from the Perspective of Teachers

The figure reveals that on average more than 52% of teachers in Pelita-implemented areas said that the quality of planning, doing, seeing and organizing is perceived to be better than that in areas where PELITA is not implemented, namely only 20%. This indicates that in general Lesson Studies have not been undertaken in those areas.

#### 4.1.6 The Impact of Lesson Study

The question raised to reveal the impact of Lesson Study' activities is as follows:

Choose the following statements about the **impact of Lesson Study' activities** by crossing the corresponding number(s). You may choose maximally 3 statements. If you wish to choose OTHERS, write down specifically what you mean.

(1)	They help teachers to master knowledge on their subject matter through study.
(2)	They equip teachers with innovative and useful learning and teaching methods.
(3)	They cover real issue that teachers deal with in the class.
(4)	They provide opportunities to teachers to exchange ideas and experiences.
(5)	They motivate teachers to improve teaching and learning quality.
(6)	They help teachers to enhance their academic competence (e.g. researching and writing academic articles).
(7)	They help teachers to comprehend the relationship between daily teaching and learning and long-term education objectives.
(8)	OTHERS (specify.....)

Teachers' answers to the question can be seen in figure 6 below.

Figure 6. The impact of Lesson Studies' activities from the perspective of teachers

The highest percentage (54%) goes to innovative teaching methods which are perceived to be useful as a result of Lesson Studies. This percentage is higher than that of teachers who have not been in the PELITA program, namely 18.90%. Impact is also perceived among teachers in areas which implement PELITA, namely opportunities in exchanging ideas amounting to 48%, whereas teachers who are not affected by PELITA amounts to only 11%.

#### 4.1.7 The Weaknesses of Lesson Studies

To reveal the weaknesses of Lesson Studies' activities, the following question was asked:

Choose the following statements about the **weaknesses of lesson study activities** by crossing the corresponding number(s). You may choose maximally 3 answers. If you choose OTHERS, write down specifically what you mean.

(1)	Lesson Study' activities are not in accordance with teachers' need.
(2)	Lesson Study' activities will be costly in planning, doing and seeing to it being done consistently.
(3)	Only a small number of teachers participate in Lesson Study' activities.
(4)	No coordination and communication between Lesson Study and other institutions.
(5)	An absence of financial support.
(6)	OTHERS (specify.....)

Teachers' responses to the question asked are presented in figure 7:

Figure 7. The Weaknesses of Lesson Studies' activities according to Teachers

The biggest percentage comes from teachers' who have participated in the PELITA program, namely 40% for the option "small number of participants", followed by 3.92% for the option "boring" and 29.2% for the option "lack of financial support" (e.g. from headmasters or education department officials). Those data constitute very useful suggestions for the PELITA organizers to undertake Lesson Studies in more meaningful ways so that more teachers will be interested in joining the program.

#### 4.1.8 Teachers' Development

Based on the obtained data in figure 8, as for teachers' development program related to PELITA, generally teachers (above 89%) chose the options "agree" and "strongly agree" that they were given enough opportunities to participate in training activities, to observe teaching and learning and they gave examples how character education should be conveyed through learning materials to be applied in everyday life. Teachers' opinions from areas which have not implemented PELITA are also included. From these data, it is discernible that all the schools have given broad opportunities to teachers to participate in activities carried out in both schools' projects and activities undertaken in their local department of education. This tendency appears to the impact of the programs promoted through the agreement between schools, the local education departments and provincial education departments. In addition, the impact of these programs is that teachers have been made aware of the need to implement character education through real and direct examples that they witnessed.

Figure 8. Teachers' Responses to schools' effort to developing Teachers' Competence

#### 4.1.8.1 School-based Teachers' Development

Meanwhile, the following figure illustrates the school-based Lesson Studies' development.

Figure 9. Teachers' Opinions about School-based Development

Figure 9 shows that in areas implementing PELITA 37.40% of the teachers said their headmasters often and always encourage or organize training, whereas in areas without PELITA only 24% of them said so. Sixty three point fourty eight percent of the teachers in areas implementing PELITA said that their headmasters often and always encourage the teachers to establish study groups in their schools, while teachers in areas without PELITA said that only 48% of them said so. According to data on teachers' opinions in areas with PELITA, 46.61% of them said their headmasters often and always give teachers opportunities to observe teaching and learning, whereas teachers from areas without PELITA said that only 17.5% of their headmasters do so. This indicates that teachers from the PELITA group have more opportunities to observe lessons than their counterparts from the non-PELITA group.

#### 4.1.8.2 Learning Process

This figure shows the learning process which teachers can undertake.

Figure 10. Teachers' Opinions about the Teaching and Learning Undertaking

Information obtained from teachers in areas implementing PELITA indicates that 55% of them said that they often and always various types of teaching media in their teaching and learning. Meanwhile, only 45% of teachers from areas which have not implemented PELITA reported such a thing. This finding indicates that teachers in the PELITA group used more teaching aids than their counterparts. However, as for marking, teachers from both groups said that they often and always administered marking according to the students' performance.

#### 4.1.8.3 Support for Students

Students' success in learning is sometimes affected by non-academic factors such as teachers' psychological support to students. Therefore, through these questionnaires, this study aims to reveal the extent to which this support is given to students. The results are indicated below.

Figure 11. Support for Students according to Teachers

Ninety three percent of teachers in PELITA areas stated that they often and always encouraged their students to work together and develop their potential, and 91% of the teachers said that they often and always positive attitudes in the learning process. This is also the case with teachers from non-Pelita group, that is, 92% of them expressed the same thing. This finding appears to indicate that actually all the teachers have sought maximally to encourage their students to develop their abilities to listen, discuss and self-develop.

**4.1.8.4 Teachers’ Support according to Students**

The following figure indicates students’ opinions about their teachers’ support in learning.

Figure 12. Teachers’ Support according to Students

Following are statements teachers’ support to students.

- The teachers appear to know when I have a problem in the class.
- I feel that the teachers in this school care about my learning process.
- The teachers give the students opportunities to ask questions outside of their classrooms.

Students’ responses to the questions above are as follows.

Eighty seven percent of the students under the PELITA program said that their teachers care about the learning processes in the class and 71 % stated that their teachers give opportunities to discuss and ask questions outside of the classroom. This finding is the same as that among the students from areas that have not implemented PELITA. However, 52% of the students said that the teachers do not know that their students have difficulties or problems in their learning. It appears that, teachers still need to learn to detect students’ learning difficulties in the class. This finding applies to both groups.

**4.1.8.5 Support among Students according to Students**

To reveal support among students in their learning processes, these option statements are presented:

- I feel free to ask questions to classmates when I encounter problems in learning in the class.
- I like to help my classmates if they encounter learning difficulties in the class.

Figure 13. Students’ Responses about Support among Students

This study reveals that 77% of the students agreed that they are free to discuss with classmates, and 87% agreed and agreed strongly that they help each other among classmates. This finding indicates that both the control group (without PELITA) and the experimental group (with PELITA), the students communicate well among one another in the class or in the school. This information is of value because students’ success in learning is supported by their interaction among classmates.

**4.1.8.6 Students’ Perceptions of Science Teaching and Learning**

**1) Group work in Science Learning**

Students were asked to fill out questionnaires about the science learning. Based on the results of the questionnaires, it was revealed about the implementation of group work and idea exchanges.

Figure 17. Group in Science Learning

Forty eight point five percent of the students involved in teaching and learning with teachers under PELITA reported that their teachers often and always encouraged the students to exchange ideas in the teaching and learning process. The teachers under the PELITA program are then required to even more motivated to promote group work and idea exchanges because these activities will help develop critical thinking and communication competence.

## 2) The Use of Realia (Science Teaching Aids) According to Students

Based on the following figure, it is shown that in science teaching and learning under PELITA, 59% of the teachers rarely used various realia and teaching aids from everyday life. However, the teachers often involved the students in computations, drawing and other activities. As for the use of realia, teachers trained in Lesson Studies should still be encouraged to use realia more often.

Figure 18. Students' Perceptions on the Use of Science Realia

## 3) Science Teachers' Support

Students' opinions about teachers' support in science teaching and learning are indicated in figure 19 as follows:

Figure 19. Students' Opinions about Science Teachers' Support to Students.

Figure 19 reveals that 65% of the students under PELITA stated that their teachers often and always encouraged the students to work harder. Meanwhile, 89% of the students stated that their teachers often and always helped the students in solving difficult problems (both their lesson problems and other problems). It is also the case with the students' opinions from areas which have not implemented PELITA.

### 4.1.8.7 The Results of a learning Observation of a Science Teacher

The science teacher started the lesson by opening the class, giving the students some motivations and informing them the materials to be covered. This

was a good prerequisite and helped prepare the students for the lesson. In the core activity, the teacher delivered a planned teaching material, which was suitable for the students. This helped the teacher to get the students actively participated in the learning process even without the use of a learning medium. At the end of the class, the teacher closed the lesson by asking the students to draw a conclusion together and giving the students an assignment to help them deepen their understanding of the presented material and preparing the students for the next meeting.

The following were the results of an observation of science subject learning in other PELITA participated school.

Students first saw the teacher demonstrating a static electricity phenomenon by attaching a ruler to a small piece of paper. Students did the same experiment to investigate characteristics of static electricity using a ruler and a small piece of paper. Students were not actively involved in the learning process and found it rather difficult to fill in the students' work sheets. Students had a hard time communicating with their peer. Another problem was that the teacher was busy with some active students. Another problem was that the teaching medium was too small that made it difficult for the students to see it. Students found it difficult to draw a conclusion based on their observation.

Results of an observation of science subject learning in an area not implementing PELITA program was as follows.

At the beginning of the class, the teacher checked students' attendances. He then explained the objectives of the session. When starting the lesson, the teacher did not provide his students with some motivations so that many students did not seem enthusiastic or ready to learn the lesson. The learning process was carried out in a classical format where students sat in a row just as what we would find in a conventional learning.

In the core activity, the teacher checked if the students did the reading assignment he gave in the last session. Apparently, the teacher gave his students a reading assignment (the class was divided into groups of 4-5 students). Some students were asked to come forward and present their understanding of their reading of human reproduction system. After all students did the presentations, the teacher then gave some comments and explained some aspects related to what have been presented by the students. Unfortunately, the result of students' work was not used for a discussion by other groups.

To enhance the understanding of the materials that had been presented by the students, the teacher gave a power point presentation. Unfortunately, the power point presentation was not clearly visible for

students sitting at the back of the class including the observers who were sitting in the back row.

In this activity, no interactive dialogue or discussion took place between the teacher and the students. The teacher indeed asked the students some questions related to his presentation but they did not respond well and the teacher himself at the end had to answer all his questions.

At the end of the class, no reinforcement or conclusion was provided on the materials covered that day. Nevertheless, the teacher gave the students homework available in one of the textbooks used in the school.

Based on the observation of the learning process, in general it can be concluded that the lesson was delivered monotonously. From the beginning up to the end, the teacher did not move from his chair. The teacher did provide a PowerPoint presentation but the content of the presentation did not seem to be well prepared in terms of its viability by the students. The teacher did not pay a good attention to the students so that there were many students who were not enthusiastic in following the learning process.

Pictures of a learning activity in areas not implementing the PELITA program

**4.1.8.8 Students' Academic Achievements**

**1) Comparison of average students academic achievements.**

The chart shows the comparison of the average score for Mathematics, Science, Bahasa Indonesia and English in areas implementing PELITA program and in areas not implementing PELITA program.

Figure 26. Comparison of academic achievement in areas implementing PELITA program and areas not implementing PELITA program.

The figure shows that academic achievement of students in areas implementing PELITA program was 5.10, which was higher than academic achievement of students in areas not implementing PELITA program of which was 4.69. This shows that PELITA program could help improve students' academic performance.

**2) Comparisons of average students' academic performance in each subject.**

The following figure shows students' academic performance in two areas for each of the subjects.

Figure 27. Comparison of Scores in Each Subject

The figure shows that Mathematic subject had the highest score of 5.24 percent in areas implementing PELITA program while the lowest scores on Mathematic subject was 4,64 in areas not implementing PELITA program. The detailed data can be seen in the following figure.

Figure 28. Comparison of Students' Scores in areas implementing PELITA program and areas not implementing PELITA program.

The table shows that in areas implementing PELITA program, West Sumatera province had the highest academic performance of 6.7 compared to academic performance of students in areas not implementing PELITA that was only 5.42. Meanwhile in North Sulawesi, which had the lowest academic performance score, schools implementing PELITA program scored 4.85 and schools not implementing PELITA program scored only 3.19.

## 5. RECOMMENDATIONS

The impact study conducted in five provinces, namely West Java, East Java, North Sulawesi, West Sumatra and South Kalimantan showed that the commitment of teachers in areas implementing PELITA program on average is higher than the one in schools not implementing PELITA program. The same was also true in the students' academic performance; students in schools implementing PELITA program performed better than students in schools not implementing the program. It can be concluded that PELITA program was a model for teachers development that improve teachers' performances in teaching their students which resulted in the improvement of the academic performances of the students in Science, Mathematics, Bahasa Indonesia and English language lessons.

Based on the impact study, we proposed the following suggestions and recommendations:

- a. Teachers' development through Lesson Study was an effective way to leverage the performance of teachers so that the quality of learning would improve
- b. The application of Lesson Study in some areas needed a quality improvement especially in doing the *plan, do* and *see* to help teachers improve the quality of the learning.
- c. Some areas that were no longer doing the MGMP-based lesson study was suggested to do a school-based lesson study due to the importance of teachers having a learning community that could improve the quality of learning.
- d. Teachers needed support from the local education councils and school principals to have have a forum for discussing important issues and developing their potentials through the Lesson Study activities
- e. Based on an identified impact study, teachers' skills that were still weak and needed upgrading were the skills of developing learning media, creating realias from local materials/components readily available in the immediate surrounding and to involving

students in making use of learning media. Thus MGMP-based LS and school-based LS activities should provide teachers with some supports to improve these skills.

- f. Teachers had some difficulties in identifying students' learning difficulties and developing students' motivation. Thus, it was essential for teachers to have a strategy or an approach that focused more on solving students' learning difficulties and stimulating student's motivation through active, innovative, creative and recreative learning.

## PREDICTIVE VALIDITY OF IPP GRADES AND APTITUDE TEST SCORES OF LEARNING ACHIEVEMENT OF ELEVENTH GRADE STUDENTS OF SENIOR HIGH SCHOOL

By: Yaya Sunarya

**Abstract.** Placement as guidance and counseling activity that exists from the beginning of establishment of senior high school is aimed at helping develop students' potencies (aptitudes) as wide as possible, so that if someone has been placed in a field of study suitable with his/her talent/aptitude, success and satisfaction can be achieved. How far has the activity develop students' aptitudes and potencies? Are the first criteria of placement (IPP and aptitudes) able to predict students' achievement? This study aimed at examining predictability of IPP and aptitude scores of achievement of eleventh grade students. Therefore, documentary study of placement documents of several schools in Bandung Regency and Bandung municipality and Cimahi municipality was conducted. Results of the research showed that IPP of Language Program had high predictability ( $r=0.825$ , significant at  $p<0.01$ ) on achievement; IPP of Science Program had enough predictability ( $r=0.376$ ,  $n=631$  significant at  $p<0.01$ ); and IPP of Social Sciences had enough predictability ( $r=0.4$ ,  $n=303$  and significant at  $p<0.01$ ). Whereas scores of aptitudes tests of language had good predictability with  $r=0.506$  and significant at level of trust 99%. Aptitudes of science had very low predictability ( $r=0.078$ , and insignificant). Aptitudes of social sciences had enough predictability, that is,  $r=0.333$ , significant at  $p<0.05$ .

**Key words:** predictive validity, IPP, scores of aptitude test, placement, learning achievement

Processes of schooling manifested in forms of education, academic, administrative and managerial, and individual services. The services are oriented to facilitate optimal development of students' potencies. In the level of senior high school, optimizing potencies of students' academic either through placements of students into fields of study covering science, social sciences, and language. Determining students' placement into one study program conducted at the end of even semester of tenth grade, and its implementation begin on the first semester of eleventh grade.

Based on currently prevailed provision, there are two main criteria that become basic reference for determining placement of students' study program, namely: (1) mastery of academic grades achieved by students in the eleventh grade in group of subjects that become distinctive traits of each study program stated in achievement index of study program; and (2) students' interest toward the program study.

As long as students meet criteria of required IPP, there was no problem. A problem occurs if: (1) IPP is not suitable with their interests, (2) students do not fulfill academic requirement (having one or more low grade(s) of distinctive subjects of each study program), and (3) students meet the requirement but after being placed to certain study program, they feel unsuitable. In this case, to determine study program that should be chosen by the students, procedurally the homeroom teacher need to ask considerations and inputs from guidance and counseling teacher(s).

Involvement of guidance and counseling teacher(s) in decision making of placement, in one hand, is a strategic opportunity because it can strengthen urgency of guidance and counseling teachers at senior high school in making important decision concerning with students' future. In the other hand, this is a strong challenge because guidance and counseling teachers have to be skillful and experts in analyzing students' potencies and capabilities, so that consideration and input that will be given should be appropriate.

Practices of placement at senior high school based on IPP as currently applied evidently have weaknesses, and are often criticized strongly. Placement was considered useless. Mohammad Ali (2006) questioned current practices of placement, where students would bring, to prepare for continuing study to university or entering field of works, still unclear. For example, a student who had entered science field of study, he/she should continue his study to university by choosing science study program. The reality is different where he/she is able to choose any study program. This practice generates negative stigma for social science and language students. Students of social sciences and language have limited opportunity. Hence, parents criticize it. Practices of placement at senior high

schools do not guaranty success of students in society, so that there are a lot of disappointed parents.

Although placement is not new practice, real conditions showed various weaknesses such as (a) students’ and parents’ disappointment toward results of placement; (b) a priori attitudes of students toward existing fields of study where science considered to be more prestigious than others; (c) still a lot of switch of study field, (d) unclearness and inconsistency of provisions where students who have chosen certain field of study at senior high school when he/she continues his/her study to university, he/she may choose other field of study, (e) several schools begin to organize psycho-tests as consideration for placement, (f) favorite schools tend to add seats/classrooms for science field of study rather than social sciences and language ones, and (g) on the other hand, findings based on empirical data suggested that most of students’ aptitudes are suitable to enter social sciences and language field of study than science.

A good model of placement should have a high predictability of success of learning. In line with this, phenomena described above indicate that the model of placement used currently has not meet expectations of concerned parties. Considerations on other aspects apart from students’ IPP and interests which are more valid in predicting success of students’ learning are needed. Efforts for that have been done by the laboratory of Educational Psychology and Guidance of Education Faculty of UPI through collaboration with schools in west java in the form of Psychology Assessment before placements were conducted. The test used in the placement was Intelligence Structure Test (IST). Unfortunately, results and recommendations from the psychology assessment were not used optimally. Although according to its manual, scores of IST have very good predictability toward students’ academic achievement at school.

In the other hand, based on interview with the board of the laboratory, they said that they had no empirical data concerning with predictive validity of placement program recommended to students toward success of their learning. Formula of placement used at the laboratory currently was still results of judgment and its theoretic information was relatively limited, so that empirical validations

were needed. In dealing with this, this study tried to reexamine the formula of placement at senior high school based on scores of IST used currently, hence new formula examined empirically can be formulated.

In line with the discussion above, problems studied in the research can be operationally formulated in the following questions:

1. How the predictive validity scores of certain subjects are established (mentioned in index of study program achievement/IPP) toward success of students' learning in certain department at the eleventh grade?
2. Do the formulas used at the laboratory of educational psychology and guidance in placing students (addition scores of certain aspects) have a good predictability toward learning achievement at the eleventh grade (exactly describing students' tendency of success)?
3. Can aptitude aspects predict students' success in a study program (alone/partially has a correlation with achieved grades)?
4. How can formulas of combination of aptitude and achievement aspects describe real achievements of students?

### **Methodology**

This study utilized descriptive and ex post facto approaches. Descriptive method was used to study students' characteristics happened when the research conducted by using correlation strategy (Satrock, 1977). Ex post facto method used to examine students' characteristics through analysis of grades and IPP documents. Design of this research was cross sectional survey (Shugnessy & Zechmeister, 1994; Lemer & Hultsch, 1983).

Operationally data gained through documentary study were (1) quantitative data in the form of scores of aptitude test covering nine aspects of aptitudes explored by IST (Intelligence Structure Test), (2) data of students' grade achievement in the second semester of tenth grade and grade achievement in the first semester of eleventh grade. Collected grades of subjects were ones in ledger books used as bases for the placement at the school.

### Several Concepts of Predictive Validity, Aptitude, and Placement

“Validity” term is generally found in measurement or assessment field. The term is used to show a level of exactness quality of a measuring tool in measuring aspects of materials or behavior that need measuring. But, validity is also frequently connected with objective(s) of a measurement. In this context, validity defined as exactness of a test (measuring tool) in producing data or information relevant to objective(s) or decision that will be made.

“Predictive” term means forecasting, containing a meaning that something will happen in the future. So, predictive validity of a test is that how far the test can show its ability in forecasting what will happen in the future (Sudijono, 2007: 168-170).

In a provision about placement at a senior high school, it is stated that entering a field of study needs index data of study program achievement (IPP) and consideration of aptitudes and interests of each student (Depdiknas, 2004). In this context, grades of certain subjects and capabilities in certain fields (special aptitudes) are predicted to contribute greatly to someone’s achievement in a field of study.

Abin syamsudin (2005: 60) stated that by observing prominent scores (results of quiz) achieved by a student, a teacher can predict that the student has a capability (special aptitude) in the field and the result can be used as a base for placing the student in a study program (department/ a field of study) at school.

The two views above provide a base that in choosing a field of study, data of students’ learning attainments (achievement) and data of psychology tests (especially about results of special aptitude test). The views strengthened by Dewa Ketut Sukardi (2005) stated that results of aptitude tests appropriately used together with other information materials. The tests should be conducted objectively meaning that in administration and implementation there is no unfair change of scores. Further it explained that if results of aptitude test matched with requirement of work and personal characteristics (results of personality test), hence the results will be able to predict well (having a high predictive value).

In line with this, Sumardi Suryabrata (1999:167) explained that aptitudes have a big role in education processes and it is ideal if we can provide an education suitable to the aptitudes. Someone will be more successful if he/she learns in a field suitable with his/her aptitude. The same is true for someone who will work better if he/she works in a field that suits his/her aptitude.

In dealing with prediction of results of aptitude tests, Murphy and Davidshofer (1988:202) explained, “...although the test is specifically designed as an aid in *making admissions and placement decisions for prospective college*, since it primarily measures comprehensions and reasoning ability rather than knowledge of specific facts”.

From the explanation above, it is clear that aptitude test has a good prediction toward someone’s success in taking an education. Historically search on aptitude began from field of work (occupation), but it turned to field of education. Moreover, nowadays, aptitude tests are activities frequently done in education field. There are a lot of schools organizing psycho-tests for uncovering data concerning with aptitude.

Efforts in understanding students can be done through various ways. Some of them are by assessing students (psychology tests or psychology examination), either done by a counselor or in collaboration with other professional.

Basically, psychology test is symbolizing psychological aspects constructed in a theory. Murphy (1998:73) stated “...all psychological test is to assign numbers to individual so that some attributes of these individual are faithfully reflected by some properties of the numbers assigned”. A problem in assessing level of goodness of a psychological test is that how far the test is able to measure special psychological aspects objectively. So that individuals who gained high or low scores of a psychology test can be predicted whether or not they will be successful, or how are their performance qualifications in real behaviors.

To assess how well a psychological test can predict an individual performance, according to Murphy (1998:73) can be seen from two things, namely: (1) reliability of the test scores and (2) the validity of inferences that are made about individuals on the basis of the test scores.

Concerning with the goal or function of measuring, testing, evaluating or assessing activities, Anastasi (1988), Thorndike, et al. (1991), and Nitko (1996), stated that goal or function of psychology test is as a base of decision making in dealing with selection, placement, and/or diagnostic. But they required that the decision will be appropriate if the test used as an instrument has or meet a requirement of a good test, that is, reliability, validity, and having a good discriminating power or discriminating index.

Reliability refers to a capability level of a test (as a measurement tool) in providing relatively consistent data. It means that when a test is used to the same subjects in different times, or when its items are divided into two, the test showed a high correlation index. Validity refers to a level of test exactness as a tool for measuring aspects expected to be measured. There are several kinds of validity covering content validity, construct validity, criterion validity, face validity, and predictive validity.

In dealing with this study, the most important validity is predictive validity, that is, how far the selection model of placement can predict capability (behavior, achievement) of subjects in the future.

The way of testing for identifying level of predictive validity according to several experts is by correlating scores gained from test predictors with expected behavior. In this study, identifying level of predictive validity is by correlating scores gained from IST test and students' grades of achievement in the form of index of study program achievement (IPP) with gained grades (in the form of achievement) in the first semester of eleventh grade. Another variable uncovered in the study is aptitude. Aptitude scores gained from a psycho-test by using IST test. To examine predictability, IST scores are also correlated with grades gained in first semester of eleventh grade.

### *Aptitude and Its Measurement*

Experts suggested different limitations concerning with aptitude based on their believed philosophical foundations. For example, John Carroll considered someone's aptitude in term of “needed time” side in doing a task or job. Shorter time needed for doing a task, more talented he/she is (Abin Syamsudin, 2000:234).

Morse (1962:257) connected capacity to ability. According to him, aptitude is a capacity, that is, potentials for developing a concept or skill, rather than ability, i.e., actual present potentials for performance. Whereas, Woodworth and Marquis defined aptitude as results that can be predicted and measured by a test developed specifically. He suggested that aptitude can be categorized into a group of ability. But, Guilford defined it by referring to capability in action. He said that number of aptitude test is the same as number of activities that can be done. He added that aptitude has three dimensions, namely: perceptual, psychomotor, and intellectual dimensions. Each dimension consists of more specific psychological factors, for example: capability in memorizing, reasoning, etc.

To measure aptitude, an aptitude test can be used. According to Cronbach (1984:31), “An aptitude test is one intended to predict success in some occupational or training course – there are tests of engineering aptitude, musical aptitude, aptitude for algebra, and so on.” Test for selecting achievement is an achievement test. In dealing with the condition, Abin Syamsudin (2005) explained that achievement test can be used for predicting aptitude, that is, by identifying prominences of scores (in parts/aspects of test) achieved by a student, a teacher can predict that the student has a capability (a special ability) in a field. The result can be used as a base for placing students in a study program at school. The two views provide a foundation that in choosing a field of study, data of learning achievement and data of psychology test results (especially about results of special aptitude) need integrating.

Dewa Ketut Sukardi (2005) explained that results of aptitude tests are most appropriate to use with other information materials. The test should be implemented objectively. It means that in its implementation and administration there is no unfair score changes. Furthermore, he suggested that if results of aptitude test matched

with requirement of work and personal characteristics (results of personality test), then the result will be able to predict well (having a high predictive value).

Whereas, Sumadi Suryabrata (1999) explained that aptitude has a big role in education process and it is ideal if we can provide an education really suitable with aptitude. Someone will be successful if he/she learns in a field suits his/her aptitude. The same is true for someone who will work better if he works in a field suitable with his/her aptitude.

According to Abin Syamsudin (2005: 54) there are six indicators of a talented person as follow:

1. Easiness in using numbers.
2. Efficiency in using language.
3. Quickness in observing
4. Easiness in memorizing.
5. Easiness in understanding relationship.
6. Imagination.

Based on the indicators, people can be categorized into ones that have special basic capabilities in the following field: numbers, language, space control, social relationship, and motor movement.

To detect aptitude, experts have developed various tools/instruments for measuring special capabilities called *aptitude test*. Among aptitude tests, the most frequently used tests are DAT, FACT, and IST. The test instruments uncover various aspects, some of them are:

- a. V = Verbal Comprehensions
- b. W = Word Fluency
- c. N = Number
- d. S = Space
- e. M = Associative Memory
- f. P = Perceptual Speed
- g. R = General Reasoning
- h. Mo = Motor

For schools in West Java that use psycho-tests from the Laboratory of Education Psychology and Guidance of Education Faculty of UPI, uncovering aptitude aspects uses IST test. IST is a tool for measuring special capability (aptitude) that uncovers 9 aspects of aptitude, namely:

1. SE (*Satzerganzung*), especially for measuring problems of forming decision, commonsense, an assessment close reality or reality capability. Through this sub test, capability of thinking independently is expected to uncover.
2. WA (*Wortauswahl*), especially for measuring capacity of integrative verbal thinking, to understand content of a definition through capability in comprehending language matters fully.
3. AN (*Analogien*) measures capability of thinking flexibility, combining, understanding and depth in thinking.
4. GE (*Gemeinsamkeiten*) measures abstraction capability, that is, capability in making/forming understanding and expressing the understanding into verbal language.
5. ME (*Merk Aufgaben*) measures memory power, that is, capability in storing or retrieving learned or memorized words.
6. RA (*Rachen Aufgaben*) measures capability of practical inductive thinking or practical thinking power in counting.
7. ZR (*Zahlen Reihan*) measures capability of theoretical inductive thinking in using numbers or calculation, and rhythmic components.
8. FA (*Form Auswahl*) measures capability in analysis and synthesis.
9. WU (*Wurfel Aufgaben*) measures capability in space or three dimensions control/monitor, constructive-technical components, including analytical components in it.

Based on the 9 aspects, certain study program is predicted or supported by a number of aptitudes. The laboratory of educational psychology and guidance of Education Faculty of UPI has developed a test based on the aspects. For example, to enter language department, it needs reality talent, verbal thinking, analogy, abstraction,

and memory power, etc. Based on the discussion, formula of potency for placement as follow:

$$\text{LANGUAGE} = (\text{SE} + \text{WA} + \text{AN} + \text{GE} + \text{ME}) \times 4$$

$$\text{SCIENCE} = (\text{GE} + \text{RA} + \text{ZR} + \text{FA} + \text{WU}) \times 4$$

$$\text{SOCIAL SCIENCE} = (\text{SE} + \text{WA} + \text{AN} + \text{ME} + \text{RA}) \times 4$$

In practice of placement at schools, several combinations of psychological aspects (aptitude), achievement and school condition are done. A guidance and counseling teacher at school, Sukmana (2005) explained that in placement, schools have to pay attention to: learning achievement, students' interests, parents' expectation, psycho-test results, and capacity of a school.

Based on the explanation above, placement at school at least needs three kinds of basic data, namely:

1. Data of learning achievements in each field of study, realized in IPP.
2. Data of aptitudes owned by students.
3. Data of interests expected by students.

In field of education, each study program or field of work needs more than one aptitude factor functioned. There are various factors need to function for a field of study or certain work place. For example, aptitude for continuing study in technology faculty, factors of number, space, abstract thinking, language, mechanic, and many more. In each individual, there are all factors needed for various kinds of jobs/works, with different kinds of jobs, combination only, constellation, different and intensity (Sumadi Suryabrata, 1999).

One of psychology references stated that students of SMA are individuals experiencing developmental processes. Each individual walks through steps of development. In each step, there are certain tasks occurred as a response of physical changes, maturity of an organ, environment challenges, or physical changes. In psychology term, the tasks mentioned above are called developmental tasks (Hurlock, 1997). As a result, the case can cause difficulties of individuals.

As a whole and conceptually, system of education in our country has answered psychological demands of teenagers/adolescent needs, that is, by existence of school in the level of senior high school and vocational high school. The senior high school is as a realization of development of academic aptitudes, and vocational high school is as a development of vocational aptitudes.

In other condition, developmental tasks often become a challenge and sometimes obstacles for organizing education. But, individuals demanded to be able to complete the tasks because incompleteness of the tasks will cause abnormality or barrier for completing tasks coming up next time. To help complete the developmental tasks, education is needed (Abin Syamsudin, 2005). In order that all students can develop their developmental tasks optimally in the process of education, Blocher (1987) stated that a school needs to be equipped by counseling profession.

If we observe the nature of learners as developing individuals and in each stage of development, certain tasks occur (development task), then education and guidance have been existed since human being existed. But because education and guidance are dynamic things, so they will change and develop. According to Blocher (1987) and Sunaryo Kartadinata (2005) direction and perspective of new guidance and counseling can make guidance and counseling as a proactive and systematic effort in facilitating individuals to achieved higher level of development, effective behavior development, developing a development environment, and improving individual function in his/her environment. All of these behavior changes are processes of development, interaction processes between individual with environment development through healthy and productive interaction. Guidance and counseling have tasks and responsibility for improving environment of development, building dynamic interaction between individual and his/her environment, making an individual to learn about developing, repairing, and making behaviors smooth.

Guidance and counseling activities at school are professional. It means that guidance and counseling have to be done by qualified person in the field. But currently, implementation of the activity is various. The variation (ABKIN, 2004)

is caused by several things. Some of them came from conditions of schools, counselors, real problems face by students with various backgrounds. Aspects of school conditions cover school physical and non physical aspects. The physical aspects of schools consist of conditions and quality of buildings, number of rooms, and facilities. The facilities may generate the variation in organizing or implementing activities of guidance and counseling. Conditions of guidance and counseling teachers in field are also various. Based on a research result done by Solehuddin (2003) described that guidance and counseling teachers at field have various spectrums. The variations were observed from feasibility, service years, and academic qualifications. The variation may generate variation in service quality. Variations of real problems face by students with various backgrounds can determine variation in program arranged.

In states of USA, a model of standardized program created by a professional association (ASCA) is available. The structure of program in general has three components of activities covering *academic development*, *career development*, and *personal/social development* (Bowers and Hatch, 2004). Further more, it was explained that in the program consists of four components of national standards that needs achieving, namely:

*... establish the school counseling program as an integral component to the academic mission of your school, ensure equitable access to school counseling service for all students provided by state-credentialed school counselor, identify the knowledge and skills of all students might acquire as a result of the K-12 school counseling program; and ensure the school counseling program is comprehensive in design and delivered in a systematic fashion to all students.*

### **Provisions of Placement at School**

Based on provisions of the national education department (2004), placement into fields of study at senior high schools should consider the following things:

1. Time for determining and implementing the placement. Determination of study field placement of students for science, social science and language programs begin in the first semester of eleventh grade.

2. Criteria of placement. Choosing study program at senior high school is based on the following criteria, namely:
  - a. Academic grades. Students who are promoted to the eleventh grade and intended to choose certain programs, that is, science, social sciences, or language, may have no more than three subjects which are not mastered yet. The subjects should not be included in ones that have distinctive traits of the chosen program (see the curriculum structure). The students who are promoted to the eleventh grade with having three unfinished subjects placed in a field of study by considering the unfinished subjects. For example, if the unfinished subjects are physics, chemistry, and geography (2 subjects are distinctive to science and 1 subject is distinctive to social sciences), then the students academically placed to language program. If the unfinished subjects are Indonesian, English, and physics, (two subjects are distinctive to language and 1 subject is distinctive to science), then the students are academically placed to social sciences program. If the unfinished subjects are economics, sociology, and English (2 subjects are distinctive ones of social sciences and 1 is distinctive to language), then the students are academically placed into science program. If the unfinished subjects are physics, economics, and Indonesian (covering all of subjects that become distinctive traits of the three program at senior high school), then considerations are needed on students' achievements of knowledge, attitude, and practice of subjects that become distinctive traits of science program such as physics, chemistry, and biology compared with ones that become distinctive features of social sciences program (Indonesian and English). The comparison of achievement grades of students can be done through remedial program and ended by examination. If grades of each subject that become special feature of certain program are more prominent, then the students can be placed into the program with the prominent grades. If the interest and achievement are not suitable, a homeroom teacher with some considerations from guidance and

- counseling teachers can determine what program that can be chosen by the students.
- b. Students' interests. To know students' interest can be done through questionnaires and interviews, or other ways that can be used for detecting interests and aptitudes of the students.
3. For students who have fulfilled requirements for entering all programs, they have an opportunity to change their programs if they feel unsuitable with the first program or inappropriate with their learning capability. The school needs to facilitate them in order to reach standards of competences and basic competences in the new class.
  4. Time limitation for changing the program is determined by the school, the latest is in 1 (one) month.
  5. A school can add criteria for placement based on characteristics and needs of each school.

The provisions require certain things for someone who chooses a field of study. Hence, the placement can be considered as both selection and placement.

## **Research Results and Discussions**

### **1. Predictability of Index of Study Program Achievement (IPP)**

Results of a correlation test between index of study program achievement and means of achievement grades in primary subjects of language fields (n=19 subjects), gained  $r=0.825$  significant on  $p<0.01$ . The correlation number according to Guilford categorized into high correlation. The correlation showed that there is high relationship between the two correlated variables. It means that, in this context, index of study program achievement gained by students in the tenth grade had a high connection with their achievement in the eleventh grade. In other words, IPP grades of language field can become a predictor for seeing students' success in the following grade.

In science field, results of correlation calculation between IPP with achievement grades in the first semester of eleventh grade acquired correlation

index  $r=0.376$ , with  $n = 631$ , significant to  $p<0.01$ . The index of correlation number was categorized into medium correlation. This showed that predictability of IPP grades of science field in the tenth grade toward achievements of primary subjects of science field in the eleventh grade was real (significant).

In social science field, results of correlation calculation showed  $r=0.414$  with  $n=303$  and significant at  $p<0.01$ . This correlation index was included in medium or enough qualification. It means that index of study program achievement of social science fields gained from average of some subjects predicted very well for success of attained achievement in the eleventh grade of senior high school.

## 2. Predictability of Aptitude toward Learning Achievement

Analysis or description concerning with predictability of aptitudes toward achievement is going to be explained as follow:

### a. Predictability of Aptitudes toward Achievement in Language Fields

A whole results of prediction calculation stated in correlation can be seen on the following table.

**Table 4.1**  
**Matrix Correlation among Sub Aspects of Aptitudes with Potency and Achievement in Language Field of Study**

	SE	WA	AN	GE	ME	BHS	IPP	PRESS
SE	1.00							
WA	.159	1.00						
AN	.058	.177	1.00					
GE	.316	.211	.307	1.00				
ME	.193	.309	.417	.543	1.00			
BHS	.477	.583	.434	.629	.574	1.00		
IPP	.253	.157	.293	.306	.216	.188	1.00	
PRES	.388	.358	.378	.343	.275	.506**	.825	1.00

\*) Correlation is significant at the 0.05 level (1-tailed).

From the table, some of the sub tests having very good correlation with learning achievement can be seen. The first five sub tests (SE, WA, AN, GE, ME) partially have correlation with achievement ranging from 0.275 to 0.388 significant at level of trust 90 up to 95%. Then the five sub tests were examined and predicted as basic success of language fields. In the research, it was proved that if the five aspects

were integrated, they had a good predictability with  $r=0.506$  and significant at level of trust 99%. Thus, the formula model provided by the Laboratory of Educational Psychology and Guidance proved to have a good predictability.

b. Predictability of Aptitudes toward Achievements in science fields

Several aspects of aptitude predicted to have a good supportability toward achievement in science are GE, RA, ZR, FA, and WU. The calculation results to answer the problem can be seen in the following table.

**Table 4.2**  
**Matrix Correlations among Sub Aspects of Aptitude with Potencies and Achievements of Science Fields in Placement of Science Study Program**

		GES	RA	ZR	FA	WU	IPA	IPP	ACHIEVEMENT
GES	Pearson Correlation	1	.241*	.245*	.179*	.241*	.481*	.060	.038
RA	Pearson Correlation	.241*	1	.499*	.264*	.267*	.625*	.305*	.108**
ZR	Pearson Correlation	.245*	.499*	1	.314*	.273*	.691*	.186*	.118**
FA	Pearson Correlation	.179*	.264*	.314*	1	.331*	.625*	.040	.063
WU	Pearson Correlation	.096*	.267*	.273*	.331*	1	.617*	.065	.023
IPA	Pearson Correlation	.481*	.625*	.691*	.625*	.617*	1	.217*	.078
IPP	Pearson Correlation	.060	.305*	.186*	.040*	.065*	.217*	1	.376**
ACHIEVEMENT	Pearson Correlation	-.038	.108*	.118*	.063*	.023*	.078	.378*	1
	Sig. (2-tailed)	.344	.007	.003	.113	.568	.050	.000	
	N	631	631	631	631	631	631	631	631

\*\*\*) Correlation is significant at the 0.01 level (2-tailed)

From the table, it can be seen that correlation owned by aspects of GE, RA, ZR, FA, and WU (partially) toward learning achievements of science fields is low (all of them are under 0.2), although some of them show significant correlations. It means that learning achievements of science fields in the first semester of eleventh grade can not be predicted by the aptitude scores. In other words, predictability of aptitude toward achievement in science fields is low.

In other conditions, if scores of GE, RA, ZR, FA and WU aspects are combined, as formulated by the Laboratory of Educational Psychology and Guidance, number of correlation is low ( $r=0.078$ , and insignificant). It means that either partially or in combination, achievement grades of subjects of science fields can not be predicted by scores of aptitudes of science fields.

c. Predictability of Aptitudes toward Achievement in social science fields.

To identify or examine predictability of aptitudes expected to support social science fields can be seen in the following table.

**Table 4.3**  
**Matrix Correlation among Sub Aspects of Aptitude with Potencies and Achievements of Social Sciences in Placement of Social Sciences Study Program**

		SE	WA	AN	ME	RA	IPS	IPP	ACHIEVEMENT
SE	Pearson Correlate	1	.138*	.170*	.211*	.167*	.510*	.119*	.160**
WA	Pearson Correlate	.138*	1	.227*	.312*	.249*	.538*	.031*	.197**
AN	Pearson Correlate	.170*	.227*	1	.215*	.266*	.592*	.134*	.270**
ME	Pearson Correlate	.211*	.312*	.215*	1	.295*	.650*	.202*	.213**
RA	Pearson Correlate	.167*	.249*	.266*	.295*	1	.541*	.050	.098
IPS	Pearson Correlate	.510*	.538*	.592*	.650*	.641*	1	.210*	.335**
IPP	Pearson Correlate	.119*	.031*	.134*	.202*	.050	.210	1	.414
ACHIEVEMENT	Pearson Correlate	.160*	.197*	.270*	.213*	.098*	.335*	.414*	1
	Sig. (2-tailed)	.005	.001	.000	.000	.089	.000	.000	
	N	303	303	303	303	303	303	303	303

\*) correlation is significant at the 0.05 level

From the table above, it can be seen that correlation numbers gained from aspects of aptitudes connected to social sciences (rationally they predicted as requirement for achieving good achievement in social science fields), namely: SE, WA, AN, ME, and RA have low correlation numbers (between 0.2 up to 0.3), but almost all are significant at  $p<0.05$  and  $p<0.01$  (except RA aspect). If the aspects are formulated (like one done by the laboratory of educational psychology and

guidance of UPI), in fact, they have higher correlation values, that is,  $r=0.335$ , significant at  $p<0.01$ . It means that considered aspects of aptitude have a good predictability.

### **Discussions of Research Results**

If scanning results of data process as described above, in dealing with IPP, in fact IPP on all fields of study have good predictions on attaining learning achievement in the eleventh grade, although the prediction is low. It means that other aspects that also influence attainment of good achievement.

According to experts, there are a lot of things that are able to predict learning achievement. One of them mentioned by Murphy (1998) as *attribute psychologist*. Murphy then mentioned that psychological aspects are not enough, but the important thing is quality of instrument that uncovers the aspects.

Low number of prediction of IPP toward learning achievement also can be caused by low quality of teachers' made tests. Based on the writer's experience in analyzing the teachers' made tests, only 25% up to 40% of the tests were categorized into good ones. IPP gained by adding some grades of distinctive subjects of study program taken from test items made by teachers. Learning achievement also acquired from tests in the eleventh grade using teachers' made test. It means that it is possible that either a test used for uncovering IPP or one used for measuring achievement did not have a good quality.

Several experts suggested that intelligence and aptitude are factors frequently called as predictor. But, why there were a lot of studies concerning with it were fail to predict someone's success. This is in dealing with validity and reliability of an instrument. If observing current school conditions where there are a lot of test leaks, where dishonest teachers intentionally gives answer keys to students. As a result, a valid and reliable test will not be able to predict well.

Murphy (1998: 111) explained that there are six groups/kinds/categories causing inconsistency of scores of a test. The six categories consist of:

1. Lasting and general characteristic of the individual.

2. Lasting but specific characteristic of the individual (factors affecting performance on many or all tests at a particular time).
3. Temporary but general characteristics of the individual (factors affecting performance on many or all tests at a particular time).
4. Temporary and specific characteristics of the individual.
5. Systematic or change factors affecting the administration of the test or the appraisal of test performance.
6. Variance not otherwise accounted for (chance).

Other research findings are that in language field of study, several formulated aspects of aptitudes had a good prediction toward achievement. In other words, the aspects of attitudes (SE, WA, AN, GE, ME) had a good prediction toward learning achievement of the language field of study. If we analyze them further, results of correlation of aspects of aptitude and grades of subjects can be seen in the following table.

**Table 4.4**  
**Matrix Correlation between Sub Aspect of Aptitude with Language Learning achievement in Language Study Program**

		IND	ENG	MATH	LIT	ANTR	JPG	HIST
SE	Pearson Correlation	.478	.238	.255	.101	.215	.210	.172
WA	Pearson Correlation	.442	-.005	.432	.133	.175	.218	.193
AN	Pearson Correlation	.454	-.184	-.336	.431	-.105	.572	.287
GES	Pearson Correlation	.181	.246	-.123	.005	.491	.043	.580**
ME	Pearson Correlation Significant (2-tailed) N	.251	-.120	.039	.062	.327	.158	.268
		.301	.625	.873	.800	.172	.518	.267
		19	19	19	19	19	19	19

From the table above, it is clear that SE, WA, and AN have correlation of good predictability with achievement on Indonesian subject and significant at the level of trust 95%.

If seeing from predictability of each aspect of aptitude, the description as follow: Aspect SE (reality capability) has good prediction toward achievement of

Indonesian ( $r=0.487$ , significant at  $P<0.034$ ); aspect WA (verbal language capability) has good predictability toward Indonesian and Math ( $r=0.442$  and  $0.432$ , significant at level of trust, 94%); AN (analogy/thinking flexibility) has a good predictability toward Indonesian ( $r=0.454$ , with  $P<0.051$ ), Indonesian Literature ( $r=0.431$ ,  $P<0.065$ ), and achievement of Japanese Language ( $r=0.572$  with  $P < 0.010$ ). Then aspect of GE (abstraction capability) has a good prediction toward anthropology achievement ( $r=0.491$ , with  $p < 0.033$ ) and toward history achievement ( $r=0.580$ , with  $P < 0.172$ ). Whereas, aspect of ME (memory) provides good prediction toward anthropology ( $r=0.327$ , with  $P < 0.17$ ). These facts show that each aspect of aptitude has its prediction toward field or assessed aspect. Whereas, it explained by Thorndike, et all (1991:357), Morse (1962: 256-258), and Murphy (1998) said that the point is to explained that an aptitude test constructed based on certain aspects in the future. The success can be in academic field (education) or occupation.

Morse (1962: 283-284) suggested that test as a predictor, “...the use of test for predicting how well students are likely to do in school and college.” It explained further by Cronbach (1984: 31) that “...an aptitude test is one intended to predict success in some occupational or training course.” Further more, it was elaborated that although in reality an aptitude test could be more general and uncovered several concerned aspects. For example,”...a test of engineering aptitude may include sections measuring general mental ability, mechanical and spatial reasoning, and proficiency in mathematic.

Further more, it was explained by Cronbach (1984) that “...the achievement/ aptitude contrast is one of point of view, more than the test content. Any test was an achievement test inasmuch as it is a report on development and learning to date, and it is aptitude test in as much as it says something about the future...A test used to identify such students come to be known as a minimum competency test.”

From the discussion above, it is clear that an aptitude test measures certain aspects that conceptually predict someone’s success in doing a field of work (performance) or forecast someone’s success in reaching an achievement in a field

of education. Someone who has a high score in one aspect of aptitude test is predicted to reach a success in a field of work or education.

Another research result is that in the sample group of science field of study, the gained correlation number was very low. It means that the predicted aptitudes that have a relationship or become a base for determining achievement, in fact, are not visible. But partially the aptitudes have good predictability toward learning achievement in the eleventh grade. The predictability can be seen in the following table.

**Table 4.5**  
**Matrix Correlation between Sub Aspects of Aptitudes with Achievement in Science Field of Study**

		MATH	PSYC	BIO	KIM
GES	Pearson Correlation	.045	.011	.062	-.078
RA	Pearson Correlation	.148**	.200**	.237**	-.021
ZR	Pearson Correlation	.144**	.150**	.164**	.025
FA	Pearson Correlation	.030	.041	.080	.039
WU	Pearson Correlation Significant (2-tailed) N	.014	.071	.009	.003
		.718	.073	.826	.935
		631	631	631	631

In the table above, it can be seen that primary subject or distinctive subjects in science field of study covers Mathematics, Physics, Biology, and Chemistry. Whereas, aspects of attitudes that become predictors consist of GE, RA, FA, and WU.

Sub aspects of GE (*Gemeinsamkeiten*) or abstraction capability, FA (Form Auswahl) or analysis and synthesis capability, and WU (*Wurfel Aufgaben*) or space/three dimensions control capability are not predictor on achievement in primary subjects of science field of study. It means that correlation of all of the

aspects is under 0.1, whereas aspect of RA (Rachen Aufgaben) or practical calculation capability and aspect of ZR (Zahlen Reihan) or capability in theoretical calculation have significant correlation with achievement in mathematics, physics, and biology, except chemistry. According to Utami Munandar (1985:15-17) that whether or not someone’s aptitude can be realized into achievement, determined by environment conditions like treatment and knowledge of teachers/parents, structure and infrastructure of school, interests of students groups mainly peer groups, and also internal factors such as motivation, drive, persistence, and perseverance.

In dealing with the discussion above, Dewa Ketut Sukardi (2005) explained that results of aptitude tests is appropriately used together with other information materials, and if the test is implemented objectively, meaning that in its implementation and administration there is not unfair score changes. Further more results of the aptitude test are matched to requirement of work and personal characteristics (results of personality tests), then the test results will be able to predict well (having a high predictive value). Concerning with this result of the study, probably one (or two) variable(s) in the research has a defect in conducting data administration. In this case, the most possible defect is invalidity of learning achievement data.

The existence of the invalidity is strengthened by several research results showed (1) there were students’ negative attitudes toward several subjects, (2) students’ learning motivation was low, (3) there was an assumption that science field of study is the best, so that the students bragged about them selves and they considered that social science field of study is the second class, and (4) there was a tendency that a favorite school just opened science field of study.

Another research result is that IPP of social science field of study has significant correlation toward achievement in social science fields (primary subjects in social science field of study). The correlation is that  $r=0.335$  significant at  $P<0.01$ . It means that aspects of SE, WA, AN, ME and RA all together are predictors toward social science achievement. Partially correlation among the aspects of aptitudes can be seen in the following table.

**Table 4.6**  
**Matrix Correlation between Sub Aspects with Achievement in Social Science Field of Study**

		MATH	HIST	GEO	ECO	SOC
SE	Pearson Correlation	.048	.124*	.127*	.086	.143*
WA	Pearson Correlation	.132*	.238**	.142*	.064	.075
AN	Pearson Correlation	.233**	.228**	.136*	.172**	.118*
GES	Pearson Correlation	.183**	.236**	.073	.098	.126*
ME	Pearson Correlation	.133*	.111	.005	.043	.037
	Significant (2-tailed)					
	N					

\*) Correlation is significant at the 0.05 level (2-tailed).

Numbers in the table above can be described as follow. *First* in social science field of study, mathematics is predicted by 4 sub aspects of aptitude, namely: WA, AN, ME, and RA. But, aspect of SE does not really predict. It means that capabilities of language, analogy, memory power, and practical calculation can predict mathematic achievement in social science field of study, whereas reality capability does not guaranty occurrence of mathematics achievement in the field of study. *Second* achievement of history subject in social science field of study is predicted by capabilities of reality, language, analogy, and memory power. Practical calculation capability does not predict achievement in history subject. In other words, someone who has good scores in the first four aspects is predicted to have a good achievement in his/her history lesson. *Third* achievement in Geography can be predicted from capabilities of reality, language, and analogy (thinking flexibility). But, memory power and practical calculation do not predict well. Fourth, achievement in economics is only predicted by analogy capability, whereas the other four do not have good prediction. Fifth, achievement in sociology can be predicted by scores of reality, analogy (thinking flexibility) and memory power capabilities.

nyodamsyk@yahoo.com

<sup>3</sup>Departement of Non Formal education, University of Palangkaraya, Kalimantan Tengah, Indonesia

**Abstract:** Vertebratal Zoology Course in University of Palangka Raya in due course is delivered using Direct Instruction; lecturer become the learning center, so the student activities tend to be less. Lesson plan was composed without involving other collegians, lecturers work on their own. The demand on learning achievement are not only in cognitive aspects but also accompanied by other skills such as critical thinking. The implementation of lesson study (LS) by applying cooperative learning model of Student Team Achievement Division (STAD) type to be applied to develop the activity and the capability of student critical thinking. STAD is a learning model in which students are demanded to work independently, cooperative, and revealing their thought to other students in learning process. The implementation of Lesson Study were conducted four times covering plan, do and see with STAD learning model on vertebrate course to enhance the activities and critical thinking capability. The results of the study showed that with STAD model in 4 cycles were able to enhance the activities during the problem analysis stage, discussions and delivering its results on vertebrate zoology topics which are in line with plan, do and see cycles. Critical thinking capability of students are better, evidence from the answers and questions raised by students during discussion and their presentation of each group from given assignments. Therefore, it can be concluded that the collaboration and mutual learning as a result of the LS implementation could enhance the activity and student critical thinking capability during vertebrate zoology lecturing stage by stage.

**Keywords:** lesson study, cooperative learning, learning activity, critical thinking.

### 1 INTRODUCTION

Lesson Study is a sustaining classroom-based development strategy for teachers profession development by researching collegians principles and mutual learning to establish learning communities (Susilo *et al*, 2011), its three philosophy of learning community, public, democracy, and excellency (Sato, 2014). A teacher is not only performing teaching but he also developing a learning process every day. The development is called *jugyo kyenyuas* a medium to analyze the learning process by a teacher together with others (Syamsuri & Ibrohim, 2011). Therefore to develop a professional educator, a lecturer is not only able to teach, but by forming a learning community to study a learning process in depth in a classroom.

Generally, vertebrate zoology lecturers in University of Palangka Raya are performed using

Direct Instruction with a stressing on a lecturer as a learning centre. Lesson plans were created individually; learning purpose was stressed on cognitive only. Meanwhile in learning, there are also affective and psychmotoric skills (Sudjana, 2005). In daily live, we need skills to be developed as a lifeskills such as critical thinking capability. Based on the results of survey of National Association of Colleges and Employers that the Higher Education output quality in job fields are also determined by soft skill such as social interaction capabilities, not by GPA. To develop social interactions including activities and critical thinking of students, a lecturer could apply cooperative learning model (Killen, 2009) of Student Team Achievement Division (STAD) type. The principles of STAD learning model was developed by Slavin, in which students are demanded to be independent, cooperative, and delivering their thoughts to other students during learning process to produce social interactions

(Arend, 2009). For thermodynamic course, the capability to think critically, learning mastery increased by 28,9 % and the classroom average score increased from 68,4 to 74 after the implementation of the STAD model (Zulhelmi, 2011). Also, the application of Lesson Study for learning Sciences, students achieved the lesson material and also enhance the capability to study critically (Suyanto, 2011). Accordingly the implementation of Lesson Study with the application of STAD could enhance critical thinking to understand concepts thought by a teacher or lecturer. The study method for the implementation of Lesson Study on vertebrate zoology course were performed in four cycles. Every cycle consists of plan, do, and see. It started from syllabi study, learning execution, and reflection (Lewis, 2006). The taskforce consists of one model lecturer and three observers with similar leveled skills. During the plan stage, the lecturer collaborate with three observers to create a Lesson Plan (LP = SAP) and student working sheets (SWS = LKM) as an observation sheet. On do stage or the execution and learning observation (open class), an in charge lecturer (ICL) conducted class as planned in LP. Other collaborators acted as observers. On see stage or reflection the ICL and other observers revealed facts found during the lecturing and discussed for improvement. All observers studied the student learning process in depth based on open observation sheets. The studied subjects as data sources were students from biology education study program who took vertebrate zoology course during the even semester. Instrument to collect data was observations sheet toward activities and critical thinking of students. The resulting data on activity and critical thinking were analyzed descriptive-qualitative

## 2 RESULT AND DISCUSSION

Observation results on the student activities during LS implementation with the application of cooperative learning of STAD type on vertebrate zoology topics can be seen on Table 1. According to Table 1 during the learning process or do 1, 2, 3 and 4 the activity of students increased. On first open lesson the capability of student to explain the connection of concepts were poor (a), classroom discussion were optimal since many students were still passive and never asked or argue (b), student has never used lecturer as a supervisor or companion during learning process because they used to be in a centralistic learning process (c), Student interaction

during lecturing were adequate (d). The capability of student to present the group achievement (e) Student maintained their activity results (f).

Table 1. The Implementation of Lesson Study on student activity with STAD learning model

Activity	Observed results ( In Do stage during open lesson)			
	I	II	III	IV
a	2,6	2,7	3,0	3,4
b	3,0	3,1	2,8	3,1
c	2,9	3,2	3,2	3,5
d	3,0	3,2	3,4	3,5
e	3,1	3,0	3,2	3,2
f	2,9	3,2	3,2	3,3

Note :

1 : poor, 2: adequate, 3, good, 4: excellence

During the 2<sup>nd</sup> open lesson it was recognized that the capability of students to explain the connection of concepts were improving (a), Classroom discussion run optimum, many students started actively (b), Students already took advantage of having lecturer as a supervisor and companion during learning process (c). Student interactions during learning process run adequate (d). On Do stage from first open lesson, the student activities were seen clearly during the discussion which can be categorized well. (e), Then during the presentation of student group achievement. The activity changes connected with the syntax of STAD which was more during discussion and presentation of discussion results.

On do stage for the third and fourth open lesson all students activities observed have reached maximum scores on problem resolving, discussion, presentation, and giving opinion which can be categorized as very satisfy. According to stages on the application of Lesson Study (Hartono, 2011), that during the learning process, as a results of the changes of learning model from direct instruction to become STAD, in this study stages of Lesson Study helped model lecturer a lot to perfect Lesson Plan which was created collectively amongst lecturers from related subjects.

The study results on student activities showed that STAD learning model were able to activate students to follow the learning process well. Besides, the application STAD could centralize the learning process to students. It was evidence from the increasing of the student role during learning process. The implementation of Lesson Study for the lecturer of Chemistry Textbook and Curriculum Overseen with cooperative learning model in a small

group and presentation could improve communication skills in learning process (Hartono, 2011).

Element to think critically used in this study were adopted from Inch (Inch, 2006) with only five elements of critical thinking ;asking the problem (a), aims (b), information (c), concept (d), interpretation and making conclusion (e). The observation results on the critical thinking capability by application of STAD cooperative learning for vertebrate zoology topics with modified critical thinking capability from each element are listed in Table 2.

Table 2. The Implementation of Lesson Study with the application of STAD Model toward the critical thinking for vertebrate zoology course

Critical Thinking	Results of Observer Assesment on Open Class			
	I	II	III	IV
a	2,75	3,75	3,75	4,00
b	3,00	3,75	4,00	4,00
c	2,00	2,50	3,25	3,75
d	2,50	3,25	3,75	3,75
e	2,00	3,00	3,00	3,50
Average	2,45	3,25	3,55	3,80

Note :

1 : poor, 2: adequate, 3, good, 4: excellence

Based on the implementation of plan do and see for 4 times, it was known that the students capability to describe the discussion results was getting better as a result of the application of STAD learning model which was implemented with Lesson Study. Also, to understand the aims, interpretation and making the conclusion showed a similar trend. This is in line with LS for biology course with NHT model (Pangestu, 2011). Lesson study provided experience for students as an effective effort to enhance the learning quality by lecturer and also student learning activities. This based on the development of Lesson Study as a result of knowledge professional “sharing” on teaching practice and result by related subject lecturers. Students joining lecture Lesson Study have learning quality not only to understand the concepts being thought, but they also have other competency that is able to be developed as a life skill (Suherman, 2011). The learning focus with Lesson Study is mainly for student activities based on the real experiences in the classroom, then Lesson Study is able to be used as a base for the development of

learning cooperatively by placing a teacher or lecturer as the researcher of the learning process (Warianto, 2011).

Table 3. The role of a lecturer during the Implementation of Lesson Study for vertebrate zoology course

LS cycle	Participant (LS cycle)				Collaboration Activity Quality
	I	II	III	IV	
Plan	3	3	3	3	Adequate
Do	6	6	8	8	Good
See	6	9	8	8	Good

During the execution of Lesson Study for 4 cycles, it could enhance the collaboration activities amongst biology lecturers, especially Lesson Study team in zoology fields during Plan, Do, See activities. Lecturer activities during Plan agreed with the corresponding lecturers (3 person), Do during open lesson dan see were followed by 6 to 9 person from zoology related subjects. By the increasing of the observer who responded during open lesson or reflection (see) toward the learning process, then the positive suggestions and improvement were getting more and more (Table 3). This provided chances for model lecturer to improve for the subsequent lesson. In addition to this, the observer from different subjects could learn the weakness and the benefit and also comparing it to usual lesson on their on subjects during class. Lesson Study is a simple strategy to improve a learning process with a collaboration (Lewis, 2002). Therefore Lesson Study could form collegiality and collaboration amongst, the students and amongst the lecturers from closed-related subjects in the same university which is able to be extended to form a bigger learning community

### 3 CONCLUSION

The implementation of Lesson Study with the application of STAD cooperative learning model could increase the learning activities and critical thinking as a result of collaborative-cooperative learning and collegiality amongst lecturers within zoology field in performing Plan, Do dan See during lecturing.

### 4 ACKNOWLEDGEMENTS

Authors acknowledge all lecturers from the University of Palangkaraya who teach zoology related subjects for their useful collaborative

discussion during Plan, Do and See. Thanks to The Director of BELMAWA DIKTI for financial support by providing Grant for Lesson Study in Higher Education Institution from 2010 until 2012.

## The Comparison of Mathematical Understanding and Connection Through Cognitive Conflict of Piaget and Hasweh

Jarnawi Afgani Dahlan<sup>1</sup>, Ade Rohayati<sup>2</sup>

<sup>1</sup>Indonesia University of Education, Bandung, Indonesia  
afgani\_lan@yahoo.com

<sup>2</sup>Indonesia University of Education, Bandung, Indonesia

**Abstract:** Cognitive conflict believed as the process of how knowledge is constructed. There are three the cognitive conflict theory, namely Piaget, Hasweh, and Lee. Piaget cognitive conflict is known as cognitive imbalance. According to him, cognitive conflict is built from imbalance between cognitive structures with information coming from it. Equally, imbalance may be occurs between internal structures with external input. Hasweh cognitive conflict is known as metacognitive conflict. According to him, cognitive conflict built from contradiction between old cognitive structures with new cognitive structure or with is being learned. This research tried to compare mathematics abilities (mathematical understanding and connection) through implementation of teaching material design compiled based on the two cognitive conflict theory, namely cognitive conflict of Piaget and cognitive conflict of Hasweh. Result of the research indicates that mathematical understanding and connection ability of student through both teaching material designs does not significantly different.

**Keywords:** Cognitive conflict, mathematical understanding and connection.

### 1 INTRODUCTION

It is widely accepted that understanding is an important part in learning of mathematics. A vast of researches focused and concerned on enhancing understanding in learning of mathematics (Hiebert & Carpenter, 1992). Mayer; Olsson & Rees; Perkins & Simmons (in Hiebert & Carpenter, 1992) asserted that understanding is a fundamental aspect in learning; hence the development of learning model is always related to enhancement of understanding. Thus, mathematical understanding occupies a strategic position in mathematics learning.

Minarni (2013) stated understanding is not independent, but supported and interconnected with all processes in mathematics. For instance, representation of a concept or problem will help one's understanding as it viewed from many points of view. Hiebert & Carpenter (1992) asserted that the ability to relate interconnected mathematics ideas takes part in understanding the ideas. Minarni (2013) identified the poor understanding of mathematics is engendered by student's shortcomings in constructing internal representation of mathematical objects, and portraying mental image into mathematical representation. In addition, Minarni conjectured that the poor of students' ability caused by their weakness in relating internally as well as externally one representation to another, whereas in fact the degrees of understanding is defined by number and strength of the relation. An

idea, procedure or mathematical fact will be fully understood when all the ideas, procedures and facts are interconnected in a network with a number of strong connections (Hiebert & Carpenter, 1992), and as students are able to connect their mathematical ideas, they come to profound and stronger understanding (NCTM, 2000). They can see that with mathematical connection, topics in mathematics are interacted to one another. Thus, a strong relationship between understanding and connection in mathematics is apparent.

Teacher needs to encourage students to use their own thinking strategy to develop connections of their mathematical ideas, synthesize new ideas and procedures based on that ideas with a representation (NTMC, 2000). For instance, students frequently use objects and strategies in enhancing their understanding in addition and subtraction by connecting both operations. Teachers also frequently use addition to help students learn multiplication.

Beside connections in mathematics, students' environment may provide opportunity to learn topics of mathematics. Students' experience at home, at school and the association with their community are good instances to develop mathematics connections. An example suggested by National Council of Teacher of Mathematics or NCTM (2000); position and direction of trip from one place to another may be used to develop geometric ideas of utilization of coordinate to depict location. Moreover, students can be

encouraged to develop map in coordinate system of various routes from home to school. By the map they could determine and compare the distance of the ways they go through.

Both examples described above are the approach which frequently used by teachers in teaching mathematics. When we use conflicts from environment, so that the students understand or learn new mathematics concept, then the conflict presented is Piaget cognitive conflict. In contrasts, if teacher use conflicts from inadequacy of lesson learnt by students in overcome new mathematics problem, it is apparent that the teacher use Hasweh cognitive conflict. The forms of conflicts are briefly shown in figure 1 by Kwon and Lee (2001).

Figure 1. Cognitive Conflict Model (Kwon & Lee, 2001)

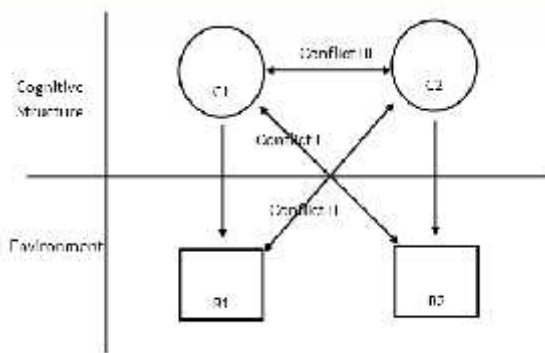

Figure 1 shows the cognitive structure comprises C1 and C2; R1 and R2 show the environmental stimulus. C1 depicts preconception of students which probably is of students' misconception. C2 is the concept to be learned. R1 is the environment which can be described by C1, and R2 is the environment which can be described by C2 (Ismaimuja, 2010). Conflict I is Piaget's conflict, which is between C1 and R2, or between preconceptions of student's environment that can be described by the concept to be learned. Conflict II cited by Kwon, the conflict is between concepts to be learnt from the environment that can be described by students' preconceptions. Conflict III described by Hasweh, it is between students' preconception with the concept to be learned.

Since 1980s the use of cognitive conflict as learning strategy is very popular, particularly in science education (Lee et.al., 2003). Many researchers asserted argumentations about the important role of cognitive conflict in conceptual change. However, the influence of cognitive conflict remains plenty questions. Lee set an example of several types of cognitive conflicts, such as visual conflict, kinesthetic conflict, social conflict between peers and between children and adult (Druyan, 1997), individual conflict and peer conflict (Chan, Burtis & Bereiter 1997). While Zimmerman and Blom (Lee et.al., 2003) examined cognitive conflict assessment which is

focused on two topics; degree of uncertainty and response latency or internal cognitive conflict.

The studies on learning practices with cognitive conflict strategy are conducted in various ways. Watson (2002) finds the cognitive conflict strategy helps reconstruction of students' knowledge. Students are easier to connect knowledge to be learned through this reconstruction. This learning activity provides meaningfulness to the students. In addition, cognitive conflict prevents misconception on the students (Maier in Pathare & Pardhan, 2004). Mosham & Geil (1998) and Kruger (1993) in Prata, et al. al. claimed that productive cognitive conflict occurs in context of cooperative learning, not in competition or interpersonal conflict. Mosham and Geil described that productive cognitive conflict does not occurs in the process of independent thinking, but in collaborative construction of conceiving consensus of a problem solution. This notion is supported by Sutawijaya and Dahlan (2011) that interaction with others is source of the occurrence of cognitive conflict. Dahlan, et.al. (2012) revealed in their research that creative thinking through cooperatively cognitive conflict is significantly better than individual cognitive conflict.

It is encouraging to study whether the model developed by Kwon & Lee (2003) from Piaget, Hasweh and Kwon can be developed partially in subject matter? And is there influential difference on student's mathematics ability? In this study, only two models will be compared, those are cognitive conflict from Piaget and Hasweh. The mathematics ability to be assessed are mathematical understanding and connections.

## 2 RESEARCH METHOD

This is an experimental research that aims to study comparison of mathematical understanding and connection through cognitive conflict of Piaget and Hasweh. Since the researchers did not place students randomly in the class, then this study is a quasi experimental research, with pre-post test control nonequivalent group design.

Sample is selected purposively with consideration that the ability of students in the school where this study is undertaken is considerably equal. The selection of sample is recommended by mathematics teachers who teach in those classes. Two classes are selected as experiment classes. One class used subject matter of Piaget cognitive conflict (experiment 1); and the other class used subject matter of Hasweh cognitive conflict (experiment 2). While the strategy used in both classes is similar, that is adapted from Sugiyatna (2008). The first step is introduction, students are oriented to conflict. In this step teacher

explains learning objectives, the necessary learning source, motivate students to actively engage in overcoming conflict and seek the truth of concept. The second step is organizing students to learn. In this step teacher helps students to define and organize learning task related to the conflict. The third step is guiding students to conduct individual as well as group investigation. In this step teacher encourage students to gather relevant information, conduct experiment, and internal discussion to get clarification and problem/conflict solution. The fourth step is developing and presenting learning products. In this step teacher assist students to planning and preparing learning products and helps students to share learning task with peers. The fifth step is analyzing and evaluating. In this step teacher helps students to reflect or evaluate the investigation and all processes undergone by the students.

In implementation, a collaborative work is conducted by researchers and students who are working on final assignment (thesis). One student conducts research to gather data of mathematics understanding, and one student conducts research to gather data of mathematics connections. Mathematics connection is assessed by instrument with indicator developed by Sumarmo (2002), which is to recognize equivalent representation of similar concepts, recognize mathematics procedure connection of a representation to equivalent representation procedure, to use and assess relation among mathematics topics and relations beyond mathematics, and to use mathematics in daily life. Mathematics understanding is assessed by indicators suggested by Skemp, which are instrumental and relational.

### 3 RESULT AND DISSCUSION

Subject matter of the cognitive conflict in this study is developed based on the model of Kwon and Lee (2001). In Piaget cognitive conflict, a contextual problem from where the students learn new mathematics matter is presented to the students. Here is an example of the problem:

*There are four types of human blood, A, B, AB, and O. If 5 people examine their blood type, then is it possible that two people have similar blood type? Give your reason!*

To solve the problem above, students are encouraged to make possible relations through arrow diagram among five students with their blood types. From that process, it is expected that at least two students have similar blood type. Through the activity students are urged to determine the number of possible relations from set A with  $n$  elements to B with  $m$  elements.

The subject matter of Hasweh cognitive conflict is designed by delivering students to mathematical problem that related to new mathematics matter.

When teacher teaches addition of fractions, For instance, students are asked to determine result of  $\frac{1}{2} + \frac{1}{4}$ , and the students answer by adding the numerator with numerator and the denominator with denominator, so that resulted  $\frac{2}{6}$ . Then the students are asked to simplify it that resulted  $\frac{1}{3}$ . Here the students can see the relation that  $\frac{1}{3} < \frac{1}{2}$ . With this condition, the students undergo a cognitive conflict.

The conflict built from both examples are naturally similar, that is how new knowledge is constructed by utilizing students prior knowledge. As Herbert & Carpenter (1992) stated that network of mental representation occurs through relation process between new information with students' prior information and understanding will grow and organized through the network built. Glaser (Hiebert & Carpenter, 1992) cited that the existence of networks influence quality of constructed relation that help formation of new network.

As described previously, both classes use five steps cognitive conflict learning strategy, which is student orientation on conflict, organizing student to learn, individual and group investigation, development and presentation of learning product, evaluation and reflection.

The observation revealed that from all learning activity in class experiment 1, the third instruction could not conduct learning activity such as presentation, responding and concluding. It occurred because many students did not finish solving the problem presented yet. In class experiment 2 same activities were not conducted in fourth instruction. Thus, it can be concluded that learning in both classes had well conducted as it planned.

As previously described, this research aimed to compare mathematics understanding and connection through cognitive conflict strategy of Piaget and Hasweh. The research is implemented in two different schools for each variable assessed. Hence both variables are not simultaneously discussed. The ability of mathematical understanding result is descriptively shown in table .

Table 1: Descriptive Statistics of Mathematical Understanding Ability

Test	Class Experiment 1		Class Experiment 2	
	$\bar{x}$	S	$\bar{x}$	s
Pretest	5.12	2.06	9.87	2.54
Posttest	51.10	4.48	56.92	3.26
n-Gain	0.49	0.21	0.52	0.15

Table 1 show that initial understanding ability of students in class experiment 2 is better than students in class experiment 1. The distribution in class experiment 2 is higher than in class experiment 1. Hence the initial ability of class experiment 2 is higher but the difference among students is much higher than students in class experiment 1.

The posttest and n-Gain revealed that level of data distribution is shifted. The mean of posttest on understanding ability of class experiment 2 is higher than class experiment 1, but the distribution in class experiment 2 is lower than in class experiment 1. Similar result yielded by n-Gain, standard deviation of class experiment 2 is lower than class experiment 1. Thus, treatment applied in class experiment 2; the Hasweh cognitive conflict has lessen the gap of understanding ability among students in the class. Since the test result on student initial ability of mathematics understanding is different, the n-Gain was employed to examine the influential difference of both treatments on student understanding enhancement. Descriptively, on table 1 we can see that mean of the n-Gain of both classes are similar in qualification, which is middle qualification. Mean of n-Gain for class experiment 1 is 0.49; and for class experiment 2 is 0.51. Table 2 show details of mean distribution of n-Gain of students understanding ability in both classes.

Table 2 Distribution of n-Gain Qualification of Mathematics Understandings Ability

Class	n-Gain Qualifications (g)	Number of students
Experiment 1	High (g > 0.7)	6
	Middle (0.3 < g ≤ 0.7)	28
	Low (g ≤ 0.3)	7
Experiment 2	High (g > 0.7)	5
	Middle (0.3 < g ≤ 0.7)	32
	Low (g ≤ 0.3)	2

On the table we can see that number of student distribution of both classes on each n-Gain qualification is relatively homogenous, with the curve tendency towards n-Gain small. This is proven by the result data normality test, class experiment 1 distribution is not normally distributed. This result implicate that the test the difference of both classes use non parametric test, the Mann Whitney U. The result of Mann Whitney U Test is  $Z = -1.243$ . The Z value is not sufficient to reject the null hypothesis on significance level of 0.05.

The following discussion focused on ability of student mathematics connection. Table 3 show

descriptive statistics of connection ability of both classes.

Table 3 Descriptive Statistics of Mathematics Connection Ability

Test	Class Experiment 1		Class Experiment 2	
	$\bar{x}$	S	$\bar{x}$	s
Pretest	3.42	3.02	5.59	2.92
n-Gain	0.48	0.28	0.57	0.27

The descriptive statistic of mathematics connection ability resembles the descriptive statistic of understandings ability. Mean of initial connection ability class experiment 1 is lower than class experiment 2, but distribution in class experiment 2 is higher than class experiment 1. Data of n-Gain in both classes are slightly different, mean of n-Gain of connection in class experiment 1 is lower than class experiment 2. This also occurs in data distribution, where n-Gain of class experiment 1 is low but slightly higher than class experiment 2. This result is concomitant with findings on students' ability of understanding that students are familiar with problems related to mathematics application in other subjects and daily life. However, from the data distribution is apparent that Piaget cognitive conflict is able to lower gaps among students. This is very rational, because cognitive conflict built in Piaget is initially introduce to the environment or context used as tool to learn mathematics matter. According to NCTM (2000), real world context provide opportunity for the students to relate what they learn with their mind. In addition, it is suggested to deliver students to questions such as: What made you think that? Why does that make sense? Where have we seen a problem like this before? How are these ideas related? Did anyone think about this in different way? How does today's work related to what we have done in earlier units of study?

The following is result of mathematic connection enhancement test from n-Gain data. The test used non parametric statistics Mann Whitney U Test. The selection of this test caused by one of n-Gain distribution data, which is class experiment 2 is not normally distributed. It is gained with probability of null hypothesis rejection only 0.113. Since the probability less than 0.05, and then the null hypothesis do not rejected. It means there is no difference in students' mathematics connection enhancement through both learning.

The findings described above revealed that Piaget or Hasweh cognitive conflict did not result in significant difference on enhancement of understanding as well as mathematics connection. The non existence of difference from both treatments might be influenced by cooperative activity in the phase of cognitive conflict strategy. According to Johnson & Johnson (2000), in cooperative strategy, interactions, sharing and collaboration of students in group brings success to all students. This occurs by sharing of resources ability and encouragement from each group member. There are significant cognitive

activity and interpersonal dynamics so that every student is encouraged to learn.

Consistency of this result needs to be followed by research that concern on factors influence cognitive conflict. As cited by Kang et. al. (2005) that success of cognitive conflict strategy is highly depending on various factors, such as willing and ability of students to recognize conflicts. Thus, Kang et. al. suggest to take logical thinking ability, learning style—classified into dependent/independent fields, and learning approach into considerable factors.

#### 4 CONCLUSION AND REKOMENDATION

Conclusions of this study are as follows:

1. Development of subject matter with Piaget or Hasweh cognitive conflict base is descriptively able to enhance students' ability of mathematics understanding and connection. The enhancement is at middle qualification.
2. Inferentially, there is no significant difference of understandings enhancement between applications of Piaget or Hasweh cognitive conflict. As well as mathematics connection, even descriptively learning with Hasweh cognitive conflict slightly higher, but statistically did not show significant difference.

From the conclusions above we posed some recommendations:

1. The subject matter of Piaget or Hasweh Cognitive conflict can be developed and used by teachers in mathematics learning, so can enhance students' ability of mathematics understanding and connection.
2. The development subject matter for both cognitive conflicts partially is not easy. Hence it is suggested to develop both conflict cognitive collaboratively and concurrence with characteristic of the matter to be taught.

For future research, it is possible to develop qualitative study in development of subject matter through didactic pedagogic theory that accommodate students' learning difficulties and related to other mathematics competency.

**Abstract:** Assessment of learning is often a difficult thing for teachers, one hand a teacher must pay attention to each student's competences will be assessed, while on the other hand it should be kept to facilitate the learning process. Some teachers who are not satisfied that the assessment in learning can be done after it by using teacher's memory on students activities, start to find their own strategy that allows to recognize students from their seating arrangement. This paper examines a junior high school science teacher who modifies seating arrangement during 5 months learning to obtain the most optimal seating arrangement that allows her to conduct an assessment in learning. The teacher has been experienced with lesson study since last 4 years ago. The strategy might be internalized from a case study of student activities in the classroom, but teacher sense and competencies could be developed through learning activities of interaction with colleagues in the teacher professional development activities such as lesson study. Field notes for 5 months during her teaching period in a half academic year on 36 students are investigated and analyzed. How teachers' learn in finding most reasonable seating arrangements for recognizing students learn also discussed here.

**Keywords:** Assesment in Learning, seating arrangement, Lesson Study.

### 1 INTRODUCTION

West Java government did dissemination of Lesson Study for 10 regencies in three years starting in 2011 until 2013. This forum found some teacher's problem in learning process, especially in assessment. According to government law no 19, 2005, one of teacher's duty is assessing of learning. Several reasons found related to how hard teachers to doing some assessment process, i.e. the assessment format is too rigid, difficult to be filled, teachers do not have enough time to assessing, and how hard teachers to be facilitator in learning and to pay attention in student's competence assessment at the same time. That is why teachers did assessment after learning process be done rely on their memory. Meanwhile, in science learning, teachers have to doing assessment in learning process. It is useful to help students get the learning purpose. That is why assessment has to be done together or along with, in learning process either after learning be done.

Regarding to this learning way, it is analogous with Curriculum 2013 in Indonesia which is

emphasizing process, so that teachers must doing assessment in learning process. There are three assessment aspect that must be fulfill in learning: knowledge, attitude and skill. Assessment process can be done in learning process including attitude and skill aspect. In learning process, teachers can assessing student's attitude to get student's attitude profile along with conducting them to change the negative attitude (for example: apathetic, passive, rely on the other team members, etc.) to the positive one. In additional, when learning process is going on, teachers can assessing skill aspect too, such as intellectual skill or psychomotor skill.

Teachers do realize there are some difficulties to do assessment process. Therefore, teacher must learning to find a new strategy which is can helping teacher's duty to be easier to do assessment process. This teacher's ability of course cannot be occur by itself, but through long and continuous process in certain vessel, such as Lesson Study. As an impact of dissemination of Lesson Study, teachers is accustomed to always made some daily notes in learning journal form. Based on this learning journal, teacher can find a new simple strategy to

make process assessment easier to do by utilizing student’s seating arrangement

## 2 ASSESSMENT PROCESS FORMAT WITH SPECIAL TABLE

When learning is taking place in the class, generally teacher stand up in the center of the class. He/she try to be able to see, observe, and communicate with the students during learning. From the teacher’s point of view, teacher can understand which student who achieved the competence and who is not yet. Usually teacher will approaching the problematic students and help them. But this condition is really rare to described in teacher’s finding note and be written in process assessment note. The main cause of this condition is the teachers are not adapting yet to write whatsoever during learning process.

This matter has been a case study in State Secondary School of 52, Bandung. The science teacher who had been teaching for the last seven years, and active in Lesson Study community tried to apply the Lesson Study’s habit in their class. She started to sketch the seating arrangement to identified student’s learning characteristic on the science learning journal. The alteration in this note is keep going on but it always describe the student’s seating position in the class.

When the learning is taking place, surely some point of assessment must be filled up based on anything teacher’s found out in the class. Generally, teacher decide which aspect will be assessed along with it rubric, then teacher will preparing an assessment table which is appropriate with its rubric. Just like explained in Table 1.

Table 1. Process Assessment Format in Force Measurement

Assessment Rubric:

Assessed Aspect	3	2	1
Scale reading	Student’s eyes is exactly in front of the scale	Student’s eyes is not properly enough in front of the scale	Student’s eye is forming a big angle with the scale (Parallax)
Stating the result of measuring	The scale measuring is sketched and marked. The result is exactly valid	The scale measuring is sketched and marked, but the result is not enough valid	Students drew dynamometer scale carelessly, the scale measuring is unmarked, the result of reading measurement is wrong

Table 2. Assessment Documentation Type

Name	Scale Reading			Stating the measuring result			Score	Mark
	3	2	1	3	2	1		
ALDI SURYA K.								
ANDI RAMDANI								
ANITA SETIAWATI								
ANWAR SAEPUDIN								
ARFAN HAMID								
And so on..								

Assessment format above at a glance looks like easy to do and ideal. But actually, this format is difficult to apply. Just imagine if there are 30 more students in one class which is the student’s name had already filled on the list. It makes consequence when the teacher doing some observation and assessing, the teacher need to find student’s name on the list while observing him/her, so that the teacher needs more time to fulfilled the format. This matter makes a problem if the assessing process going on learning process on one table which is prepared to be fulfilled to getting student’s profile. Meanwhile in one meeting, the teacher have to assured the

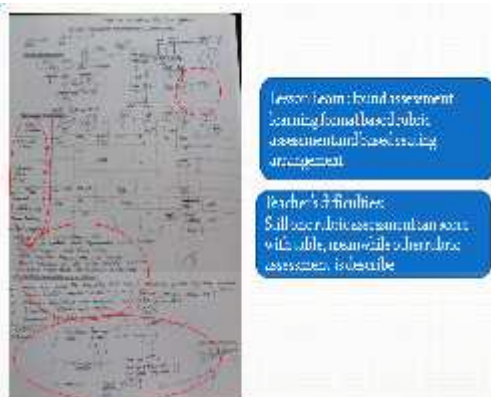

achievement of learning purpose, facilitated the students, and assessed.

The goal research is to describe how teacher find out most appropriate assesment input strategy that allows to recognize students from their seating arrangement as part of her “pushed-out” innovation .

Based on the problem above, teachers need a new strategy to do process assesment, such as attitude assesment, skill process, as well as product assesment in special form. The purpose of this format creating is to help teacher do easier way to filling the assesment data practically just in one paper format for one meeting, and it can be fulfilled in a shorter time along with learning process. Hopefully with this format creation, the teacher can get student’s profile learning, and can be used for whoever need this format without try to finding student’s name in the table of assesment beforehand which is waste more time.

Practically format which is mentioned before means to doing assesment process in the class with sketch of student’s seating arrangement and its “Special Table”. Student’s seating arrangement need to be made because it help the teachers easier to

observing. This sketch is appropriate with the class condition in that meeting. If the seating arranged classically, the sketch drew classically too, then teacher mark the line seating, so that the filling of special table can be observed: which student act active or passive based on the seating line. If the seating arranged as group activity, so the sketch drew appropriate as that condition as well, then mark the group name as necessity. This group seating arrangement sketch help the teacher to observe easily, not only observing the student’s group activities, but also student’s individual activity. Moreover, the special table as mentioned before is containing with some information of assesment aspect and its criteria, along with the student’s name. The teacher named it ‘special table’ because this table can be used teacher’s necessary of assesment for anything: skill process, attitude assesment, or product assesment. The form of assesment process can be seen in appendix part.

How to filled that format?

1. Firstly, make sure the student’s seating position in classically or grouping condition, then draw the sketch, mark the group’s name or line.
2. Make the special appropriate based on teacher’s necessity aspect. It made by teacher’s rubric which is had to be applied.
3. To filling the special table, concern about teacher’s observation aspect. Write down the student’s name, but only the students in 3 category or 1 category. If in one group indicating the same ability for all members, give the checklist mark due to its assesment category. This way make the assesment be more practicable and not wasting much time for assesment in learning.
4. If the raw data in special table had fulfilled, it means assesment process is finished
5. For getting student’s individual assesment, move the data to the process assesment format

The trial of assesment format with the special table above had been done in five months for 6 classes which is consist of 36 students. The result pointed out that, the format is really helping teacher to do assesment process. As a product, this special table also has excellence and weakness reviews. The excellence one is reviewing bellow:

1. Simple, quick, practical, and easy to be fulfilled in the class during learning process
2. Synergy with teacher’s performance
3. Can describe the class’s profile generally
4. Flexible for anything assesment, such as attitude or skill aspect during observation on going

As for the weakness of this format is not describing student's individual score assessment, so that the teacher has to move the data to the basic assessment format.

### 3 CONCLUSIONS

Teachers have to keep learning from the problems which is appeared in learning process. Assessing skill also must be owned by the teachers to do their duty in the class. The assessment process format with the 'special table' can be used by the teachers to help them assessing during learning process.

Assessment process format with special table is a product created from teacher's learning process to do the assessing process easier by using student's seating arrangement. This alteration is important to do as impact of Lesson Study activities for all teachers, especially from dissemination of Lesson Study in West Java, Indonesia.

### ACKNOWLEDGEMENTS

In this very happy occasion, I would like to thanks to principal of Junior High School 52 which give me to opportunity to do research with regard to how to

assess our students by using the new curriculum 2013.

This appreciation also goes to some of lecturer's at Faculty of Mathematics and Science Education especially for team of Lesson Study.

## EMPOWERING PRIMARY TEACHERS on CREATING SUB-THEMS of INDONESIA “2013 CURRICULUM”

*Liliasari\*, Supardan D., Hartati,T.,and Prabawanto, S.*

School of Postgraduate Studies  
Indonesia University of Education,Bandung, Indonesia  
*\*liliasari@upi.edu*

### Abstract

In the year 2013 there was a changing curriculum for primary and secondary education in Indonesia, that named “2013 Curriculum”. Due to the curriculum for Primary School, students should be learned through thematic integrative models of teaching. That means the curriculum gave 8-9 main themes for first to fourth grades, and 5-6 main themes for the fifth and sixth grades. Teachers have difficulties in creating sub themes from the particular main themes given in the curriculum, because in ordinary they teach based on topics in seperated subject matter. Teachers training program have been created to solve the problem. The training used focuss group discussion. The discussion meet some rules to create the sub-themes based on subject matter of Mathematics, Science, Social Studies, and Indonesian Language that should be integrated to make the particular main themes, combined with standard competencies and essensial competencies, that deal with learning schedule. The training involved 20 primary teachers from Bandung, Cianjur, and Subang. Result show the training could empowered teacher in the competency to create the sub themes for each lesson plans that could be implemented in schools on each class. It was hope the primary teachers had new competencies in splitting sub themes from the particular main thematic integrative themes to write their new lesson plan models.

**Keywords:** empowering, primary school teachers, sub-themes

### 1. Background

Indonesia’s 2013 Curriculum for Primary School is a new currilum. To create the new curriculum there were many challenges. As internal challeges there should be completed the eight challenges of National Educational Standard, that consist of content standard, process standard, assessment standard, output competency standard, management standard, budget standard, educator and educational staff standard, building and equipment standard. The growth number of Indonesian productive age people on 2020 -2035 will be the next challenge to be a development capital. To change the uncompetent peoples there should be a good education. Therefore the curriculum should be change.

There are many external challenges consist of the next era of globalization : WTO, ASEAN community, APEC, CAFTA, environmental problems, increasing of ICT, the convergent of science and technology, scientific-based economy, emergence of cultural and creative industry, the move of world economy strength, the influence and impact of technoscience, quality, investation, transformation of educational sectoral, matter of TIMSS and PISA. The other external challege from community perception is too stressing in cognitive aspect, too heavy the students load, less of character laden. At the same moment there are development of knowledge and paedagogy that are neurology, psychology, observation based or discovery learning and collaborative learning.

The future competence that should be mastered are communication skills, clear and critical thinking skills,judging ability of moral in the problem, responsibility of citizenship, ability to understand and tolerant to other view, ability to live in global community, ready to work hard, responsibility to enviroentment, have an intellegent according to interest and talent. There were also some negative fenomena, like student fighting, drugs, corruption, plagiarism, examination cheating, social unrest. To face of the challenges the Competency-based Curriculum at 2005 and the Unity Level of Education Curriculum at 2006 should be change. The changes will answer the internal and external challenges, national education goal, and addition of rearrange in thinking profile, management, depth and width of matter, strengtning process, and agreement load. The new curriculum created is the “2013 Primary School Curriculum”.

## 2. The 2013 Curriculum of Primary School Characteristics

The differences of the 2013 Curriculum with the 2006 Curriculum are the competence standard based on the students needs; the content standard refers from the essence competence (KI) that free from lesson; all lessons should contribute to the creation of attitude, skill, and knowledge; the lesson derived from the competence that will be reached; all lesson tight of the essence competence of each class.

In the process of education there are strengthening in scientific approach, using science learning to activate all lesson. Guiding students to discover something, stressing in language in communication skills, bringing knowledge and logical, systematic, and creative thinking. In the evaluation measure level of student's thinking from lower to higher order, stressing on question that need deep thinking (not only recall), measure students' process of working, on only yield of work, using portfolio of students' lesson.

On the primary school the teacher only using teachers' book, thematic integrated approach on one book for all lessons in harmony, using Indonesian language as communication tools and carrier of knowledge. Therefore teachers should not constucting syllabi, looking for book according to lessons, teaching many subjects, using Indonesian language to drag on other lesson to make it harmony, using science to become a discussion.

On the other hand students should not learn many lessons in different way, buy many books and students worksheet. Government have prepared students book for them. The graduate competence of primary schools increase and ballance in the soft skills and hard skills included attitude, skills, and knowledge. All lessons' content derived from competences and using thematic integrated model, therefore all lessons interelated each other and have basic competence binded through essence competence, through scientific approach (observing, questioning, experimenting, associating, and communicating) in cross curriculum or integrated curriculum. The level of students competence are first level of competences for grade 1 and 2; second levels of competences for grade 3 and 4; and third levels of competences for grade 5 and 6.

## 3. The implementation of 2013 Primary School Curriculum

Based on regulation letter of Indonesia Minister of Education and Culture number 57 / 2014 about the implementation of the '2013 Primary School Curriculum' included several issues that describe further.

There are essential competence (KI) included: essential competence of spiritual (KI 1), essential competence of social attitude (KI2), essential competence of knowledge (KI3), essential competence of skills (KI 4); The essence competence is formulated to create basic competence (KD);

Other issue was there are two groups of lesson, i.e. lesson of group A and Lesson of group B. Lessons of group A consist of : Religion and Natural Ability Education, Pancasila and Civics Education , Indonesia language, Mathematics, Science, Social Studies. Lessons of group B consist of : Art Culture and Manual labour learning , and Sport and Healthy Education;

Lengh of study for 1 lesson hours (lhs) is 35 minutes. In grade I there are 30 lh/week , in grade II there are 32 lhs/week, in grade III there are 34 lhs/week, but in grades IV, V, VI there are 36 lh/ week. For grade I- V lesson task minimum 36 weeks effective per year, except on the VI grade is 34 weeks effective/year.

All syllabi are in thematic integrated approach, exopt of the Religion and Natural Ability Education syllabus. Application of the 2013 Primary School Curriculum using thematic integrated approach that integration competence of several subject matters into several themes. In grades I- III compose 8 themes, for each theme formulating 4 subthemes. For grades IV – VI compose 9 themes, which formulating into 3 subthemes. The themes for grade I – III can be seen in table 1 and themes for grades IV – VI can be seen on table 2.

In grade I, II and III Indonesian language role as a carrier of other lesson, basic competence of Science included in Indonesian language and Mathematics basic competences, although social studies was placed in Indonesian language basic competences, to make more contextual (interdisipliner integration).

In grade IV, V, and VI using interdisipliner approach. Basic competence of Science and Social Studies also can be applied by integration with local content. Similarly basic competence of local content also can be integrated to Art Culture and Manual Labour learning, and Sport and Healthy learning.

Table 1. List of Themes for Grade I, II and III

No	Grade I	Grade II	Grade III
1	Myself	Union of life	Propagation of animal and plant
2	My hobby	Playing in my environment	Technology development
3	My activity	My everyday tasks	Changing of nature
4	My family	Me and my school	Environment attention
5	My experience	Clean and healthy life	Traditional play
6	Clean, healthy and orderly environment	Water, world and sun	Beautiful friendship
7	Things, animal and plant on my surroundings	Take care of animal and plant	Energy and its changes
8	Natural phenomena	Safety at home and journey	Earth and space

Table 2. List of Themes for Grade IV, V and VI

No	Grade IV	Grade V	Grade VI
1	Beautiful gathering	Things in the environment	Save the life
2	Always energy retrenchment	Phenomena in life	Unity in differently
3	Care of live environment	Union of social being	Prominent figure and inventor
4	Several work	Health is important	Globalisation
5	My hero	Proud as Indonesian	Enterpreneurship
6	My beautiful country	Human and animal organs	Public health
7	My ideal	Indonesia civilization history	Organisation around me
8	My house	Ecosystem	My earth
9.	Our health and nutritive food	Our invironment friend	Journey to space

In order to search primary teacher idea in applying the 2013 Primary School Curriculum, a study have been done especially in determining the subthemes from the themes prepared. The study have been done using focuss group discussion of 20 teachers from public schools at Cianjur, Subang and Bandung, and also a private primary school at Bandung. The teachers as a group of lesson study with a goal to implement the new Curriculum correctly. The lessons that have been discussed consist of the first semester in grade II and grade V. They have been chosen because the lessons have been implemented at the first time in 2014. In the beginning of discussion there was found that Bandung group teachers only teaching the A group of lesson, and the contrary with teachers of Cianjur and Subang group that teaching the whole groups of lesson (5 subjets in grade II and 7 subjets in grade V). Because of the differences, the whole group of teachers determined to discuss only the A group of lesson on the both grades.

The activity was based on the 2013 Primary School Curriculum manuscript, Teachers’ Guide Books, and students’ Books. In grade II of the 2013 Primary School Curriculum there are 8 themes for a year. Each themes implemented on 4 weeks. Because each themes consist of 4 subthemes, therefore each subtheme implemented on a week. In grade V Primary School there are 9 themes and each themes consist of 3 subthemes. Therefore each themes implemented in 3 weeks plus a week for enrichment or project/ application skills in project-based learning (PjBL). On the first semester there were 5 themes, and on the second semester 4 themes. The subthemes of each theme for can found on table 4 and table 5.

Table 4. Themes and subthemes for first semester on grade II

No	Themes	Sub-themes
1	Union of life	1.1. Union of life at home
		1.2. Union of life with my friends
		1.3. Union of life at school
		1.4. Union of life in society
2	Playing in my environment	2.1. Playing at home
		2.2. Playing in my friend’s home
		2.3. Playing at school
		2.4. Playing in the tour ground
3	My everyday task	3.1. My task at home
		3.2. My task at school
		3.3. My task as religion people
		3.4. My task in social life
4	I and my school	4.1. My task at school
		4.2. My extracurricular
		4.3. My school environment
		4.4. My school prestation

Table 5. Themes and subthemes for first semester on grade V

No	Themes	Subthemes
1	Things in the environment.	1.1. Phase of matter and their characteristics
		1.2. Changing of phase of matter
		1.3. Man and environment
2	Phenomena in life	2.1. Several event of life
		2.2. Important events
		2.3. Man and natural events
3	Union of social being	3.1 Union of life
		3.2 Union of life advantage
		3.3 Care of union of life
4	Health is important	4.1 Importance of own health and environment
		4.2 Profile of health in life
		4.3 Environmental health
5	Proud as Indonesian	5.1 My Indonesia, a wealth nation
		5.2 My Indonesia, a cultured nation
		5.3 My Indonesia, a peace lover nation

The analysis of discussion results on grade II and V, show that for Mathematics lesson all themes and subthemes were relevant. Paralelly with Mathematics lesson, for Indonesian language lesson there were relevant

on themes and subthemes; but mostly some subthemes were not explicit on the basic competence, especially on the texts.

On the contrary in the Pancasila and Civics Education lesson on grade II there were many mismatch of each subthemes, except on subtheme 1.4. The mismatch also exist on the themes 2 and 3, about themes and the basic competences, especially on the basic competence in the subtheme 3.1. The same case also found in the basic competences 3.1, 4.1 for sub-subthemes 3.2 to 3.4. Tema 4 show the same mismatch on the basic competence 3.1, 4.1 for subtheme 4.1 dan 4.3. Many basic competence were find mismatch also on the grade V.

Science lesson on the grade V showed the unpaired of basic competence on subthemes 2.1 to 2.3. For Social Studies lesson on grade V also found many mismatch. Analysis result of the social studies lesson showed the mismatch of basic competence 3.1, 4.1 on every subthemes on the 1 to 5 themes. The result of many mismatch propose the rearrange the subthemes to make the lesson contextually better understanding by the students. Choosing of many subject matter that compose the subthemes ideally by correlated with the basic competence that will be reached by the student. Teachers have to give attention to the depth of the subject matter especially on the grade II, because they were only learn about the factual knowledge. Many difficult concepts had been found in the students' books. Although the fifth grade students learn the conceptual knowledge, they have limitation on reaching the learning resource.

In the implementation of thematic integrated lesson in primary school many integrated models of teaching should be combine not only the content but also included the students' emotional and skills. Based on the teachers' opinion there were two integrated models could be choosen, the webbed model on grade V and the integrated model for the grade II. On each model there should be scientific approach with various activity to make students engaged tightly and develop their cognitive, affective and psychomotor aspects.

#### 4. Result and Discussion

Teachers determined to discuss only the A group of lesson on the both grades. Therefore the lesson plan only consist of 3 subjects for the grade II and 5 subjects of the grade V, Results of study showed that sometimes subthemes greater than the themes. Such as the fourth subthemes on the grade II were greater than those themes. On grade V subtheme 'Several event of life' most greatest than the theme 'Phenomena in life', such as 'Union of life advantage' and 'Care of union of life' to 'Union of social being' theme. These phenomena was not agree with the theory of creating subtheme of the theme (Fogarty, 1991).

There were subthemes not agree with the theme such as 'Phase of matter and their characteristics' and 'Changing of phase of matter' from the theme 'Things in the environment'. Besides there were too philosophical subthemes like 'My Indonesia, a wealthy nation', 'My Indonesia, a cultured nation', and 'My Indonesia, a peace lover nation' that support 'Proud as Indonesian' theme in the grade V. The theme and subthemes likely choose for the higher grade of education according to students' cognitive development, although on the grade V student may be arrived at the operational formal thought agree with students' cognitive development at those ages. (Wadsworth, 1995). This was also not agree with the former idea in the 'Curriculum 2013 for primary school' development that also fit to child cognitive development and the idea on implementing scientific thinking, also critical and creative thinking (Robertson, 1999; 21st century skills, 2008; Dyer et al, 2009; Voogh and Roblin, 2010).

## 5. Conclusion

The 2013 curriculum of Primary School should be applied thematically. Teachers should be empowered to choose the right subject matter and approach to make students learn meaningfully for each grade, especially on grade II and grade V. Twenty primary teachers at Bandung, Cianjur and Subang had been discuss to analyze the agreement of subthemes content with the basic competence. They agree to reorganized the subthemes and choose two kind of thematic models, e.i.webbed and integrated models. In those kinds of teaching models, teachers integrate cognitive, affective and psycomotoric domain, in their lesson plan. The content of students' book should be revised to decrease the depth of the subject matter.

Based on the analysis it should be repaired the teachers' ways of thinking to make students learn meaningfully in the primary school, through creating the new set of subthemes better.

## The Implementation of Students Achievement Division (STAD) Combined With Lesson Study-Based Mind Mapping in General Biology Course to Improve Motivation and Concept Comprehension of Students in University of Muhammadiyah Malang

Elly Purwanti<sup>1</sup>, Tince Koroh<sup>2</sup>

<sup>1</sup>Biology Education Department, UMM  
purwantielly@gmail.com

<sup>2</sup>Post-Graduate Program: Biology Department – State University of Malang  
tincekoroh@yahoo.co.id

**Abstract:** STAD (Student Teams-Achievement Division) is effective to improve student learning motivation, because STAD gives significance to reward structure as reinforcement towards what have been done by students. The reward is one aspect to increase motivation. Mind mapping is a method to manage information holistically. Mind mapping may be used to: restore information, organize information, make priority, learn to comprehend information within context, conduct a review on learning material, and retain information completely. In order to answer concept comprehension problem, the writer tried to combine STAD model with Mind Mapping. This study aimed at: (1) improving students learning motivation in general biology course at University of Muhammadiyah Malang, as well as (2) improving students' concept comprehension in general biology course at University of Muhammadiyah Malang. This study was a Classroom Action Research (CAR) Lesson Study (LS) based with two cycles. The study result showed that: 1) the implementation of STAD combined with Mind Mapping had a high learning feasibility with these steps (Plan, Do, See) derived from LS that were used for betterment in each meeting, 2) the implementation of STAD combined with Mind Mapping was proven to increase motivation and concept comprehension. For further research, the combination of STAD-Mind Mapping requires clear instructions and a better time management.

**Keywords:** STAD, Mind Mapping, Learning Motivation, Concept Comprehension

### 1. INTRODUCTION

Teaching is about delivering knowledge to students. As the consequence of this definition, students are passive because they tend to only receive information given by their teacher. Therefore, it is a teacher centered teaching (Sardiman, 2001:45). Teachers are aware of their role when they meet their students. To improve the teaching and learning quality, teachers are expected to have skill to select and apply teaching method for effective teaching (Hamalik, 2001). Hence, teachers are seen as agents of modernization in every field of life. The main effort from teacher is through education program for students.

Based on this statement, teaching quality is directly linked to the use of optimal teaching model which means in order to achieve high quality teaching, each education course or subject has to be organized with suitable organizational strategy. In addition, the knowledge should be delivered with proper strategy (Berg in Prayekti, 2006:2).

According to the survey result and the interview with the lecturer of general biology course in University of Muhammadiyah Malang held on September 16-19, 2013, it was concluded that students' activeness and participation in learning process was quite low. There was also a lack of

motivation to do self-learning; students were less motivated to study biology. Studying biology was considered boring because it required a lot of memorizing and complicated processes. Besides, students were likely to become passive and silent during the lesson. When the lecturer asked questions, students gave minimum response. Students had difficulty to connect theoretical concept of biology to the pragmatic application of the knowledge in daily life. When biological problems were introduced, students could not solve the problems. Students' various background study also influenced the knowledge acquisition, as they might come from vocational school majoring in cooking, sport, and so on.

One of the cooperative learning models which have broad application is STAD (Student Teams-Achievement Division) model. STAD is the easiest cooperative learning model compared to the other models of teaching. STAD is proven to be effective to improve students' learning motivation because STAD focuses on reward system as reinforcement tool. The reward itself may function as a motivation booster.

Mind mapping is a teaching method used to manage information thoroughly. Holistically, mind mapping can be used to: keep information, organize information, make a priority, comprehend information in its particular context, review

material, memorize information holistically, therefore, to answer the problem regarding concept comprehension, the writer tries to incorporate the STAD model and mind mapping.

STAD cooperative learning model would be implemented by the use of mind mapping teaching strategy. The aim of this corporation is for students to gain chances to have class discussion in solving the problem in students’ work sheet. Another benefit of using mind mapping will be seen by the time students explain their mind map designed by their group in front of the class. By presenting, students are expected to overcome their low learning motivation and strengthen their concept comprehension. Students are more interested in creative writing technique with colors rather than the boring one. By this collaboration, it is expected that students’ learning motivation can be increased so that their learning outcome improves as well.

Based on this assertion, the writer was interested in conducting a Classroom Action Research (CAR) on the basis of Lesson Study (LS) under the title of “the implementation of student achievement division (STAD) combined with lesson study-based mind mapping in general biology course to improve motivation and concept comprehension of students in University of Muhammadiyah Malang”.

## 2. RESEARCH METHOD

This study was a Classroom Action Research (CAR) based on Lesson Study (LS), conducted in two cycles. In this context, a cycle means a whole set of activities ranging from planning, doing, observing, and reflecting.

The combination of CAR and LS design can be seen in Table 1 as follow:

Table 1. Combination of CAR and LS

CAR	LS	Activities
<ul style="list-style-type: none"> <li>• Planning</li> </ul>	Plan	<ul style="list-style-type: none"> <li>• Identifying problem and its cause</li> <li>• Designing lesson plans/study scenarios</li> <li>• Creating research instrument in the form of observation sheet</li> <li>• Making Mind Mapping scoring rubric</li> </ul>

		<ul style="list-style-type: none"> <li>• Preparing evaluation tool and authentic assessment</li> </ul>
<ul style="list-style-type: none"> <li>• Action</li> <li>• Observation</li> </ul>	Do	<ul style="list-style-type: none"> <li>• Conducting activities as written in lesson plans</li> <li>• Observing students activities as the form of the researcher treatment during the learning process</li> <li>• Using research instrument to measure the achievement in each step of the activities:                             <ul style="list-style-type: none"> <li>- Study achievement sheet of STAD and Mind Mapping</li> <li>- Monitoring sheet for (Plan, Do, See) Lesson Study</li> <li>- Observation sheet of students motivation</li> </ul> </li> </ul>
<ul style="list-style-type: none"> <li>• Reflection</li> </ul>	See	<ul style="list-style-type: none"> <li>• Analyzing the observation result based on reflective discussion and collected instrument</li> <li>• Offering feedback from the observer for lesson plan betterment and for further cycle improvement</li> </ul>

This study was conducted in Biology Education Department, University of Muhammadiyah Malang, Academic year 2013-2014, on odd semester, September-November 2013. The study subjects were students of B offering who were

taking General Biology course in Biology Education Department at University of Muhammadiyah Malang academic year 2013-2014. The total participants were 42 students.

This study was a Classroom Action Research-Lesson Study that was conducted collaboratively. Cycle I consisted of two meetings and each meeting comprised *Plan, Do, See* stages. Cycle II consisted of two meetings and each meeting also comprised *Plan, Do, See* stages.

The data collection techniques were observation, motivation questionnaire, and concept comprehension scoring rubric.

The data analysis technique was a descriptive quantitative based on the available formula as below:

a. Observation Analysis

The data from the observation were analyzed by describing the activities done during the lesson.

b. Students' motivation questionnaire analysis

Students' motivation was measured by motivation questionnaire, where the scoring criteria involved:

- Absolutely Agree
- Agree
- Disagree
- Absolutely Disagree

The total score derived from the students in the scoring rubric for creative thinking would be converted in percentage, by applying the following formula:

$$\% \text{ motivation} = \frac{\text{obtained score}}{\text{total score}} \times 100\%$$

c. Concept Comprehension Scoring Analysis

Students' concept comprehension was measured by essay test and mind mapping result; the following was the scoring criteria:

$$\% \text{ concept comprehension} = \frac{\text{Test Score per cycle} + \text{Mind mapping}}{\text{total score}} \times 100\%$$

### 3. RESULT AND DISCUSSION

The CAR Lesson Study based activities were conducted in two cycles, cycle I and II, where each cycle consisted of two meetings. Cycle I was done in two meetings on Tuesday October 8 and 16, 2013. The main learning material was Bio-molecule and living creature characteristics.

On Tuesday October 8, 2013, the study was conducted in 3 x 50 minute period. In the first meeting, the introduction began with exploring the knowledge of human origin, about living bio-molecule through probing and staging questions. The lecturer played a video on biological molecular

structure and function, and then he/she showed a picture on his/her PowerPoint slides about macromolecular while asking “What is this picture about?”, “Why do scientists study macromolecular?”

The lecturer asked students to sit in groups as many as 6 groups. He/she distributed the work sheet and asked students to conduct group discussion and to answer the problem in a mind mapping. During this activity, the lecturer observed the learning of each group and guided them in discussion part. When the group discussion and mind map drawing finished, they pasted the mind mapping on the white board. Afterwards, the lecturer chose one mind mapping which represented the most comprehensive concept to be discussed all together. The next phase was question and answer session among the groups based on the presentation. The following activity was a game in which students were asked to directly answer the questions delivered by the lecturer.

The lecturer provided conclusion for the given material and informed students the following week's material on making resume about living creatures. The observation result showed that students were quite able to follow the lesson, they were enthusiastic, and they were also highly motivated due to the use of game during the lesson. Students were able to study appropriately, however, some students sitting at the back row seemed to be busy while following the lesson stages; they still gossiped to each other. The predicted cause of the behavior was that students had covered the material before; therefore, one of the suitable efforts for the lecturer to overcome this problem was to give more strict instruction or warning so as students followed the activities more seriously. The lecturer should be able to control the class. Another point was that the use of mind mapping could improve students' motivation to stay focus during the lesson. Time management should be considered by the lecturer as well.

In the second meeting, the class was conducted similar to the previous week that was to divide the class into groups, to discuss the material in groups, and to draw a mind map based on the discussion result. In the second meeting, students were identified to be more focused; only some groups did not stay focus. Students' motivation was increasing; students were used to making the mind map. The following description was the observation result from the second meeting: the 'do' activity had been conducted smoothly; students were motivated in following the lesson. It was proven by students' willingness to bring textbooks related to the lesson, their willingness to work in groups, and they were more focused on studying although some students did not fully fit the proper condition. By

video broadcast and mind mapping, it was expected that students were helped in comprehending materials. In the beginning of the cycle, students might be less passionate due to the extra assignment loads from other subjects.

In cycle I reflection, students were highly motivated. This condition was correctly predicted since they were semester 1 students, so that their passion to join and participate in activities during the lesson was quite high already. Hence, the model lecturer should find a suitable assignment construct to give more motivation during apperception or whilst activities. In this stage, students' concept understanding was quite low but their creativity for mind mapping was excellent. Therefore, the solution for the model lecturer was to manage time allotment to give proper concept emphasis on the material. In order to comprehend the resume assignment concept, structured or outlined assignment points should be previously determined to keep the students' focus in understanding the concept. Students had enough courage to express their opinions, but they often felt in doubt and were afraid of making mistakes. It was a job for the model lecturer to motivate students to eliminate their doubt and improve confidence to state their opinions.

Cycle II of CAR-Lesson Study based was conducted in two meetings; they were on October 23 and 30, 2013. In the third meeting, apperception activity was to be the focus, so as to motivate the students. The writer also paid more attention to time allotment and game which was designed for the whole groups, not only for several groups. The model lecturer applied STAD combined with Lesson Study-based mind mapping.

In pre-activities, the lecturer greeted the students while asking if they were ready to start the lesson. Some students indicated their less readiness to receive material as they were busy doing some assignments from other lecturers. The model lecturer kept on motivating students to follow the lesson. In the next step, the lecturer delivered materials and broadcasted a video as a-perception; the broadcasted video was about cell movements from various kinds of cells. The lecturer asked some questions, “What can you find from the video? What kinds of activities you notice? Explain the definition of cells based on your understanding related to the previous video”. It was expected that students answered all the questions thoroughly and the lecturer proceeded to explain the objective of today's lesson.

The lecturer asked students to sit in groups as many as 6 groups and distributed the work sheet to each group. They started the discussion and drew their answers in mind mapping. During this period, the lecturer observed students' work and guided

students in discussion session. The group which finished the mind mapping might paste their work on the white board; the lecturer chose the most appropriate mind mapping and appointed the group to lead class discussion and question and answer session. Afterwards, students played game by answering some questions from the lecturer directly.

In the third meeting, students gained focus towards the materials, there was an increase in group work, they were enthusiastic to follow the lesson but there were some students who were still passive and lack of seriousness in designing a mind mapping. The predicted cause was the lack of class control from the lecturer; more strict treatment and distributive control should be performed by the lecturer. The reflection result from that meeting gave the writer plenty of lessons on the importance of motivation for students as well as the significance of time management in a course.

In the fourth meeting in cycle II, the material was about cell division. In this session, the lecturer paid more attention to students' concept comprehension by presenting a video with appropriate time duration to avoid boredom. The result showed that students comprehended the concept more after the video broadcast and there was also an indication of creativity improvement.

The reflection result showed that apperception was required to motivate students to join the lesson and to assert the material concept.

Learning implementation reflection captured the achievement of STAD learning combined with mind mapping. The reflection proved that this combined teaching method could increase students' motivation and their concept comprehension. The most highlighted point was to witness students' self-improvement through the implementation of the combined method. This success could be achieved with the help of other lecturers as observers who always gave constructive suggestions and criticisms.

### **a. Students Learning Motivation**

The data of students learning motivation was derived from learning motivation questionnaires that were designed based on motivation improvement strategy (ARCS model). The analysis was done by calculating the score of each aspect, and after the calculation, the scores were classified into five categories; very poor, poor, fair, good, very good. By the end of the calculation process, classical scoring classification was performed to find out classical score for holistic assessment of motivation. The questionnaire result after the treatment in cycle I and II for B class, Biology

Education Department, University of Muhammadiyah Malang can be seen in Table 4.1.

Tabel 4.1 The Mean Score of Motivation Aspect (%) per-cycle and its improvement for students of B class, Biology Education Department, University of Muhammadiyah Malang.

Motivation Aspects	Cycle I	Cycle II	Improvement (%)
A	86.2	87.4	1.2
R	81.73	85.38	3.65
C	82.17	87.40	5.23
S	82.27	86.63	4.36
Categories	Very good	Very good	

Based on table 4.1, there was significant improvement for classical students' motivation by the use of STAD model combined with mind mapping. The analysis result of students' motivation questionnaires showed that, in every aspect, students' motivation grew and increased, in line with the expected achievement set by the researcher. The expected achievement was a cooperative learning activity through STAD learning combined with mind mapping to increase students' motivation in learning biology. The increase of students' motivation can be drawn in a graph in Picture 4.3.

Graph 4.1 Students' Motivation Improvement from Cycle I to Cycle II

### b. Students Concept Comprehension

STAD learning combined with mind mapping could increase students learning result. This concept understanding can be derived from the test score in Cycle I and II.

Tabel 4.2 Percentage Data of Students Concept Comprehension for B Class, Biology Education Department, University of Muhammadiyah Malang

Objectives	Cycle I	Cycle II	Improvement (%)
Concept comprehension	75.5	80.6	5.1
Score conversion	B+	A	

Based on table 4.2, it was stated that the improvement percentage was 5.1 %; however, if it was converted into score, the improvement was significant especially for concept comprehension. The analysis result based on concept comprehension scoring rubric showed that the result was in line with the expectation of the researcher. Cooperative learning activities by the use of STAD learning combined with mind mapping would increase students' motivation in learning biology. The improvement of students' concept comprehension can be described in Graph in Picture 4.4.

Graph 4.2. The Improvement of Students' Concept Comprehension from Cycle I to II

## 4. CONCLUSION

- Based on the implementation of STAD combined with mind mapping, there was an increase in students' learning motivation for B class, Biology Education Department, University of Muhammadiyah Malang with the following details: Attention improvement (1.2%), Relevance improvement (3.65%), Confidence improvement (5.23%), and Satisfaction improvement (4.36%).
- Based on the implementation of STAD combined with Mind mapping, it was concluded that this method could increase students' concept comprehension, especially for B class, Biology Education Department, University of Muhammadiyah Malang with the following details: Cycle I: 75.5, and Cycle II: 80.5; therefore, there was 5.1 increase in comprehension.

## 5. SUGGESTIONS

Based on the conducted research, several suggestions need to be proposed:

### a. For Lecturers

The implementation of STAD combined with mind mapping needs clearer instructions in order to be easily understood by the students for meeting the effectiveness purpose.

### b. For Students

Students should work in team and minimize individual work. Students should submit the group work results on time. Students should not feel shy and in doubt to ask questions if there is any information they do not understand during the activities.

### c. For Further Researchers

The implementation of STAD combined with mind mapping should be improved; in this study, only two cycles were performed by the researcher with a lot of changings in developing mind mapping; hence, it is recommended that lecturers or teachers be more creative in designing mind mapping.

If this combined method is implemented, it is better for the researcher to pay more attention to time management.

**Abstract:** There is a gap frequently found among curriculum at national level with its implementation in to the classroom. Japanese lesson study as an activity for teacher to learn more about students' learning might also be utilized as teachers' media to formulate a feedback to improve implemented curriculum from classroom activities. The paper studied a case of the implementation of the new science curriculum in the junior school classroom during six months in Indonesia which started the wave since 2013. The research focusing on one of striking point new science learning according new curriculum i.e.: adopting how scientist works using a scientific approach. A science teacher with 5 years experienced of lesson study voluntarily to teach as what is recommended in the student and teacher books. A total of approximately 27 daily classroom learning videos obtained, transcript and analyzed. Focus group discussions which emphasized on students response conducted after analyzing each video, read the transcript, and looks back at the student book and teacher book used. Feedback from teachers regarding how scientific approach should be should be presented at each meeting is categorized to gain the concepts of teacher feedback from students' response to the national curriculum. Suggested results in one semester to the student and teacher's book then analyzed and discussed here.

**Keywords:**

### 1 INTRODUCTION

Formal learning in school is one of the most important part in the development of human resources. Learning activities in Indonesia is guided by a curriculum that is updated regularly and the results of the previous curriculum evaluation. Currently, renewable curriculum which is being implemented in Indonesia is the Curriculum 2013.

Curriculum 2013 is designed to strengthen students' competencies in terms of knowledge, skills and attitudes intact. The competency of curriculum 2013 on the domain knowledge using the scientific approach is characterized by the presence of the 5 M, observe (Mengamati), ask (Menanya), try (Mencoba), reasoning (Menganalisis), and presents/concluded (Menyimpulkan). The curriculum requires students to actively participate in the learning process. Learning activities brought near the student center, which overall was students who actively participate in learning activities and the teacher acts as a facilitator only. So that students are required to learn on their own, but in accordance

with the scientific attitude. To strengthen the scientific approach, the government prepared a syllabus-based learning and books disclosure/research (discovery/inquiry learning) with a textual approach. The 2013's book curriculum consists of student's books and teacher's book. This handbook is given by the government as a reference implementation in the classroom.

Scientific approach is needed to foster students' ability to think, work and scientific attitude and communicated as an important aspect of life skills, application integrated in various models, strategies, methods and approaches to match the characteristics of science learning. Its application can be through operational process skills such as Finding problems, formulate hypotheses, designing the study, collecting data, analyzing the data, and make conclusions. All of this in the form of government is preparing the syllabus and books in order to equalize the minimum learning throughout Indonesia.

Lesson plan prepared by the government is a new thing in Indonesia, so will many shortcomings findings when its execution. So the government help

the learning implementers to provide suggestions for improvements and suggestions to improving the quality of teacher and student book, it is mentioned in the preface to the book the teacher.

This research was carried out by implementing the learning process in science subjects in accordance with the teacher and the student handbook, 2013. Implementation of curriculum learning process according to the book of teachers and students is done for the purpose of reviewing how far the influence of learning made by the government and the influence of the use of the book teachers and students to the scientific attitude is formed on students.

## 2 RESEARCH METHOD

This research was conducted in grade VII in one of the Junior High School in West Bandung regency, precisely in SMPN 1 Lembang 7G's class where students tend situation and characteristics kinesthetic, noisy and do not want to silence, the number of students in class is 41 people consisting of 18 men and 23 woman. The study was conducted during the first half of the subjects of Natural Sciences. Video analysis of qualitative descriptive study conducted by researchers as the main data of scientific research on students' attitudes formed through the implementation of the student book and teacher books based curriculum 2013. Interviews and deployment of instruments into one of the data. The results of this study are expected to provide an overview and make a recommendation to the teacher books and book-based curriculum students in 2013.

## 3 RESULTS AND DISCUSSION

The Implementation of the student's book and teacher's book based on the curriculum in 2013 has made the students learn actively. While the function of the teacher is as a facilitator to help the students to engage in inquiry-based learning or discovery learning. As well as the first chapter in a junior high school science teaching materials about the scientific method that helps students improve the ability of observation, interfere, and communicate. However, the scientific attitude in students formed uneven in every aspect. Scientific attitude of students was very evident during the learning process in the form of experimentation.

The dominant scientific attitude that formed in students is observed, student curiosity it high when

it comes to this process. Usually, High curiosity make student do experiments out from the procedure that given by the teacher, they do in order to get results that can expand their knowledge or even otherwise only hinder the time because according to age is still happy to play that instrument or experimental material was used as a toy. As an example when the teacher forbids to taste acidic and alkaline materials when teaching acids and bases (video lesson # 17), most of the students want to know the taste of sour taste or not, and the end of the lesson students easily determine other fluids whether acid or base based on the taste of the liquid. Students were very enthusiastic when observing like When The learning is to observe the nature of plants, flower's Fahmi is dismantled in order to see the flower like petals, pistil, petals etc., But there are students who are not enthusiastic when observed, it is because the instruction book is assigned only use a magnifying glass to see it. Ask very rarely seen, most will ask only for clarity of experimental procedures or tasks to be performed in the study. Besides, ask the student will still be covered content. Besides, the learning goals of students to asking are still not very visible so that teachers should continue to provoke so that students dare to ask, especially in the preliminary event. Average courage students inquire correctly emerging in core activities, both at the time of the experiment or group discussion, there is a student who dared to ask when the teacher approached the group discussion, there are some students who shouted from his seat serviced immediately ask the question, even exist also students who without hesitation toward the teacher to ask about things that are poorly understood. That is because the habit when elementary school students to ask still lacking and very difficult students can ask well only in short implementation time.

Scientific attitude tried very rarely done, because some experiments require a measuring instrument and the object to be measured as well as the preparation of teachers to be mature. But the increasing scientific attitude trying is easily to be seen, it can be seen from the students who do not shame if he did or not, most of the students are embarrassed because the number of students who pay attention, but when the group season, the student is not depressed because being seen for those students. Overall the students are not shy to try out

when most students are grouped and embarrassed when trying to forward.

Reasoning is a scientific attitude depends on the learning process, Fahmi who usually just playing around but actively answer can answer "for oily hair mam" for question "why hair shampoo give lemon extract?" where other students are not answered correctly, such as vitamins D, dust, dander, and others. While hard scientific attitude to be formed during the process of implementation of teacher and student books book is conclusion. Most students still difficult to draw conclusions from the activities that have been carried out. So in conclusion, the role of the teacher in learning is very dominant, and students get conclusions from the guidance of a teacher who is constantly striving to direct for students to get conclusion from the results of its activities. The process of making inferences during the discussions is stuck because of many opinions of members of the group but which the student confusion ensure proper to be taken as a conclusion on theirs group, so they need for consultation to teachers, at this time that teachers act as servants both for individuals and groups. In some activities of the students scientific attitude, the form of presenting the results of experiments that have been done or the results of observations that have been observed, is still dominated by certain students who already have a degree of confidence that more than any other of his friends, so it looks still students that the same thing the scramble appear communicate study results.

Thus the role of the teacher as a facilitator is needed to direct that such students can be facilitated to re-focus on the purpose of the current study was to without prejudice to the sensation for fun (found in video # 5, Fahmi damage the flowers that should be used to analyze the body part of interest) that on materials or tools is can be played but by meaning as learning.

Additional notes found in interviews and dispersive instrument with a question:

1. How is the experience when learning science during the semester in grade 7?
2. How comment each chapter, the most difficult and the most easy to learn?
3. How do students of teachers in the teaching material during the semester chapter 1?
4. What makes the students do not want / trouble to ask questions to the teacher during the lesson?

5. What factors make it difficult if you have to summarize the results?
6. What advice / do you think about the last semester book?

We obtain results of student responses as follows:

Nu mb	Good Responds	Bad Responds
1	<ul style="list-style-type: none"> <li>➤ It helps much</li> <li>➤ Easy to learn</li> <li>➤ Feels happy</li> <li>➤ Found so many new things from the games and video</li> <li>➤ Feels happy when studying in Laboratorium</li> <li>➤ It contains a lot of formula that can helps to solve a problem</li> </ul>	<ul style="list-style-type: none"> <li>➤ It is bored</li> </ul>
2	<ul style="list-style-type: none"> <li>➤ Bab 1 (The Object of Science and its observed) is easy to learn</li> <li>➤ Bab 2 (The Classification of Object) is easy to learn</li> <li>➤ Bab 3 (Classification of Living Things) some of the picture is unclear so it's hard to learn. But for some student it's still easy to learn</li> <li>➤ Bab 4 (Life Organization system) some student said that it is hard to learn, and the rest of it said that it is easy to learn.</li> <li>➤ Bab 5 (The Changing Matters) is easy to learn.</li> <li>➤ Bab 6 (Energy) some student said that it is hard to learn, and the rest of it said that it is easy to learn.</li> <li>➤ Bab 7 (Temperature and its change) some student said that it is hard to learn, and the rest of it said that it is easy to learn.</li> <li>➤ Bab 8 (heat and its process) some student said that it is hard to learn, and the rest of it said that it is easy to learn.</li> <li>➤ Bab 9 (Environment interaction) some student said that it is hard to learn, and the rest of it said that it is easy to learn.</li> </ul>	
3	<ul style="list-style-type: none"> <li>➤ Easy to understand</li> <li>➤ A lot of experiment</li> <li>➤ Exciting</li> <li>➤ The teacher is exciting</li> </ul>	<ul style="list-style-type: none"> <li>➤ Unclear</li> <li>➤ The experiment is hard to understand</li> <li>➤ Sometimes the explaining of teacher is hard to understand</li> </ul>
4	<ul style="list-style-type: none"> <li>➤ Lake of concentration</li> <li>➤ Lake of confident</li> <li>➤ I don't know what to answer</li> </ul>	

Nu mb	Good Responds	Bad Responds
	➤ Too noisy	
5	<ul style="list-style-type: none"> <li>➤ Add the materials</li> <li>➤ It's not clear</li> </ul>	<ul style="list-style-type: none"> <li>➤ Got the disturb from others student</li> <li>➤ Failed in the experiment</li> <li>➤ Sometimes, it's hard to understand</li> <li>➤ The formula</li> <li>➤ Too much steps on experiment</li> </ul>
6	<ul style="list-style-type: none"> <li>➤ It has been completed</li> <li>➤ Easy to learn</li> <li>➤ Makes happy</li> <li>➤ Make it clearer</li> <li>➤ It's better to give an answer sheet in the book</li> <li>➤ Too much formula</li> </ul>	<ul style="list-style-type: none"> <li>➤ It's big</li> <li>➤ It's heavy</li> <li>➤ The pictures it not clear</li> <li>➤ Too much formula</li> </ul>

From the results of student responses, can be analyzed that:

1. Learning in accordance with the teacher guide book / the government suggest, can be said to be good, fun, easy, and invite curiosity to know.
2. Any material that is easy or difficult by all students or easy and difficult for most students is a normal, because every student has an interest different. Difficulties students will not require a material change material, but can be changed from the model or method of learning. But for that chapter 3, where the picture is unclear and incomplete is important for repair.
3. Student responses will be "teachers sometimes do not understand" and "not clear" can be nothing if the existing teaching materials to teachers book complete and clearly written.
4. It clear that students are not familiar with asking skill. The process needs to be sharpened continuously ask, so that at the next level, students are used to question.
5. Similar to ask activity, concluded looks students are not familiar with this activity.
6. For a physical book, students is hard to bring the book because it size and weight. the image must be fixing by student responses "suggest clarified again" and "the picture is not clear", while student comments "many formulas that do not understand" probably because students do not understand the material.

#### 4 CONCLUSION

Based on the study findings, we suggest:

1. Observing not only observe from the outside (see picture / movie), but observed by holding directly and do something immediately. Students may be assigned to carry the tools / items available daily life in accordance with the content of these subjects.
2. ask is not easy to be improved, there needs to be a long process and just need to give a clue to the trigger. Such as flowers after the observation, the teacher gives the clue "look at the flowers" and students are expected to ask about what was found in the flowers.
3. Trying is not only at the time of the experiment course, students are guided to try everything, like trying to move forward, trying to ask, trying to be the leader of that nature can be reduced afraid to try.
4. With the questions according to the context of learning and life, students are expected to think with his reason.
5. Remind the students that the conclusion is the answer to the problem.

**Abstract:**

Clinical practice for midwifery students aimed to achieve nine midwifery competencies. The process of consultation on practice field is very important for students. Yogyakarta Midwifery Academy innovate the consultation model of clinical practice to help students' learning process in practice field. Students receive consultation from Clinical Lecturer Assistant in giving midwifery care. The evaluation of students' consultation process by Clinical Lecturer Assistant is needed, as a tool to improve learning quality of clinical practice in the practice field. This study aims to find out the consultation process that has been done by Clinical Lecturer Assistant, to find out students perception about Clinical Lecturer Assistant, includes: The important of Lecturer Assistant for student, the students' comfort that consulted by Clinical Lecturer Assistant, and the easiness for students on the consultation process in practical field. The research method is quantitative and qualitative method with case study plan and descriptive. The analysis part is education institution Diploma of Midwifery. Research conducted in Yogyakarta Midwifery Academy in the area of Bantul district. The subject of research is 120 students. The sampling method is simple random sampling. The data collection are questionnaire and Focus Group Discussion (FGD). 90.83% students said that the Clinical Lecturer Assistant appearance convince, 85.83% students said that the consultation model is very clear, 95% students said that they always conduct feed back for students, and 92.5% students said that Clinical Lecturer Assistant are regularly monitor students' attendance during practice process. Based on the interview, some students said that Clinical Lecturer Assistant is very important in assisting process during practical learning in field, learning process in field, solve problem if there any problem found in practice field, and students are easier in conducted report consultation process of midwifery care.

### 1. INTRODUCTION

Based on data from the Indonesia Demographic and Health Survey (IDHS) in 2007, the number of MMR numbering 228 people out of 100,000 births. This figure is 20-30 times higher than the MMR in Malaysia and Singapore. Based on IDHS 2012, the average maternal mortality rate (MMR) was recorded at 359 per 100 thousand live births. Mortality rate is much increased compared to the results of the IDHS 2007 reaching 228 per 100 thousand.

In order to focus on accelerating the achievement of MDG 5 of improving maternal health, it takes efforts effectively, efficiently and consistently from all stakeholders to come together in its efforts to accelerate the reduction in maternal mortality rate (MMR). To achieve that aim, the Indonesian Ministry of Health arranges the Action Plan to Accelerate MMR Decline years 2013-2015, with the purpose of: describe the vision, mission, and programs are guided by the President and the

National Long Term Development Plan (RPJPN) 2005-2025.<sup>1</sup>

Midwife is a woman who has graduated from a midwifery education recognized by the government and professional organizations in the territory of the Republic of Indonesia and has the competence and qualifications to be registered, or certified and legally licensed to practice midwifery.<sup>2</sup>

In Indonesia, the scope of practice, authority, and competencies that must be mastered by midwife are very extensive. Midwives have a responsibility in health services for mothers and newborns, family planning, child health and primary health care. So the midwife has a very big role in efforts to accelerate the reduction in maternal and infant mortality.

Yogyakarta Midwifery Academy Midwifery is intended to imprint professional midwives and independent. According to Diploma of Midwifery curriculum, students are prepared to become professional midwives who have the intellectual ability, attitudes and skills, so that they can provide

safe midwifery care and satisfactory for mother and baby, their families and communities. In line with these objectives, the teaching and learning activities carried out by the method of learning theory, lab, and clinical practice in the field.

Teachers commonly called faculty is one of the main factors that directly contribute to improving the quality of student. Faculty workload includes the main activities, plan teaching and learning, implement learning process, an evaluation of learning, guiding and training, conduct research, perform additional duties, and community service.<sup>3</sup> The number of workloads that taken by lecturer causing lecturer can not focus in doing every single work, especially in teaching and learning process in obstetrics clinical practice on field. Therefore, Yogyakarta Midwifery Academy has innovation to assist the faculty by recruiting alumni to become an Assistant Lecturer. During the implementation process of learning Midwifery Clinical Practice, students get guidance of Assistant Lecturer in midwifery care act. Field guidance process is very important for students to achieve midwifery competency that has been determined and listed in nine midwifery competencies, so it is necessary to evaluate the guidance process by Assistant Lecturer, as a means to increase or improve the implementation process of clinical practice in order to give better guidance for students.

From this study it can be proven that lecturer assistants are able to give guidance for students during midwifery clinical practice, students have a very good perception to lecturer assistant, and feel more comfortable and easier in clinical midwifery practice guidance on field.

## 2. RESEARCH METHOD

The method that used in this research are quantitative and qualitative methods using a case study design and descriptive nature. The experiment was conducted in the month from October to November, 2013, at the Yogyakarta Midwifery Academy. The unit of analysis in this study is the fifth semester student of Yogyakarta Midwifery Academy.

The subjects were 120 students. Data were collected by simple random sampling using a questionnaire, and through Focus Group Discussion (FGD).<sup>4</sup> Qualitative data analysis was done by using explanation (eksplanasi building), presenting a summary of the data population data in tabular form.<sup>5</sup>

## 3. RESULT

### 3.1 Guidance process for the midwifery clinical practice students done by field lecturer assistant

The guidance process for the midwifery clinical practice students done by the lecturer assistant can be seen on table 1 below:

Table 1.1 Frequency Distribution of Student Answers to the Process Guidance taken by Field Lecturer assistant

No	Questions	Answers (n=120)	
		Yes	No
1	The lecturer assistant was looked convincing in delivering guidance	109 (90,83%)	11 (9,1%)
2	The way or method given by the lecturer assistant during the field guidance gave me a clear view	103 (85,83%)	17 (14,16)
3	The lecturer assistant was always gave evaluation after the guidance by giving suggestion about our field clinical practice that we have done	114 (95%)	6 (5%)
4	The lecturer assistant monitored my presence during the field practice and asked me about problem that we had	111 (92,5%)	9 (7,5%)

### 3.2 The importance of faculty assistance

Most students assumed that the lecturer assistant is needed in field clinical practice. Lecturer assistant was considered very beneficial in the field learning process, especially in providing guidance for action obstetrics. Lecturer assistant always have discussions with students and evaluate any actions taken by students, so that students know the advantages and disadvantages of the current practice. According to students, this is important because the results of the discussion and evaluation of results provided by the teaching assistant can be used to make improvements in the next field practice. As expressed by the following respondent:

*I think it is very important to have a lecturer assistant, of course that she/he is very helpful in guiding us in clinical practice learning. Lecturer assistant are also very attentive to us. More discussions, and always give a complete evaluation at each visit to us, so we know the point that we do not understand, and that we make as input for further action during our practice”*

Other respondents said that the teaching assistant was also gave a better supervise to the student during practice. During this field clinical practice, the students lack of monitoring from the supervisor. Respondents also said that lecturer assistant are very helpful in the implementation of the comprehensive exam, in which students are required to perform this test care to pregnant women, maternal and mothers during childbirth. As expressed by the following respondent:

*“Alright, lecturer assistant were also more able to monitor us, because the supervisor lecturer was just like a brief-monitoring, now we have more time. Besides when we conduct comprehensive exam are easier and faster, because assistant lecturer have more time than lecturer. In fact more time is now right? Moreover, when we want to do a comprehensive exam, it is more easily and quickly for us to do that because the more time that lecturer assistant gave to us. Sometime it was very hard to make a appointment with lecturer, even sometime we faced into annulment. You know, students and lecturer have different times or activities, something like that”*

### **3.3 Students’ pleasure in lead lecturer assistant**

Comfort becomes very important in terms of the guidance in field midwifery clinical practice. Students feel more comfortable with the guidance given by lecturer assistant than with lecturer because there is no awkward feeling as if doing counseling with the lecturer or supervisor. Students feel freer recounts, because age is not too different between the lecturer assistant and students. As expressed by the following respondent

*“Obviously that it is easier to talk with the lecturer assistant because our ages are not too different. Of course the things going so different if we have guidance from our supervisor. Sometimes we are afraid or shame, so for me, it is much more easier to face the lecturer assistant than the supervisor”*

### **3.4 Ease of Doing Tutoring in the Field**

Ease of students during guided by the lecturer assistant is in taking the time for field test, the ease in terms of time to provide guidance for action in the field, the ease in planning field practice, convenience in terms of time to provide guidance for action in the field, the ease in planning practice in the field, and ease of troubleshooting during on the field. Problems often arise in the field is related to the factor of communication between the student practitioner with the patient. In addition, communication between the owner of the clinic with the student, another difficulty is unqualified students in understanding the actions and maneuvers were performed in providing midwifery care to patients. As expressed below:

*“I think it is easier in almost everything, because you know, they (lecturer assistants) have time for tutoring, field exam; especially comprehensive exam will be more easier either, and the ease of troubleshooting during on the field.”*

## **4. DISCUSSION**

### **4.1 Tutoring process taken by lecturer assistant**

Lecturers are professional educators and scientists with the main task of transforming, developing, and disseminating science, technology, and the arts through education, research, and community service.<sup>3</sup> The definition of lecturer assistants is a person who helps a person perform his professional duties, so that the sense of teaching assistant is a person who helps a lecturer in performing professional lecturer duties.<sup>6</sup>

In a study of the practice of midwifery clinic, lecturers should provide a strong rationalization to students in the learning process, helping them determine what they need to learn, helping them set up and make what should be learned by students, ensuring that students participate and get involved, make the teaching and learning environment to be exciting and fun, giving plenty of opportunity to practice the students and tell the students about the progress they have achieved.<sup>7</sup>

Based on the results of the study, most of students said that the lecturer assistant gave evaluation/feed back against actions made by a student against the patient. The feedback will give you the ability to monitor students on himself with success, have higher aspirations for further achievement, greater personal satisfaction, and higher performance overall, so that feedback be improved naturally.<sup>8</sup> Feedback should give the

students an explanation of what they are doing right and what wrong they did as well as just in time, because the feedback is given with much-needed immediately in order to give the most effective benefits.

#### 4.2 Importance of lecturer assistant

The number of tasks that burden the responsibility of lecturer cause the focus in doing any work, especially in the field of education and the teaching practice of obstetric clinics in field. The current practice of indicating conditions students need the opportunity to earn the assessment and feedback when they integrate and implement the knowledge, skills, and new behavior. So as to achieve the goals of learning and applying new skills, required a conducive environment practices. One way to help improve conditions and the lecturer, lecturer assistant is required to help the professional duties of a lecturer in clinical obstetrics practice learning delivers on the field.

Based on the results of the interview, discussion in the process of clinic learning is very important because students can find out shortcomings and advantages as well as adding knowledge about various actions or case that founded by students during practice. Approach to guidance clinics approach can help students adapt to integrate theories in health services, developing competency clinics, build confidence and develop the professionalism by means of exchange of knowledge and skills with tutors<sup>9</sup>

#### 4.3 The Convenience Of The Students Guided by Lecturer Assistant

Results of the study mentioned that the student more comfortable guided by lecturer assistant because there is no sense clumsy as if done with the guidance of faculty mentors. Students feel more freely recounts his/her experiences, because age lecturer assistant are not much different from the student.

Yogyakarta Midwifery Academy has the innovation to help lecturers by recruiting alumni to become an Assistant Professor. Assisting lecturer Program is an alternative solution to improve the skills of students by engaging students and alumni as a peer educator/peer educators.<sup>10</sup> Expected with peer educator can provide a more effective approach on students.<sup>11</sup> The advantage of learning with peers is more open communication, so a sensitive issue can be discussed openly and searchable troubleshooting.

#### 4.4 Ease for Students in doing the guidance in the field

Communication is a message delivered to recipient of the communicators (source) through certain channels either directly/indirectly with the intent to give effect to the recipient according to what communicator wants. Thus, communication is the process of delivering the message or information from a person to another person.

Communication is very important because it is the primary method of communication in the process of implementing the education or action. Midwives need to understand and apply the concepts and process of communication to enhance the relationship of mutual trust with clients that will help change the behavior of the client in a positive direction. Communication with a midwife can deliver and receive messages so that the purpose of the midwifery can be succeeded.<sup>11</sup>

Based on the results of the interviews, the students found that it is difficult to communicate, either by the patient or by field supervisor. This can be caused by barriers of culture and language,<sup>12</sup> that one of the obstacles in conducting communications is due to cultural background.

The practice of midwifery obstetrics clinics by Yogyakarta Midwifery Academy held in the Special Region of Yogyakarta and Central Java, Yogyakarta Midwifery Academy students and come from various regions in Indonesia. At the time of the clinic practice in the field, students who come from outside of Java is often difficulty in terms of communication because of language used in contrast to communities in Java. The presence of lecturer assistant ease students in communicating with the client or with the pembimbing in the field and provide guidance in carrying out actions that have not been mastered by midwifery students, thus helping students achieve competencies should be owned by a midwife in providing midwifery services in order to be able to provide high-quality service.

### 5. CONCLUSION

Lecturer assistant at clinics need to be maintained to increase its quality. Practical learning in the classroom needed to use lecturer assistant as learning practice in the field so that students learning more convenient and easier to understand practical-learning material.

## Class Management and Teacher Analysis: *An Action Research Lesson Study*

Tomoko Kawakami  
*Jounan J.H.S., Saga, Japan*  
[Tkmoko23@yahoo.co.jp](mailto:Tkmoko23@yahoo.co.jp)

**Abstract:** Action Research is “of the teachers, by the teachers, for the teachers,” where teachers need to analyse their own personalities and practice tendencies from specific concepts and a situation theory. It is important for self-analysis action research to examine teacher’s specific qualities, because each teacher has their own educational style and effective skills or techniques.

**Keywords:** Action research, Self-analysis, One’s own specific, Practice tendencies, Intermediate theory

This is a very typical example of action research which focused on self-analysis. The bottom line of action research is that even though you have the same theory and same teaching plan among teachers at your school, the effectiveness of each classroom must be slightly different. This is because each teacher has his/her own specific personality and professional skills.

In this study, I needed to analyze one’s own specific teaching character. The methodology of the action research contained two data analyzing strategies. One involved text mining through software called Word-Miner, the other was the KJ method which was an inter-subjective analog strategy.

Firstly, I was an 8<sup>th</sup> grade homeroom and mathematics teacher, surveyed my impression on the students and parents without their identification in order to analyze their true answers.

The questions were;

- 1) What do you think of me as a teacher? (both students and parents)
- 2) How do I associate with each individual student? (both students and parents)
- 3) What do you think of me as a person? (only students response, not parents)

I collected 133 respondent’s answers, which consisted of 31 first level students (as a classroom teacher), 43 second level students (as a mathematics teacher), and 38 third level students (as a mathematics teacher of 9<sup>th</sup> grade). I also gained responses from 22 parents (only from the 8<sup>th</sup> grade classroom).

The factors sampled from the teacher’s specific characteristics were “fairness,” “flexible sociological

distance between myself and the students,” “eagerness,” “great observant sense,” and “aspiration.”

It is important for self-analysis action research to examine the practitioner’s specific factors because each practitioner has their own educational style which is effective for their students, even though many teachers may have used the same educational theories, teaching materials and strategies.

Therefore, the important characteristic of the model (Figure F-7) below is that it included my own specific factors and genuine classroom management theories. Furthermore, it is necessary in order to develop the personal intermediate theory of classroom management as one of the action research strategies.

The small steps of intermediate theory play an important role in helping students recognize the connection between themselves and the whole class in order to improve classroom settings. In other words, these small steps emphasize the integration between students’ interests and the whole classroom needs.

As shown in the explanation of my classroom management style, it is the teaching and learning method that integrates students’ interests with classroom needs to increase both students’ personal/social skill development under classroom culture. Each micro step in Step 1 (cooperation) and Step 2 (independence) are essential to make students aware of their roles and their ability to cultivate their classroom climate. When students understand the connection between themselves and classroom problems, they become active partners and are

highly motivated to accomplish their classroom tasks. These small steps are part of the process of developing individual tasks from the main theme of classroom project. This process helps students identify their vital connection with each other.

Through the use of this process of classroom management, common classroom problems become relevant as a personal problem to each student. Therefore, it is possible to say that the micro steps included in Step 1 (cooperation) and Step 2 (independence) are valuable in helping students identify their personal classroom problems, to positively engage them in classroom volunteer work, and to promote the development of students' self-esteem. Step 3 (autonomy) engages students in performing classroom volunteer/positive work, which is the foundation of building democratic responsibility in the classroom. Students' correct understanding of problems facing the classroom and their appropriate reactions to improve their classroom are ways for them to become responsible students. Step 4 (reflection) is the best method to make students realise their efforts and improve their self-esteem.

The intermediate theory with the self-analysis method above was developed from action research which has proven to be beneficial in promoting self-esteem and building democratic responsibility in junior high school society. This action research successfully integrated students' interests with the issues of their own classroom. In this action research, one's specific factors were core elements combined with other analyzed elements. The issues of classroom management were genuine and meaningful. I had a strong "connection" to my students. Through their involvement in volunteer or positive work, the students had the opportunity to meet their individual needs. Their volunteer or positive work was not only meaningful to the classroom management but also relevant to themselves. The issues of classroom management gradually became personal tasks to students when they recognized their roles in the process of improving the classroom.

In this study, when students are engaged in classroom volunteer work students have the opportunity to meet needs that are not being met in an average school environment. Clearly, this contentious idea matched with the case study of action research.

Based on these findings through the analysis of the teacher's specific teaching characteristics, I found that action research succeeded in promoting self-esteem and building democratic responsibility in all students in all cases. Action research involved the students in meaningful classroom volunteer or positive work to help them become valued members of their school and classroom. Students developed a sense of classroom membership and exhibited high

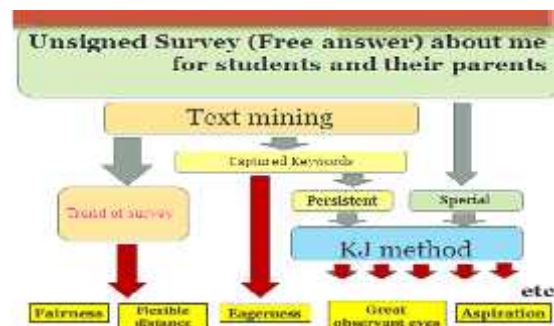

self-esteem through participation in meaningful volunteer or positive work to improve their small classroom society.

Based on the model theory shown above and the practice of action research, I developed an intermediate theory of the classroom that offers potential benefits in promoting self-esteem and building democratic responsibility in junior high school students. The strong connection between students' interest and classroom needs was the key point to create a successful classroom. The value of the intermediate theory combined with self-analysis lead to the development of individual tasks for students.

Conversely, there are some limitations in this research. It is essential to keep in mind that the intermediate theory was developed solely on the case study of action research.

However, to conduct action research procedure, it is imperative to understand the process itself. The reason why academic research and educational practice do not combine well is due to the cognitive distance between them. Therefore, the most important strategy for improving action research is to build an intermediate theory to connect academic theory and educational practice.

This is especially important in action research which is "of the teachers, by the teachers, for the teachers," where teachers need to analyze their own personalities and practice tendencies from specific concepts and a situation theory. In conclusion, it is important for self-analysis action research to examine practitioner's specific qualities, because each practitioner has their own educational style and effective skills or techniques.

## Teacher-Student Collaboration in Solubility Product Constant and Colloid Concept in Chemistry Learning of Senior High School

Yorika Zainal<sup>1</sup>, Yeva Olenia<sup>1</sup>, Sumar Hendayana<sup>1</sup>, Ahmad Mudzakhir<sup>1</sup>, Arif Hidayat<sup>2</sup>

<sup>1</sup>Chemistry Education Department - Indonesia University of Education

<sup>2</sup>Physics Education Department - Indonesia University of Education

**Abstract:**

The tendency of low interaction between teacher and student became the background of this study. The aim of this study is to analyze teacher-student collaboration in solubility product constant and colloid concept of chemistry learning. The subject of this research were one chemistry teacher and 27 students of XI IPA 2 SMA Laboratorium UPI. The type of this research was descriptive qualitative. The instrument that used in this research were observation sheet, video recorder. Ten times lessons were recorded by handy-cam and observed using observation sheet, and then made lesson transcript based on video lesson. Teacher and student's responses and questions analyzed using Hendayana lesson analysis framework to see the collaboration between teacher and student to improve pedagogical competence of teacher. The result of this research showed that the tendency of teacher response in solubility product constant lesson were INT (teacher interruption in group asking result and progress), MMR (teacher asking student to do something/procedure) and LJW (teacher answer student question directly). The tendency of teacher response in colloid lesson were MMR (teacher asking student to do something/procedure), LJW (teacher answer student question directly), and RPI (teacher answer by scientific question). Lesson analysis can be used to improve pedagogical competence of teacher especially to answer and response student's question and answer. It is importance for teacher to increase scientific question and reduce interruption to increase teacher-student collaboration.

**Keywords:** teacher-student collaboration, solubility product constant, colloid, chemistry learning

## 1 INTRODUCTION

In education there is interaction between learners and educators, the interaction of learners and educational resources that can take place in a situation of education, teaching, training, and guidance (Sukmadinata, 2006: 24). The importance of interaction between learners with educators will affect the learning process that can improve the quality of learning. To improve the interaction among students and student-teachers honed through experience and the establishment of collaborative learning community, that can be the vision and philosophy of the school reform. Learning community guarantees the right of every child's learning without exception, improving the quality of learning and the simultaneous achievement of quality and equity of learning but not only students but also teachers in the classroom (Sato, 2012: 19). Teachers collaboration to plot or no plot other subjects in order to improve the quality of learning to form a learning community. In the activities of learning community, according to Sato (2012: 19) there are three systems of collaborative learning in the classroom which are professional learning community and collegiality in the staffroom and participation of parents and communities. Building the learning community is to build a culture that facilitates its members to learn from each other,

mutual correction, mutual respect, mutual trust, mutual restraint ego. Building a culture of no moment, take a long time.

According to Vygotsky (1978: 32) the process of learning can occur in two phases: the first phase occurs when collaborating with others, and the second stage is done on an individual basis in which a process of internalization. During the process of interaction among teacher-students and among students, the following capabilities should be developed: mutual respect, test the truth of the statement the other hand, negotiate, and each adopted the idea that developing. The first stages of learning Vygotsky was started by a student who could not solve the problem alone, and then he had to ask the other students (Masaaki, 2012: 29). Teachers should be able to enable students to each member actually has a role in the group.

Each group should be given the opportunity to think for themselves, to work alone without any intervention from the teacher, if students are having difficulties, there will be collaboration between them. Thus, there will be a good and close relationship so that each student will be free to think and absorb the material without too much under pressure. The system can encourage students to collaborate for mutual learning (mutual learning)

in the classroom learning community in the learning community (Hendayana, *et. al.* 2013: 12).

Learning occurs when children work or learn to handle tasks that have not been studied, but the tasks are still within range of ability or the task is in the Zone of Proximal Development (ZPD / region proximal development) (Vygotsky, 1978: 34). The zone of proximal development is defined as the distance between the actual development and potential development. Vygotsky believes that higher mental function in general appears in the conversation on cooperation between individuals, before the higher mental functions were absorbed into the individual. How long it takes to build a culture of learning community has no limits (Hendayana, *et. al.* 2013: 11). In a learning community, communal reflection takes place so that the teacher can see for themselves how the learning is done during the learning process.

Lesson analysis developed by several experts including lessons according Fernandez analysis where the analysis focuses on teacher learning and student responses in learning. Previous lesson development analysis focussed on students in the learning phase. Matsubara's lesson analysis by focusing on the student's response and analysis by Hendayana and Hidayat lesson focuses on the interaction of teachers and students' responses (Hidayat, 2013: 7). In this study, researchers used variant of lesson analysis developed by Hendayana and Hidayat, this because in accordance to the characteristics of the class in Asia for self-reflection in order to identify the teacher-centered to student-centered.

In the subject matter that must be studied colloidal students, especially students of class XI second half, has the characteristics of a concept based on the concrete meaning can be expressed in real life, especially the application of the concept of colloid in everyday life, but also has the characteristics of colloidal material abstract with concrete examples. Students should be easier to understand this matter, but in fact the students have difficulty in understanding the colloidal material associated with many concepts and examples, as well as not being able to build relationships between existing concepts (Mutiasari, 2011: 3). Same with that said Oktariani (2011: 2) that, in the students' learning colloidal material has been unable to reconstruct the concept and the learning process is still dependent on the student's ability to memorize briefing information is then followed by doing exercises without being followed by the ability to understand the information that is memorized and connect with everyday life. This makes students' understanding of the material be comprehensive. Many students struggle to study chemistry, but often to no avail. This is because many of them do not build a proper understanding of the basic concepts of chemistry based on the

educational experience of students (Nakhleh, 1992: 192). The learning process chemicals also tend to emphasize aspects of any product without any aspect of the process. The nature of chemistry not only covers aspects of the product just like hooking facts, concepts and principles of chemistry. Chemistry is essentially also a process that involves scientific process skills and attitudes that are useful to acquire and develop knowledge of chemistry. In chemistry learning process, students and teachers involve in a series of activities in the order: observing phenomena and learn the facts, understand the models and theories, develop reasoning skills, and test chemical epistemology (Ahmad and Baradja, 2012: 6). One success key of the learning process variable is a qualified teacher. Teacher as educator is the figure who most associate and interact with the students compared to other personnel in the school. The teacher is responsible for planning and implementing the learning process, assessing learning outcomes, conduct guidance and training, conduct research and studies, and open communication with the public. Background of the above problems to tackle the problem, then it is time for teachers to try to make learning more fun in class two-way communication between students and teachers. So that students liked the chemistry lesson without being burdened with the collaboration of teachers and students in the material solubility product and colloidal systems in chemistry learning.

## 2 RESEARCH METHOD

Research method that is being used in this research is descriptive qualitative research methods. This research is focused on study about student-teacher collaboration on the solubility product constant and colloid concept in chemistry lesson. The research was conducted in there steps: 1). Analyzing instructional videos about solubility product constant and colloid concept in ten times of learning; 2) Analyzing the learning transcript's videos based on implementation in learning for student's responses analysis and anticipating teachers to the student's responses; and 3) Analyzing learning process based on the Hendayana's model framework to analyze the characteristics of collaboration among students and students-teachers. Subject on this research is students SMA Laboratorium Percontohan UPI class of XIIPA2, year 2013/2014 as initial respondents. There are a chemistry teacher and five researchers who becoming the observer. The instrument that used in this research consist of three kinds instruments: (1) Observation sheets, (2) Handycam, (3) Lesson analysis sheets. This observation sheets is done to obtain direct interaction between teacher and student, interaction and participation students during learning process. In addition, it is to

obtaining the data and the facts about the difficulties of respondents in concept of chemistry related to solubility and colloidal system of subject matters. Patterns of interaction and participation present on the format of observations. This format is referenced from research conducted by Dukmak (2009:271).

According to Hendayana (2013:9), lesson analysis is a method that is used to analyze the characteristic of learning process in the class in Indonesia, characteristic of interaction in the classroom with a student-centered learning and more to teacher self-reflection. In addition, according Matsubara (2012:40), lesson analysis is a method for analyze the learning process by using transcript that focus on students responses and learning situation.

Verbal data will be transcribed into written data. All the entire lesson videos that was recorded during implementation of learning process transcribed and refined to obtain the basic text from learning process that was observed. That basic text later used in coding step to obtain data of learning activities, interaction among students, interaction between students and teachers that would be appears during implementation study of solubility product constant and colloid subject.

### 3 RESULT AND DISCUSSION

The result of this research shows learning process that has done in solubility product constant and colloid subject matters based on Hendayana lesson analysis framework focus on analyzing the collaboration between students and teachers on the group session. The first lesson shows that the interaction and collaboration of teacher-student not good enough, it can be seen from the results of analysis lesson. Interaction is mostly done when the teacher-student grouping session is, the categorization LJW have not seen teachers interact with students. It can be seen from the following photo.

Figure 1. Teachers answer student's question directly.

In the second study was increasing and the difference pattern teacher-student collaboration is evident MPR from the frequency 81 categorization, categorization RPI occur with 61 frequency that is

pretty good compared to the collaboration of The first lesson but still not significant.

In the third study in group interaction and collaboration sessions conducted teacher-student looks more to the MPR categorization of the frequency 58. This shows that based on the results of this analysis lessons seen an increase in the pattern of teacher-student collaboration on categorization RPI where teachers more 31.

In the fourth lesson, the common ion effect and the effect of ph on solubility concept did not shift the pattern of interaction and collaboration are very significant, but the reduction of the pattern in which the teacher so teachers can do self-reflection on the categorization LJW of the four learning collaborative learning has yet trend still teacher-centered learning.

Figure 2. Teacher answers students question through scientific question.

In the fifth and sixth learning increased teacher-student interaction patterns are caused by the MPR characteristics of the material colloidal system is enough to give a fairly good collaboration patterns and students are doing and find experiment result without always guided teachers that learning tendencies already towards student-centered.

On learning the seven visible increase teacher-student interaction patterns on TPS categorization with frequency LJW categorization and the increased MPR and RPI, but generally occur fairly good collaboration between teachers and students in learning so that learning more focused on the students (student-centered). This is evident from the way students interact in a group when the presence of the teacher involved.

Figure 3. Teacher does interruption for students observation result.

In the eighth study showed an increase and shift pattern of significant collaboration on the categorization of the Assembly with the RPI, but the frequency of INT and MJL category sodium

absorption ratio change significantly and includes patterns of interaction and collaboration are rarely performed teachers.

In learning to nine looks learning has been highly increased more significantly in the presence of a more effective learning between teachers and students where the teacher is to answer the questions asked by the students to return scientific questions for this is the level of teacher-student collaboration categorization is quite high.

Figure 4. teachers instruct students to do something procedures

On the tenth learning occurs collaboration and interaction is excellent between teacher-student learning so that trend more towards student-centered with the categorization of MMR and the RPI is still increasing and categorization LJW and INT were increased also in the last lesson of 10 times the learning undertaken by of the transcript of the video, the lesson by lesson analysis Hidayat & Hendayana occur fairly good collaboration between teacher-student.

#### 4 CONCLUSIONS

Lesson analysis could be used to increase the competence of teacher's pedagogy, especially to answer student's question and making anticipation for student's responses. This is important to teachers to develop any scientific questions and limit the interferences thus, collaboration between teachers and students in the chemistry lesson could be increased especially, and for the RPI category those are teachers answer the scientific question and present presence of good communication patterns between teachers and students.

**Abstract:** Zambian government has put a strong focus on the Continuing Professional Development (CPD) of in-service teachers. Under this policy, the Ministry of Education, Science, Vocational Training and Early Education introduced lesson study practice of teachers into primary and secondary schools in the country. This paper shows an outline of workshop presentation on how government of Zambia introduced and modified lesson study practice of teachers in primary and secondary schools in order to promote learner-centered lesson in science and mathematics. The first part describes methods of implementation of lesson study in Zambia together with its effects and challenges. Though the practice contributed the improvement of teachers' skills and students' performance, there could still be quality issues to be improved in conducting lessons and lesson study activities. The second part shows how Zambian teachers understand learner-centered lesson with sample results of questionnaire. It was found that teachers understanding on learner-centered lesson are still superficial; therefore, it is necessary for them to continuously try conducting problem solving or inquiry lessons based on Kyozaï-Kenkyu (intensive study of teaching and learning materials) practice in the lesson study at schools.

**Keywords:** Continuing professional development, Learner-centered lesson, African context

### 1. INTRODUCTION

The Ministry of Education, Science, Vocational Training and Early Education (MESVTEE) in Zambia has put a strong focus, in its policy, on the Continuing Professional Development (CPD) of in-service teachers at primary and secondary schools to improve the quality of teaching and learning at classroom (GRZ, 2011). As the policy recommends implementation of demand-based, continuing small-sized teacher training (MoE, 1996), the Ministry has been conducting School-based CPD (SBCPD) programme since 2005. This programme enables all the teachers at primary and secondary schools in the country to have opportunity to continuously learn from each other at school level. In SBCPD, the institutionalized framework called “School Programme of the In-service for the Term (SPRINT)” provides a platform for teachers to continuously have meetings and trainings at school and zone level. Using this framework, the government introduced lesson study practice of

teachers in Central province in 2005 with technical cooperation of Japan International Cooperation Agency (JICA). In 2007, the practice was extended to Copperbelt and Northwestern provinces, and in 2013 it was introduced in all the provinces in the country. As of June 2014, 2,682 schools out of 8,500 are conducting lesson study with a participation of 41,243 teachers in total out of 85,000 (MESVTEE, 2014). The aim for introducing lesson study is to improve the quality of lessons at primary and secondary schools, especially in science and mathematics subjects, with a focus of enhancing learner-centered lesson at classroom.

### 2. OBJECTIVE

Based on the lesson study practice and experience in Zambia, this workshop is organized with objectives below.

- 1) To introduce how primary and secondary school teachers in Zambia are conducting lesson study at school level with its effects and issues

2) To share experiences and challenges of Zambia in promoting learner-centered lesson through lesson study

The workshop consists of three parts. The first part is an introduction of lesson study conducted in Zambia. The second part is a presentation on how learner-centered lesson has been promoted in Zambia through lesson study. The third is an open discussion and exchange of ideas. Visual and descriptive aids are used in the presentation.

### 3. LESSON STUDY IN ZAMBIA

#### 3.1 Features of Zambian Lesson study

Among many African countries, the Zambian government has institutionalized a programme to request all the teachers at primary and secondary school level to conduct lesson study at their schools as CPD activity. Lesson study in Zambia is basically conducted by schools following the Implementation Guidelines prepared by the MESVTEE under the SBCPD programme. The basic features of Zambian lesson study are described in Table 1. When lesson study is conducted, teachers basically follow eight (8) steps of activities shown in Figure 1 (MoE, 2010a). The flow of activities is called lesson study cycle.

Table 1. Basic Feature of Zambian Lesson Study

Factor	Feature
Target level	Both at primary (1-7) and secondary (8-12) levels
Target subject	Science and Mathematics as entry, extended to all subjects
Participants	Teachers at school (by subject group or grade group)
Unit for Implementation	By school or by cluster
Frequency	Once a month (7 cycles per year) by each group
Lesson Study Cycle	8 steps of activities
Planning of lesson	Lesson plan prepared by a group of teachers
Demonstration teacher	Selected by each group
Lesson Observers	Fellow teachers, Head teacher, Deputy head teacher
Resource person	Trained Lesson Study Facilitators

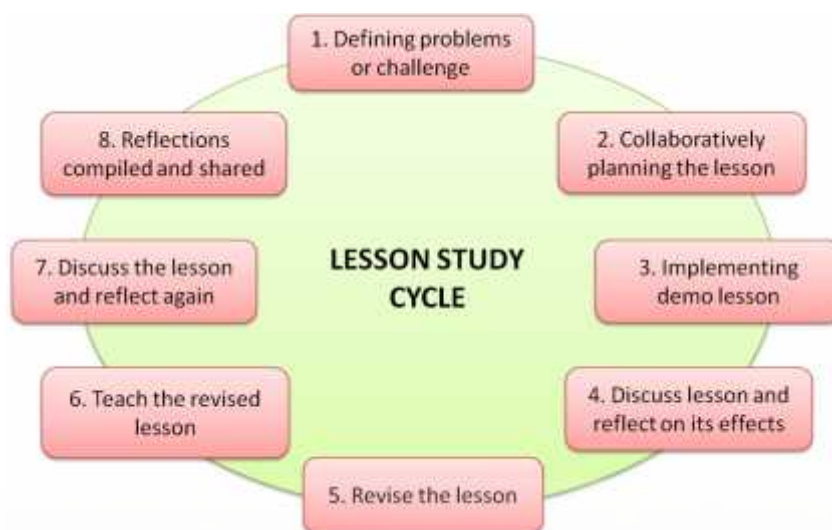

Figure 1: Lesson Study Cycle

In the eight (8) years of implementation, Japanese practice of lesson study has been modified to fit the Zambian system and situation. For example, Zambian lesson study cycle has two demonstration lessons and post-demonstration discussions. This is to ensure that the improvement of a lesson takes place in the second lesson. Another unique feature is that planning of the lesson is usually done by a group of teachers instead of individual teacher, so that each teacher can feel ownership on the lesson and does not need to criticize a particular person. In the same manner, teachers are careful of making comments on the lesson in the discussion to have better critiques for improvement instead of criticizing a demonstration teacher. In addition, in parallel to lesson study activities in schools during school terms, stakeholders such as head teachers, deputy head teachers, education officers and resource center coordinators gather at workshops to be held at provincial, district or zone level in every school holiday to make implementation reports of

lesson study and to share outputs or difficulties. Further, experienced or eager teachers are appointed as “lesson study facilitators” who are given special training and requested to make technical inputs to lesson study activities in schools. These modifications were created in trial and error according to the situations and cultures in Zambia.

### 3.2 Effects of Lesson Study

To assess the effects of lesson study, the Ministry conducts surveys before (baseline) and after several years of lesson study implementation (endline). The survey consists of observation of lessons and administration of questionnaire to students on the impression of the lesson. Below are the sample results between 2008 and 2010 in Northwestern province which show the changes of teachers’ skills and impression of students, though the changes of students were still minimal (MoE & JICA, 2010).

Figure 2: Comparison of science lessons observed in 2008 and 2010 in Northwestern province

Figure 3: Comparison of students’ impressions on science lesson in 2008 and 2010 in Northwestern province

After five (5) years from when the Central province started lesson study, an impact survey was conducted in 2010 to assess the effect of lesson study on the students’ performance. The graphs below show the changes of Grade 12 students’ pass rate at national examination in science (physics & chemistry) and biology. Comparing with students in the provinces which had not started lesson study, it was found that examination pass rates increased after lesson study was introduced (MoE, 2010b).

Figure 4: Examination Pass rate for Science

Figure 5: Examination Pass rate for Biology

### 3.3 Issues on the implementation of lesson study

The impact survey in 2010 revealed that teachers’ heavy workloads, having extra classes and high pupil-teacher ratio were hindering factors in implementing lesson study, while existence of trained facilitator and availability of teaching materials were found as enhancing factors. In the monitoring at some schools, the following issues were found as main challenges for the implementers

to overcome.

#### [Management issues]

- Some teachers and headteachers still show negative attitudes to have CPD activities and lesson study. Lesson study could be a kind of routine work of teachers without having effectiveness.
- In some schools, understaffing of teachers and their heavy workloads make it difficult for them to find time to have lesson study.
- In rural schools, teachers have difficulties to get reference books and information for the improvement of the lesson.
- Some schools cannot get support of a facilitator or resource persons. As a result, extent in the improvement of a lesson is limited.
- Schools are scattered in vast area of the country. Geographical location of schools makes it difficult for education officers to monitor and assist teachers periodically.

#### [Contents issues]

- Quality of lesson delivery is still an issue. Teachers generally appreciate the methods which are considered to enhance learner-centered lesson such as problem solving and inquiry methods; however, it is still difficult for them to apply those methods in their lessons. They easily go back to teaching in their traditional way of teacher-centered teaching.
- In lesson study, most of the teachers still focus on how they teach and not on how students learn.
- Teachers do not always have ideas for improvement of lessons in lesson study. It is difficult for the school especially in rural areas to have technical inputs from resource persons.

## 4. LEARNER-CENTERED LESSON AND LESSON STUDY

In Zambia, one of the crucial aims for conducting lesson study is to promote learner-centered lessons in the classroom. Among the implementers in the MESVTEE, it is considered that, firstly, teachers need to understand the fundamental principles and practices of learner-centered education, although the

ultimate aim is to ensure that learners are developed holistically in the lessons. Learner-centered education is defined in Zambia with some key features like, 1) The learner’s thought process takes the center stage, 2) The teacher provides support as well as challenges to the learner, 3) Learners express their own thoughts, and 4) Learners have dialogue and debates. To promote these ideas to the teachers, implementers of the programme found that various approaches, such as problem solving, inquiry & discovery, ASEI-PDSI (Activity, Student-centered, Experiment, Improvisation – Plan, Do, See, Improve) as well as the concept of subjective learning (active learning) and Kyozaï-Kenkyu practice (intensive study of teaching and learning

materials), could be disseminated to improve the lessons in schools through lesson study. Therefore, the sessions on these knowledge and skills are conducted for facilitators and teachers in many opportunities of workshops and meetings to enhance the introduction of these approaches and practices.

In the process of introducing and deepening lesson study practice in schools, implementers of the programme periodically conduct a small assessment to the teachers on the understanding of learner-centered lesson using a questionnaire prepared by the programme implementers (Annex). The questionnaire includes 20 questions on the general features of learner-centered lesson.

No	Explanation	Agree (%)	Disagree (%)
1	It is generally easier for teacher to organize learner-centered lesson comparing to organizing teacher-centered lesson.	49	51
2	To conduct a good learner-centered lesson, it is recommended for a teacher to always prepare activity sheet for students.	80	20
3	In learner-centered lesson, students understand a problem with an assistance of teacher.	64	36
4	If a lesson has experiment or activity by students, it is a learner-centered lesson.	63	37
5	In learner-centered lesson, sometimes lesson topic is not told at the beginning of lesson.	78	22
6	In learner-centered lesson, teacher should put more attention to groups of students than individuals.	16	84
7	Learner-centered lesson focuses thinking process of students.	98	2
8	Achievement of lesson objectives is not very important in learner-centered lesson.	10	90
9	Interaction among students is one of the important factors in learner-centered lesson.	84	6
10	Whenever preparing activity sheet for a lesson, detailed prescriptions for students has to be written.	54	46
11	Teacher should manage a lesson so that students don’t have wrong idea in a development process of a lesson.	76	23
12	Wrong idea of students has to be corrected immediately by a teacher.	58	42
13	There is no perfect lesson even if a lesson is learner-centered.	68	32
14	Teacher has less work in conducting learner-centered lesson, because students can work by themselves.	69	31
15	Problem given to students is a key to conduct learner-centered lesson.	95	5
16	Teacher needs to plan a good introduction of a lesson to start learner-centered lesson.	96	4
17	If a teacher attends a special training on learner-centered lesson, he/she would be able to conduct learner-centered lesson immediately after the training.	58	42
18	There is no uniform definition of learner-centered lesson.	69	31
19	Learner-centered lesson put more focus on the development of varied abilities of students than memorizing knowledge.	98	2
20	Learner-centered lesson cannot be conducted without equipment.	17	83

Figure 6: Sample result of questionnaire on understanding of learner-centered lesson

Figure 6 is a sample result of the assessment conducted in July 2014 for randomly selected 100 teachers at secondary schools in the country who teach science or mathematics. For example, on question No. 1 (It is generally easier for teacher to organize learner-centered lesson comparing to organizing teacher-centered lesson.), 48% of teachers think that it is easier to organize a learner-centered lesson comparing to organizing a teacher-centered lesson. They might think that a learner-centered lesson is easy to be conducted because learners can study by themselves. On question No. 10 (Whenever preparing activity sheet for a lesson, detailed prescriptions for students has to be written.), 54% of them answered agreeable to the sentence which recommends teachers to always put detailed prescriptions on students' sheet, without having an idea that teachers sometimes do not need to give detailed instructions in order to foster students' thought and creations. On question No.12 (Wrong idea of students has to be corrected immediately by a teacher.), 57% of them agreed with this sentence, even though teacher can intentionally use students' wrong idea for deepening their discussion and understanding in the process of lesson. Further, on question No. 17 (If a teacher attends a special training on learner-centered lesson, he/she would be able to conduct learner-centered lesson immediately after the training.), more than 50% of teachers agreed with the sentence. This makes us consider that teachers think they can easily master how to conduct learner-centered lesson and realize it in the classroom. In summary, it is revealed, from some of these results, that teachers understanding on learner-centered lesson are still shallow and superficial, thus, quality issues described in prior chapter were observed in lessons and lesson study activities. It also tells us that changing teachers' idea and understanding on learner-centered lesson may take a more time, since they need to deepen their idea through the continuing study and practice as their CPD. Therefore, it is necessary for the implementers of the programme to continuously provide the teachers with ideas and hints based on approaches and practices mentioned above for improving their lesson study.

## 5. CONCLUSION

Since lesson study was introduced to the schools in Zambia, almost ten (10) years have passed. In the ten-year period, the practice has been quantitatively extended to more number of schools in the country; however, there could still be qualitative issues in terms of implementing learner-centered lessons which are the aim of lesson study practice. It is known that certain period of time is required to change the understandings of teachers on how to conduct lessons, because the implementers always do trial and error in selecting better methods of teaching or conducting lesson study. Based on the practice in Zambia on the conduct of lesson study and promotion of learner-centered lesson, information and experience are shared in this paper. Considering a long-term effect of lesson study, the daily efforts to improve lessons and lesson study activities are important for implementers as their CPD activities.

## Interpreting Knowledge Creation in Lesson Study

Tatang Suratno<sup>1</sup>

<sup>1</sup>*Department of Primary Teacher Education, Indonesia University of Education, Jl. Ciracas 18 Serang, Indonesia  
ts@upi.edu*

**Abstract:** This presentation discusses the dynamic nature of knowledge creation of teaching and learning within Lesson Study context in Indonesian primary education. By drawing on the case of innovative partnership between a private primary school and Indonesia University of Education, I highlight how these collaborating organizations exploit pedagogical knowledge. In doing so, I use the notions of SECI model, Ba and Knowledge Assets (Nonaka and colleagues., 1998; 2000) to articulate the spiral action and interaction of participating teachers involved in mathematics Lesson Study workshops enriched by didactics perspective. Hence, I describe such a workshop in terms of Ba as providing shared time and space in transcending existing ontologic and organic boundaries. It then leads to depict the interacting nature of tacit-explicit knowledge conversion through SECI model moderated by specific knowledge assets called Didactical Design Research (DDR) and metapedadidactic (Suryadi, 2013). Finally, I discuss the challenge to interpret such educational partnership in the teacher education and development field from the knowledge creation stance.

**Keywords:** Knowledge creation, SECI model, Ba, Didactical Design Research, Lesson Study.

### 1 INTRODUCTION

In Indonesian context, the interrelationship between school improvement and professional development is best represented by Lesson Study (LS). It has been introduced since 2000s through technical cooperation between Japan International Cooperation Agency (JICA) and three Indonesian leading teacher education institutions, e.g. Universitas Pendidikan Indonesia (UPI). Its development has shown key important stages: 1) capitalising university-school partnership by applying collaborative action research; 2) establishing subject teacher group-based and school-based LS as to promote reflective practice among partnering teachers; 3) developing district-wide subject teacher groups and school-based LS in promoting learning community and school reform; and 4) dealing with challenges to bear on practice of improvement and sustainable leadership (Suratno, 2012).

The Indonesian Lesson Study movement resembles, to some extent, four phases of school improvement as described by Harris and Chrispeels (2006). As LS has been established through partnership, it might contribute to the establishment of the fifth phase of networked learning communities. Reaching such stage, though, is indeed

challenging. Suratno (2012) describes such key issues as: 1) dealing with contrived collaboration and collegiality; and 2) leading practice of improvement: system learning, capacity building and cultural change. Chrispeels and Harris have underlined of keeping balance between: 1) individual initiative and system change; 2) internal and external resources and ideas; 3) pressure for accountability and support for change; and 4) independence and collaboration. Therefore, I would argue that dealing with challenges need organising theme underpinning methodological approach for inquiring both professional learning and school improvement.

Our experience has suggested that it should be centered on improving teacher knowledge about the nature of teaching and learning. Therefore, this study is based on practical knowledge of Japanese Lesson Study (NASEM, 2011) and theoretical stance of European tradition of didactics (Kansanen, 2003; Brosseau, 2002). In addition, we also consider the notion of Deweyan extensive knowledge and adaptive expertise of teachers (Darling-Hammond & Bransford, 2005; Darling-Hammond, 2006) as well as practice-based professional education (Ball & Cohen, 1999) that might be developed expansively through activity systems (Engestrom, 2001).

## 2 BA, SECI MODEL AND KNOWLEDGE ASSETS

In their seminal works, Nonaka and colleagues (1998; 2000) underline the importance of *ba* in knowledge creation. The notion of *ba* can be defined as shared context for learning in which knowledge is embedded. As knowledge is intangibly placed in the individuals or groups physically, virtually and mentally, it will be best acquired through direct experience or reflection on the experience of others. To grasp the knowledge one should transcend one's own limited perspective and explore the boundary between rationality and intuition. Hence, as the foundation of knowledge and frame for knowledge activation, *ba* needs organic concentration: sharing knowledge should be focused at defined space and time.

Knowledge creation occurs when two kinds of knowledge, i.e. tacit and explicit knowledge, interact. Explicit knowledge can easily be expressed in various forms and transmitted between individuals as we read for example the text book or manual. On the contrary, tacit knowledge is invisible and inexpressible as it is rooted in one's action and experience. Tacit knowledge includes technical skills or know how and cognitive dimension such as belief system and mental model that shape how one perceives the world.

There are four patterns of knowledge conversion largely known as SECI model: 1) socialization in which individuals share tacit knowledge directly; 2) externalization that requires articulation and translation of tacit knowledge to which it is understandable by means of dialogue; 3) combination that systemizes explicit knowledge to be communicated and distributed in the sophisticated manners; and 4) internalization which is the conversion of explicit knowledge into organization's tacit knowledge, for instance through practical training.

Central to knowledge-creating process is knowledge asset as specific resource creating value that consists of inputs, outputs and moderating factors. There are four types of knowledge assets: 1) experiential mode in which tacit knowledge is shared through common experiences; 2) conceptual mode in which explicit knowledge is articulated through cultural signs; 3) systemic mode in which explicit knowledge is formalize and packaged; and 4) routine mode in which tacit knowledge is embedded in actions and practices.

## 3 TEACHER KNOWLEDGE, LESSON STUDY AND DIDACTICS

How these three element of knowledge-creating process be interpreted to explain the creation of knowledge base of teaching and learning through Lesson Study? As Jackson (2006) has noted that inquiry for educational change implies informed reorientation around interventions and associated knowledge management (Nonaka & Takeuchi, 1995). Reading research on teacher thinking and learning may shed light on knowledge development approaches: 1) knowledge for practice (i.e. subject matter, pedagogy, and theories of learning); 2) knowledge in practice (i.e. practices of curriculum, instructional and assessment); and 3) knowledge of practice (i.e. accumulated theoretical and practical knowledge) (Hammerness et al., 2005).

Capitalizing thinking may establish teaching culture and promote teachers' capacities as having both curriculum developer lens and students lens to dig out the vision of powerful lesson, motivation to put knowledge into purposeful practice, as well as personal and collegial qualities that support learning (Fernandez & Yoshida, 2004). In the context of lesson study, it may also lead to our understanding related to how we manage system thinking and create pedagogical knowledge.

Managing both teacher knowledge and thinking through lesson study is both important and yet difficult. Literature review has shown that the notions of expansive knowledge (theoretical vs. practical), adaptive expert (efficiency vs. innovation), practice-based professional education (analysis of disequilibrium), knowledge creation theory (tacit vs. explicit knowledge) and activity theory (analysis of contradiction) all discuss about discrepancies in terms of thinking (cognitive) process and content of knowledge. Hence, dialogue of different point of views and networks might provide spatiality and temporality for transfer and application in the workplace learning. Therefore, neo-Vygotskian views that knowledge and expertise are generated through vertical and horizontal dialogue. Hence, promoting thinking culture within professional learning community requires dialogic inquiry (Wells, 2004).

Through dialogic inquiry on interrelated perspectives, our research team has further developed the thinking tool called Didactical Design Research (DDR) introduced by Suryadi (2010; 2013). It represents the very nature of teacher thinking regarding: 1) how teachers develop relationship directly with students (pedagogical relation) and

relation mediated by teaching materials (didactical relation); and 2) how teachers design, implement and reflect on teaching-learning processes.

According to DDR framework, one of key issues to be studied is the relationship between teacher's and students' thinking from which teachers could develop their teaching sequences and strategies. Therefore, analysing teaching-learning should focus on key features of didactical design: 1) didactical situations; 2) learning obstacles; 3) learning trajectories; and 4) didactical assessment.

Brousseau (2002) conceptualises teaching sequence as interconnected situations. The notion of situation is dialectic in nature that mainly involves thinking interactions through information exchange, action and feedback. Relations among situations constitute a mental model that might be represented as strategy, representation and argumentation. Hence, didactical situations consist of three important features: action, formulation and validation situations. Action situation is when student develop implicit mental model as strategy for solving problem. Formulation situation is when students make communication and exchange of information particularly feedback from the milieu. In this stage, students make reasoning and argumentation as represented in their language as to indicate their formulation model that is accessible for one another. Finally, validation situation is when students share their mental model and formulation model to validate each other as to promote conceptual construction such as a theorem. This stage links action and formulation situations. By utilizing feedback, it may give rise to students' awareness, for instance, learning from mistake. Therefore, designing didactical situations should consider their interconnected sequences. Moreover, the overall situations that acted upon and handled by students constitute a milieu in the way that didactical situation approaches learning as thinking.

Brousseau also identifies learning obstacles as epistemological, ontogenic and didactical. In short, ontogenic obstacle relates to the gap between the level of student thinking and internal logic embedded in the didactical design presented by teacher. Didactical obstacle results by the way teacher design the lesson that hampers the learning trajectories of students. Epistemological obstacle represents limitation of student understanding that hinders him/her to expand understanding to wider context. Meanwhile, didactical assessment comprises of students' interest and affect, mathematical or scientific thinking, representational skills or inquiry skills, and conceptual

understanding. Finally, learning trajectories represent logical sequences of previous, current and future content to be taught. Therefore, teacher should consider the interrelated mental processes embedded in the teaching materials.

DDR framework provides teachers a critical reflective practice. First, reflection for action which is undertaken by a teacher before the lesson conducted. In doing so, teacher does prospective analysis by means of recontextualisation and repersonalisation the content to be taught as to make curriculum analysis. Second, reflection in action in which teacher analyses didactical situations as to base his/her pedagogical decisions. Third, reflection of action is conducted after the lesson finished. In this way, teacher might involve other colleagues to do retrospective analysis by means of comprehensive inquiry about what was designed and what was happen in classroom. In doing so, teachers can discuss the interrelation of didactical design, didactical situations, learning obstacle and learning trajectory, as well as didactical assessment.

Furthermore, Suryadi (2010; 2013) introduces the notion of metapedadidactics as framework for teacher argumentative reasoning. It is argued that basically teacher thinking processes happen before, during and after the lesson. The overall processes are complex in nature. According to metapedadidactics point of view, a good quality of teaching-learning should achieve the following criteria: 1) unity (of situations); 2) coherence (logical sequence of situations); and 3) flexibility (dealing with students' learning obstacles and trajectories). It is through such key ideas teacher can base his/her reasoning in dealing with the complexities of teaching and learning.

Basically, there is no perfect lesson but there are rooms to improving teaching and learning. DDR puts such premise in scrutinising teaching culture by means of teacher thinking. DDR analysis starts with any current didactical design through both recorded and/or lived observation. The analysis has many foci, it may focus on learning obstacles, learning trajectories, didactical situations or metapedadidactics. The results of analysis may produce alternative didactical design that can become current didactical design for further analysis.

To engage teachers experiencing DDR analysis, we stimulate their thinking process by means of what so called as Socratic Questioning. This tactic promotes teachers to do what so called as repersonalisation. For instance, we scrutinised what is mathematics, how we learn it and then how we

teach it. In doing so, we intentionally engage ourselves to interrogate and inquire our practice. Hence, our dialogue generated diverse point of view which in fact represents tacit knowledge. Through such reflective and argumentative dialog we analyse practice of improvement in terms of networked knowledge and expertise between primary school and teacher education institution. It provides the knowledge vision is to develop and promote sharing of knowledge assets, create and energise ba, and enable and promote the continuous spiral of knowledge creation.

#### 4 KNOWLEDGE CREATION IN LESSON STUDY

This study is part of collaborative inquiry between a group of UPI's faculty members and a private primary school that has been conducted since September 2012. Promoting thinking culture in professional learning and school improvement through lesson study is our central theme of inquiry.

Lewis et al. (2006) suggest that to improve instructional core requires intervening changes in terms of teachers' knowledge and beliefs, professional community and commitment, and teaching-learning resources. Hence, reflecting from LS experience, UPI's faculty members and the primary school leaders strategised series of workshop centering on developing teacher thinking as to create.

Firstly, the workshops, for example with group of math teachers, focused on three important questions regarding the concept to be taught: What is the volume of cube? How we learn it? Then how we teach it? Through dialogic inquiry, we tried to extend knowledge of math teachers about teaching and learning the volume of cube as to improve their meta-knowing of pre-lesson planning. Secondly, the activity system for DDR was developed as to recontextualise the plan-do-see cycle of LS. Compared to ordinary LS which tended to focus on classroom observation and immediate post-class discussion (Hendayana et al., 2007), our approach is to focus on preparation phase and employ delayed post-class reflection. The reason is to provide more space and time for us to think deeply about mathematical teaching-learning. Therefore, we engage them with the repersonalisation, i.e. teachers were asked to experiencing the way they think and learn what they are going to teach.

One of key vignettes is the math lesson of the volume of cube and rectangular. The objective of the

lesson was that children are be able to formulate the volume of cube and rectangular by their own with help of manipulative.

Teacher started the lesson by presenting the following situation: "I have many books. If I would like to put those books into book shelf and this small container, which one can contain more books?" As it was predicted, children could easily imagine the difference. It aimed to introduce concept of volume in terms of 'contain'. Teacher then showed a volley ball and a tomato and asked: "Which one is having more" and students could imagine the difference as well. Finally teacher asked students to prove two different sizes of rectangular in which students filled in it with set of cube units. At the end of this apperception stage, students could prove which one is having more. They seemed to be interested by discussing their prediction. At this point, teacher intended to show relation among shapes, sizes and contain.

When entering to core instructional activity, teacher then asked students to count and compare three rectangular with different sizes by using pictorial model. It was then followed by asking students to determine how many cube units within a cube of  $5 \times 5 \times 5$  and how many cube units of several rectangular with different sizes. Finally, teacher asked students to formulate the volume of cube and rectangular. At this stage, we observed that children could do all tasks, including counting, comparing and determining how many cube units within a rectangular. They seemed enjoying these sessions and actively used manipulatives. These stages aimed at pointing out children to the idea of volume. However, we were curious of what happened in the end of the lesson. When teacher asked children to make abstraction of volume, most students were confused how to formulate it.

During post-class discussion, mostly participating teachers viewed that the lesson run well and equipped with rich teaching materials. Children were considered as having joyful and active learning. However, model teacher sensed that children had difficulty and lost focus when asked to formulate the volume of rectangular. We analysed that students were dealing with didactical obstacles as represented by the ways teacher develop teaching sequence. Since it was started, the lesson tended to engage students with comparative thinking between two or more different sizes of cube or rectangular. At beginning, it was appropriate to present the idea of contain. However, next steps kept comparison as ways of thinking. Children felt confuse because they spent time to perform tasks of comparing. Therefore,

children had image that the aim of the lesson is comparing volume, not formulating volume. It was the reason why children lost focus. In addition, we identified that the lesson only applied action situation which clearly explained why students were in difficulty to make mathematical formulation. We then shared our finding as well as our hypothetical didactical situations of the lesson.

Such vignette provided space for conceptual difference, a kind of disequilibrium in our dialogic inquiry. It stimulated us to think more in terms of how we design and analyse the lesson. Immediately we found the ideas such as “acting like students”, “predicting and anticipating learning obstacles and learning breakthrough”, “hop-jump-step” to incorporating action-formulation-validation situations”. Such pedagogic discourse with specific articulation represents both epistemological and ontological dimensions of knowledge creation in specific context of primary school improvement. In what follows, we are discussing such practical notions.

**4.1.1 Acting like students**

We exercised the notion of acting like students by asking teachers to clarify what is the very nature of volume of rectangular or cube. We then asked teachers to use manipulatives and make comparison of the volumes and questioned them “Does it help you to make formulation?” Then we went back to the question of what is the volume of cube of rectangular. We finally discussed that the formula is a multiplication of three variables of  $p \times l \times t$ .

By doing such acting like students we intended to give rise teachers’ awareness about what would happen from what we delivered and presented to students. It would promote teachers’ sense making of their students’ thinking as to find ways of focusing their thinking into the idea of multiplication. It also would help teachers to make prediction and anticipation of students’ learning.

**4.1.2 Predicting and anticipating student learning**

One of key feature of mathematical thinking in this lesson is counting skill. We did prediction and anticipation of student learning by presenting a cube with 64 cube units. We asked teachers to find out how to count that resulted in 64 units. Figure 1 illustrates teachers’ predictions. By considering

students’ ways of thinking, teacher can make anticipation to support their learning in practice.

Figure 1. Predicting students’ thinking

**4.2.3 Hop-Step-Jump**

We will illustrate the notion of hop-step-jump through our analysis to the observed lesson. This teaching tactic aims to engage students thinking for all. In short, hop stage is intended to invite all students to learn by experiencing a necessary to think. In this stage, teacher presents the core problem, for instance, “There are 64 cube units of a cube. Explain how you find out way of counting them?” It is assumed that teacher will find students’ ways of thinking as predicted in Figure 1. Step stage aims to provide opportunity for slow learner to think appropriately; for instance, those who make counting one by one. Teacher may present the problem as follow: “Explain how you find out way of counting 8 cube units of a cube!” By making a reduction, we intend to promote the exchanges of ‘counting language’ among students that lead them to find out the idea of multiplication of three variables. Finally, we engage all students to apply previous thinking or to jump. Teacher may ask: “Explain how you find out way of counting 60 cube units of a rectangular!” Figure 2 illustrates the arrangement of hop-step-jump approach as it is assumed to promote formulation and validation situations.

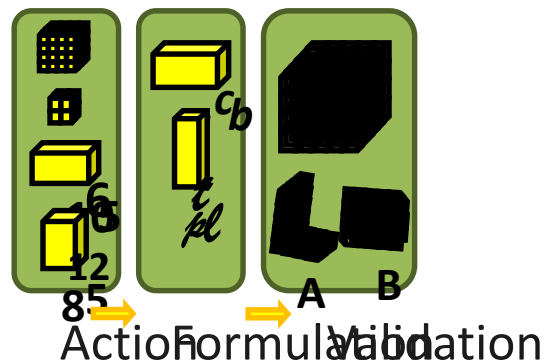

Figure 2. Arrangement of hop-step-jump that promotes formulation and validation situations

## 5 CONCLUDING REMARKS

Based on observed lesson, children faced didactical obstacle by which teacher design the lesson that could inhibit mental action of students as it was expected. We call it the problem of unity by means of logical arrangement of didactical situations of action, formulation and possibly validation could not fully be structured. The tactic of hop-step-jump which is based on the practice of acting like students and predicting and anticipating students' thinking may shed light on how we design such lesson. Although this is a hypothetical design based on reflection of the observed lesson of the volume, DDR and metapedadidactic framework provide thinking tools for teachers to analyse didactical situation and the criteria of unity, coherence and flexibility by focusing on critical mathematical thinking taught. In addition, hop-step-jump tactic is designed to promote collaborative learning by considering possible learning obstacles (particularly for slow learners).

Our experience reveals harbinger of knowledge-creating process of teaching and learning through lesson study enriched by DDR and metapedadidactic framework. The framework and its associated thinking tools (such as didactical situations; learning obstacles; learning trajectories; and didactical assessment) constitute knowledge assets. Hence, series of DDR workshop, that promote Socratic questioning, repersonalisation, dialogic inquiry, classroom observation and reflective practice, provide a powerful ba.

Establishing a team of mathematics teachers that work together with teacher educators promote four types of ba that support and speed up the process of knowledge creation: 1) originating ba is where individuals socialize to share feeling, ideas, belief, care and commitment; 2) interacting ba is the place within which individuals establish specific team and make productive dialogue to reveal explicit knowledge; 3) cyber ba is the place for virtual interaction in combining explicit knowledge; 4) exercising ba facilitates the conversion of explicit to tacit knowledge through real life application: lesson design, classroom practice, observation and reflection.

The workshops also indicate how knowledge conversion through SECI model is enacted: 1) socialization is facilitated by Socratic questioning; 2) externalization is promoted by dialogic inquiry; 3)

combination is strengthened by using thinking tools; and 4) internalization is actualized by examining three pedagogic discourses found. Finally, the hypothetical design starts the new cycle of knowledge creation.

Such lesson study sessions enriched by DDR and metapedadidactic framework as ba provides teachers argumentative-reflective practice for knowledge exchange and transformation through the SECI model. It is a dynamic process undertaking by a series of self-transcendental from which ba provides integrating conceptual metaphor, such as the notions of acting like children, predicting and anticipating student response and hop-step-jump. To sum up, knowledge-creating process involves three elements of SECI, ba and knowledge assets. Nonaka and colleagues (2000, 22) conclude that “Using its existing knowledgeassets, an organisation creates new knowledge through theSECI process that takes place in ba. The knowledge createdthen becomes part of the knowledge assets of the organisation,which become the basis for a new spiral of knowledge creation”.

Our approach to knowledge-creation through lesson study is based on our believe that improving teacher knowledge and expertise might be seen from bit by bit development in understanding the whole range of students' learning, i.e. their thinking. It is incremental in nature though it is hard to be sensed by most of teachers. However, it underlies the development of teacher's cognition and intuition. Therefore, teachers' expertise in making sense of students' learning and development from time to time is of paramount important. Spillane, Reiser and Reimer (2002) suggest that teachers as sense-makers are influenced by values, emotions, and motivated reasoning as well as by social environment. The dynamics of LS practices enriched by DDR and metapedadidactic framework insist that knowledge is created and shared between and within agents across time and materials.

Our attempt suggests that integrating school improvement and professional learning by focusing on teacher thinking for knowledge-creating process may be facilitated by means of: 1) repersonalisation to the curriculum that students study; 2) based on lively classroom setting; and 3) connected to several dimensions of teaching and learning (e.g. didactical situations and learning obstacle-trajectory). It is common that in the process of analysis there will be a contradiction among observers; however it is a trigger to the teachers' realisation towards the recontextualisation on the situation they encounter. This is the key factor that encourages teachers to

keep thinking and improving that grounded from collective efforts.

We would argue that the interconnection of professional expertise and knowledge underlie the key role of schools as the real learning place for everyone. Little (1999) asserts the needs of organizing schools as learning community to establish the culture such as ‘norms of collegiality and experimentation’, ‘collaboration and innovation’ and ‘collective work in trusting environment’ that engages teachers to dig into students’ learning and put together shared responsibility among them.

## A Lesson Study Network in Bandung: Focusing on Designing Teaching and Learning

Tatang Suratno<sup>1</sup>

<sup>1</sup>*Department of Primary Teacher Education, Indonesia University of Education, Jl. Ciracas 18 Serang, Banten, Indonesia  
ts@upi.edu*

**Abstract:** One of key challenges in enhancing the quality of lesson study in Indonesia is the fact that most participating teachers facing difficulties in creating a meaningful lesson. This presentation discusses a lesson study network developed specifically for transforming its members' conception and belief system about designing teaching and learning through critical reflective practice. The network consists of faculty members and student teachers from a teacher institution along with a group of teachers from a private primary school in Bandung. The aim of the network is to develop the framework of teacher learning in order to promote dialogic inquiry in the field of teacher education and school improvement.

**Keywords:** Lesson study network, lesson design, teacher education, school improvement.

### 1 INTRODUCTION

In Indonesia, there are several types of lesson study conducted by various agencies and networks. Subject teacher-based (LSMGMP) and whole school-based lesson study (LSBS) are considered as a classic example. Both were formally arranged and structured in the context of partnership or cooperation between teacher education institution, local education office, subject teacher group and school. Meanwhile, a so called Lesson Study Club (LSC) was established voluntarily by a group of committed teachers and educators across educational institutions that embrace powerful and meaningful learning community. In fact, they are participants of LSMGMP and LSBS but they are eager to understand lesson study better so as to improve their practice. Therefore, teachers from various schools work together informally and flexibly to enhance their sense making towards student's learning.

### 2 THE CONTEXT OF STUDY

This study reports a different network of lesson study that promotes collaborative inquiry between teacher education institution and school that has been initiated since 2012. Such limited and informal partnership involves three faculty members, a group of student teachers, a group of teachers and leaders of a private primary school. The school has conducted a self-initiated lesson study since 2009

with very limited network and access to lesson study experts.

There are several reasons why we undertake small scale collaboration. First, as teacher educators we are seeking a school that is committed to learn together; and vice versa. The school is also seeking a committed partner to improve the quality of lesson study. Second, such collaboration is intended to promote transformation in teacher education and school, particularly the culture of thinking, working and interacting in upbringing children and next generation of teachers. Third, we are learning together by focusing on developing framework for teacher thinking and knowledge base of teaching and learning by dealing with teacher belief system in order to make progressive change. To articulate such change, narratives of experiences representing teacher educator, teacher, principal and student teacher will be discussed in the presentation.

### 3 CONSTRUCTING THE NETWORK

We develop the network as a shared context for learning in which knowledge base of teaching and learning is embedded. As knowledge is intangibly placed in the individuals or groups, it will be best acquired through direct experience or reflection on the experience of others. As Nonaka and colleagues (1998; 2000) argue that in creating knowledge it needs two kinds of knowledge, i.e. tacit and explicit

knowledge, interacts. Explicit knowledge can easily be expressed in various forms and transmitted between individuals as we read for example the text book or manual. On the contrary, tacit knowledge is invisible and inexpressible as it is rooted in one's action and experience. Tacit knowledge includes technical skills or know how and cognitive dimension such as belief system and mental model that shape how one perceives the world.

Considering research on teacher thinking and learning may shed light on knowledge development approaches: 1) knowledge for practice (i.e. subject matter, pedagogy, and theories of learning); 2) knowledge in practice (i.e. practices of curriculum, instructional and assessment); and 3) knowledge of practice (i.e. accumulated theoretical and practical knowledge) (Hammerness et al., 2005). However, managing both teacher knowledge and thinking through lesson study is both important and yet difficult. Literature review has shown that the notions of expansive knowledge (theoretical vs. practical), adaptive expert (efficiency vs. innovation) (Darling Hammond, 2006; Darling Hammond & Bransford, 2005), practice-based professional education (analysis of disequilibrium) (Ball & Cohen, 1999), knowledge creation theory (tacit vs. explicit knowledge) (Nonaka & Takeuchi, 1995) and activity theory (analysis of contradiction) (Engestrom, 2001) all discuss about discrepancies in terms of thinking (cognitive) process and content of knowledge. Hence, dialogue of different point of views and networks might provide spatiality and temporality for transfer and application in the workplace learning. Therefore, neo-Vygotskian views that knowledge and expertise are generated through vertical and horizontal dialogue. Hence, promoting thinking culture within professional learning community requires dialogic inquiry (Wells, 2004). Therefore, we construct the network as presented in the Figure 1.

#### 4 INQUIRING THE DESIGN OF TEACHING AND LEARNING

One of key challenges in the implementation of lesson study in Indonesia is the fact that mostly teachers could not create a powerful lesson. This issue is related to the notion the design of teaching and learning. It will be difficult for teachers to reflect on a lesson without a well designed preparation. In fact, it is our network's concern in which our work is focusing on developing framework for the design of teaching and learning. We would argue that in Indonesia to improve the quality of lesson study is to improve the quality of lesson designing.

Through dialogic inquiry on interrelated perspectives, our team has further developed the thinking tool called Didactical Design Research (DDR) introduced by Suryadi (2010; 2013). It represents the very nature of teacher thinking regarding: 1) how teachers develop relationship directly with students (pedagogical relation) and relation mediated by teaching materials (didactical relation) (Kansanen, 2003); and 2) how teachers design, implement and reflect on teaching-learning processes.

One of key issues to be studied is the relationship between teacher's and students' thinking from which teachers could develop their teaching sequences and strategies. Therefore, analysing teaching-learning should focus on key features of didactical design: 1) didactical situations; 2) learning obstacles; 3) learning trajectories; and 4) authentic assessment. According to Brosseau (2002) there are three learning obstacles as epistemological, ontogenic and didactical. In short, ontogenic obstacle relates to the gap between the level of student thinking and internal logic embedded in the didactical design presented by teacher. Didactical obstacle results by the way teacher design the lesson that hampers the learning trajectories of students.

Epistemological obstacle represents limitation of student understanding that hinders him/her to expand understanding to wider context. Meanwhile, authentic assessment comprises of students' interest and affect, mathematical or scientific thinking, representational skills or inquiry skills, and conceptual understanding. Finally, learning trajectories represent logical sequences of previous, current and future content to be taught. Therefore, teacher should consider the interrelated mental processes embedded in the teaching materials.

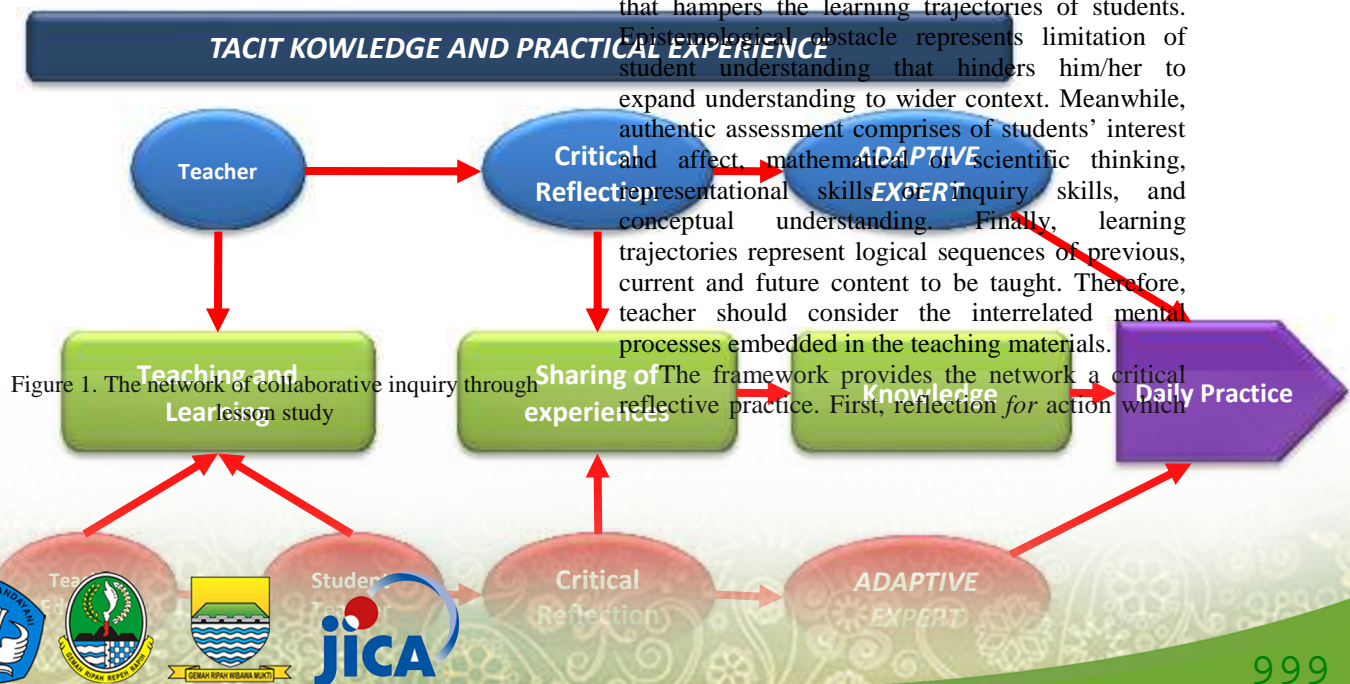

Figure 1. The network of collaborative inquiry through lesson study

is undertaken by a teacher before the lesson conducted. In doing so, teacher does prospective analysis by means of recontextualisation and repersonalisation the content to be taught as to make curriculum analysis. That way, teachers think and act as if they are students. Second, reflection *in action* in which teacher analyses classroom situations as to base his/her pedagogical decisions. Third, reflection *of action* is conducted after the lesson finished. In this way, teacher might involve other colleagues to do retrospective analysis by means of comprehensive inquiry about what was designed and what was happen in classroom. In doing so, teachers can discuss the interrelation of didactical design, didactical situations, learning obstacle and learning trajectory, as well as authentic assessment.

As teacher thinking processes happen before, during and after the lesson, the overall processes are complex in nature. We would argue that a good quality of teaching-learning should achieve the following criteria: 1) unity (of situations); 2) coherence (of logical sequence of situations); and 3) flexibility (in dealing with students' learning obstacles and trajectories). It is through such key ideas teacher can base his/her reasoning in dealing with the complexities of teaching and learning. In the presentation, a highlight of lesson designing activity will be discussed.

## 5 CONCLUDING REMARKS

Lesson study undertaken collaboratively, besides being able to produce a change in culture of thinking, working and interacting, can encourage the establishment of a community of educators, lecturers, teachers and prospective teachers in the context of teaching and learning endeavour. Such synergy is mutually empowering academically in building a socio-cultural context of teacher education and school reform. Experiences of faculty, students, principals, and teachers in lesson study activities bring impacts of change in mindset and practice of education, thus far in terms of the design of teaching and learning.

## LESSON STUDY: A NON-INSTANTANEOUS VALUABLE EXPERIENCE

Tri Budianti<sup>1</sup>

<sup>1</sup>SMPN 1 Jatinangor, Sumedang, Indonesia  
tri.budianti@yahoo.com

**Abstract:** Teaching is easy for teacher, but creating a lesson which enables all students to learn and understand is another story. Moreover, if students' characters in a class are so heterogeneous, it would take particular sense from teacher to facilitate their learning. Through lesson study, teacher could enhance and sharpen their competence so that they could develop better sense toward students' heterogeneity. However, such competence could not be achieved instantaneously. It would take a long process and strong commitment from teacher.

**Keywords:** Lesson Study, teacher competence, personal journey.

### 1 A FLASHBACK TO THE FIRST TIME KNOWING ABOUT LESSON STUDY

When I heard about lesson study for the first time in 2006, there were a lot of questions running in my mind, such as: “Another new project, *huh?*”, “How long is it *gonna* last?”, “Is it another new teaching model?”, “Can it enhance students' understanding in Math lesson?”, “How is it different to previous programs?”. At that time, the three steps in lesson study, i.e. plan-do-see, were explained. I said to myself, “Ah, what is so special about it?” All this time lesson always go through those three steps anyway, it is planned, done, and reflected afterward.

It was still awkward at the first meeting for plan session with MGMP teachers (subject matter group of teacher). I felt nothing special. We made a lesson plan that was going to be implemented in a class after choosing a model teacher. How the model teacher was chosen was interesting in a way because all teachers were reluctant, including myself. It is not easy to be observed while teaching and it also feels like an invasion to your privacy. At that time, Mr. Zaenal agreed to be the first person to “sacrifice” himself and chose the summation of common terms as the topic.

The first time being an observer, I was confused of what to observe and what to record. Once in a while, my friends (other teacher) chatted with me, hehe (giggle). Most of the time, I focused on observing the model teacher who was sweating so much. He might be panic, but he obviously looked so nervous. I got very little note on students, and that was not even clear.

After “watching the lesson”, there was a reflection. This session is a whole new thing to me and I had no idea what to say. More to it, Mr. Dadang Juandi and Bu Entit Puspita, lecturers from UPI who support MGMP teachers in our area, kept reminding observers not to criticize the model teacher. During the reflection session I thought, “Ah, even this reflection is so flat”, and I said to myself again, “nothing special to it”.

The first round of MGMP Lesson Study passed just like that without any significant impression on me until another round came up. I had to join the MGMP for the plan session again, and oops! Model teacher will be selected again! “Ah, this is not fun”, I thought. This is just a waste of time! The model teacher for this second round was Mr. Oih from SMP Plus Al Aqsha and ...ME! I said to myself, “Ah, whatever, I'll just do it no matter what”.

Compared to the previous time, I was more serious since I would be the model teacher. Mr. Oih picked the area of circle as his topic, and I picked application of Phytagoras Theorem. I thought I had picked an easy topic, because I just have to pose the problems without explaining the concept. During the plan session, a lecturer informed us that one of the open lessons would be visited by JICA expert. I was terribly shocked and I regretted my decision to be the model teacher.

The time for Mr. Oih to open his class finally came. As it was planned, the JICA expert who came to visit was Mr. Masaaki Sato. I was extremely happy. Thank God it's not my class to be visited. Just like other previous model teachers who were reluctant to be visited, I felt the same way too.

Mr. Oih conducted his lesson step by step, started with determining the center of circle. Students were asked to make a circle from any

circular things and then cut it. The circle cut is folded into two equivalent parts. The fold is then opened and folded the same way on different side. It turned to be a way to find diameter, central point, and radius. It might be simple but it's very important for students to know. Students were divided into several groups of 4-5. They were given a task chosen from a lottery game, which was to shape a plane from cuts of pie from the circle. For the next step, students who got the task to shape a parallelogram and triangle divide the circle into 16 equivalent pies. The students had no particular difficulty doing this part. To the group who got the task to shape a rhombus, they have to cut the circle into 20 equivalent parts. Model teacher remind the group to use a protactor to make the pies with central angle of  $18^\circ$ . This part was a bit difficult because some students were not able to do it since they were not used to the protactor. Model teacher intervened students' learning several times, so it made the lesson seemed so tiring. Students were seemed not confident with their work, and always longing for model teacher to come over and ask. Just like the first time being an observer, I still haven't got any clue of how to observe students.

## 2 VALUABLE EXPERIENCE DURING REFLECTION

The reflection of this lesson also started with the same comments as before, it was flat and nothing special. As a matter of fact, I said to myself repeatedly, “why should they give comment about my lesson? What benefit would it do to me?” I didn't give any comment because I had no idea what to talk about. My heart was so restless and I couldn't wait to end the meeting until Mr. Masaaki spoke. Between the desire to go home and curiosity, I forced my self to stay. Accompanied by the interpreter, Mr. Masaaki spoke in front of us while showing some pictures taken during the lesson. At that time, I was like “Aaaaah...” I was so amazed by Mr. Masaaki's comment. How could he observe students who were just playing around during the lesson and those who were yawning or daydreaming. Our MGMP teachers also burst into laughter while looking to those pictures. Ah, so this is what it means to observe a lesson, it is about to see students who were learning and were not. Mr. Masaaki also showed some pictures of students' bright faces at the end of lesson, which was just a few. So that was it, beside looking for those who were not learning, to observe also means to look for students who were smiling at the end of lesson. I set my heart at that time. When I become the model teacher next time,

that is what I have to prepare: how to make students smile happily.

The plan for my open lesson had to be revised, but there was no time left for MGMP. Then, it was decided to be discussed with fellow teacher, particularly with Mrs. Endang, the facilitator for our homebase. Mrs. Endang suggested me to implement Numbered Head Together(NHT) method for the open class so there will be no opportunity for students to play around. Besides, this could be a good opportunity to introduce NHT method to other teachers. Mr. Dadang from UPI also reminded me to prepare all tools required. I felt like a fool, I just followed their instructions without asking further about how students would react to it. I just thought that I have to teach and many people will observe me, and it has to be fun.

One thing which came from my own initiative, and because it has become a habit to me, I prepared “kartu curhat”, a card to share students feelings that I have always used. At the end of lesson, students were asked to write on those cards about their understanding or their feeling toward the lesson then I would give my comment to it. The cards serve its function more as a tool for communication between me and my students.

## 3 THE FIRST OPEN LESSON AND REFLECTION

I conducted my first open lesson as it was planned and I thought of it as a fun activity. During reflection, it was revealed that the students seemed to have fun in the 2-hour lesson but the reason to it was not clear. There were only 2 problems completely solved in the class. It turned out they were talking about the football team from Bandung (PERSIB) who was going to have a match in the afternoon. Besides, there were some misconceptions among the students regarding algebraic operation and in applying Phytagoras theorem. More to it, the tools that I prepared to support the lesson didn't support students learning. I finally came to a conclusion that teaching is not only about helping the students to have fun or smile. I found myself misinterpreting what Mr. Masaaki said earlier about creating smile at the end of lesson. It is not merely a smile, but a bright expression which indicates satisfaction from being able to understand the lesson well.

In that reflection, I also learned from previous reflection that some colleagues were busy mentioning students A and B were not learning. All was just like observation reports only. Teachers were still giving report of who were being active and who were being quite. This way of reflection last for

quite a while, we were reporting that the quite students didn't learn repeatedly. During that time, most of us were still thinking of the open lesson as a teaching show, so it should be different from daily lesson. Despite these facts, I found myself feeling excited to ask Mrs. Endang for latest information every time she got back from facilitator training.

#### **4 BECOME A FACILITATOR IN JATINANGOR**

Early in the third year (2009), there were some positive movements from the MGMP in our area (Jatinangor, Sumedang). For instance, Math teachers in our MGMP were more open in discussing problems encountered in daily lesson and how to deal with students. We started thinking about what tools or media would be suitable for certain topics. However, in observing students, we haven't done much to it. We still discussed about seating arrangement, number of LKS (students' worksheet) whether it should be given for each students or group, and we keep saying that the quite students didn't learn at all.

In the same year, there was a historic day in my learning journey about lesson study. Our facilitators (Mrs. Endang and Mr. Tandi) told us that according to Educational Office (Dinas Pendidikan) for Sumedang District, there had to be a replacement for facilitator. Mr. Sirodjudin (our principal and the head of MGMP for our homebase) asked me to run for it. Mrs. Endang also agreed with the idea. I started to doubt myself, "should I go for it?" The same question kept running in my head, I was totally confused. Because Mr. Sirod (this is how we call our principal) was so persistent in asking me, I finally agreed to be nominated as a facilitator. I tried to calm my nerve by keep thinking that this is not final yet.

On the day where facilitator would be chosen, Mrs. Endang reminded us that according to the instruction from Dinas Pendidikan, there should be two facilitator, one from public junior high school and one from private. The process was just like how a chairman in class was chosen. Mrs. Endang led the voting, she asked everyone in the room to write two names for candidates who fit the criteria from Dinas Pendidikan. It was beyond my expectation that major vote chose Mr. Deni from SMP PGRI Parakan Muncang (private) and ME, by only one vote difference. Finally, it was decided that there is no need for further voting. I said to myself that my friends had made the wrong choice, because both Mr. Deni and I belong to the out-of-the-box kind of teacher. But my heart kept telling me that I have to

be reliable, my friends put their trust in me so I must take this seriously. Moreover, I started to fall for lesson study. I really liked it, especially as a place to meet my colleagues and share ideas with them besides visiting other schools.

#### **5 FACILITATOR TRAINING: SUPPLEMENT TO ENHANCE MY ABILITY TO-LESSON-STUDYING**

I grew fond of Lesson Study as time went by, especially every time I joined facilitator training. Just a special supplement, this training gave a kind of power to learn more about lesson study.

I felt a little bit awkward at the beginning. Why there is no lecture about theories of doing Lesson Study and how to improve our competence in the facilitator training? Instead, why would we have to open the lesson, see how the lesson runs, and then reflect on the lesson just like what we did in base camp? (Oya, basecamp is the area of MGMP meeting in Sumedang). In Sumedang, there are 8 basecamps and my school is the central location of MGMP activity in basecamp A. I was confused of open class that we had in basecamp and in the training but I found more to learn there. I was trained to sharpen my ability to observe. I found a new community, the facilitators from eight basecamps whose observation ability way much better than observers in my basecamp. I learned a lot from their comments during reflection. And what is more valuable for me is that in every training, there was always JICA experts who came to enhance our knowledge in observing and reflecting. I also became more motivated to learn about Lesson Study.

#### **6 LESSON LEARNED FROM OPEN LESSON**

We could learn many things from every open lesson. Since I know about lesson study, I have been a model teacher for several times. From one open lesson to another, I got a lot of things to learn especially after I heard observers' comments. At least, the most obvious improvement that I can tell is that I have changed from being reluctant to be a model teacher to being a volunteer.

My first open lesson has been discussed earlier, which was full of doubt and very inefficient in time management. My second open lesson was when Mr. Masaaki Sato from JICA expert came to visit our school. On the day before at 4 pm, I was told to open

my class. Even though I wasn't nervous at first, the sudden notice quite made me restless. Just based on what I was supposed to teach tomorrow, I prepared my lesson alone with the topic of Arithmetics and Geometric Sequence. During reflection, I learned that in choosing the problem, we should consider putting the problems in order, from the easiest to the most difficult. At that time, one evaluation problems that was considered far from the lesson was how to determine the number of piece of paper when it is divided into two equivalent parts for five times. Mr. Masaaki suggested that the problem should be posed during the lesson because it was related to the main concept. The reason behind this suggestion was that there were many students got confused about the problem but they couldn't ask to their friends since they were in evaluation.

My next open lesson is more likely to be called a disaster (haha...). In August 2010, Mrs. Kikuchi from JICA came to our school to observe Science lesson. Perhaps, she intended to see the daily lesson in our school because after the open lesson finished, she visited my class. Of course I had no preparation about it and the lesson ran as it was. The topic was multiplication and division of fraction. During reflection, Mrs. Kikuchi commented of positive thing that I did, which was giving a lot of opportunity to students to create alternative solutions to each problems so that the students were challenged to think continuously until they got the answer. Another interesting from Mrs. Kikuchi is that how I chose money as learning media, which enable students to get into the lesson easily. However, Mrs. Kikuchi also expected me to prepare more various problems for the topic that can be challenging enough for the students to solve it.

At the beginning of 2011, there was a facilitator training in my school. Automatically, the teacher from my school has to open her or his class. What is interesting from this open class is that the preparation was supported by Mr. Ryo Suzuki from JICA and Mr. Encang Jana from SMPN 1 Tomo. I learned a lot from both of them. There are surely a lot of things should be prepared to design a lesson that really can help students to learn. In other words, a teacher should be able to facilitate students' learning. The topics at that time were intersection and union of sets and how to draw Venn diagram.

Usually, lesson about that topic requires two until three periods. The first period started with the definition of set intersection until determining the intersection of two sets, definition of sets until determining the union of two sets. In the second meeting, the students could learn about drawing Venn diagram and the law of de Morgan which is related to the intersection and union of set, which usually confuse the students until the next meeting.

Based on this experience, I was doubtful when Mr. Ryo suggested that the topic of set intersection to be taught together with the union of two sets even with the drawing of Venn diagram included.

In that plan session, I was introduced to how to design a lesson for the first time. Lesson design (LD) which is more likely to be recognized as lesson plan (RPP), is much more difficult to create than what I imagined. The steps to create a lesson design are started with choosing a topic, planning the evaluation, thinking of how the students should learn the topic, and formulating the learning objectives. There are two type of learning objective, the objective that teacher expects and the objective to help the students focus on and be challenged to learn the topic. The most difficult thing in creating a lesson design is to predict students' answers, to predict students' difficulties, and anticipation from teacher to those difficulties. I was like trapped in confusion so I couldn't answer questions from Mr. Ryo fluently. Even choosing learning tools is not easy, I should really think of how to make the tools to be really helpful in lesson, and not turning into another problem.

Each step that we've been through was always tested with little simulation among ourselves. Here, I learned again that trying to put ourselves as students who don't have any understanding of the concept being taught, is really something I have never done even for once. Mr. Ryo also reminded us to be more patient in giving students time to think. I was startled. I realized how I have wronged my students because I have always thought that they could always keep up with my thought. It seems like all this time the students were forced to follow teacher's thought, tough it is teacher who should be able to follow students' thinking. Another valuable experience is that after everything is prepared, Mr. Ryo suggested the design to be implemented in other class be reflected afterward. The result from that reflection could be used to improve the real open lesson.

On the D-Day of open lesson, I was highly influenced by Mr. Ryo's suggestion that students should be given time to think. However, because the portion was not so fit, I wasted the time again. It happened when the students were allowed to draw Venn diagram on the small board for too long. (The small white board was one of media for students to discuss in group. Because with the help of the small whiteboard, students could write feely, erase it, write again, and erase again repeatedly until they find the proper concept/answer).

In the reflection, there was a debate which gave me another lesson about the proper portion to let students think with intervention when they faced difficulties. It means, teacher should be sensitive to

this because if this situation is allowed to last longer, it can reduce students' motivation. Besides, this is also important for the sake of lesson effectiveness. This idea was what I can infer from Mr. Koji Sato's comment at the end of reflection.

I had to open one more lesson suddenly when Mr. Masaaki Sato visited our school. At that time, I was going to teach two lines being intersected by other lines. I did the preparation alone according to the topic I was going to teach. During reflection, I got more lessons like in giving name to the lines I should pay specific attention in order not to make students difficult to think. Students would be easier to think if the material is arranged in order, not moving from one to another randomly. Moreover, if it is arranged from abstract to concrete unsystematically, it would really cause the students to be confuse endlessly.

## 6 AN OPEN LESSON THAT GIVES INSPIRATION AND MOTIVATION

The most memorable open lesson to me is when Mr. Manabu Sato visited Indonesia. When I got informed from Dinas Pendidikan to open a lesson which would be observed by Mr. Manabu Sato, I was in doubt. However, thinking that I would get a lot of thing to learn, I finally agree to open my lesson. I believe I will get an opportunity to learn this time.

Just like what I had expected, open lesson this time would involve many people, such as from facilitators, lectures from UPI, and JICA experts. I was so happy because more comments mean more lessons. Even, there were several preparation meetings for this open lesson. During the preparation, the most valuable lesson I learned was when Mr. Masaaki Sato suggested that the lesson should be related to National Exam problems under the topic of Function which I was going to teach. From the problems, he moved back to the material. There should be a way to help students to learn the concept so they can solve those problems. At first, I allocated the two-hour lesson just to cover the topic of relation between two sets because usually the first meeting for this chapter would always have that topic. However, beyond my expectation, Mr. Masaaki challenged me to teach until the students are able to differentiate common relation to function showed by arrow diagram. (Hahaah... how could that be possible? I started to feel pessimist, but I kept trying to understand the way he thinks. This is a challenge, this is a lesson, I kept repeating those sentences in my mind).

The discussion went tough for quite a while. Mr. Masaaki asked me several times, it seemed like he was worried or afraid I might look confuse (as a matter of fact, I was really confused). I immersed myself in that confusion until I grasped the lesson I was going to teach. However my heart still doubtful, will the time be enough? Started from making a set, relating two sets with a relation, naming the relation formed by two sets, and differentiate common relation to function. All these topics normally required three periods (3 x 80 minutes). All I had to do was to challenge myself through the first trial the next day.

The trial was conducted in class 8B, the best class I had at that time. I conducted the lesson as it was planned. It turned out to be different to my expectation, especially about the time. Those many topics were finished in 85 minutes! I thought this was my best record so far since I usually do it longer. During reflection, learning activities which still required much time were discussed, for example: waiting for the students who were low, choosing the right problems for evaluation, and teacher's sensibility in choosing students to perform in front of the class, to be asked, or to be instructed to help other students. The 'help' here is different to what I used to think. I understand "help" is about helping students to solve the problems. In fact, the "help" here could be interpreted in another form. For example, when we choose a low-ability student to do something in front of the class, this could motivate that student to solve the problem. I was like, "Aaaaah... I got another lesson!" Then, a teacher should be sensitive in helping low-students. Instead of asking the clever students to teach the low-ability, teacher should ask those low-ability students to ask other students. Even though the goal is the same, the result would be different because the students who asked usually pay more attention to his/her friend than when they are being taught.

Based on the experience doing the trials and revisions from reflection, I opened a lesson which was observed by Mr. Manabu Sato, JICA experts, officers from Dinas Pendidikan in Sumedang district, lecturers from UPI, and fellow teachers. Surprisingly, I enjoy the lesson as soon as I stepped in front of the classroom. Some turn-outs in class matched our predictions. This is also another lesson I gained, so the plan should be detail in order to anticipate any turn-out in class. And my trial record was broken again, the lesson finished in 75 minutes! Nevertheless, JICA-experts adviced me that I should try to make it only in 50 minutes after having practice like this. I laugh to myself, another challenge. This means, I have to plan a lesson more effectively whenever I am going to teach in class.

The most memorable reflection I had of course the one with Mr. Manabu Sato. He was so detail in observing. Waah, I would really like to be like him in observing students, knowing what students feel during lesson, knowing their difficulty to help they learn (not to help them solving problems). In one period only, Mr. Manabu could notice many things about my students. Meanwhile, I who have met them several times, didn't even notice that much. What a very valuable lesson! What I could still remember vividly in mind is that he counted that I gave 27 questions during the lesson. He counted it! In the beginning, the students were chosen well because those students could answer my questions. However with panic expression in teacher's face, when the lesson was about to end, the teacher was kind of in hurry so teacher tend to pick students who most likely would be able to answer the question. This is another lesson I should apply in my own class. Another thing I should keep doing in my own class is to reduce intervention to students learning. Instead of intervening too often, I should prepare the lesson in detail so that the students could learn and teacher could facilitate their learning.

After knowing and implementing lesson study for a while, I learned a lot. I felt really lucky because there are may be only a few teachers who got the opportunity to learn about lesson study and keep doing it. I also feel lucky because fellow teachers in Sumedang still have the motivation to discuss the lesson through lesson study. If we stop doing it, we are afraid we might have malpractice in teaching without having a chance to revise it. I also feel really lucky to keep doing lesson study even though I doubted I could improve my competence during my first years of lesson study. It is true that the effect of lesson study felt significant after several years of implementation and it also requires consistency and commitment. If you are just joining the activity, you might take longer to feel the effect. In lesson study, everything would not be like “Abracadabra”! From every meeting, you will gain little by little until it builds up to be a whole huge benefit. As a matter, it's better to gain little by little and then followed by implementation, rather than to gain much but limited to theory only.

## Fusion with Children: The Lesson Study Club

**Abstract:** In Indonesia, there are various forms of Lesson Study. In this presentation, we will highlight the so called the Lesson Study Club (LSC) which is informally and voluntarily conducted by a group of teachers in Banjarbaru, South Kalimantan. The aim of LSC is to improve our sense making towards student learning. Hence, we learned how to comprehend the overall development of student learning so as to enhance classroom practice. In the presentation, we will depict how we conduct LSC, what thinking tools used and what the practice of improvement occurred and distributed among LSC members. We strongly believe that to be reflective practitioners, we should emphasis on ‘what can we learn from students’. It teaches us to learn from and with students and small change in teachers will be a miracle for the students.

**Keywords:** Lesson Study Club, learning from student.

### 1 INTRODUCTION

It was around 2008 – 2009 when teachers in Banjarbaru were introduced to Lesson Study. At that time, Banjarbaru was assigned as one of the new sites for Lesson Study program. Teachers from different schools in Banjarbaru started to implement Lesson Study through MGMP (subject matter teacher group) and LSBS program (school-based lesson study). The MGMP-based and School-based (LSBS) lesson study program is still running in Banjarbaru, especially in SMP Negeri 8 Banjarbaru. Both of us are member of such activities.

Although lesson study is regarded to be relevant to improve teaching practice, mostly teachers perceived considerable obstacles: 1) it required time, energy and solid teamwork; and 2) it demanded support from local education authorities and principals. Such constraints imply that their participation in LS sought to fulfill administrative requirements. They were more focused on matters external to the teaching-learning process, such as incentive and training certificate. Hence, their meetings to accomplish LS uncovered a contrived collegiality. Though in practice the principle focus of LS is on student learning, it was only on the outside surface. We often heard that in the end they experienced boredom and felt exhausted. It seemed to us that they ‘must do’ something that they did not

consider their first priority. We often noticed that most teachers deem LS a ‘teaching show’. It implies a constant barrier to lesson study: teacher concern of having others observing their class and judging their work.

### 2 LESSON STUDY CLUB

In 2010 Japan International Cooperation Agency (JICA) supported the establishment of the Lesson Study Club (LSC) founded by a group of teachers that embraced meaningful learning community. They are teachers who extremely eager to understand lesson study. Therefore, LSC can be run informally and it is attended by teachers who are seriously keen to improve their practice. Hence, the members of LSC were few in number and were, in fact, participants in either LSMGMP or LSBS. The members of LSC were content to follow LS since they acquired insight that they could comprehend, particularly concerning students. This could have occurred because they felt freed from the burden of ‘obligation’ and obstacles pertaining to ‘structural-seniority’ as perceived when they followed LSBS or LSMGMP.

LSC consists of teachers from several schools, but mostly from SMPN 10 Banjarbaru. We conduct LSC flexibly as to avoid formalities because we aim to improve our sense making towards student

learning. One way to develop our sensitivity is to pretend ourselves as student. By doing so, we try our best to be collectively responsible in upbringing our students. It also gives raise our understanding and awareness to take care of students learning and their development above all other matters. How do we do such approach?

In implementing LSC, we use thinking tool called chapter and lesson design that engaged us in mapping out teaching materials and classroom arrangement. We learned it from Mr. Ryo Suzuki. He opened his class for a week in our school, SMP Negeri 10 Banjarbaru. By observing Mr. Rio’s class, it turned out our attention. The way he conducted the lesson and led discussion in the reflection session impressed us a lot. Hence, we started to be more open in doing lesson study. In addition, some other teachers gradually showed their interest to join. We now have committed members comprising teachers from MIPA (Maths and Sciences) subjects as well other subjects such as social studies and languages.

Teaching is indeed uneasy, as well as observing classroom practice. Our strategy is to identify several students who achieved a ‘breakthrough’; namely, those who quickly found the solution. Having predicted that some students would not succeed, we encouraged these students to meet with the ‘breakthrough’ students as to promote collaborative learning. In addition, we are trying to promote active and reflective learning for students in order to deepening their thinking process and connecting to their daily life. It is our concerns to design authentic learning.

In the reflection session, the focus of the discussion was on the identification of learning obstacles and breakthroughs experienced by the students (student-content relation) and of student collaborative work (student-student relation). Such kinds of comments demonstrate our sensitivity in understanding the student learning process. By doing so, we learned how to comprehend the overall development of student learning so as to enhance our teaching practice. We strongly believe that to be reflective practitioners, we should emphasis on ‘what can we learn from students’. It teaches us to learn from and with students as indicated by our motto: Fusion with children.

In the presentation we will illustrate how we conduct LSC. Since a picture worth a thousand words, a brief description of our LSC activities will be depicted.

First, *Plan* activity: the making of Lesson Design (LD), preparation of learning tools and materials, conducting pre-action, analyzing possibilities learning obstacles and trajectories, and reconstruction the overall lesson design, including predicting and anticipating student learning. Second, *Do* activity: description of do’s and do not’s for the model teacher as well as for the observers. Third, *See* session: typical impression from model teacher and observers, how did observer deliver his/her comment and how we shared what we learn from students, and how we redesign the lesson.

### 3 MAINTAINING LESSON STUDY CLUB

It was the willingness and initiative of teachers in LSc Banjarbaru to maintain the activities of LSc. They didn’t join LSc because the principal or vice principal forced them to. They joined the LSc because they had common language about the challenge of dealing with students learning, and the same concern about how to improve the quality of their lesson.

Until now, teachers in Banjarbaru keep on doing lesson study indirectly and informally through small discussions between them or even voluntarily opening their class to other teachers. Some teachers even voluntarily opened their class to fulfill the request from whoever who wants to see how the lesson was going.

In the future, we hope that this small step can be gathered as a one whole intention from all teachers to change little by little for a better lesson since “small change in teacher will be a miracle for the students”.

## Pattern Assessment Learning Science In Lesson Study of West Java and Authentic Assessment Curriculum Development Claims 2013

imansyah@gmail.com*

Has conducted research on science learning assessment pattern for science teachers in West Java in lesson study activities. This study aims to determine how far the pattern of assessment conducted by teachers in learning science through lesson study. Lesson study as a teacher professional development program, providing a very open space for teachers in the development of learning assessment. Research conducted on a number of science teachers involved in the lesson study activities in West Java. The instruments used were the observation and interview, as well as analysis of product design is developed teacher learning has science in learning through lesson study. The results showed that the pattern of assessment, particularly in science learning, the development is still the dominant pattern in the type of assessment test pattern. Teachers do not use different types and varying assessment tools such as test and non-test. It is not yet able to assess comprehensively to various learning targets such as cognitive, affective and psychomotor accordance with the demands of the curriculum in 2013.

Keywords; The pattern of assessment, lesson study, learning science

### 1. Background

Science education in junior high school has an important role in the formation of intelligence and intellectual personality of the child. Generally, people familiar with science learning as a learning pattern that gives more information about the concepts of materials science in the form of natural phenomena or the environment, and also related to the principles and laws in science. However, if only in the form of learning patterns provide information only, then students can get stuck in a system that only rely on rote learning, so that students tend to get bored with learning system like this. That is why learning and assessment of learning science should continue to be developed in order to favor and interesting for the students to learn. As an integral part of the learning assessment has a strategic role in presenting a challenging learning and encourage students to think and develop different potential students. Therefore, the application of assessment is one important part of a learning process associated with student achievement. Pattern good assessment can provide a positive contribution to the learning process and will affect student learning outcomes (Anderson, 1996).

Based on observations in lesson study activities in the field, especially towards learning science in junior high school, carried out during the assessment

process is generally only emphasizes the mastery of concepts (cognitive) were captured with a written test objective and subjective as a means of measurement. So that this condition causes the teacher to focus less on skill development of children in the learning process.

This reality encourages students to memorize at any time will be held daily tests or test results to learn. Yet according Stiggins (1994) for students at the high school level should come first is how to develop a curiosity and critical power of children to a problem. Phenomenon above shows that the system of assessment used to measure student learning outcomes affects the learning strategy designed and carried out by the teacher. Correct assessment system is of course to be aligned with the goals and the learning process. Science learning objectives in the curriculum in junior high school in 2013, can be summarized into three aspects of learning objectives are mastery of the concept of science, skill development student performance, and planting scientific. Therefore so that student learning outcomes information can be revealed as a whole, it is necessary to measurement of the three aspects mentioned above. So that the objectives of the assessment of learning outcomes in the secondary high school includes all components related to the process and the learning outcomes of students in learning activities can be achieved. Surely needed

alternative assessment tool that is assumed to be able to achieve that include a performance test or performance test and other types of alternative assessments such as product assessment, portfolios, and other assessment called authentic assessment. Where according Stiggins (1994) with the authentic assessment can improve the ability of students with the students the opportunity to connect with the real world, demonstrating its expertise in authentic, and also the teacher can monitor students' abilities through the work - the resulting work students, of course, this is not obtained with tests that rely solely on paper and pencil. By applying the alternate assessment for students, can be collected evidence - evidence of student progress that can actually be used as a material consideration to improve the learning process further. According to Marzano (2007), in the authentic assessment tasks and situations difference given to the students as well as providing opportunities for understanding and truth indicate in the application of knowledge and skills according to the habit of thinking.

By reviewing the data that was collected in the field, reflecting the discrepancy between learning science in junior high with the use of a scoring system, which is the usual assessment process for teachers is only able to describe aspects of student mastery of concepts, so the subjects of Science curricular objectives can not be achieved thorough. It would require a valuation technique that is capable of revealing aspects of a product or process. Assessment system is assumed to be able to meet these demands is the assessment scoring system such as assignment, project valuation, and portfolio assessment are all referred to as authentic asesment. Form of assessment requires the assessment of competence and creativity as well as a broader initiative of students. In addition, the assessment also provides comprehensive information about the students' progress, including strengths and weaknesses. However, the reality in the field are still many teachers who do not understand fully authentic assessment, and also have not been able to implement good planning in designing autentic assessment. Besides the teaching load and the number of students who are not ideal in a classroom can also make it difficult for teachers to implement assessment autentic ideally. One assessment that can be applied to learning, especially learning in junior high SCIENCE is an authentic assessment that can reveal aspects of cognitive, affective and psychomotor student in the learning process. According Arends (2007), authentic assessment is an assessment that requires contextual

conditions, as for examples of what it can be incorporated into the student is autentic assessment tests, performance assessment, portfolio assessment and journals of the work that has been evaluated for compulsory student assignments, tasks duty performance, and work projects such as papers or other assignments made by the students themselves. Therefore, this study was conducted in order to reveal patterns that are generally applied in the assessment. So that by applying an assessment that is expected to accommodate the function, purpose and principles of assessment and also provide input for teachers in designing alternative assessment. The problem will researched in this study is a science teacher assessment in science learning by taking as a reference benchmark authentic assessment.

## 2. Research Method

This study aimed to examine the pattern of assessments conducted a science teacher in the learning sains. Benchmark assessment pattern used is the authentic assessment as appropriate to the curriculum in 2013. The research done using qualitative research methods and design case studies. This study was conducted in several secondary schools in West Java in lesson study program. Activities carried out at a school attended by teachers science who gathered in the main school. The activities carried out in 2012 in Bekasi, Subang, Tasikmalaya and Bandung. Research instrument in the form of questionnaire, guidelines for observation, interviews, and analysis of the products of learning the lesson plan in which there is a pattern of assessment developed by a science teacher. The data obtained and analyzed to determine the pattern and profile assessment authentic assessment conducted by a science teacher in science learning.

## 3. Results and Discussion

Based on the results of research conducted shows that in junior high science teacher has been largely understand the concept of a comprehensive assessment conducted. The teachers understand the concept of test, measurement, performance assessment and teacher authentic assessment. However apply the principles of assessment in terms of the application of authentic assessment learning. Only a small proportion of teachers who implement authentic assessment in learning. Teachers have difficulty both in software development authentic assessment, as well as in the application. Lead teachers use assessment test pattern that is easy to

plan and conduct. Pattern tests such as multiple choice tests and essays, is planned, created and implemented and is also analyzed the result. Meanwhile authentic assessment patterns that implement various assessment strategies are very complex and takes a long time in the planning, implementation and analyze. This is which makes the teacher chose a test pattern in any assessment of learning both in and sumatif. Comprehension formative assessment and teacher assessment pattern of the concept of assessment in percent more as presented in Figure 1 and 2 (n = 160).

Figure 1; Understanding teacher about the concept of assessment

Figure 2; The pattern is applied teacher assessment

The results showed that the teacher has to understand the basic concept of authentic assessment, in which the teacher is able to identify the goals of authentic assessment before applying the science of learning, but it also looks a teacher has to understand the components that will be used in determining the type of authentic assessment, the results of the interview can also be seen that the teacher has has a specific format in determining the selection of authentic

assessments, teachers also have to understand that in the application of authentic assessment should determine the focus of assessment, teachers also have to understand the importance determine assessment criteria that will be used to assess the processes and outcomes of student learning and also have determined the form of reporting that will used to report the progress of students in the learning process to related parties, and the teacher has to understand the importance of the use of authentic assessment in the process of learning, especially learning of Science.

Based on interviews, observation, and documentation study revealed that there are some things that prepared teachers in preparing the planning application of authentic assessment in the learning of Science, of which is to design the syllabus and Learning Implementation Plan (RPP). Where the results of interviews and observations of documentation designed lesson plans teachers indicate that teachers have planned use of authentic assessment at the beginning of the new school year with a syllabus and lesson plans prepared by reviewing the indicators which are suitable for various types and patern authentic assessment, teachers have also developed principles authentic assessment is applied to the openness between teachers and students, and of course authentic assessment has been applied in accordance with the standards of core competencies, basic competencies and indicators of achievement of learning outcomes. From planning is also seen that the teacher has communicated to the use of authentic assessment at the beginning of the semester and also describes the material as well as a graded assignment with authentic assessment that looks at the beginning of the lesson plan activities that have been designed, teachers also have determined the type of bills to be collected and also provides a map as storage tasks that have students collect, at the planning stage teachers also have a selection procedure determines the type and level of assessment that students collect and also have determined that assessment criteria set out in the form of the assessment format is also called the assessment rubric, but the assessment rubrics designed teachers still general not in accordance with the use of authentic assessment indicators.

Based on observations at the preparation stage it appears that teachers in core school and the impact has been identified learning objectives will be assessed with an authentic assessment that can be seen in the early stages of learning. In the preparation

phase is also seen that the teacher has communicated to the implementation of authentic assessment to students and explain the types of tasks that will be used in authentic assessment. The next process looks teacher explains the assessment criteria will be used to assess the students, but the results of observations in the two school teachers explain the impact is not visible to the student assessment criteria. During the implementation phase the teacher is able to distinguish the authentic look assessment individually and as a group, the teacher also has been discussed regularly authentic assessment tasks that must be gathered students and motivate students to produce authentic assessment better. Teachers also have determined sessmen selection process, but teachers do not routinely help students select a task that has been collected, and the teachers do not use authentic assessment in all material science to be learned. Crucial stages of the implementation of authentic assessment is the process of assessment, which is based on the observation shows that the teachers in the core schools have designed assessment instruments well, but the criteria are designed still common. The results of observations on the impact of school looks guru teacher still difficulty in designing an authentic instrument asesmen specifically, especially teachers are still difficulties in designing a special assessment rubric in accordance with the characteristics of science learning.

In the process of learning a very important role of the teacher, the teacher must be able to develop its creativity so that students do not feel bored with the existing learning systems. One of them by developing a scoring system that is the use of authentic assessment to motivate students to produce better work is to implement an authentic assessment of learning, especially learning of Science. Application of authentic assessment in the learning process requires good planning. Therefore, before applying the authentic assessment of the student, the teacher must have an understanding of the basic concepts of authentic asesmen. Base on interviews with teachers revealed that teachers understand the basic concept of authentic assessment. Teachers comprehension authentic assessment as assessment of the work product in use teacher has identified that the use of authentic assessment not only as one of the assessment instruments used to measure students' cognitive abilities but also can monitor the progress of learners as a whole. Assessment application process can work well if the teacher has a good understanding of conceptually related to authentic assessment. Brookhart (2010) suggests that there are

several steps that must be understood teachers in implementing authentic assessment include: determining the goal of authentic assessment, determine the content of authentic assessment, determine the assessment criteria, specify the format of assessment, their observations and authentic assessment, selecting evidence, set methods for estimating and reporting the position of learners in map capability. In the process of implementing authentic assessment takes good planning. The planning process can be done by the teacher at the beginning of each school year to prepare a device such as the syllabus and assessment systems, lesson plan (RPP), It can be seen from the draft that has been prepared teachers. Where from research data visible comprehension teachers have the basic principles of authentic assessment when will design lesson plans, teachers also have identified learning objectives that will use authentic assessment, explaining the use of assessment and the types of tasks that must be collected to students, from the planning stages is also seen teachers has designed a rubric assessment criteria which form the overall assessment.

Once teachers understand conceptually authentic assessment, teachers have better planning in designing the syllabus, lesson plans, and assessment instruments that will be used to implement an authentic assessment in science learning in particular. Word (2000) opinion that the use of authentic assessment can be directional, it takes six step plan, which was to determine the focus of authentic assessment, determine the content aspect assessed, determine the structure of authentic assessment, determine the use of authentic assessment, determine authentic assessment method and determine the use of rubrics. But this time the teacher is still difficulty in designing assessment criteria specifically, this was due to lack of time to prepare authentic design and amount of material that must be completed in one semester learning. When will plan the use of authentic assessment, teachers should have designed a special assessment criteria. As Gronlund statement (1994) that the assessment criteria that will be used in an authentic assessment can be immediately made to ensure that the content will be inserted into authentic assessment has actually contains evidence that is expected in the indicators of achievement of learning outcomes and all will depend on the characteristics of the basic competencies which have been determined and how the assessment will be conducted. In the implementation of authentic-based learning, teachers have been involved students from the beginning of the use of authentic assessment mainly in determining

the content should also be able to apply authentic collected. Teacher assessment involving students in determining the criteria for assessment of the instrument and also help students choose an assessment tool that should be incorporated into in learning. One of the success of teachers in the learning process is when the teacher is able to develop the cognitive, affective, and psychomotor students well. The existence of authentic assessment get make students more creative and independent learning.

#### 4. Conclusions and Recommendations

Based on the results of the analysis of teachers' understanding of the pattern of authentic assessment and benchmarking against authentic assessment found that the pattern of teacher assessment conducted science are more dominant on the test pattern in the form of multiple choice and essay. Also obtained information that the junior high science teachers generally have to understand the concept of authentic assessment, but the junior high school science teachers are still experiencing difficulties in implementing a comprehensive assessment authentic. Teachers have been able to identify the intended use of authentic assessment, understanding the content of the authentic asesmenyang be applied to students and also have to understand the evidence of selection procedures, has set focus and understand the position of authentic assessment assessment science learning. But the teachers still do not understand in determining the assessment criteria and report forms should from authentic assessment that allows teachers to monitor student progress.

Based on the analysis of the planning portfolio that has been conducted by researchers that through interviews with teachers, found that of the seven indicators to be disclosed only four indicators that have been conceived and developed with a good teacher. Where in the planning process authentic assessment indicate that teachers are able to identify learning objectives will be assessed by an authentic assessment, teachers have also been able to communicate using assessment to authentic look of the design students who had teachers prepare lesson plans, teachers also have determined the type of evidence and procedure to select evidence that students collect. However, teachers have difficulty in designing the assessment criteria, assessment sheet format and authentic assessment rubric. Based on observations made to look authentic assessment that implementation has been made to the junior high science teacher in West Java, it is seen that

the process of implementation of the authentic core assessment at school better than at school impact, which looks authentic teacher preparation before applying the assessment, in practice also seen teachers have implemented principle the principle of good assessment with authentic, where teachers engage students in discussing the type of evidence that must be collected, and also have established assessment focus both individuals and groups, but in school-induced less authentic assessment in order to conceptual understanding, which saw the percentage of the use of authentic assessment for subjects science less compared with other assessments, in addition to the current teachers have not had the column and specific assessment criteria for the assessment of authentic assessment.

To be able to perform better learning, teachers are expected to be able to design and develop learning tools with existing systematics especially in developing authentic assessment scoring system in particular, which can be obtained from various sources which relevan. For particular school principals can review the implementation of the evaluation process and monitoring the performance of teachers in preparing the particular learning assessment system in accordance with the applicable curriculum. In order for the quality of education, especially education in junior high can be better, it is expected that the relevant parties (stakeholders) can give attention to teachers in an effort to improve the ability of educators to prepare lesson plans and assessment tools, implement and evaluate learning, by providing training.

#### 5. Acknowledgements

Researchers would like to thank all parties who have supported to implementation this research activities in the context of lesson study activities in West Java. The author would like to thank all parties in particular to the Indonesia University of Education, West Java Provincial Education Department, and the Ministry of Education and Culture of the Republic of Indonesia, WALS and the schools and the teachers who have participated actively in the activities of lesson study.

**Abstract:**

A self-help reading is ideally the learning goal of reading classes which should then be applied in the future lives. Earlier, the students' self-help reading was still considered quite low as they all depended much on external helps rather than on their own innate skills. This could be the result of several factors. The teaching and learning strategies implemented were still much focused on the teacher centered. The reading activities did not focus on developing reading life skills. Therefore, the goal of the lesson study was to improve the students' self-help in reading. Implementing the goal, two main focuses were done; first by improving the teaching and learning reading strategies and second by implementing peer-review. The method of research was an action research with 4 cycles and each cycle consisted of *plan, do, see* and *reflection*. This lesson study lasted for 3 months with 32 semester 3 students of class A of English Education Department in Academic year 2013/2014. The method of collecting data used was through tests and observations. The data were analyzed using descriptive qualitative analysis. Through reflections, the activities in reading classes which did not really help develop the students' comprehension should then be excluded. Those activities covered reading aloud, Indonesian translation and extensive grammar discussions. The research finding showed that (1) the students' self-help reading improved well viewed from their reading commitment and activities, (2) their reading comprehension improved viewed from their test results, and (3) the students' participation in reading classes also developed viewed from their participation in reviewing their works, in making and giving responses.

**Key words:**

self-help reading, peer-review, lesson study, comprehension, reading life skills

## 1. INTRODUCTION

Self-help learning is a great demand which has to be applied in a university study to achieve life skill learning. This is well understood as the students are already considered in their perfect maturity level. Therefore, their study is understood as their own responsibility. They have to study their lectures independently without depending on other people. They need to have their own attitude which supports themselves in achieving their successful goals in learning. As quoted from Sukarman Purba (1992: 16), self-help learning is obviously visible from the students' efforts in making themselves aware of doing their own goals and gaining them. They then pursue the goals by implementing orderly practices, disciplinary in learning, focusing on the learning materials and having good and tactical strategies in achieving the goals. They also need to have realistic ideas or thought and high responsibility. Thus, self-help learning is then understood as an important factor to pursue successful learning achievements.

However, self-help learning is still considered a problem in high learning in our country due to several reasons. First, most students are still dependant on their lecturers as their only resources in getting information. Therefore, they always tend to always come, wait for the lecturers and get ready to have learning materials from their lecturers. This attitude happens as they have already developed the habit of depending on their teachers as the center of their learning when they were at high schools. Second, quite often more lectures do not require students to think critically, work disciplinarily and independently at classes to use their time to learn the learning materials. These are the situations which could not facilitate them to get self-help learning in their lives.

The case also happens in reading activities in most high learning institutions. Most students do not develop yet the habit of independent reading. They seem to have felt that they do not need reading for their future investment. They might think that reading is just the burden they have in their study. When they read, they mostly do reading as they are assigned to do so by their lecturers. Therefore, when they read a text, they mostly find themselves lots of problems in comprehending the texts. They have problems in understanding difficult words. They do not have good strategy how to deal with the new words which should later then help them understand the message of the whole text they are reading.

Reading Class A is not another different class. Most of the students in this class also developed reluctant feeling of independent reading. More students developed comprehension skills depending on their lecturers, they did not feel

encouraged to venture reading for their own information enrichment. In another word, they had not developed yet high disciplinary reading to get as much information as possible as this was clearly visible in their reading activities in the classroom. Such situation was proved when they had shown little criticism during the class activities when they had some problems given by their friends or even by the lecturers. The fact that they had got less confidence in expressing ideas, criticism and perhaps suggestion only showed that they had not developed yet self-help reading. The more the students developed themselves self-help reading, the more confident and understanding the students had on their reading.

The students' less confidence and ability in expressing ideas, criticism and suggestion related to reading classes could be the result of learning strategy being designed and implemented by the lecturer. Less self-help reading employed by the students did not directly come out from the students' side. The lecturer had also developed the role in also making such an unexpected thing to happen. Classroom learning strategies being applied in the class would also contribute to the failure and success of the students' reading activities in developing self-help reading.

Referring to that problem, the solution which could be applied to develop students' self-help reading in Reading 3 was through *lesson study*. *Lesson study* which was meant to learn and apply classroom learning through collaborative work was considered appropriate to solve the reading problems. By designing good lesson plans collaboratively, assessing the teaching and learning procedure collaboratively and also solving problems happening to the classroom learning together, hopefully, effective classroom learning would then yield out.

Within this *lesson study* context, *peer review* and graphic organizers would then be applied to develop students' self-help learning reading. By applying peer review and graphic organizers, students were not only expected to develop independent reading as the short term goal, but they would also be expected to develop their self-help learning in common which they certainly used later in all aspects of life as their life skill for their future later.

## 2. FORMULATING LEARNING GOALS

The lesson study team consisted of 4 instructors, (Listiani as the model instructor, Pudiyono, Dyah Kusumastuti and Suwartono as observers), from English Education Department in

which two of them were considered as junior instructors having less than 5 years teaching experience, while the other two were considered to have the teaching experience of more than 10 years teaching time. The instructors began by selecting a reading course aiming at developing self-help reading, available reading texts or topics and the soft skill goals for students' learning based on the current syllabus. The instructors then selected the topic of interests to the students, usually the topic that was considerably important in building students' reading skills or one that posed problems for students in developing their reading interest and fluency.

Basically, the reading lesson focused on immediate academic reading goals related from qualities of character, dispositions and sensibilities such as curiosity, independent and critical thinking, tolerance of individual differences understanding specific concepts and subject matter to that of broad goals for development of intellectual abilities, habits of mind and personal qualities and specifically to those dealing with reading life skills.

### 3. LESSON STUDY METHOD

This lesson study was accomplished in Reading 3 in the even semester of Academic Year 2013/2014. It took 6 months, and located at English Education Department of FKIP Muhammadiyah University of Purwokerto.

Research data consisted of: 1) self-help learning progress on reading classes through peer-review learning technique, 2) students' learning participations during reading instructions in the form of student to student or student to teacher interaction during the implementation of peer-review learning technique, 3) students' psychological feelings during and after the application of peer-review learning technique.

Data collecting techniques applied consisted of three different techniques. Observation was applied to get both the data on self-help learning progress on reading classes and the students' learning participations during reading instructions. While to get the data on the students' psychological feelings during their joining the reading classes with peer-review, questionnaire and informal interview were applied.

### 4. THE THREE STEPS

The lesson study cycle consisted of mainly three steps or phases: planning a lesson (Plan), observing student reactions to the lesson (Do), and then analyzing those reactions (See). With these

three steps, theoretically, a lesson study could be considered so simple to implement. But in real practice, these had developed into highly complex in their execution. In implementing these three steps, even though each of all instructors had been, to some extent, accustomed to developing collaboration in their own professional learning communities in almost any aspects, we still found to have complex and sometimes surprising problems which could go beyond our earlier knowledge. Lesson study had offered us lots and various dimensions. Sometimes it could be risky to share multiple and various points of view that could have been the sources of disagreements among instructors, such as on reading class strategy, contextual solutions on reading problems and the students' academic attitudes, etc. By and large, these types of academic challenges could be handled well during the implementation of the three steps in lesson study and this had certainly developed a great deal of knowledge about building a team and a learning community in professional atmospheres.

#### 4. 1 Step One: Planning or Designing the Lesson (Plan)

The team of instructors designed a lesson which was intended to bring the goals of reading to become their life skills (Lewis, 2000). Therefore, in creating a good and appropriate lesson the instructors had to design and modify an existing lesson or start a new one. Newly hired instructors, who might be unfamiliar with the materials being designed, explored and shared the materials based on their own previous experiences in their teaching the topic, and discussed possible ways to address the lesson goals profoundly. Experienced instructors then responded to their possible understanding and procedures of the lesson. As it was considered a research lesson which was much different from everyday class preparation, the degree for instructors to collaborate should be appropriately extended in such a way to guaranty the success in creating and achieving the lesson goals.

Moreover, as the team designed the instructional reading activities, they certainly considered how they would possibly help students achieve their goals. More significantly and basically, instructors doing lesson study practiced cognitive understanding and activities to make student thinking visible. In planning a lesson, the instructors then predicted how students would be likely to respond to those specific texts, new vocabulary, questions which follow, possible problems and exercises on reading the text the instructors had already prepared. Certainly, the instructors had to put themselves in the position of a student and

imagined what it would be like to experience the material and lesson activities. Basically, this reading approach should foster the development of pedagogical content knowledge. As it was a lesson under the research, the lesson was designed in such a way in order to investigate student learning during the class period. As the instructors, we had to try to design a lesson that could make students’ thinking visible—that means, open to observation and analysis. Therefore, lesson study needed more time and greater depth of planning and discussion than typical class preparation. Instructor team should meet multiple times to plan a research lesson well. Research instruments should also be well designed to get enough and appropriate data needed to get the result of the research on the lesson study.

In this *plan* step, learning strategy was designed as the following: (1) deciding the learning materials and the research instruments; (2) asking students to analyze the learning materials given based on the texts which had been distributed for each group; (3) telling students to grasp the message of the text by making graphic organizers through peer-reviewing their work; (4) presenting the group work’s result to class; (5) confirming the correct result in class presentation.

To guarantee the steps to run well, the model instructor felt necessary to make the reading class procedure well understood by making posters exposed first in front of the class. As it was considered a crucial step, the model instructor explained the procedure clearly by making use of the poster. But before the instructor explained the procedure, she asked one or two students to read well and explain it to the whole class. Overall, it took more time for the instructors to get into the right frame of mind for planning the lesson. Frankly, we also had a recommendation on using an already-prepared lesson so the teams could spend more time focused on the observations and analysis. The team had to reach consensus on what actions the instructors would take to administer the lesson. Next, the team had to determine the intended student behavior for each action, meaning what behaviors the observers would see in the students as a result of the model instructor’s actions.

The team of instructors also developed a plan to investigate how students learn new vocabulary from the reading text. The plan certainly specified the type of observable evidence the team collected and how observers would observe and record data during the lesson. Later on, team of observers gave feedbacks on how to deal with the new vocabulary found in the text as students had tried to solve them by using their dictionary. As we know that dictionary help should be considered as the final help in reading.

Planning the lesson study also means with planning how to deal scientific activities on the lesson. As the team designed the lesson they also discussed what types of data they would collect as evidence of student learning and thinking. Therefore, the team designed several exercises in which students explained key words for clues in understanding the words. By this, it was quite obvious on the students’ participation in executing problems of vocabulary. During the lesson, observers attended to how students explained those new words in the reading material and also observed students’ written explanations for later analysis. More importantly, observers paid much attention on the students’ activeness in proving their reading comprehension of the text.

As this lesson study was not intended to determine the lesson’s effectiveness, nor what students learn, this lesson study much focused more on the way students learn from the lesson. To investigate the way students learned, therefore, the teams focused more on student thinking during the lesson; how they made sense of the material, what kinds of difficulties they encountered, how they answered questions, how their thinking changed during the lesson and so forth. To give help in data collection, the team of this lesson study prepared observation guidelines that described the lesson and indicated what kinds of data to collect. Data typically consisted of detailed observations of student activity and written work during the reading lesson.

#### **4. 2 Step Two: Teaching and Observing the Lesson (Do)**

In the step *do*, the model instructor applied self help reading strategy which was meant to improve the students’ self-help reading. The progress on the students’ self help reading in Reading 3 showed clearly during the time the students was doing peer-reviews. Socially, peer review improved students’ ability in building cooperative work with their friends. This cooperative work was quite visible when students were doing discussions both within the groups and among the groups inside the classroom.

Referring to the well carefully designed lesson; possible reading responses, potential reading difficulties, students’ potential speaking activities and model instructor interventions were planned in great details. The teams of instructors moved on to the way how to conducting the lesson. Observing student reactions was the point where lesson study proceeded; from typical uses of instructor observation. Instead of focusing solely on the actions of the instructor, observers collected data on behaviors or objectives identified in the planning

process. It was important for instructors who were observing students during this phase not to interact with students. Sometimes, we learned that when model instructor observed their colleagues, asking students questions about their lessons or about the model instructor would then bother the observation process.

Before doing presentation, students discussed in small groups the materials which they would present in the plenary class. The subjects that students discussed covered the following; new vocabulary, reference, mind map comprehension and a précis making based on the *guided questions*. Students then discussed at length in their small groups those subjects and made them ready to do the presentation.

After every group had already finished their small group assignments, the presentation time began in which each group had to make the presentation. In turns, each group presented their work in such a way as to show their understanding of the text based on the components having been discussed in their small groups. Within this step, students applied peer review phase one in which peer review was done among the members of the small group. The small group could share; work together, in order to get correct comprehension of the reading on their own understanding.

In the presentation phase, groups of students presented their discussion results dealing with comprehension exercises on the text message, language features, and other important information taken from the text. The text had been decided earlier taken from a text book or other sources the instructor had provided. The presentation was followed by a question and answer session to let students develop their comments, disagreements, feedbacks and arguments based on their reading comprehension.

The question and answer session considered also as peer review activities and accomplished before feedback session was done after students in their own understanding analyzed and identified the presenting groups' mistakes and unacceptable results on their way to understand the reading text pertaining on the message and also language components. The presenting group had to listen carefully to the correction and arguments given and had to be ready to refuse or accept their arguments in order to make their small group work better.

After the presentation was over, members from other groups were encouraged to give comments, corrections and feedbacks based on their understanding to get better comprehension and make the presenting group' assignments better. This was considered the real forms of peer review activities of phase two applied among small groups.

The activities done during peer review expressed their forms of reading text comprehension which were implemented into their agreements or disagreements referring to what the group had done or presented. Both agreements and disagreements toward the group results were ideally followed by logical arguments. Through this logical argument then the students' maturity in understanding concepts and ideas offered from the text would then develop better. But logical arguments were not enough for the students to get complete disclosure of ideas. Therefore, the need to get solution or alternative of the problems being discussed was considered primary important.

Students who had got good agreement or disagreement completed with appropriate solution would therefore get perfect appreciation both from the instructor and other students. Besides giving arguments, members of other groups could also express their response through suggestions or recommendations. When the class had no more arguments or responses from the other groups, the presenting group could then conclude their presentation.

During this activity, the model instructor should manage the activities which were going on to make sure that the peer review activities could develop as planned. Other instructors observed critically to what activities the class was proceeding. They could take a minute to all activities happening to both the students and the model instructor. They should also make sure that there would be no activities without being noticed under their observation.

The lesson was taught at the normal scheduled time during the term without any adjustments prior to the observers' sake. One member of the team, the model instructor, taught the lesson and other members attended the class to observe to collect data. Teams could also invite guest observers (e.g., departmental or professional colleagues, graduate students) when necessary. Instead of observing how the model instructor taught solely, as in typical classroom observations, observers focused on how students responded to the lesson. This was certainly designed by the team earlier rather than by the model instructor who was scheduled to teach.

Observers gathered as much evidence as possible related to the learning goal during the lesson, capturing the dynamism of actual teaching and learning processes. Depending upon the team's data collection strategy, observers could record detailed field notes, focus on specific types of student activity, or use checklists or rubrics to categorize or monitor student engagement, performance, thinking, and/or behavior which were visible in the classroom participations. They could

observe the entire class or focus on specific students during the lesson. Students were guaranteed to have no learning interference during the activities of the learning process. Instructors explained the reason for observation and other related activities and how the data would be used to improve the lesson.

First observation got a good finding showing that not all students paid attention to the presentation. Therefore, only few students were ready to propose feedbacks and suggestions towards the result of the presentation. This all could stem from the possible problems for students in understanding the text being presented. Consequently, the feedbacks came from the model instructor by telling that students should focus on the difficult words as the new entry for students to learn, the new phrasal expressions which they thought difficult to understand. The model instructor also underlined that students giving feedback would take more points as their extra advantage.

Second observation got a finding that exposed students' problems in understanding unfamiliar words. They still had their own belief that the problem of a difficult word could be solved by looking up the word in a dictionary. This belief was not completely correct as a dictionary usually offered many lexical meanings students had to choose. Practically, students had to learn the word in context to get the correct meaning by making logical and analytical guesses. By applying this, students would then be able to develop their self help comprehension on new vocabulary which should not depend much on their dictionary. In turns, hopefully students could find some pleasure in reading a text.

Third observation found a finding that students still found it difficult to get the main ideas of the text. Therefore, students were not able to design a correct mind map of their understanding or comprehension of the reading text. To solve this problem, the model instructor always gave necessary correction to the comprehension map made by the presenting group to get the confirmation of the correct comprehension map. By this, hopefully students could manage to develop their skill in making the comprehension map. Besides the fact that students were still in confusion in making a comprehension map, the medium of communication they applied in their discussion mostly was still in Bahasa Indonesia. This could perhaps be understood citing that they would not take the risk of having double problems in implementing the activities; communication and comprehension barriers. Some surprising phenomena came out during the third observation, the class procedure applied translation activities as well in their process. Related to real life skills, such a thing never happened to people reading a text by translating it into another language. The correct stance toward this activity was to recommend

them to minimize translation bit by bit and finally to stop it for good.

#### **4. 3 Step Three: Analyze the Data and Discuss the Lesson (See)**

After having observed the lesson, particularly on the students' participations, each member of team met for a debriefing or exploring meeting where the teams analyzed the students' reactions to each part of the lesson they had just joined. More than just looking at what parts of the lesson didn't give any effects to students; the instructor team also analyzed what parts of the lessons worked for students well and why. This in-depth analysis helped the instructors understand how the students made sense of the materials and what each student's reactions revealed about during the lesson. During this phase, the goal was to help model instructor think about her own instruction and her students' thinking in a different way. In trying to know "the success and failure" of the class instruction, the following questions could be considered; Are students really engaged into the lesson? In what parts of the lesson are they engaged? In what way are they engaged? In what way do we know that they are engaged?

The observation result showed that during small group discussions all group members seriously worked hard to implement the assignments as recommended. They worked in their teams to finish their assignment on time. It was also obvious from this event that the strong academic students also helped the weak ones in trying to understand the text being discussed. This happened clearly when some students did not understand the words unfamiliar to them; the strong academic students offered some help to make them comprehend. When they had to make the mind map based on the text understanding, each team showed quite intense group work. In making the comprehension map, some students in the team were captured showing their ideas into some scratches of the map.

The observation result on the small group presentations showed that most students presenting the group assignment presented their work based on their written work or they presented textbookly. They could not yet present their results by producing their language utterances orally. Mostly, they presented their work by reading the précis or the text summary. Ideally they should present their work by using their comprehension map as their media presentation.

A variety of approaches could also be applied to analyze the student observations. Time mapping was also applied in which this measured how much time the model instructor or students spent talking, doing an exercise, waiting for next

turns. During small group presentations, what the model instructor did was not considered to have dominated the meeting as she observed every presentation and discussion profoundly. Therefore, the time mapping in the learning procedure was still considered timely. From this, it could also give clear picture that the model instructor considered the time of teaching to always rethink whether she dominated lessons or not.

Another observation result showed that the model instructor still applied translation techniques by asking students to translate the text parts by parts into Indonesian. This was probably meant to know and check whether students could understand the reading texts. This was certainly considered an unacceptable practice as in our daily life translation was not a common practice when reading texts. Besides, another result also emerged as she also sometimes used Bahasa Indonesia as a medium of her clarification or explanation.

A well prepared lesson study, of course, organized facilitation process and helped create a smooth and comfortable analysis. After the observations, the model instructor who taught the lesson would note her thoughts dealing with what ‘successes’ and ‘failures’ in implementing the lesson plan to get her ready to present in the debriefing. On the other hand, the observers wrote what they thought went well and what could change on certain notes. The observers then exposed this notes of comments somewhere on the board in the room to encourage everyone to see around the notes in the room reading before we began the discussion.

The team of instructors applied the agreed rules to proceed with the discussion. The model instructor talked first followed by team members. She then expressed her feelings and impressions after she had executed the lesson plan. We got the understanding that she did not feel as she wished as quite many students could not present their assignment in the correct reading comprehension and fluent and well presented grammar. Besides, the model instructor also noted that students still found it difficult to design the correct comprehension map based on the text. Such conclusion was quite visible on the students’ presentation as well as the students’ written evidences. Observers also shared their observations and exposed some necessary evidences from the lesson on the model instructor’s medium communication and also the application of translation activities. Such events and also other student written work could reveal important insights on teaching practice and student learning responses leading to some valuable learning reflections.

Following the data exposing or debriefing session, the team of lesson study held one or more meetings to organize and analyze the data further and discuss possible changes to the following lesson.

Based on the evidence, the team revised its approach by encouraging the model instructor to use less Indonesian, apply less Indonesian translation and encourage students more to design better and correct mind map. In addition to revising the lesson and the method for collecting data, some teams reconsidered their learning goals in light of the findings. Students’ activities which were mainly observable in this lesson study such as paper presentations, paper discussion and feed backing or peer reviewing sessions and also some other aspects such as the level of difficulty of the materials and exercises resulted information to the model instructor and observers to revise the learning strategy.

As the goal was to develop good reading habits in reference to their daily reading practice, the big learning advantage in this step or phase three came out to determine the implications to learn that students should not develop the habit of reading aloud for developing their reading comprehension. Therefore, the main goal of reading was mainly for comprehension. Activities which did not really develop comprehension building should then be excluded from reading learning processes.

## 5. FINAL RESULTS

Lesson study would certainly give good result to both the instructors and students concerned. Both were expected to make significant changes on their willingness to adopt some learning in the class interactions on the pedagogical attitudes. The instructors hopefully got transferable skills in handling classroom interactions on the subject they would teach. They would walk away and say that they had got a more efficient way of doing something. The students also got better learning strategy in developing their language skills.

Through the activities applied in *peer review*, students were led to develop their ability to analyze their reading comprehension well by comparing the reading comprehension of other group members. Besides, they should also develop their ability to identify other member’s possible mistakes in deducing meaning from the reading context. Trough this peer review, students were also encouraged to develop their courage and skill in offering some suggestion or feedback towards the ideas and comprehension of the presenting groups.

On the other hand, through these activities, the students were also encouraged and trained to develop their patience and tolerance in taking ideas offered by other groups to make their job perfect. Making their job better by listening ideas from other groups was not easy and, therefore, this needed lots of practices. This also means that they needed

discussion and arguments in order to come to the desired conclusion.

Another benefit taken from this peer review was that students were motivated to read more to develop their reading skills and to broaden their life understandings in order to be ready to participate in the group discussions. Some students who could not get themselves involved in the discussion or debates might have felt that they were much left behind from others. Therefore, they felt they needed more knowledge to participate well in the class discussions. This activity consequently made the students develop their reading habit bit by bit by running reading activities of their own independently as their effort to increase their reading experience to comprehend texts.

In the presentation step, the presenting group presented their group discussion results which were related to their effort in understanding the reading text they had to digest. In this step, students had to give their solution to the reading problems commonly happened in reading, covering new vocabulary entries, understanding main ideas and the text message by designing the comprehension map. In designing the comprehension map, what students did was still considered less complete as they only designed the main ideas only on the map. This means that they still left the supporting details on the map which in turns made them unable to do the presentation well. Ideally, presentation should then be based on the comprehension map they had already designed. Therefore, the map should provide enough information related much to the title.

Besides that, students had to develop their language productivity by expressing their text understanding on their own English. Sadly, some students still found it hard to create their own English sentences to express their text understanding. Some took the best advantage of a computer feature just by copy pasting the expressions, sentences they thought to have born representing the comprehension of the text message. Fortunately, such this practice was certainly spotted by other students and observers during presentation which then led them to reprimand students to cease doing such practice. In common, most students took much progress both in their reading skill and language productivity and also their soft skill developments, such as creativities and critical thinking.

## 6. CONCLUSION

1. Learning reading through *peer review* was concluded to be effective in developing student's self help reading. This was meant that in every step of learning students were

led to develop their independency and to depend on neither their classmate nor their model teacher. The students fully worked hard to develop their understanding of the text they read fully exploring their own capability towards the assignment given.

2. Anyhow, peer review also developed students' critical thinking towards text comprehension by commenting the job their peer had already done through feedbacks addressed on their friends and other groups. Without having any critical thinking, students would not be able to lend any helpful recommendations.

## Increasing Students Sensitivity Toward Environmental Problems And It's Implementation To Building Research Proposal Trought Project Based Learning (Pjbl)

Nurwidodo<sup>1</sup> and Iin Hindun<sup>2</sup>  
Universitas Muhammadiyah Malang  
e-mail: nurwidodo88@yahoo.com

**Abstract:** Professional competence is characterized by mastering teaching materials, conduct educational learning and able to do research. Environmental science course equips students to be able to increase the sensitivity to environmental issues and use them to formulate a research plan based environment. Problems were found in the lecture during this extremely sensitive to environmental issues and the ability to use the research to develop an environment that is still low. Though sensitivity to environmental issues is the entrypoint to piled plan-based research environment. The purpose of writing this paper is to describe the implementation of the *Project Based Learning* results in increased sensitivity to environmental issues and apply them to plan research on the biology of the prodi student education semester V. It has been applied to Project Based Learning on knowledge of the environment in the course semester in 2013/2014. Its activities include *the determination of the issues and groups, formulation of how to solve problems, conduct field investigations, organize and analyze the data, present the results and evaluation*. This activity takes place within 4 (four) cycles. In the determination of Plan, the teacher makes the lesson plan (RPP) personally, than discussed together with the lecturers. In this activity students carry out the learning process DO and observed by several lecturers. See on activities, do reflect on the learning that has been carried out led by a moderator. Data on students' learning activity findings after analysis showed that there is an increased sensitivity to the problems of the environment and student ability to piled plan research for lectures from cycle to cycle. With PJBL They conditioned to learn sincerely and responsible. It can be concluded that the PJBL can increase student sensitivity to environmental concerns and PJBL can improve the ability to plan-based research environment.

**Keywords:** *Sensitivity, the environment problem, research plan, Project Based Learning*

## 1. INTRODUCTION

Throughout human exploration of the environment takes place naturally, then the carrying capacity of the environment will be better, and the relationship among them will happen naturally, it is. But because humans have changed the level of need (basic) to desire (tertiary), the human exploration of the environment becomes greedy and greedy. Drained environment as closely as possible to satisfy the growing number of human beings. Beginning this moment, then there is an imbalance (disequilibrium) the relationship between man and his environment. Changes in the pattern of human relationships and the environment is the beginning of the emergence of environmental problems and result in the occurrence of a disaster (hazards) environment. Man in the running life of the role and consequences on environmental issues.

Sensitivity is the response speed (fast response) someone to everything in their environment. Sensitivity to environmental issues is the awareness of the environmental issues that arise as a result of the imbalance ecological relationship between biotic and abiotic factors. These problems are very diverse and attract attention to get to review and potentially as an input in preparing the study. Sensitivity is the degree of awareness and response to environmental changes. While sensitivity to environmental issues is the degree susceptible to the changes that may lead to damage or harm the environment. Sensitivity to environmental problems can be identified through the ability to detect potential problems or that appear in the environment. The number of potential problems that have arisen or are able to realize or indicate the degree kepaakaan someone responds to environmental problems. In lesson study, there are two aspects of the students' sensitivity and awareness that the response observed in the scale of quantity and quality.

Based on the results of preliminary observations indicate that student sensitivity to environmental issues is not optimal. Most students do not have awareness of the potential for environmental problems. They have a new awareness of the problems that have arisen as a result of the various changes that have preceded it. And to be able to become a researcher must have a sensitivity to the phenomenon that may occur or be potential. Increased sensitivity to environmental issues is possible realized with the implementation of lesson study in environmental

science lectures were conducted by the method of Project Based Learning.

Environmental Science course is one of the courses that support the achievement of the goals of biology study program. Subjects that have the competency standards and eight (8) basic competence is the reference targets. Applying the standard of competence, namely the principles of learning strategies in biology teaching and research-based learning strategies. Competence is essentially the first Mastering the environmental knowledge and sensitivity to environmental issues and applying environmental problems in knowledge-based research proposal peyusunan environment, with indicators as follows: 1. To describe the basic concepts of environmental science, 2. Analyze the environmental problems in Indonesia, 3. Describe Environmental Law, Energy Conservation 4., 5. Menganalisis of the population, 6. Menganalisis succession and land degradation, 7. Menganalisis characteristics of natural resources, the availability, utilization and permasalahannya on humans, 8. Evaluate pest control, 9. Analyze pollution and its effects , 10. Analyzing global warming. Indicators developed on the basis of each competency can be seen in Table 1.

Learning outcomes will be more meaningful if at the time of study followed by attitude and strong motivation, learning in earnest and responsible. In order for the attitude, motivation, learning seriousness and responsibility can be maintained then the learning climate should lead in creating. Lesson Study (LS) is a model of coaching (training) professional educators through collaborative learning and assessment ongoing collegiality based on the principles of mutual aid and mutual learning to build a learning community. Lesson study implementation phase includes planning (plan), implementation (do) and reflection (see). Activity lesson study conducted by a group of lecturers. Lesson study can also be taught to the students as prospective teachers, because basically the lesson study is done on a regular basis and in order to improve the competence and professionalism of teachers gradually.

Lesson study in the learning activity, other than as an attempt to enable students, faculty can also have an impact on conducting a review of its performance. Through lesson study with the Plan, Do, See, enabling the development of academic skills of students who earnestly and cultivate an attitude more careful and responsible in learning because of the lesson study will be observed and reflected either by the student or by the faculty observer observer. Based on these insights, the students need to know the sensitivity to environmental problems and take advantage of

the preparation of research proposal. Thus, the purpose of writing this paper is to describe the results of implementation of lesson study in sensitizing students to the problems of the education department of the environment VI semester biology and apply these issues into the preparation of a research proposal.

## 2. METODE

To achieve the expected goals of improving student sensitivity to environmental issues and implementation issues as input in preparing the research proposal study conducted by the Lesson Study with three stages of plan, do and see. The three stages are implemented in four (4) times the cycle of lectures LS. Sensitivity students in environmental issues and the application in the preparation of this research proposal is the focus in the implementation of a managed learning environment knowledge through Lesson Study in Project Based Learning teaching methods (PPA).

To obtain empirical evidence of the focus of the study, the subjects were studied as a source of data is the faculty and students are involved in LS for Environmental Science course. Lecturers involved are Drs. Nurwidodo, Kes., Dra. Atiq Himmah, MPd., Drs. Joni Hidayat, MSi., Drs. Husamah, MPd., Dra. Iin Hind, Kes., And DR. Poncojari Wahyono, Kes. Lesson study in Environmental Science course is designed in 4 cycles or rounds. Each round is conducted in three stages: (1) planning (plan) in preparing the teaching plan and teaching materials, (2) conduct lectures based SAP has been prepared (do) and was observed by the Lesson Study team members and other observers, as well as (3) a discussion of reflection based on the observation (see).

At the stage plan, a comprehensive assessment is shared equally to teaching plans and teaching materials that have been planned which include course syllabus, the material to be taught, faculty role models that will, sheet kePjBLatan students and evaluation instruments are required. The assessment results are used for necessary improvements to the design of structured learning.

At the stage of implementation (do) lecturer implementing learning models according to the lesson plans that have been getting together assessment and repair (revision) in accordance with the advice and input. Meanwhile, the subjects acted as an observer team (other than the lecturer models). In carrying out the implementation of learning observation, also invited lecturer for Environmental Science course outside the group to participate in the learning observations. Observations based on a standardized observation sheet that has been

prepared. Observations aimed towards students' learning activities during lectures both positive and negative. To strengthen the observation of documentation was created through photos and video recording (audio-visual). Documentation is made to the behavior and general or specific events during the learning process, and valuable as evidence Authentik events during reflection activities to reinforce learning.

Stages of Reflection (see). Reflection activities carried out immediately after completion of learning. This activity was followed by all observers and lecturers models and led by a moderator and assisted by a secretary. In this activity the discussion of the events that arise in learning both general and specific, positive or negative, but not to convict the lecturer models. Student learning activities are a major concern. Steps taken in this activity is the moderator introduced each audience who participated in the reflection of the role of each, then lecturer models are required to submit prior perceptions of the learning that took place recently. Next the entire observer requested to submit their observations in a sequence. After all observers submit comments, then the next step is a model lecturer asked to respond to comments by the observer. The spirit that is built to enhance the learning performance as the focus of a problem that has been planned, rather than on the search for a model lecturer weakness. The results of this reflection is then used to input for the preparation of the next lesson planning.

Techniques and instrumentation for data collection. The data collected includes data on (1) the sensitivity of students to environmental issues and (utilization issues to plan peelitian). For data on the sensitivity of the issue, mainly on two aspects: the number of environmental problems was realized and the student response to the problem. While the problem of data utilization to develop a research proposal based environment, the data collected includes 1. Ability to formulate research titles, 2. Ability to describe the background, 3. The ability to describe the formulation of the problem, and 4. The ability meumuskan research purposes.

In describing the lecture, a data analysis technique using content analysis results of observations on the activities undertaken do and see. In the content analysis was then carried out the collection of information, reduction, verification and conclusion. To describe the increased sensitivity and the ability to utilize the remedy problems digunakan research plan descriptive data analysis.

## 3. RESULTS AND DISCUSSION

Description of the implementation plan, do and see for every material used in the open lesson

### 3.1 Plan

Lecturer models namely Drs. Nurwidodo Kes, learning tools used include syllabus, lesson plans (RPP), an outline of the lecture material, methods and media are required for implementation (do) the first cycle (material Succession and Adaptation). RPP is delivered openly one day prior to the implementation of the open class for feedback, criticism and suggestions from all the lecturers in the group Environmental Science course. In the discussion of this RPP, faculty input, and some models get a note for improvement. Such a move is made to the preparation and open discussion of the lesson plan for the second cycle (Pest Control), played by Drs. Nurwidodo, Kes., Cycle III (Environmental Pollution), played back by Drs. Nurwidodo Kes, and cycle IV (Global Warming) is also played by Drs. Nurwidodo, Kes. In preparing and doing the open discussion, the attention is also focused on student sensitivity to environmental issues and the application of these issues to develop a research proposal.

Foto 1. Plan session

### 3.2 Do (implementation)

Cycles (rounds) I lecturer implementing learning models (do) with competency standards and Adaptation analyze ecological succession and apply it to develop a research plan. Learning step is done by following the syntax of Project Based Learning, which asks students to form groups, then each group was asked to determine the issue of succession ekoloPjBL and adaptation, followed by field investigation activities. The results of field investigations discussed in the group, and do organizing the data squares to then presented and discussed in class with the other groups. Before the meeting ended, the lecturer asked the students to menPjBLmentasikan various issues related to succession planning and adaptation into

the theme-based research. It is addressed primarily to the title of the proposal, the background, the formulation of the problem, and the purpose peneitian.

In the second cycle models lecturer played by Drs. Johni Hidayat, M.Pd. Lecturer implementing learning models (do) the PPA method again. Basic competence is assessed eradication of pests. Steps to be taken in accordance with the procedures contained in goup of Investigation as the first cycle that determines the problems associated with pest management, field investigation related to pest control, to discuss the results of the investigation and then at the end of the meeting when the group was asked to present the results of their discussion. After the presentation, each group was asked to make a response to pest problems. They are also given the opportunity to respond to pest agreed to put forward the slogan of each group. After that proceed to the next task, namely the use of assessment penمبرantasan pest problems to develop a research proposal, primarily for titles, backgrounds, formulation of the problem and research objectives. Each member develops their own plan research proposal in question, then the discussion group to which the proposal memferivikasi of any member who most deserves to be a group proposal. Proposals were selected to represent the group then studied further to obtain endorsements associated with originality, a sense of urgency and perfection of the proposal preparation.

In the third cycle models lecturer in charge is the father of Drs. Nasrullah, MPd. Lecturer model of implementing the learning model PPA. Competence is developed environmental pollution. Lecture from the beginning to the end of follow syntax of Project Based Learning, which asks students to form groups, then each group was asked to define the problem of environmental pollution, followed by field investigation activities. The results of field investigations disiskusikan in groups, then presented and discussed in class with the other groups. utilization of environmental pollution problems to develop a research proposal, primarily for titles, backgrounds, formulation of the problem and research objectives. Each member develops their own plan research proposal in question, then the discussion group to which the proposal memferivikasi of any member who most deserves to be a group proposal. Proposals were selected to represent the group then studied further to obtain endorsements associated with originality, a sense of urgency and perfection of the proposal preparation. At the end of the meeting, the lecturer asked the students to prepare a model pembelajaran come.

While in the fourth cycle of the lecturer in charge of the model is Dra. Atiq Himmah, M.Pd. In this fourth cycle of basic competence is assessed students can understand global warming and exploit the global warming problem in the preparation of research proposals. The method used is Project Based Learning. Steps to be taken are as follows. which asks students to form groups, then each group was asked to define the problem of environmental pollution, followed by field investigation activities. The results of field investigations disiskusikan in groups, then presented and discussed in class with the other groups. Utilization of the global warming problem to develop a research proposal, primarily for the title, background, formulation of the problem and research objectives. Each member develops their own plan research proposal in question, then the discussion group to which the proposal memferivikasi of any member who most deserves to be a group proposal. Proposals were selected to represent the group then studied further to obtain endorsements associated with originality, a sense of urgency and perfection of the proposal preparation.

Foto 2. Do with observation by observer

### 3.3 See (Reflection)

Reflections on the cycle I, II, III and IV were held to discuss the learning process has been going on and work on improving the quality of the next cycle in accordance with the issues raised in the focus of the lesson study course for Environmental Science. The implementation process of reflection following the standard guidelines given by the Director General of Higher Education. Led by a moderator and assisted by the trial secretary. A professor or teacher first models were given the opportunity to express his perception during the learning process, then the observers are requested to submit observations and models lecturer asked to respond back to the comments made by the observer. In this reflection is discussed and reviewed on the achievement of learning as the focus in the implementation of lesson study on

environmental knowledge subjects. In a reflection of the first cycle, the level of student sensitivity to environmental issues and the ability to use the issue to develop a research proposal has yet to show the results as expected. Then the ability to plan based study that examined the problem of succession and adaptation are still not meet the standards that are expected. Karakteistik becomes the input for the next cycle of improvement.

In a reflection of the second cycle, the level of student sensitivity to environmental issues and the ability to exploit the issue to develop a research proposal continued to show the results as expected. Then the ability to plan based study also examined the issue meets the standards expected. Karakteistik becomes the input for the next cycle of improvement (III and IV).

### 4. Data Sensitivity Student and His discussion.

The sensitivity data obtained from the students in the first cycle when the lecture was held on 13 November 2013 (syntax 1 s / d 4) and dated 17 November 2013 (syntax 5 s / d 6). Basic competencies covered are analyzed succession and adaptation. The results of the sensitivity of identification of students showed that there were 14 students who are very high sensitivity, low sensitivity of 15 students and 10 students kepekaanya regular (medium). The results of the identification of the student's response to the problem of showing show that 14 people are very responsive, unresponsive 15 and 10 responsive..

Tabel 3. Sensitivity Siklus I

Tabel 4. . Capability to Write Proposal Siclus I

In the second cycle of learning for Environmental Science held on 17 November

Indicator of sensitivity	Frekuensi	Prosentase (%)

Relevance respond	15	30

2013 (syntax 1 s / d 4) and dated 25 November 2013 (syntax 5 s / d 6) to discuss the basic competence problems that arise as part of the

Indicator capability to write proposal	Frekuensi	Prosentase (%)
Writing Titel proposal	13	65
Writing Background	11	62
Writing problem formula	25	70
Writing aim of study	15	30

eradication of pests. Data on student sensitivity to the problem of pest control and the ability to develop a research proposal based pest control in the second cycle is increased as can be shown by the following table.

Tabel 5. Sensitivity Siklus II

Indikator kepekaan	Frekuensi	Prosentase (%)
Numbers of problems identified	13	25
Relevance of problem	11	22
Respond to the problem	10	15
Relevance respond	5	10

Tabel 6. . Capability to Write Proposal Siclus II

Indikator kemampuan menyusun proposal	Frekuensi	Prosentase (%)
Writing Titel proposal	15	68
Writing Background	15	65
Writing problem formula	27	74
Writing aim of study	19	33

In the third cycle Knowledge learning environment which was held on December 2, 2013 (syntax 1 s / d 4) and dated December 9, 2013 (syntax 5 s / d 6). Basic competencies covered are environmental pollutants. Data on student sensitivity to the problem of environmental pollution and the students' ability to take advantage of the environmental pollution problems for the preparation of a research proposal showing the results as in the table below.

Tabel 8. Sensitivity in Siclus III

Indikator kepekaan	Frekuensi	Prosentase (%)
Numbers of problems identified	20	20
Relevance of problem	15	15
Respond to the problem	15	15
Relevance respond	10	20

Tabel 9. Capability to Write Proposal Siclus III

While in the fourth cycle were held on December 28, 2013 (for syntax 1 s / d 4) and January 4, 2014 (for syntax 5 s / d 7) to discuss

the issue of global warming. Results of the sensitivity of the data collection of students to

Indikator kemampuan menyusun proposal	Frekuensi	Prosentase (%)
Writing Titel proposal	20	69
Writing Background	19	66
Writing problem formula	29	74
Writing aim of study	21	35

issues relating to global warming and the students' ability to exploit these issues to develop a research proposal are as follows:

Tabel 10. Sensitivity in Siclus IV

Indikator kepekaan	Frekuensi	Prosentase (%)
Numbers of problems identified	23	65
Relevance of problem	21	62
Respond to the problem	20	65
Relevance respond	15	30

Tabel 12. . Capability to Write Proposal Siclus IV

Indikator kemampuan menyusun proposal	Frekuensi	Prosentase (%)
Writing Titel proposal	25	68
Writing Background	25	65
Writing problem formula	31	74
Writing aim of study	26	69

From the tabulation of data collection and analysis suggests that sensitivity to environmental problems are indicated by the number of environmental issues were identified and the relevance of the issue with the theme being studied as well as the ability to use a problem-based research to develop a plan of environmental knowledge in environmental science lectures from the first cycle to cycle the second to the third cycle and the fourth cycle was increasing.

#### D. CONCLUSIONS

From the implementation of Project Based Learning in Environmental Science course in

Education Studies Program Biologi JPMIPA FTTE UMM can be summarized as follows:

1. Project Based Learning can sensitize students to environmental issues as the main input to formulate a research plan based on knowledge of the environment in order to prepare candidates for professional teachers.
2. Project Based Learning can improve students' ability to take advantage of the environmental issues to develop a research plan, as the demands of graduate education is to graduate biology that is ready to become a professional teacher.

#### E. ADVICE

1. In relation to the benefits to be gained from the implementation of Project Based Learning in the course of environmental knowledge then needs to be developed for the implementation of other scientific subjects.
2. The subjects beyond Environmental Sciences are strongly advised to apply the lesson study to occur simultaneously coaching profession and improving the quality of the process and results of the lecture can be felt soon spread and more benefits.

## Lesson Study (LS) in Nicaragua

Gerardo Gracia

**Abstract:** The Ministry of Education of Nicaragua is introducing Lesson Study mainly for two reasons: To improve the courses of Mathematics and its Didactics in Teacher Training Schools at national level. To improve the approach of teaching of all subjects of primary education. The former corresponds to one of the four outputs of the Project for Improvement on Quality of Mathematics Teaching in Primary Education (PROMECEM) Phase 2 which is being implementing in Nicaragua with the Technical Cooperation of JICA. The latter is one of the objectives of the National Strategic Plan of Education (PEE) and the implementation of LS in this context is an immediate impact of the Project in elementary education. LS is becoming an specific process within these strategic actions of the PEE: (1) Development of Teachers' Inter-Training inside Clusters of Elementary Schools through the monthly Pedagogical Meetings, and (2) Implementation of the System of Teacher Training and Teachers' Knowledge Updating through the TEPCE (Monthly Meetings of Monitoring and Planning), Pedagogical Meetings and Teacher Training and Advising Networks. This introduction of LS itself, carry some challenges (intrinsic and extrinsic) in Teacher Training and in Teacher Practicing related to the three main steps of the LS process, Plan, Do and See.

**Keywords:** Lesson Study

### 1. SETTING THE CONTEXT

The National Strategic Plan of Education has within its central themes the Quality of education and in this theme has as one central concern Teacher Profession that has as objective "To improve teacher profession through programs of early teacher training, teacher practicing and educational research (...)". This objective implies 11 strategic actions, three of which refer to: teacher inter training through monthly Pedagogical Meetings based on schools' clusters, implementation of the System of Teacher Training and Teachers' Knowledge Updating through the TEPCE (Monthly Meetings of Monitoring and Planning), Pedagogical Meetings and Teacher Training and Advising Networks.

The actions mentioned before (Pedagogical Meetings and TEPCE) are related mainly to elaborate a list of contents that will be taught through a period of two months and to monitor and check the fulfillment of this plan, and on the other hand, to interchange (verbally) experiences related to the teaching of some contents. These two processes or actions lack of the research concern mentioned in the PEE and this lacking is the main reason (and an opportunity) of the introduction of LS in the Teacher Training Schools as well as in elementary schools.

### 2. IMPLEMENTATION OF LS IN NICARAGUA

Implementation of LS implies several activities that has two targets primary education and teacher training. Activities related to primary education arose as an impact of the activities of PROMECEM 2, and those related to teacher training are properly within the project concerns.

### 3. IMPLEMENTATION IN TEACHER TRAINING SCHOOLS

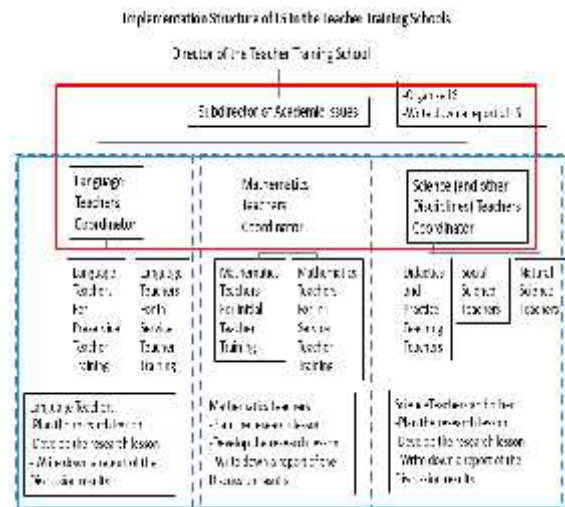

Nicaragua has 8 Teacher Training Schools located in the same number of departments. Teacher training takes three years (2.5 corresponding to in-school lessons and 0.5 corresponding to teaching practicing at elementary schools).

The introduction of LS in Teacher Training Schools began with the LS on the Course of Mathematics and its Didactics as an outcome of the implementation of PROMECEM 2. The project trained mathematics teachers and, currently, is giving advising on planning, open classes and

reflection. The main activities in this context are strongly linked to the following concerns:

- LS introduced as "Mathematics and its Didactics Lesson Study" with all its grades/each grade at least once a year.
- LS at schools is organized with the aid of the Project, in which teachers of other subjects, including students of different grades participate.
- Cluster based LS is organized and facilitated by teachers, in which in service teachers of primary schools and pedagogical advisers of the municipal offices of the ministry of education participate.
- These LS are monitored by the Project, the Schools themselves and, sometimes, by municipalities (email, phone callings and visits) and its cost of implementation is shared by the Project and the Schools.
- The opportunity to face and identify main teaching problems at a real situation (not a written or verbal one) and discuss and find possible solutions.

The structure of the implementation of LS in the Teacher Training Schools is as shown in the following diagram:

The coordination committee is enclosed by the red line (its members: Subdirector and the coordinators of each subject area) and the implementation committee is enclosed by the blue line (its members: the coordinators of each subject area and teachers of all disciplines). The groups enclosed by the dashed lines are the implementation committees of each subject area.

Actually, most of the activities of LS in Teacher Training Schools correspond to the mathematics teacher team and, as an effect, teachers of other

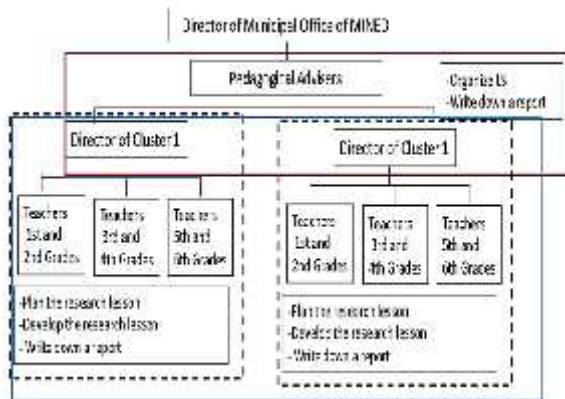

subjects are experimenting LS by their own initiative.

LS in Teacher Training Schools is monitored by PROMECEM 2 and, in some cases, by local pedagogical advisers.

#### 4. IMPLEMENTATION IN PRIMARY SCHOOLS

LS in primary schools is cluster based and is organized and facilitated by initiative of the municipal officers of MINED, in which in service teachers of primary schools plan, observe and discuss a research lesson.

These LS are monitored by local officers of MINED and, in some cases, by the Project. The implementation's cost is covered by the municipal offices of MINED and by schools themselves. The implementation structure is as shown in the following diagram.

The coordination committee is enclosed by the red line (its members: Pedagogical advisers and the directors of each school or clusters of schools) and the implementation committee is enclosed by the blue line (its members: the directors of each school or clusters of schools and teachers of all grades). The groups enclosed by the dashed lines are the implementation committees of each school or cluster of schools.

#### 5. OUTCOMES THUS FAR

In Nicaragua, Introduction of LS is an ongoing process that began with the implementation of PROMECEM 2, some of the outcomes achieved thus far are related to pre service teachers and in service teachers:

- Effects upon Practice Teaching Students (pre service teachers)
- The participation of these students as pre-service teachers in the LS implemented in the

Teacher Training Schools motivates them to do LS in their Teacher Practicing.

- Effects upon Teachers

Teachers are improving their teaching. LS is giving an opportunity to deliberate on:

- Teachers of Mathematics and its Didactics are improving the application of Problem Solving Approach.
- Use of Textbooks and Guiding Books (corresponding to elementary education) has improved.
- Use of the Mathematics and its Didactics Guide (corresponding to Pre service Teacher Training) has improved.
- Communication of teachers as a team has improved.

#### 6. CHALLENGES FOR IMPLEMENTING LS

Thus far, we had recognized two types of challenges related to the implementation of LS, those related to external facts and those related to the process itself.

Extrinsic challenges

- Encourage and motivate teachers
- Implementing LS in rural regions
- Make sense that LS isn't a punishment or an extra task that carries difficulties neither the possibility of being dismiss.
- Implementation of LS in Schools of only one Teacher

Intrinsic challenges

- Promote deep discussions
- Improve the moderation in Reflection

Some possible actions to face these challenges could be the following:

- About propagating LS and making sense of advantages
  - Encourage and motivate teachers: broadcasting results, practicing teachers' interviews and videos that show good experiences.
  - Rural regions: Organizing LS through TEPCE and Pedagogical Meetings and Implementation of School based LS.
  - Make teachers see LS as a chance of professional improvement and a way to open the classroom to colleges that will show them how to convey a better lesson to the students.
  - Promote LS in which participants are pedagogical advisers and Cluster Director and teachers of the nearest schools.

- In the process
- a. Point out the things that matter and may produce some learning for participants before Open Class and revise the LS Guide in order to include specific examples.
- b. Fundamental roll of the Moderator: Include list of specific functions and examples of how a moderator must be and behave during post lesson discussion.

## **7. OUR VISION AND FUTURE PLAN**

Getting advantage of the context and of the feasible of LS implementation, we are looking forward in order to set our vision and future plan about LS implementation. Currently, this vision and plan are as follow (but this could change in order to improve while we go through):

Vision: LS will be an official Preservice and Inservice teacher training methodology because of its low cost of implementation and its high richness in outcomes.

Expects: We hope LS will improve teaching and students will raise to a higher level of outputs.

Our Future Plans:

Short term: Create a National LS Team: 17 Province Advisers, 17 municipal advisers and 17 Elementary School Directors as the first National LS Group. Implementation of LS with all Teachers of Teacher Training Schools.

Long Term: National LS Team promote the implementation of LS at national level.

## Pathways to Professional Learning: Lesson Study at GagasCeria Preschool

Delila Saskia<sup>1</sup>, Tatang Suratno<sup>2</sup>,

**Abstract:** The growing concern to the importance of the early years to children’s lives has inclined the numbers of early children education (ECE) institutions across the country. As the government locates ECE within informal setting, it welcomes various providers, ranging from public, private, not-for-profit, charitable, religious centers and community players, to establish preschool and child care with different directions and orientations. Such figure reinforces the confusing mix and great divide in managing and regulating provisions for ECE services. In particular, there is contention that relates to the qualifications and professionalization of ECE educators. Their qualifications are diverse and generally lower than those in primary or secondary education. Although the government provides teacher training programs, it still faces considerable difficulty due to the government’s limitation in dealing with a huge numbers of ECE educators. Therefore, the opportunity to trainings and course programs does not spread evenly. It then drives ECE institutions to provide professional development by themselves. However, it also has considerable constraints, particularly in finding resources. In this paper, such recurrent problems within the field will be reflected into the situations faced by GagasCeria preschool. By drawing on historical accounts relating to our school policies and practices on professional development, this presentation underscores the important role played by Lesson Study. As the first preschool in the archipelago that has implemented self-directed Lesson Study since 2009, it is stimulating to discuss the key challenges and possible changes that give rise to strategize Lesson Study for improving both working and learning conditions of preschool teachers. By doing so, the authors aim to illuminate a dialogue in projecting integrated actions of professional learning for ECE educators, which may also be of interest for those who have similar situation and expectation.

**Keywords:** professional learning, Lesson Study, Indonesian pre-school.

## 1. OVERVIEW OF INDONESIAN EARLY CHILDHOOD EDUCATION

Early childhood education (ECE) has become a national public movement in Indonesia, since the Ministry of National Education and Culture (MONEC) declared "Indonesian Golden Generation" on the National Education Day on July 2012. Such a long term goal is expected to mark our 100th Independence Day anniversary in 2045.

Structurally, kindergarten and elementary school were in the same directorate, however, after Dakar Framework, in 2001 the MONEC launched the Directorate General of Early Childhood Education. Two years later, the new national education system was commenced that redefined: 1) early childhood education is addressed for children aged 0-6 years; 2) developmental process of early childhood is promoted by means of educative stimulation; (3) The aim of early childhood education is to assist wholly the child's physical and mental growth and development; 4) educational process in early childhood is aimed at preparing the further education (Sujiono, 2012). Consequently, the new regulation has shaped both formal preschool (Kindergarten, for children aged 4-6 years) and non-formal preschool (Child care for children aged 0-6 years and Playgroup for children aged 2-4 years).

Nowadays Indonesia has about 30 million early childhood and the gross enrollment rate (GER) of children in preschool in 2012 is 34.5% which is still below the the government's target of achieving approximately 75% GER by 2014 (Latif, 2013). Therefore, the government promotes the increase number of preschool institutions as to enhance the opportunities of underserved children in preschool level. Such effort gives rise public attention and understanding about the importance of early childhood education (ECE). The total numbers of pre-school institutions is growing rapidly, as well as the numbers of children participating in pre-school education. However, the remaining issue is about the lack of qualified preschool educators. Many pre-schools recruit and appoint under-qualified teachers as to respond to such growing demands.

Ministry of National Education and Culture (MONEC) overcomes this issue by means of 1) establishing a national standard for qualification and competencies of early childhood educator; 2) providing teacher training and course program; and 3) encouraging all private preschool institutions to design their teacher professional development. Indeed, it is not easy to deal with the teacher quality issue due to the following reasons: 1) the problem of teacher supply and demand; 2) the recruitment of under-qualified as to fulfill the growing demand of pre-school teaching workforce; and 3) MONEC has limited capabilities in providing professional education for a large numbers of appointed preschool teachers. Even though the Directorate General of Early Childhood Education has delivered

training courses, workshops and conferences, it provides unequal opportunity for all teachers. In fact, preschool teachers are facing a lot of obstacles, particularly in finding sound resources required for their professional development. In addition, many teacher training programs are lacking of practical application.

## 2. TEACHER PROFESSIONAL DEVELOPMENT AT GAGASCERIA PRESCHOOL

To meet such challenges, each preschool institution establishes their teacher professional development program, in addition to the government's teachers training program. As private school, Gagasceria preschool has also established such a program as to contend with competing demands in delivering a high quality of preschool education.

When a novice enters the profession, they will perform many tasks: interacting with children, working with family, being part of school team, and implementing school curriculum, standards and assessment (Feeney et al, 2010). Our school has realized that the significance of professional development is crucial for the quality of early childhood education practices in terms of understanding a child's perspectives and developmental stages, designing play and learning activities, creating suitable environment for children learning, establishing harmonious collegiality, and so on (Kadota, 2012).

Based on NAEYC definition, Gagasceria believe that professional development is a continuum of learning and supporting activity designed to prepare individuals for working with and on behalf of young children and their families, as well as ongoing experiences to enhance this work. These opportunities lead to improvements in the knowledge, skills, practices, and dispositions of early childhood professionals. A professional development intervention that has three components: a) a comprehensive tool kit; b) a provision of integrated high-quality workshops; and c) two variants of coaching that purportedly could lead to practice mastery. In making those intervention, Gagasceria Preschool classify teacher professional development in to three activities as follow:

### 2.1 Pre-service training

Pre-service training serves for a new teacher that will joint at Gagasceria Preschool. Gagasceria accepts motivated teachers with various background of their undergraduate education. These differences have made our school to do much more effort for teacher's pre-service program.

## 2.2 In-service training

However strongly motivated a new teacher entering the teaching practice, they will always encounter difficulties in playing the teacher's role (Orenstein et al, 2011) without any preparation. Therefore, our school also provides In-service training. It consists of several days of lectures, classroom observation and reflection, and other kind of workshops delivered inside or outside the school. The training is designed based on teacher's need and stage of teacher development.

## 2.3 Routine Activities

There are various ways to support teacher learning and development:

### ➤ Weekly meeting

Every week teachers gather to discuss and share their experience in their own classroom, the relationship with parents, and other issues at school. Sometimes teachers conducted book review activity or small workshop on early childhood education or discussion around teaching issues.

### ➤ Classroom newspaper

Regularly, teachers publish their own classroom paper that inform about classroom activities or special occasions that happened at their classroom. Actually, such activities might help teachers to improve their writing skill.

### ➤ Lesson Study

Lesson Study is daily activity that is conducted by teachers as learning and research process in order to improve the quality of the lesson. Such collaborative approach improves the quality of lesson planning, observation, and reflection upon children learning.

## 3. DISCUSSION ABOUT LESSON STUDY

### 3.1 Lesson Study in Indonesia

Lesson Study is a model of Japanese school-based teacher professional development centering on classroom collaborative research. It facilitates the exchange of experiences between teachers through collaborative planning, participatory learning, the enhancement of professional dialogue among teachers, and teacher reflection (Matoba, 2007). Lesson study has been introduced and spread faster since early 2000s in Indonesia by a cooperation between Japan International Cooperation Agency, Indonesian MONEC and several universities (Suratno, 2012). Initially, Lesson Study has been introduced to junior high school level only, however, it is now disseminated to high schools and elementary schools. In several countries, lesson study is widely used across the continuum from secondary to preschool settings (West-Olatunji et al: 2008).

## 3.2 Typical of Lesson Study

The most interesting aspect of Lesson Study is the mechanism it provides for studying and improving the methods teachers use. Lesson Study breaks away from the model of expert telling teachers what to do. Rather, it assumes that teachers learn to teach by treating teaching as an object of study – by trying to improve teaching by studying carefully what works and what doesn't (Stigler and Hiebert, 1999). Through Lesson Study, the classroom becomes the teachers' laboratory for continuous improvement of teaching and learning (Wang-Iverson and Yoshida, 2005). Teachers in Lesson Study groups are not only improving their own knowledge and skills but are also contributing to a knowledge base that may, potentially, inform more permanent improvements over time (Stigler and Hiebert, 1999) since Lesson Study contribute to build an environment for teachers to be reflective and good observers.

## 3.3 Lesson Study in Preschool

Lesson Study was never formally introduced to Indonesian early childhood education sector. Therefore, there is no resource or reference to be accessed about the practice of Lesson Study in Indonesian preschool level. This is not only in Indonesia but also becomes an issue globally. In most countries, Lesson Study approach is spreading to early childhood education by adapting existing approach (Akita & Lewis 2008), which is the typical of Lesson Study in primary school.

It therefore becomes a challenge for GagasCeria preschool, as an institution that organizes playgroup and kindergarten for children aged 2-6 years, to introduce Lesson Study as a teacher professional development in order to create a learning community and to promote teacher as researcher. Our school has been using Lesson Study since 2009 as one of tools for teachers professional development based real-classroom context, besides the other various pre-service and in-service teachers training annual program.

In GagasCeria preschool, all teachers have to participate in on-going and sustained Lesson Study cycles in order to learn something from each of the things they do, whether it is conducted internally or by participating in other schools' activities. Moreover, through participation in Lesson Study, our school encourages each teacher to plan their personal learning journey as to improve themselves both professionally and personally. We thus strongly believe that teacher is a lifelong learner, so teacher might show to students what lifelong learning is all about, and why it is so important. This is the best way to help students to see the best life they can lead is a life where they never stop learning. Teachers must promote this idea by never stopping their learning endeavors. In our view, Lesson Study comes with an idea that teacher can develop their

professionalism through learning and researching their own work and life.

Therefore, the way early childhood education examine classes is different from another form of existing lesson study. It does not compare and examine the teaching plan and its enactment, but it observes what activities and events are children experiencing in practice, how they are recorded for recollection, and how they “reflect” and examine the case to be interpreted with colleagues (Akita, 2011).

The successful adoption and implementation of Lesson Study in pre-school setting require changes in the mindset of both teachers and leaders. Lesson Study is often misunderstood as focusing on creating perfect lessons. This is not about observing and evaluating the teachers teaching the lessons. The focus is on the students and how the lesson facilitates learning (Lewis et al, 2009). Since preschool teacher is always expected to engage in an ongoing cycle of observing, guiding learning, and assessing children's progress (Dodge, 2006), Lesson Study become an appropriate tool to support such teacher's roles.

### 3.4 Benefits of Lesson Study at GagasCeria Preschool

#### 3.4.1 Teaching quality

Effective Lesson Study will have a long-term impact on teacher professional development. For instance, teachers can develop a strong understanding of the content knowledge and pedagogical knowledge. Specifically Lesson Study improves several foundation skills for teacher such as: a) lesson planning: designing a lesson with high level of prediction and anticipation, and arrangement of teaching materials; b) classroom management: being responsive to the children, observing their learning and development; c) reflecting the lesson: analyzing data, making interpretation, and re-design the lesson to support children learning and development. Some teachers believe that the most important thing in lesson is lesson plan, but in fact there might be a risk that the regular lesson plan is followed technically without critically reflected by the teachers (Runesson & Gustafsson: 2012). Therefore, if teachers design the lesson rigorously then it is likely to have great impact on student learning.

#### 3.4.2 Teacher's collegiality

By working in groups to improve instruction, teachers are able to develop a shared language for describing and analyzing classroom teaching, and to learn each other about teaching (Stigler and Hiebert, 1999). In addition, Wang-Iverson and Yoshida (2005) describe about what makes Lesson Study unique, when compared to traditional professional development:

- It is teacher-led, long term professional learning.

- It is planned collaboratively over a periode of time through intensive study of materials, standards, and students; It was found that lesson preparation was done in a more in-depth manner.
- It supports a collaborative focus on student thinking through observation of classroom practice in real time, sometimes with external experts; the support of the knowledgeable other was critical.
- It offers a process that makes a goal (e.g., enhancing student motivation for learning) for learning concrete through an actual lesson.
- It provides fresh perspectives on teaching and learning.
- It fosters shared reflection based on classroom evidence
- It concretizes the idea of teacher reflection, as well as what problem solving looks like and what thinking entails
- It involves long-term participation of knowledgeable others.

#### 3.4.3 School's culture

Lesson study is a culturally centered professional development tool that stresses group rather than individual goals and outcomes (West-Olatunji: 2008). Lesson Study provides two important pieces that are often missing from traditional professional development: the direct observation of students and teachers in the classroom, and teachers coming together to discuss what they have observed. Such reflection and discussion session on teachers team called as collaborative research process. During the discussion, teachers are learning each other: senior teachers and also the junior teachers. The culture of Lesson Study puts together all teachers on the same level during the process. The goal of their collaborative work is to improve the lesson rather than examine teacher or classroom activity.

#### 3.4.4 Conclusion

Among the roles of the teachers are researcher and learner. Therefore, professional development is actually part of the job description, an ongoing and continuous process, rather than a qualification for employment. Perhaps the most important prerequisite for employment as a teacher is the learning disposition. Early childhood education sector need to consider alternative models of teachers professional development. Lesson Study offering professional learning process and continuous improvement of teacher's daily role by observing the children. For teachers, watching lesson from the student's perspective can build knowledge of student thinking and motivation to improve their own instruction (Lewis et al, 2012).

Becoming a qualified teacher will require consistent opportunities over long periods of time

for teachers to study and improve their own practice. There are at least three ways to improve the lesson: individual teachers, teacher community, materials and tools (Lewis et al, 2009).

Lesson Study provides a continuous learning pathway for teachers to improve the lesson. Therefore, GagasCeria Preschool has been conducted Lesson Study for five years as regular activity for teacher. It gives more benefits on developing teacher both as learner and researcher. By so doing, teachers can plan, observe, and reflect upon the lessons better time by time. Lesson study can establish a school's learning culture in order to improve the quality of teaching and learning. Finally, it is hoped that teachers, educational researchers and teacher educators could respond positively and work collaboratively to spread the benefits of lesson study in preschool sector.

# Skills in Designing and Implementing 5-E Multi-Model Learning through Craft Model Training on Lesson Study Based Science Teacher Association at State Junior Secondary School in Kendari City

Kasman Arifin

Department of Mathematics and Science Education-Biology, Haluoleo University, Kendari, Southeast Sulawesi-Indonesia

*kasman\_arifin@yahoo.com*

**Abstract:** Science teacher skills in designing and implementing learning multi-model E-5 is still low and is an urgent issue to be addressed. This was important to accommodate the diversity types of learning styles and maximize the growth and development of each student character through the learning process. This study is the first stage of the two stages to be carried out. The primary objective is to improve the teachers' skills in designing and implementing the multi-models 5-E lesson study based Science Teacher Association in Kendari. The study was designed using pre-experimental One-Short Case Study Model Craft training. Participants were 20 science teachers from 12 secondary schools. Lesson study conducted regularly every two weeks to develop seven multi-variation models, including 21 sessions, teaching the seventh grade using the 2013 curriculum. Learning preparations and peer teaching were carried out for seven cycles (late August to November 2013), and the real teaching were carried out for 10 cycles (the end of January to May 2014). Quality assessment of the teaching preparation and implementation was done by using the observation sheet which had been validated by the expert team. Results show that the teachers' ability in designing the multi-model E-5 teaching preparation has increased on the fifth cycle after a given reflection on peer teaching activities. In real teaching, participants have shown good skill to apply the model after the sixth cycle. Constraints faced by teachers in designing teaching preparation and habits that need to be avoided in applying the model are also discussed.

**Key words:** Multi-model E-5, Skills, Craft Model, Lesson Study, Science Teacher

## 1. INTRODUCTION

Indonesian Law of National Education System 2003 article 1verse 1 mandates that one of the functions of national education is, "... to develop the potential of learners to have the intelligence, personality, and noble character." The implication is that the Indonesian people is hoped not only intelligent, but also have a good character. By doing so, the later generations will be born a nation that grows with the characters of the noble values of the nation and religion. Being aware of today's society character, the government of Indonesia took the initiative to give priority to the development of the nation's character. This was reflected in the Indonesia National Long-Term Development Plan for 2005-2025, which puts the first character education as the mission in order to realize the vision of national development (Kemendiknas, 2010)). This is even more evident in the presence of characters core competencies in the 2013 Curriculum beside Process Competence and Core Competencies of subject areas (Kemdikbud, 2013).

According to Lickona and Davidson (2005) and Pala (2011), the character is a set of qualities that distinguish one individual with another individual. Good character is not formed automatically, but developed over time through a continuous process of

habituation, giving examples, and exercises (Pala, 2011). Character education is the foundation for students to be able to achieve the best academic performance (CEP, 2013). Semiawan (2012) states that education-oriented character development cannot be based on the perspective that students are empty glasses to be filled by teachers with the same content in the same way, but starting from the perspective that students are the seeds which have the diverse potential advantages. Schwartz (2008) emphasizes one of effective character education programs that have a significant impact and lasting is to use multiple strategies, namely multi-strategy learning approach. Arends (2007) explains that apply two main strategies to meet the needs of all students means applying multi-model teaching (multiple models of instruction). Woolfolk (2008) states that presenting information with a lot of models is very useful activity. Joyce *et al.* (2009) emphasizes the placement of multiple models in a single learning program in the sense of combining multiple models appropriately in a particular model is very important to establish reliable and multitalented learners. Slavin (2011), the use of many methods of teaching in the subject teaching describes as effective learning.

The results of the study (August, 2011) of the teaching preparation and the biology teachers teaching activity in junior high schools in the city of

Kendari shows that the application of methods, strategies, models of learning in any subject matter tend to be monotonous, less variation, and incomplete. This problem is a challenge in order to support the development of potential diversity, including the diversity of learning styles and character growth and development of students in the 2013 curriculum (Arifin, 2011). A study of Science Process Skills conducted in January 2012, which is based on the instrument developed by Kazeni (2005), obtained information that Junior High School students in Kendari do not understand well each component of the Science Process Skills, in general, students are likely giving speculation answers. Results of Junior High School Science teacher interviews show that Science Process Skills was less trained, not all teachers are able to teach and practice. When it is taught, is not complete because of inadequate Teaching preparation available compare to the number of students (Arifin, 2012).

To be able to grow and develop to the maximum student character through learning, it is deemed important to develop strategies that can facilitate the diversity of learning styles in order to accommodate the learning preferences of each student. Trilling and Fadel (2009) states that the two great challenges of the 21<sup>st</sup> century education, namely; how to personalize learning and differentiating instruction for a variety of classes, because it is obviously proven to have a positive influence on the performance and attitude to learn. Learning strategy that was developed called multi-model 5-E, i.e. some model / learning strategies such as inquiry, problem-based teaching, direct instruction, cooperative learning and learning strategies (PQ4R and concept maps). Those models are integrated and appropriate to the characteristics of the learning material in any 5-E learning cycle (*Engage, Explore, Explain, Elaborate, and Evaluate*), adapted from the BSCS (2009).

Multi-model learning allows students to learn the scientific approach; follow the scientists working procedure to discover science through scientific work, teach skills through modeling, working together, and train students to become independent learners. Duran *et al.* (2011) stated that one of the most powerful strategies and have proven to have a positive impact to reach the standard of science education is the use of the learning cycle and learning models. The expected result of the implementation of the multi-model 5-E is to increase student achievement. Besides, it is also aim at growing and developing students characters associated with the scientific attitude, such as: honesty, curiosity, responsibility, self-contained, open-minded, critical, creative and innovative, careful and meticulous, hard work, discipline, confidence, cooperation, democratic and communicative.

This article is the first stage of the research results of two planned phases. The study focuses on improving the skills of teachers to design and implement learning strategies multi-model E-5 on activity-based lesson study for science teacher association in Kendari. Lesson study carried out by using a Craft training model, the trainer was the main resource person (the model) and trainees follow carefully the multi-model E-5 and its application given by the trainer (Wallacea in Noor, 2001).

## 1. METHODS

This research is the development of a learning strategy by using a model of the design Pre-Experimental One-Short Case Study Craft training models based on the activities of the lesson study for science teacher association in Kendari. The number of participants was 20 science teachers from 12 Junior High School. Lesson study conducted regularly every two weeks to develop seven variations of multi-model E-5, which includes 22 sessions teaching seventh grade science based on the 2013 curriculum. Modeling and peer teaching were setup and executed as many as seven cycles (implemented at the end of August till November 2013), and the real teaching done by 10 cycles (End of January to May 2014).

Lesson study procedures were applied in this study are as follows:

- Preparation, includes: (1) forming the lesson study group consisted of 20 junior high school science teacher-Biology in Kendari as a member, and two teachers and their core researchers as a companion to help researchers; (2) Researcher created model of multi-model 5-E Teaching preparation (lesson plans, worksheets and guideline, teaching materials and assessment sheet), and then validated by a team of experts; (3) The researcher guided the core teachers to create models of multi-model 5-E Teaching preparation based on a model that has been validated; (4) a work plan and schedule of lesson study is based on the framework of the development of multi-model 5-E learning strategies, that has been designed by the researcher; (5) core teachers teach how to make teaching preparation and implement multi-model 5-E to lesson study participants; (6) the lesson study participants share the task of making the teaching preparation in other subject matter based on a model designed by researcher and core teachers; (7) participants take turns to act as peer teaching teacher modeled and use the lessons that have been made, while others act as students as well as an observer along with the core researchers and teachers; (8) each participant

revise teaching preparation based on the reflection and discussion.

- Implementation phase in the classroom (real teaching), including: (1) teachers do real teaching at their respective schools, and the lesson study participants are as observers based on the division of the agreed schedule, accompanied by the core teachers and researcher; (2) observational learning is done by using the multi-model 5-E observation sheet which has been validated by a team of experts; (3) the results of learning observations are reflected, discussed, and modified.

### 3. RESEARCH RESULTS AND DISCUSSION

#### 3.1 Teaching preparation of multi-model 5-E

Based on the multi-model 5-E teaching preparation assessment sheet, some problems had been identified that generally need to be fixed by the lesson study participants, especially in the second cycle (after given the model) up to cycle IV. The percentages of teaching preparation need to be improved are as follows:

##### 3.1.1 Syllabus

- The syllabus needs to have indicators and objectives (100% syllabus).
- Learning column on the syllabus is to be given an outline of what will be done by the students (51%).

##### 3.1.2 Lesson Plan

- Indicators and learning goals has not appropriate yet (19.2%).
- Learning and assessment activities do not support the achievement of basic competencies (22.3%).
- Aspect of a character that wants to be fostered and promoted at every step of the 5-E learning cycle has not clear yet (23.6%).

##### 3.1.3 Student Activity Sheet (SAS)

- Purpose on SAS is not appropriate to the learning objectives in the lesson plan (27%).
- The formulation of goals in SAS has not in harmony with the activities carried out by students (29.6).
- The questions in SAS less referring to the results of activity (23%).

##### 3.1.4 Product Test

- In testing the aspects of product, the questions are not only measure aspects of knowledge but also developed to the high level of thinking (14.7%).

##### 3.1.5 Assessment Process

- Rubric assessment sheet is still common (18.9%).

Teachers do not put indicators and objectives in the syllabus due to the reference formulation based on the draft syllabus 2013 syllabus curriculum developed by the Center for Human Resource Development Ministry of Education and Culture. Similarly, the syllabus does not include an outline of what will be done by the students in the classroom. This is also happened to aspects of the character to be fostered and promoted in every 5-E learning cycle is not visible. Social learning theory of Bandura (1977) states that in general people learn at least from the closed-model before conducting a specific behavior. This is to avoid making unnecessary mistakes.

The study also found a discrepancy in the lesson plan between the indicator and the learning objectives. This is because the indicators are developed refer to the basic competencies that contain the concept or the study of physics. Similarly, the learning activities do not indicate or lead to the achievement of basic competencies. Student Activity Sheet contains some purpose not in accordance with the purpose of learning in the lesson plan. The Student Activity Sheet only contains most goals in the lesson plan. Other objectives will be achieved through other activities, such as discussion. A product test to higher level thinking in early learning based on experience is not developed yet. This is because in general students in Grade VII have not been trained to apply higher-level thinking. At subsequent meetings, then the high-level thinking skills trained. Some sections of the assessment process are still common, rise to a broad interpretation. The implication will lead to differences in interpretation of the evaluator. In anticipation of a different interpretation of the observer, the researcher then lead a meeting to have to have a same perception among observers, so that differences in interpretation can be minimized and the purpose of the assessment process can be achieved.

Constraints faced by science teacher lesson study participants in designing multi-model 5-E teaching preparation is the knowledge and understanding of a very wide variety of models and learning strategies that form the basis of multi-model. Moreover, according to the teachers, the 5-E learning cycle is a new thing, however, after the teacher modeled given reflection, then start the cycle V each participant's has reached a good average for their teaching preparation. Lewis *et al.* (2006 in Ibrahim *et al.*, 2014) illustrates that in the scheme of the two estimates of how the lesson study improve the quality of learning; that through collaborative lesson planning, the creation of the plan and a good

teaching preparation, there will be an increase in the quality of learning in the classroom.

b. Real Teaching

The mean scores achieved each teacher in each cycle models / meeting is presented in Figure 1 and Figure 2 as follows:

Based on Figure 1, after the core teachers show a model to the participants in the first cycle, then in the second cycle to cycle V multi-model 5-E the mean score of learning process that is achieved by teacher modeled is still fluctuate with a score of <3.0. This fluctuation is likely due to differences in the participants experience and teacher modeled performance, as well as external environmental factors at each school.

Figure 2. The implementation stage of multi-model E-5 for Every Cycle

Multi-model learning practiced by teacher modeled during the phase of real teaching in Cycle I and II use 5E-Direct Instruction (DI) -Inquiry. Cycle III and IV: 5E-DI-Cooperative Learning (CL) NHT. Cycle V: 5E-DI-Concept Mapping. Cycle VI: 5E-DI-PQ4R. Cycle VII: 5E-CL NHT-Concept Mapping. Cycle VIII: 5E-CL TPS-PQ4R. Cycle IX: 5E-CL-Jigsaw and inquiry. In Cycle X use E5-CL TPS-PQ4R.

Insight and knowledge of lesson study participants about aspects of each phase of the 5-E learning cycle is a factor that influences the performance in implementing the 5-E learning multi-model. Performance score of the teacher-model in each phase of the 5-E learning cycle presented in Figure 2; it appears that the fluctuation is relatively the same as the Figure 1.

In addition, in order for the application of the 5-E learning multi-model can optimally focus on the student, the teacher-models skills in implementing

the principles (things that need to be avoided) from the teaching of basic skills is also very important to be studied. The principles of teaching skills are as follows:

(1) Questioning skills; teacher models often repeat students' answers, answering his own question without trying to give guidance to students, and ask questions that invite answers simultaneously. These problems will hinder the assessment process. (2) Reinforcement; teachers generally give less reinforcement, both verbal and non-verbal. Even giving reinforcement often seems less warm, enthusiastic, and not be done immediately. (3) Learning variation; eye contact is intended only to certain students and teachers only be in one place and less make the turn position in the classroom, in guiding the discussion tends to be in certain groups without paying attention to group that needs more guidance. (4) Explaining; teachers still tend to be a lot of comments/lecturing and less guiding students to appreciate and use of evidence in solving a problem or formulate conclusions. This is resulted in the use of more time in each phase and less suitable to the lesson plan.

The phenomena of using the principles of teaching skills that have been presented are often visible at the end of the cycle, although the reduction has occurred. This is one indication of the importance of the well planned lesson study carried out continuously so that bad habits teacher in learning can be eliminated gradually. The study results of Subadi *et al.* (2013) showed that there are four issues to improve the professionalism of teachers through lesson study namely; (1) the internal problem of the teachers; (2) external issues; students, principals, education superintendent, environment, curriculum and facilities; (3) The problem with the commitment of teachers, and 4) the problem with the teacher concerns.

After several reflected and additional discussion of each stage of the 5-E learning cycle, then start the cycle VI scores achieved relatively increased teacher models and has been categorized as good (score 3.0) until the cycle IX (last meeting). According to Ono *et al.* (2013), the reflection is intended for process improvement cycle, so the quality of the reflection phase is seen as important to the success of the activity.

## 2. CONCLUSIONS AND RECOMMENDATIONS

Based on the research results, it can be formulated conclusions, namely, (1) Training Craft model on activity-based lesson study at junior high school science teacher association can improve teachers' skills to design and implement learning multi-model 5-E models. (2) The main obstacle that lesson study

participants in designing a learning tools is the lack of knowledge and understanding of the learning models and learning strategies as well as the 5-E learning cycle that is the basis for designing learning multi-model 5-E . (3) To improve the skills of teachers to implement the 5-E teaching multi-model-based students, the principles of the application of teaching skills need to be assessed as well.

Based on the results, this study suggested that activity-based Lesson study for Junior High School Science Teacher Association must be well-planned and implemented continuously. This is to broden teachers insight into the learning models, learning strategies as well as the phases of the 5-E learning cycle. By doing so, it is expected that teachers unprofessional habits in applying the 5-E learning multimodel can be eliminated gradually.

## 3. ACKNOWLEDGEMENTS

The authors would like to thank the Office of Education and Culture in Kendari for their support in this research. The authors also acknowledge that Lesson study program become the major programs to improve the quality of education in the city of Kendari. Principals for the school facilities support, their generosity has made the research process would run smoothly. Junior High School science teachers who joined the Lesson study for their attention and hard work so that activities can take place as expected.

**Abstract:** This lesson study examined how problem-based learning (PBL) and online flipped classroom are incorporated to help students construct the Chemistry knowledge on Qualitative Analysis. Students are given the opportunity to develop higher order thinking skills, through the problem-based learning approach, to allow students to play a more active role in learning. They can deepen their understanding and knowledge through self-directed learning (SDL), as they can explore beyond the classroom. Collaborative learning (CoL) is incorporated to promote meaningful interaction among students, and between teacher and students. To develop a learning community among the students, Information Communication Tool (ICT) is tapped on to provide a space to engage students more meaningfully and to track their learning progress. Thus, these different teaching modes are integrated to create a student-centered learning experience, which increases the students' learning and engagement level, in a safe environment. Based on the quantitative data, it is observed that students are receptive towards such learning modes.

**Keywords:** blended learning; student-centered; flipped classroom; problem-based learning; collaborative learning

## 1 INTRODUCTION

In alignment with Seng Kang Secondary School’s mission to nurture lifelong learners, a Professional Learning Team (PLT) worked collaboratively and implemented Blending Learning to enhance students’ learning. According to Catlin R. Tucker, Blended Learning in Grades 4-12, 2012, pg 11, blended learning refers to “the spectrum of teaching modes that combine traditional face-to-face instruction with an online component.” The purposes are to increase the students’ learning and engagement level, through collaborative learning using Information Communication Tool (ICT), in a safe environment, as well as to develop higher order thinking skills through the infusion of problem-based learning (PBL).

As Mr Heng Swee Kiat, our Ministry of Education, at the Ministry of Education Work Plan Seminar 2014, mentioned that ‘our students are changing’ and ‘demands in the future for our young people are changing - new jobs, new ways of working, new technologies, and new countries they will have to go to’, and thus ‘the ways we (teachers) are teaching are also changing. As we learn more about how people learn, we are improving our pedagogy.’ Thus, our PLT hopes to produce lesson packages which allow students to be exposed to the 21st Century Competencies of communication, collaboration and information skills.

## 2 METHOD

### 2.1 Participants

This lesson study involved forty Secondary Three Express Stream students, of age 15 years old.

### 2.2 Procedure

Blended Learning was implemented over 4.5 hours, over 8 sessions, facilitated by three teachers. The cycle included the following:

- Introduction of the Google site. Students were to watch the videos, uploaded on the Google Site, over the one week holiday, to help them to master the concepts at their own pace and time, based on their different learning ability. (flipped classroom concept)
- Students were then assessed on the practical skills, which they have learnt through the videos, to checking for understanding. (assessment for learning)
- After which, teachers explained the theoretical concepts of qualitative analysis of salts, with the use of the videos to strengthen the learning process. (traditional face-2-face teaching)
- At the last stage, each group of students was to solve their assigned problem-based

scenario collaboratively. The draft plan was submitted via the Google Site and peer feedback was gathered during class presentation. Upon improving their plan based on the feedback gathered, each group was to carry out the experiment to confirm their prediction. A report submission was finally expected from each group. (higher order thinking skills through problem-based learning)

An assumption was made that students required specific time to be set aside, for teachers to guide them to give constructive peer feedback, hence, an additional of one hour was set aside.

## 2.3 Results

### 2.3.1 Quantitative Analysis

Below are the questions that the teacher-facilitators had surveyed the students.

- I am involved in learning activities that helped me to analyse and evaluate the research information that resulted in improving my understanding of qualitative analysis of salts.
- The lesson allows us to work on learning activities that allow us to design our plans for the task.
- The use of Google Site allows peer learning, that is, I learnt from my peers’ feedback, which helps me to refine my plans.
- The use of Google Site facilitates peer learning which allows my group members to learn from each other.
- During the lesson, my classmates and I contribute ideas and consider the viewpoints of others to solve a real-life scenario.

Table 1 shows results from the perception survey conducted on 37 students.

Table 1: Results of the Perception Survey

Area of focus	Question No.	% of students who agree	% of students who disagree
Critical thinking	1	94.6	5.4
	2	94.6	5.4
Collaborative learning using ICT	3	97.3	2.7
	4	97.3	2.7
Articulate confidently	5	91.9	8.1

As shown in Table 1, the positive results indicated that students were receptive towards the different modes of learning.

### 2.3.2 Qualitative Analysis

Responses from the teachers were collected, so as to identify challenges and difficulties faced.

➤ Process of Flipped Classroom Concept  
Teachers discussed on the readiness level of the students towards flipped classroom model. They noticed that students, who completed their self-directed learning using the videos, were able to complete the practical assessment. However, there was a small group of students who lacked the self-discipline in such academic setting and thus hindered their learning progress.

*“The Flipped Classroom is beneficial for the motivated students as they can view the fundamental practical skills through the videos, and they are able pace their own learning. The individual practical assessment made the students more conscious that self-learning is important. From the test, students can conduct experiments that require practical skills but not on those that require critical thinking”*

*“The Flipped Classroom helps to free up curriculum time which can then be used to focus on the misconceptions observed during the practical assessment. It allows a few students to come forth and ask teacher questions, creating a student-centric environment.”*

➤ Process of Problem-Based Learning  
Through this experience, teacher-facilitators responded that students had difficulties in presenting their thinking on paper.

*“When I monitored students’ draft submission of their plan, I was not able to decipher what the groups want to do to identify the unknown salts. It was only through class presentation that the teachers questioned further for better understanding. The second submission was much better after some guidance from the teacher on the expectations on writing reports.”*

However, teacher-facilitators noticed that students need to be more confident in articulating in front of a class, although they did not have issue discussing within the groups.

*“Some students are not confident in public speaking and needs more practice for confidence building.”*

*“The peer critique session allowed the students to internalise the content and self-*

*arn. The teachers providing feedback on the students’ work was also beneficial as the proficiency level of students may not be high enough to spot some of the errors.”*

Another challenge that teacher-facilitators faced was that few students provided feedback on their peers’ draft plans submitted on the Google Site. Intervention had to be done to ensure that peer feedback was given to each group. Thus, class presentation was conducted where verbal peer feedback was collected, instead of through the online platform.

### 3 CONCLUSIONS

The lesson study is to apply blended learning in Chemistry so as to increase the students’ learning and engagement level, through collaborative learning using Information Communication Tool (ICT), in a safe environment, as well as to develop higher order thinking skills through the infusion of PBL.

From the quantitative analysis, it suggested that varied modes of engagement level seemed to appeal to this group of students who prefer hands-on activities and group work to traditional didactic teaching. They welcomed the idea of learning from their group mates as they could tap on one another’s strength and work harmoniously.

Teachers involved in the planning and facilitation felt that our students may not be ready to utilise an online component to develop effective learning community. As Catlin R. Tucker mentioned ‘...research suggests that they can be successful for independent, motivated, and self-discipline students.’ As teachers, we have to put the necessary inspiration and structure in place, so that students can be more receptive and engaged towards online learning.

Nevertheless, the use of blended learning provided students with varied modes of engagement level, as well as exposure to teamwork and real-world context. Exposure of using online component and providing opportunity for public speaking are two areas in which teachers need to incorporate more frequently into curriculum to be really effective and meaningful.

## IMPROVEMENT OF STUDENTS' ACTIVITIES IN LEARNING THROUGH DISCUSSION USING *LEVELING STUDENT WORKSHEET* STRATEGY

(*Lesson Study by Taking the Object of Calculus I Course in Semester 2*)

Nur Fauziyah

Muhammadiyah University of Gresik

E-mail: [nur\\_fauzia@yahoo.co.id](mailto:nur_fauzia@yahoo.co.id)

**Abstract:** As mathematics educator professional candidates, the students of Mathematics Education Department are equipped with professional competence as well as pedagogical, social and personality competence. Courses that support professional competence are skill courses, one of the which is Calculus 1. Calculus 1 is a basic course which must be mastered well by the students. But in reality the students are still hard to understand the material of Calculus 1. It is happened Because they just listen passively to the lecturer during the learning process and they do not want to think independently. Based on reviews these problems, the Lesson Study Team (LS) tried to apply the learning process to improve students' participation through discussion by using the Leveling Student Worksheet strategy. Leveling Student Worksheet strategy was conducted by giving the questions to the students with different levels of difficulty (Level 1 and Level 2). The students worked through group discussion and the results were presented to the class. The activities in this project (LS) were Carried out by 4 cycles and every cycle had 3 stages, namely *Plan*, *Do* and *See*. *Plan Stage* was Carried out by the team in order to develop learning equipments including syllabi, Lecture Plan (SAP), Student's Worksheet (LKM), and modules (hand-out). *Do Stage* was an implementation of *the Plan Stage* (learning equipments) into the learning process performed by a lecturer model. While the other team members did not become the lecturer model, they became the observers of students activities. After learning process had been completed, the team conducted a study or discussion called *See Stage* (reflection).Based on the analysis of the data on the observation of cycle 1 to 4 there was an improvement of the activity in students' learning process. It can be concluded that the *leveling student worksheet* strategy can improve student learning activity.

## INTRODUCTION

The Students of Mathematics Education Study Program are prepared to become mathematics educators. As prospective educators they must be equipped with professional competence, which is one of the competencies that should be possessed by professional educators. To support the professional competence, a curriculum is constructed which includes the subjects of expertise and one of them is Calculus. Calculus course is a basic course that is included in the analysis clump that must be mastered well by students as prospective educators to be the umbrella of mathematics in school. Calculus course in the curriculum of Mathematics Education Study Program of FKIP UMG, is divided into three parts, namely, Calculus I which is given in semester 2, Calculus II which is given in semester 3 and Calculus III which is given in semester 4. While the object of the implementation of *Lesson Study* for the second semester of the academic year 2012/2013 is Calculus I in semester 2.

In terms of concept, the material of Calculus I can be considered as standard, it means that it does not have much changed for the long term. Calculus I includes functions and graphs, function limits and continuity, derivatives and its applications, the integral and its applications. This subject provides the theoretical foundations for the other skill courses. Because the concept is standard then it is necessary to change and improve the problems which are the application of the concept. Besides that, a continuously improvement of the teaching techniques of the learning process in the classroom is needed.

The previous learning process is still relatively conventional learning. Learning process such as this is still centered on lecturers and students tend to passively listen to the course given by the lecturer. This passive participation of students in the learning process has an impact on students' understanding of the material, the students are only able to absorb the material that needs memorization just like the definition and nature, but the problems that require reasoning are not mastered by them. As an example, students understand the example of problems described by the lecturers, but they have trouble when working on the problems which are slightly different from the previous problems. It also adversely affects the communication ability and thinking ability. Based on these problems, the LS team tries to apply the learning in an attempt to improve students activities in learning through discussion with the *leveling student worksheet* strategy. *leveling student worksheet* strategy is the

use of LKM (student worksheet) with different levels of difficulty, it is gradually worked through group discussion and the results will be presented in front of the class. Hopefully through this strategy, students thinking skills and communication skills will grow and develop. Thus, the formulation of the problem in this LS-based research is "whether the *leveling student worksheet* strategy can improve the activity of the students in the learning process?"

## Method

To achieve the goal of this research which is to improve the activity of the students through discussion with the *leveling student worksheet* strategy, *lesson study* was implemented in the learning process. In the implementation of *lesson study* three stages were used in each cycle namely *plan*, *do* and *see*. Those three stages were carried out in four (4) times *lesson study* cycles. In accordance with the objective of this study, the focus in the implementation of this *lesson study* was the activity of the students in the learning process.

The subjects who were studied as source of the data in this lesson study were 42 students, while the lecturers involved were Nur Fauziyah, S.Pd., M.Pd., Midjan, S.Pd., M.Pd., Drs.Radi'iim Saputro, M.Ed. and Dra. Adrijanti, M.Pd.

**The stage of plan** was done 1 (one) week prior to the implementation of learning. *Plan* activities jointly conducted with the aim to assess the *teaching plan* and *teaching materials* that had been planned which includes course syllabus, lesson plan (RPP), materials or instructional materials which will be given to the students, teaching methods, student worksheets (LKM), the lecturer model, observers, and evaluation instruments which were needed.

**At the do stage**, lecturer model tred to implement the learning stages according to the lesson plan that had been studied and revised together in accordance with the advice and input. Meanwhile, three (3) other lecturers who did not become the lecturer model acted as *observers*. Observations were based on the observation sheet that had been prepared in the plan activity. Observations aimed towards students' learning activities during the lecturer to find interesting facts and phenomena related to the focus and goals which were to be achieved in the learning process. To strengthen the observation, documentation was created through photos and video recording (*audio-visual*) during the learning process.

**The Stages of Reflection** (*see*). Reflection activities carried out immediately after the completion of learning process. In this activity the

discussion of the facts or interesting phenomenon which were discovered during observations was conducted to analyze the possible causes and find a solution to fix it. The main concern in this discussion was the activities of student learning process not the lecturer model.

**Techniques and instrumentation for data collection.** In accordance with the focus set in *lesson study*, the data required in this lesson study include: (1) students' enthusiasm in listening to the lecturer, (2) The active participation of students in asking questions to the lecturer, (3) The active participation of students in answering questions given by the lecturer, (4) The ability to cooperate in working on LKM, (5) The ability to present the results of the discussion, (6) The ability to respond to the results of the presentations, (7) Timeliness in submitting LKM.

Data analysis technique used in this study was content analysis for the results of observations on *do* and *see stages*. In this content analysis these things were conducted, they are: information collection, reduction, verification and conclusion. To describe an increase in the activity of the students in the learning process descriptive data analysis was used.

## Results and Discussion

The description of the implementation *plan, do* and *see* for every material used in *the open lesson*.

### 1. Cycle 1 Plan (*Plan 1*)

Plan 1 was conducted jointly in the form of workshops of *teaching plan* and *teaching material* held in the *teleconference* room and continued in the math lab. Based on LS subject matter analysis, the decision was taken that the focus in the LS for Calculus I course was an increase in **the activity of the student in the learning process**.

Based on the analysis of the material, the definition and function notation, the area of origin and area results, describing the graph of the function, applying the concept graph of the function in daily problems, operation of functions and composition of functions would be used. For the learning models, STAD cooperative learning was used and the learning method was the discussion with the *leveling student worksheet strategy*.

Next was to revise the teaching materials which was in the form of module and making the material in the form of a power point. The last step was to develop an instrument of observation.

### Implementation (*do one*)

*Do one* was held on Tuesday, March 26, 2013 at 10:30 until 13:00 in the room D3.16. The lecturer model in this implementation of *do 1* was Drs. Radi'im Saputro, M.Ed.

The first step taken by the lecturer model was explaining the learning objectives. Lecturer presented the information to explain the material about definitions and notation functions as well as how to determine the area of origin and area results, drawing graphs of functions, and applying the concept of functions and graphs into real problems. The Media which was used in describing this material was the file in the form of a *power point* and *WinGeom software*. When the lecturer delivered an explanation of the material, **students still looked passive and the learning process seemed in an impressed tense atmosphere**. This was because the activities of *the lesson study* was the first time to be carried out so the students were still not accustomed to the presence of four lecturers in one class. Next lecturer model divided the students into 6 groups which were heterogeneous. Each student was given a name card taped to their backs with the aim to facilitate the lecturer to call the students and for the observers to identify the activities of all students. Each group was given LKM 1 level 1 and discuss it in the group. LKM 1 level 1 were collected after being completed, then two groups presented in front of the class. And so on until the LKM 2 level 2. **These discussions were still not going well, in every group there were still some students who did not dwell in the discussions, there were even a few groups which individually done the LKM without having discussion**. At the time of each group doing discussion to complete the LKM and having presentation, the observers were working hard to observe the activity of all students in each group. The results were recorded in observation instrument.

Figure 1. Students discussed in groups

At the end of the course, lecturer model along with the students concluded the material

and provided direction for further study material which was the material of limit.

### Reflection (see 1)

Reflection activities began immediately after the completion of learning activities, which was at 13:30 until 15:30. The evaluation given by lecturer model were (1) the material was too many so he must be in a hurry in the learning process, (2) collecting the LKM was not in accordance with the planned time allocation, (3) the class discussion was not going well, the question and answer were not well organized.

Furthermore, the observer conveyed interesting things related to current findings in the classroom observation, they were: (1) within each group there were 3 or more students who were not active in working group discussion, (2) there were still some students who do not pay attention when his friend doing presentation especially students who sat in the back, (3) group discussion could not be properly done because each student prefer to work alone in solving problems, (3) there was no clear division of tasks within each group discussion, (4) students were not able to think fast in solving problems in the LKM.

Based on the above problems, the solutions that had been found were (1) the material for subsequent learning was reduced so there will be more learning time for discussion because the focus was to increase the activity of students, (2) instructional materials in the form of a module was given 1 week before the lesson so that students can learn at home, (3) Before learning process started, a statement that the work for LKM have to be done in group not individually was emphasized (4) reducing the number of questions in each LKM and every level was adjusted with the time in the lesson plan.

## 2. Cycle 2

### Plan (Plan 2)

Plan 2 was held on Tuesday, April 2, 2013 at 14:00 until 16:00 in the math lab. The result of this *plan 2* activity were (1) reducing material to adjust with the allocation of time, because the learning process was more emphasized on the process of discussion related to focus in the LS. The material used in the RPP number 2 was the limit theorems and the continuity of a function. (2) Fixing module / teaching materials and immediately distribute them to students for studying in the home, (3) reducing the amount of questions in the first LKM in cycle 1 from more than 6 questions into 2 questions in each level of LKM, (4) organizing material in form of *power point*, (5) planning to give an explanation

to the students at the beginning of the learning process that the LKM was done by discussing, so that the division of tasks within the group should be clear and there was a group leader who led the discussion.

### Implementation (do 2)

Do 2 was held on Tuesday, April 9, 2013 at 10:30 until 13:00 in the room D3.16. Lecturer model for *do 2* implementation was Dra.Adrijanti, M.Pd. The first step taken by the lecturer model was delivering the learning objectives. At the core activities of teaching, lecturer model describes the material limit theorem and the continuity of the function by using *power point*. By the time lecturer model asked questions, students answer it together. **At the end of the explanation, lecturer provided the opportunity to ask for the students, but none of the students asked a question, it still looked like a tense classroom atmosphere.** Furthermore, the lecturer model divided the students into heterogeneous groups of 6 and each student was given a name card taped to their backs. Lecturer model provide LKM 1 level 1 in each group and students working on LKMs by doing group discussions. **The group discussions have been able to run pretty well, the discussions there led by a group leader.** After LKM 1 level 1 was completed, presentation activities did not done directly as in do one, but lecturer model gave LKM 1 level 2 and students rework the group discussion. After LKM 1 level 1 and 2 completed, several groups presented to the class, several other groups respond to them if there were answers which were different with theirs. The same activities was done for the LKM 2 level 1 and 2. **By the time of class discussions, students appeared to have an increase in the activity in giving different opinion for his friends, but the ability of the students in the presentation was still not good enough. There were still some students who were still passive, did not pay attention while the other group doing presentation, especially those who sat at the very back who were repeating students (6th semester).**

At the end of the course lecturer model gave students a chance to ask. Furthermore, the lecturer model along with the students concluded the material and provided direction for further study material was the material derivative.

### Reflections (see 2)

Reflection (see 2) began immediately after the completion of learning activities, which was at 13:30 until 15:30. Lecturer model stated the

problems were: (1) the difficulty of stimulating students to ask questions, (2) some of the students who sat in the back still looked passive, (3) low students' understanding of limit theorem, so that they had difficulty in doing the LKM.

Then observers conveyed: (1) the ability students in asking was low, (2) there were still some students who did not pay attention when his friends doing presentation, especially the students who sat in the back, (3) Group discussion had been able to run well because there was a group leader leading the discussion, (3) the students were not able to think quickly in solving problems in the LKM. Thus, the focus in the LS which was an increase in the activity of the students had not been achieved.

The solutions which had been found to overcome the above problems were (1) to change the seating position for all groups, which initially sitting behind changed into the front seat, (2) the groups that have to come forward to present their discussion were appointed by the lecturer model with the aim that all groups get a chance to present (3) If there were students who do not pay attention at the time of their friends' presentation, the lecturer model immediately warned them, (4) to increase students activity at the third meeting, lecturer model did not explain the material, but the students were asked **to discuss in group to understand definitions and examples of the material.**

### 3. Cycle 3 Plan (Plan 3)

Plan 3 activities held on Tuesday April 30, 2013 at 14:00 until 16:00 in the LS. The aim of the *plan 3* was to improve the learning devices that will be implemented in *do 3*. These improvements were based on the results of reflection (*see 2*) earlier.

The results of *plan 3* activities include: (1) the material which was used in preparing the lesson plan was a high-level derivative and derivative implicit as well as its application in everyday life. (2) Fixing module / teaching materials by using references from some Calculus books and reproduce some example problems and exercises in order for the student to discuss it before learning process was implemented, (3) developing LKM 1 level 1 and 2 and LKM 2 levels 1 and 2, (4) organizing the material in the form of *power point*, (4) planning to change the seating position for students sitting in the back to sit in the front, (5) during the learning plan if there were students who had not been active immediately chosen by the lecturer model to present as well as to respond to his friends' presentation.

Once all the instruments were revised, then the learning instruments were ready to be implemented in the form of learning process called *do 3*.

#### Implementation (*do 3*)

Activities of *do 3* was held on Tuesday, May 7, 2013 at 10:30 until 13:00 in the room D3.16. Lecturer model *for this do 3* was Nur Fauziyah, S.Pd., M. Pd.

The first step taken by the lecturer model was to deliver the learning objectives. Then lecturer model divided the students into 6 groups and **each group change the seating position, which at the previous meeting was in the back changed to sit in front.**

At the core activities of learning, the lecturer model did not explain the material like the previous meeting. Students were required to understand the definitions and example problems of high level derivatives and implicit derivative in the module by doing group discussion. At this third meeting students had begun to be trained to independently learn the materials, the lecturer model only gave an explanation when the student asked.

Furthermore lecturer model shared LKM 1 level 1, students doing group discussions to resolve it, then doing presentations and class discussions, it also happened for LKM 2 level 1 and 2. To speed up the process of presentation, the answers of LKM were written on wide cardboard / manila paper, so that when the presentation students just needed to put the paper on the board.

**At the time of class discussion students had begun to present the results of group discussions skillfully, other groups had also been able to respond to the results of the discussion well, exchanging arguments between groups had also begun to emerge. At this third learning activity, the students' activities had started to develop well, independent learning to understand the material had also begun to increase.**

Furthermore, the lecturer model along with the student concluded the material that has been studied and students were given referral material for further study that was integral.

#### Reflections (*see 3*)

Reflection (*see 3*) began immediately after the completion of learning process, which was at 13:30 until 15:30. Lecturer model stated: (1) students had difficulties in completing the LKM, because they did not master the prerequisites material which was about derivatives (derivatives rules and basic), (2) the need to provide a lot of standard derivative exercise

problems to students so that students were more skilled in solving problems.

The solutions which had been found to solve the above problems were: (1) providing a lot of exercise problems that were given to students in regular lectures, (2) practice questions added to the module.

The results of this reflection became the basis to improve the next lesson *instruments* which were arranged for plan 4.

#### 4. Cycle 4

##### Planning (*plan 4*)

Plan 4 activities held on Tuesday, May 21, 2013 at 14:00 until 16:00 in the LS.

The result of the plan 4 were (1) the material used in preparing lesson plan was integral in the completion of the application of broad plains and the volume of the turning objects. (2) Fixing module / instructional materials by adding illustrations of curve clearly which shows the area that were calculated, (3) developing LKM 1 level 1 and 2 and LKM 2 level 1 and 2, (4) organizing the material in the form of *power point*.

##### Implementation (*do 4*)

Activities *do 4* held on Tuesday, June 13, 2013 at 10:30 until 13:00 in room D3.16. Lecturer model of the implementation of *do 4* was Midjan, S.Pd., M. Pd.

The first step taken by the lecturer model was to deliver learning objectives, and lecturer model divided the students into 6 groups. At the core learning activities, the lecturer explained the stages to calculate the area of a curve by using the integral. **At the time of this learning process students became more active to ask either about the curve and the way of integration if the area under the  $x$ -axis as well as if there were two areas that overlap each other.**

After the class discussed with lecturer model as the facilitator, then the lecturer model shared LKM 1 level 1 and 2, the students doing group discussions to resolve it, then presentations and class discussions were done as well as for LKM 2 level 1 and 2. To speed up the process of presentation, the answers of LKM were written on cardboard / manila papers, so that when they did the presentation they just put the papers on the board, it's just that the writing on manila paper was too small so that students sitting in the back could not read it clearly.

**At the time of the students doing group discussions, each group member was active and the representatives of groups were able to present their discussions skillfully, other groups had also been able to respond to the results of the discussion well, exchanging**

**arguments between groups had begun to emerge. In this fourth learning process, the activity of students in the learning process has begun to increase, independent learning to understand the material and LKMs had also begun to rise.**

Figure 2. Students interacting with lecturer model (top) and students doing presentations (batton)

Furthermore, the lecturer model along with the student concluded the material which has been studied and students were given an instruction for further study which was the integral to calculate the surface area of the tube.

##### Reflections (*see 4*)

Reflection (*see 4*) held immediately after the completion of learning activities, which was at 14.00 till 15.30. The results of the discussions in the *see 4* were (1) Observers were emphasized for observing students not lecturer model, (2) the creativity of students was raised, (3) Utilizing IT in the learning process such as using softwares (matlab, maple, derive), (4) further emphasize was in the learning process to provide habituation to the students to find a formula to analyze the theorems.

#### 5. Data of Students' Activities in Learning Process

The Data based on the observation of the students' activities in the learning process started from cycle 1 to cycle 4 was as follows:

Table 1. Data of students activities in LKM discussion of cycle 1

No.	Activity	LKM 1		LKM 2	
		Level 1	Level 2	Level 1	Level 2
1	The number of students in each group who work together to complete the LKM	2	2	3	4
2	The ability of students to present the results of the discussion	Poorly	Poorly	Poorly	Poorly
3	The number of groups that responded to the results of the presentations	2	1	2	2
4	Timeliness in collecting LKM	Not the right time	Not the right time	Not the right time	Not the right time

Table 2. Data of students activities in LKM discussion of cycle 2

No.	Activity	LKM 1		LKM 2	
		Level 1	Level 2	Level 1	Level 2
1	The number of students in each group who work together to complete the LKM	6.	6.	5	6.
2	The ability of students to present the results of the discussion	Poorly	Poorly	Poorly	Poorly
3	The number of students who responded to the results of the presentations	2	3	2	1
4	Timeliness in collecting LKM	Timely	Not the right time	Not the right time	Not the right time

Table 3. Data of students activities in LKM discussion of cycle 3

No.	Activity	LKM 1		LKM 2	
		Level 1	Level 2	Level 1	Level 2
1	The number of students who work together to complete the LKM group	6.	7.	7.	7.
2	The ability of students to present the results of the discussion	Poorly	Poorly	Nice	Nice
3	The number of students who responded to the results of the presentations	3	2	3	2
4	Timeliness in collecting LKM	Timely	Timely	Timely	Timely

Table 4. Data of students activities in LKM discussion of cycle 4

No.	Activity	LKM 1		LKM 2	
		Level 1	Level 2	Level 1	Level 2
1	The number of students who work together to complete the LKM group	7.	7.	7.	7.
2	The ability of students to present the results of the discussion	Pretty good	Nice	Nice	Nice
3	The number of students who responded to the results of the presentations	4	3	2	3
4	Timeliness in collecting LKM	Timely	Timely	Timely	Timely

Ket:

Ability	Poorly	Pretty good	Nice
The ability of students to present the results of the discussion	Students simply read the answers on the LKM and could not explain if there was another group who gave responses	Students explain the answer on the LKM, but were not able to explain if there was another group who gave responses	Students explain the answer on the LKM and can explain if there was another group who gave responses

### Conclusion

Based on the data obtained and the results of the discussion in the implementation of *lesson study* for Calculus 1 in Mathematics Education of FKIP Muhammadiyah University of Gresik, it can be concluded that the *Leveling Student Worksheet* strategy can enhance the activity of students in learning and have an impact on the growth of thinking and communication skills.

### Suggestion

Based on the results obtained from the implementation of *lesson study* for Calculus 1 which can be perceived directly for students and teachers, the authors suggest to apply *the lesson study* for other courses so that the quality of learning process in Mathematics Education Study Program, Muhammadiyah University of Gresik can be improved.

## Algebraic Manipulation

Annabel Ho, Elaine Chua, Kerry He, Yeo Li Shan, Yong Jui Jin

**Abstract:** Research has shown that both virtual and physical manipulatives are effective learning tools for students in Algebra. The purpose of this study was to evaluate whether the use of virtual (Algetools) or physical manipulatives (Algediscs) enabled students to grasp the concept of Algebra. This study was based on a group of 19 students from Secondary 1 Normal Academic. In the first part of the study, students were taught to simplify algebraic expressions through the use of Algediscs. However, it was found that there was no significant difference in students' learning using only the physical manipulatives. Hence the team decided to examine if the use of Algetools enhanced students' learning in Algebra. Results from the pre and post-test measures showed that use of Algetools was effective in helping students better understanding the topic on solving algebraic equations. The exposure to the use of online manipulatives, Algetools, allowed them to translate from concrete to abstract representations more easily.

## 1. INTRODUCTION

According to the Secondary Mathematics Syllabuses (2006), Mathematics is ‘an excellent vehicle for development and improvement of a person’s intellectual competence in logical reasoning, spatial visualisation, analysis and abstract thought’. Mathematics develops students’ numeracy, reasoning, thinking skills, and problem solving skills. The emphasis on mathematics education will help gear students to be effective problem solvers and prepare students adequately to meet the challenges of the 21st century. The syllabus emphasizes the need for students to be provided with a variety of learning experiences.

Since algebra is an important milestone in secondary education, there is a need to ensure that students master it well. Algebra, however, pose a major challenge to students. Wong and Lee (2009) shared that the “concrete-representational- abstract” (CRA) three stage framework is listed as a key component of the Singapore Mathematics curriculum. Indeed, many students have difficulties transiting from arithmetic to algebra with its symbolism, equation solving and emphasis on relationships among quantities (Suh & Moyer, 2007).

To provide for students’ learning experiences, the use of manipulatives (concrete materials), practical work, and use of technological aid are used. Indeed research has highlighted the benefits of using manipulatives. The use of visual tools and manipulatives for algebra allows students to ‘internalise a visual language and develop habits of mind that will serve them well in high school’ (Gay & Velez, 2001) and promote students’ relational thinking (Greenes and Findell, 1999, Balka (1993). The use of manipulatives allows for a concrete representation of algebra, making it simpler for some students to understand than a symbolic model. (Bruner (1966), Goracke (2009)). Getting students to restate problems using their own words, draw diagrams to illustrate problems, or act out problems are ways students can demonstrate their ability to provide a concrete representation.

Online learning tools are defined as “computer based renditions of common mathematics manipulatives and tools” (Dorward, 2002, p.329) and provide “an interactive, Web-based visual representation of a dynamic object that presents opportunities for constructing mathematical knowledge” (Moyer, Bolyard, & Spikell, 2002, p. 373). NCTM (2000) stated that

“work with virtual manipulatives can allow young children to extend physical experience and to develop an initial understanding of sophisticated ideas like the use of algorithms”. The use of instructional software in Mathematics generally have a positive effect on student achievement in comparison to those without. (Final Report of the National Mathematics Advisory Panel, 2008).

However, Kaput (1989) cautioned that the connection between the use of manipulatives and understanding of algebra may not be automatic. Other research also warn about the possible dangers of using manipulatives when they are regarded as ‘play time activities’ (McNeil and Jarvin (2007) and ‘fun excursions’ (Moyer (2001), limiting the effect of manipulatives as a useful learning tool in Mathematics. Hence, effort and thinking should be given when designing the learning activities (Secondary Mathematics Syllabuses (2006)).

## 2. STUDY APPROACH

Using the MOE Mathematics framework as our basis, our research theme will be based on applying mathematics concepts in algebra. The objectives of the lesson study were to solve algebraic equations involving brackets using knowledge acquired in real numbers, simplification of algebraic expressions using direct teaching, manipulatives such as Algediscs and virtual manipulatives such as Algetools. This, too, allows students to engage in learning experience, aligning our lesson study to the new secondary Mathematics syllabus.

The initial discussion started off with the team consensus that algebra is one of the most important topics and most students were conceptually weak in it. Misconceptions were especially common when students learn algebraic simplification and solving of algebraic equations involving brackets. If these misconceptions are not addressed, these students continue to bring with them the common errors and tend to feel demoralised, even at the upper secondary level. In order to close this gap, the lesson study will be designed to scaffold students’ learning in Algebra. The target group of our research lesson was a group of 19 students from Secondary 1 Normal Academic. Students were taught using worksheets, demonstrations and with the use of manipulatives and ICT.

## 3. FINDINGS AND DISCUSSION

### 3.1 Lesson Study Cycle 1

After sharing the ideas members have in the teaching and learning of algebra, the team agreed to the use of Algediscs for the teaching of simplifying algebraic expressions. This part of the lesson aims at enhancing students' understanding of negative algebraic expressions. The use of manipulative allows students to bridge the gap from concrete and pictorial to abstract understanding. It allows them to explore the possibility of a unique understanding of a concept.

A pretest was given to both groups at the beginning of the research lesson based on Chapter 5 to test the homogeneity of the groups. After which, a posttest was then administered to both groups to test the difference in achievement levels.

### 3.2 Findings (Lesson Study Cycle 1)

The team collected and analyzed data from the pre and post-tests of lesson cycle 1 – simplifying linear expressions. A paired samples t-test revealed that the group did not show significant gains. These values are shown in Table 1. As these results indicate that the use of Algediscs are not significant in the achievement between the pre and post-test measures.

**Table 1.** A post lesson feedback survey was administered to capture the qualitative responses of students.

Statement	Percentage of students who agreed with the statement
The pace of the lesson was just right.	100.0%
I am confident enough to simplify algebraic expressions without the use of Algediscs	100.0%
I found the lesson fun and enjoyable.	94.7%
I think I can score well for this topic.	100.0%
During the lesson, I enjoy working in pairs.	88.2%
I work well with my friends	94.4%

Overall, the feedback provided by students with regard to the use of Algediscs for the lesson was encouraging and positive. Many students commented that the Algediscs has contributed positively to their learning. In addition, the majority of students also felt that working in pairs has helped enhance their learning experience.

### 3.3 Conclusion (Lesson Study Cycle 1)

The conclusions drawn from the lesson were that despite that the students enjoyed the lesson, they already had the necessary knowledge in using Algediscs to simplify algebraic expressions. Thus it did not enhance their learning. The group then came to a consensus to refine the lesson to using ICT-Algetools to solve algebraic equations.

### 3.4 Lesson Study Cycle 2

After which, another lesson was developed to teach students to solve linear algebraic equations. Making use of their knowledge of Algediscs, together with the use of Algetools, the next part of the lesson study was aimed at enhancing students' understanding of balancing the equation when solving. The Algetools provide a pictorial explanation of balancing the equation rather than the rote learning of moving terms in an equation.

The use of Algetools aims to enhance students understanding of solving algebraic equations through a balance. The manipulatives (Algediscs and Algediscs) provide a pictorial explanation of balancing the equation rather than using the rote learning of moving terms in an equation. At the same time, the lesson is such that students are expected to transfer the pictorial explanation into algebraic terms. This acts as a bridging tool.

Students are given opportunities to work in groups. This is in line with the learning outcomes of developing cooperative and confident learners. Through pair work, students question and reaffirm each other's responses and thinking. Team members were allocated to conduct observations during the lesson. The

#### Paired Samples Statistics

	Mean	No. of pupils	Standard Deviation	Standard Error Mean
Pre	5.81	16	2.073	0.518
Post	5.44	16	2.804	0.701

#### Paired Samples Correlations

	No. of pupils	Correlation	Significance
Pre & Post	16	0.692	0.003

#### Paired Samples Test

	Mean	SD	Std. Error Mean	95% CI Lower Upper	t	df	Sig. (2-tailed)
Pre & Post	0.375	2.028	0.507	0.756 1.256	0.739	15	0.471

#### Survey Results

main focus was to capture students’ conversations with the teacher and among the peers. Teachers then took the opportunity to highlight other common errors students may have in their learning.

The research lesson was based on solving algebraic equations involving brackets. A pre-test and post-test were administered to the group to test on the significant difference on the use of physical manipulative (Algediscs) and virtual manipulative through ICT (Algetools). At the same time, a post lesson feedback survey was administered to capture the qualitative responses of students.

### 3.5 Findings (Lesson study cycle 2)

The team collected and analyzed data from the pre and post-tests. A paired samples t-test revealed that the group showed significant gains from the research lesson. These values are shown in Table 3. As these results indicate, the use of ICT provided significant gains in achievement between the pre and post-test measures.

#### Paired Samples Statistics

	Mean	No. of pupils	Standard Deviation	Standard Error Mean
Pre	3.53	19	1.611	0.370
Post	4.38	19	1.344	0.313

#### Paired Samples Correlations

Pre & Post	No. of pupils	Correlation	Significance
	19	0.741	0.000

#### Paired Samples Test

	Mean	SD	Std. Error Mean	95% CI Lower Upper	t	df	Sig. (2-tailed)
Pre - Post	0.917	1.208	0.316	0.220 1.614	2.794	18	0.011

In addition to these overall results, the team also examined students’ perception of the use of ICT in learning. Table 4a shows the percentage of students who agree with the survey statements and table 4b shows the qualitative feedback from students.

#### Survey Results

Statement	Percentage of students who agreed with the statement
The pace of the lesson was just right.	78.9%
I am confident enough to solve algebraic equations without the use of Algetools.	100%
I found the lesson fun and enjoyable.	71.7%
I think I can score well for this topic.	89.5%
During the lesson, I enjoy working in pairs.	71.7%
I work well with my friends.	89.5%

#### Qualitative Feedback

Statement	Percentage of students who provided comments about lesson
Algetools help me understand the topic better.	26.3%
I liked the lesson.	47.4%
Working in pairs has helped me.	31.6%

### 4. CONCLUSION

This research shows how the use of ICT in teaching solving algebraic equations can contribute to student learning and promote relational thinking. Students’ exposure to online manipulatives allowed them to translate from concrete to abstract representations. The use of ICT helped to strengthen their developing understanding. The use of the tilting balance in Algetools promoted the understanding of equality in solving equations.

The teacher needs to take conscious effort in designing the learning activities. This is done through thinking through the lesson and providing scaffolding.

### 5. REFLECTIONS & LIMITATIONS

After going through the lesson study cycle, our group managed to pick up several salient from the process. For the topic on solving equations, we felt that our ICT lesson helped students reinforce the concept of “balancing the equation” by use of an actual animated beam balance shown on the screen.

However, our group also felt that we could have started the beam balance conceptualisation earlier for the students. For this current lesson study, students were exposed to the Algetools software after they already had knowledge of solving basic equations.

Because of this, we realised that a small group of higher ability students were less focused during the ICT lesson, mainly due to the fact that they had already mechanically mastered certain “shortcuts” that allowed them to find the

answer without going through the conceptually important “balancing” steps.

Hence, upon reflection, we noted that one of the areas of improvement could be to start with the “beam balance” conceptualization earlier where the class is at the exploratory stage of algebra, in conjunction with the Algetools software. This would then give our students a better foundation for understanding algebra before they are mechanically proficient in getting the correct numerical answers.

Another area which the group felt we could improve on was the students’ transition from using the software correctly to writing out the working on paper. Certain students were able to use the software to get to the desired solution, but when asked to solve a similar question on paper they were stuck and required assistance.

In order to help improve this in area, we thought about designing the worksheet and lesson such that this process becomes more guided for the students. One possible suggestion would for the teacher to help model the “screen – to-pen” transition where the teacher demonstrates to the class how and where each step in Algetools would correspond to a pen-and-paper working, with the students following the steps on their own worksheets. This method may also have the added advantage of appealing to kinesthetic learners as well.

<p>Checking understanding: If I have <math>(-x)(-x)(-x)(-x)(-x)</math>, what does this represent? [T to praise student if he is able to express it as <math>-5x</math> correctly.]</p> <p>Similarly when we add <math>-x</math> to <math>x</math>, we can make zero pairs. For example: <math>(-x)+(x)=0</math> Ie. <math>2x+(-2x)=0</math> <math>3x+(-3x)=0</math></p> <p><b><u>Adding and Subtracting Like and Unlike Terms – 15 mins</u></b></p> <p>In our previous lesson, we learnt how to add and subtract like terms. Today we include the use of Algediscs in our teaching and learning to help explain how to add and subtract algebraic expressions more clearly.</p> <p>When we have <math>2x + 3</math>, we represent it using</p>  <p>In pairs, students to express <math>y - 4</math> and <math>-x + 3y - 2</math> using the template and Algediscs provided for them. T to check answers with students.</p> <p>On your own, I would like you to draw discs to represent the algebraic expressions:</p> <ul style="list-style-type: none"> <li>• <math>6x + 2</math></li> <li>• <math>y - 5</math></li> <li>• <math>-2x - y - 1</math></li> </ul> <p>T to go through answers with students.</p> <p>In our previous lesson, we have also learnt how to simplify terms involving <math>x</math> and <math>y</math> by collecting like terms.</p>	<p><math>(-x)(-x)(-x)(-x)(-x)</math></p> <p>Students to say it is <math>-5x</math></p> <p>Students to use Algediscs to represent the expressions.</p> <p>Students to draw discs on handout.</p> <p>Students to draw discs</p>	<p>, then teacher re-explains concept of addition.</p> <p>Teacher to go through representation if students are unable to demonstrate; esp if students unable to show – representation.</p> <p><math>-2x</math> might be represented as <math>(-1)(-1)(x)</math> instead of <math>(-x)(-x)</math></p> <p>May attempt to draw out the sign in front of the <math>(x)(x)</math> to represent <math>-2x</math></p>
--	---	--

	<p>on handout.</p>	<p>Solution is similar in that teacher to go through the representations again with the class.</p> <p>Teacher to remind students to adhere closely to the steps.</p>
<p>In pairs, students to simplify <math>-3x + 4y + 3x - 2y</math> using the template and Algediscs provided for them.</p> <p>Practice</p> <ol style="list-style-type: none"> <li><math>3y + 1 - 4y - 3</math></li> <li><math>-3y - 1 + 4y + 3</math></li> <li><math>4x - 5y + x + 2y - 1</math></li> </ol> <p><b>Quick Recap on Simplifying Negative Algebraic Expression – 20 mins</b></p> <p>Today, we are going to learn how to add and subtract linear expressions. Before we begin, let's recap what we did when we use Algediscs in Chapter 2.</p> <p>We represent 1 by <b>1</b> and -1 by <b>-1</b>.</p> <p>So 4 is represented by 4 ones in a bracket <math>(1, 1, 1, 1)</math> and <math>-(4)</math> means <math>-(1, 1, 1, 1)</math>.</p> <p>When that happens, all the numbers in the box becomes negative and we get <math>(-1, -1, -1, -1)</math>.</p> <p>Teacher to model the same for</p> <ol style="list-style-type: none"> <li><math>-(-4)</math></li> <li><math>-(2x + 4)</math></li> <li><math>-(x - 4y + 2)</math></li> </ol> <p>Teacher to also show the working version at the same time.</p> <p>Students to discuss with their partners the steps taken to simplify a negative algebraic expression.</p> <p><b>Addition and Subtraction of Linear Expressions – 20 mins</b></p> <p>Today we are going to learn how to simplify an algebraic expression. Teacher to model how the working should be presented as well.</p>	<p>Students to use template to simplify expression.</p>	

Ex: $-(2x-3y)-(2y-9)$	$=$		
Step 1 $= 2x + 3y + 2y + 9$	$=$		
Step 2 $= 2x + 5y + 9$	$=$		
Step 3 $= x + 7y$	$=$		

Students to work on 2 examples with the teacher and complete the other 4 examples on their own.

- $3x + 1 + (-x + 2)$
- $4y - 3 + (y - 1)$
- $-5x - y - 4 + (-3x - y - 1)$
- $(2x - 1) - (3x + 2)$
- $(2x + 5y - 6) - (2y + 3)$
- $(-4x + y - 5) - (-2x - y - 4)$

Students to discuss with their partners the steps taken to add/subtract an algebraic expression. Teacher to go through the steps with the students. T to recap learning objectives with students

**Homework**

Students to add/subtract 4 algebraic expressions on their own without the use of discs.

- a)  $(4a + b) + (3a - 6b)$
- b) Find the sum of  $5p - 4q + 7$  and  $p + 5q - 3$ .
- c)  $(7y - 2) - (4y - 9)$
- d)  $(2a - 3b) - (4a + b)$

**B. Worksheet for lesson study cycle 1**

Name: \_\_\_\_\_ ( )

Date: \_\_\_\_\_

Class: \_\_\_\_\_

**Broadrick Secondary School - Chapter 5 Algebraic Manipulation**

**Chapter 5.1: Like Terms and Unlike Terms**

**Using Algediscs**

We can use discs to represent algebraic expressions.

**Example 1**

$2x + 3$	
----------	---

Show how you would use discs to represent the following algebraic expressions below:

$y - 4$
$-x + 3y - 2$

**Practice 1**

Draw discs to illustrate the following algebraic expressions below:

$6x + 2$	
$y - 5$	
$-2x - y - 1$	

**Example 2**

We can simplify terms involving  $x$  and  $y$  by collecting like terms.

Working	Drawing
$2x + 3y - 5x + y$  $2x + 3y - 5x + y$ $= 2x - 5x + 3y + y$ $= \underline{\quad\quad} + \underline{\quad\quad}$	

Show how you would use discs to represent the following algebraic expressions below:

$$-3x + 4y + 3x - 2y$$

**Practice 2**

Draw discs to illustrate the simplification of algebraic expressions below:

Working	Drawing
$3y + 1 - 4y - 3$	
$-3y - 1 + 4y + 3$	
$4x - 5y + x + 2y - 1$	

## Quick Recap on Simplifying Negative Algebraic Expression

### Example 3

$-(4)$ $= -4$	$-( \textcircled{1} \textcircled{1} \textcircled{1} \textcircled{1} )$ $= \textcircled{-1} \textcircled{-1} \textcircled{-1} \textcircled{-1}$
$-(-4)$ $=$	$-( \textcircled{-1} \textcircled{-1} \textcircled{-1} \textcircled{-1} )$ $= \textcircled{\quad} \textcircled{\quad} \textcircled{\quad} \textcircled{\quad}$
$-(2x + 4)$ $=$	$-( \textcircled{x} \textcircled{x} \textcircled{1} \textcircled{1} \textcircled{1} \textcircled{1} )$ $= \textcircled{\quad} \textcircled{\quad} \textcircled{\quad} \textcircled{\quad} \textcircled{\quad} \textcircled{\quad}$
$-(x - 4y + 2)$ $=$	$-( \textcircled{x} \textcircled{-y} \textcircled{-y} \textcircled{-y} \textcircled{-y} \textcircled{1} \textcircled{1} )$ $= \textcircled{\quad} \textcircled{\quad} \textcircled{\quad} \textcircled{\quad} \textcircled{\quad} \textcircled{\quad} \textcircled{\quad}$

Pause & Think

Discuss with your partner the steps taken to **simplify a negative algebraic expression without the use of discs.**

## Chapter 5.2: Addition and Subtraction of Linear Expressions

What are Linear Expressions?

Algebraic expression like  $3n + 1$  and  $-2x + 5y - 4$  are called **linear expressions**. Each term has at most one variable to the power 1.  
We can add and subtract linear expressions by **removing brackets and collecting like terms**.

We can add and subtract algebraic expressions by collecting and simplifying like terms.

### Example 4

E.g.	$-(2x - 3y) + (4y + x)$	$- \left( \begin{array}{ccccc} \textcircled{x} & \textcircled{x} & \textcircled{-y} & \textcircled{-y} & \textcircled{-y} \end{array} \right)$ $+ \left( \begin{array}{ccccc} \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{x} \end{array} \right)$
Step 1	$= -2x + 3y + 4y + x$	$= \begin{array}{ccccc} \textcircled{-x} & \textcircled{-x} & \textcircled{y} & \textcircled{y} & \textcircled{y} \\ \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{x} \end{array}$
Step 2	$= -2x + x + 3y + 4y$	$= \begin{array}{ccccccc} \textcircled{-x} & \textcircled{-x} & \textcircled{x} & & & & \\ \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} \end{array}$
Step 3	$= -x + 7y$	$= \begin{array}{ccccccc} \textcircled{-x} & & & & & & \\ \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} & \textcircled{y} \end{array}$

**Practice 4**

Using the templates provided for you, simplify the following algebraic expressions.

$3x + 1 + (-x + 2)$	
Step 1:	
Step 2:	
Step 3:	

$4y - 3 + (y - 1)$	
Step 1:	
Step 2:	
Step 3:	

$-5x - y - 4 + (-3x - y - 1)$	
Step 1:	
Step 2:	
Step 3:	

Pause and Think

Discuss with your partner the steps taken to **add algebraic expressions without the use of discs.**

1. \_\_\_\_\_  
\_\_\_\_\_
2. \_\_\_\_\_

$(2x - 1) - (3x + 2)$	
Step 1:	
Step 2:	
Step 3:	

$(2x + 5y - 6) - (2y + 3)$	
Step 1:	
Step 2:	
Step 3:	

$(-4x + y - 5) - (-2x - y - 4)$	
Step 1:	
Step 2:	
Step 3:	

Pause & Think

Discuss with your partner the steps taken to **subtract algebraic expressions without the use of discs.**

1. \_\_\_\_\_  
\_\_\_\_\_
2. \_\_\_\_\_  
\_\_\_\_\_

On My Own Questions

Simplify the following algebraic expressions without the use of discs.

a)  $(4a + b) + (3a - 6b)$

b) Find the sum of  $5p - 4q + 7$  and  $p + 5q - 3$ .

c)  $(7y - 2) - (4y - 9)$

d)  $(2a - 3b) - (4a + b)$

**C. Worksheet for lesson study cycle 2**

Name: \_\_\_\_\_ ( )      Class: \_\_\_\_\_      Date: \_\_\_\_\_

**Example 1**

$$3(3x) = 2(3x + 6)$$

**Guided Practice 1**

$$4(x + 1) = 3(2x + 5)$$

**On your Own 1**

$$2(5x) = 3(2x + 8)$$

**On your Own 2**

$$6(x + 2) = 2(2x - 8)$$

**On your Own 3**

$$5(x + 1) + 2(1 - 2x) = 0$$

Solve the following equations

1.  $7(x+2) = 2(2x+9)$

2.  $-2(3x-4) = 3(x-2)$

3.  $7-5(3x-4) = 3(x-2)$

**D. Pre and post-test for lesson study cycle 1**

**Chapter 5 Pre test**

Simplify	
<b>1</b>	$-3b + 7b =$
<b>2</b>	$5x + 2x - 9x =$
<b>3</b>	$-2q - 3q + 4q =$
<b>4</b>	$3y + 1 - 5y + 3 =$
<b>5</b>	$-4px + 2x - 9x + 6px =$
<b>6</b>	$2x^2 - 3x + 9x - x^2 =$
<b>7</b>	$-6 + 3m - 10m + 3 =$
<b>8</b>	$abc + 2bca - 3ac + 8ca =$
<b>9</b>	$\frac{2}{3}a + 2 - \frac{1}{2}a - \frac{1}{2} =$
<b>10</b>	$\frac{1}{3}a - b + 2 + \frac{1}{2}a - \frac{1}{2} - \frac{3}{2}b =$

**Chapter 5 Post test**

Simplify	
<b>1</b>	$-(-5x + 2x) =$
<b>2</b>	$-(3b + 7a - 2) =$
<b>3</b>	$(2a + 3b) + (4a - 7b) =$
<b>4</b>	$(3y + 1) - (5y + 3) =$
<b>5</b>	$(-4p + 2x) - (6p - 9x) =$
<b>6</b>	$4m - 2n + 1 - (-m - 2n + 3) =$
<b>7</b>	$-(-6 + 3m) + (10m - 3) =$
<b>8</b>	$3ac - (2ac - 1) + (-1 + ac) =$
<b>9</b>	$\left(\frac{2}{3}a + 2\right) - \left(\frac{1}{2}a - \frac{1}{2}\right) =$
<b>10</b>	$\left(\frac{1}{3}a - b + 2\right) + \left(\frac{1}{2}a - \frac{1}{2} - \frac{3}{2}b\right) =$

**E. Pre and post-test for lesson study cycle 2**

**Chapter 6 Pre test**

<b>1</b>	$a - 7 = 1$	<b>5</b>	$4 - 3f + 2 = 9$
<b>2</b>	$3b + 1 = 10$	<b>6</b>	$-3g + 4 = -5g + 8$
<b>3</b>	$\frac{1}{2}c - 2 = 0$	<b>7</b>	$3h + 5h - 1 = 4h + 7$
<b>4</b>	$1 - \frac{x}{5} = 2$	<b>8</b>	$-2k - 1 = 2k - 3$

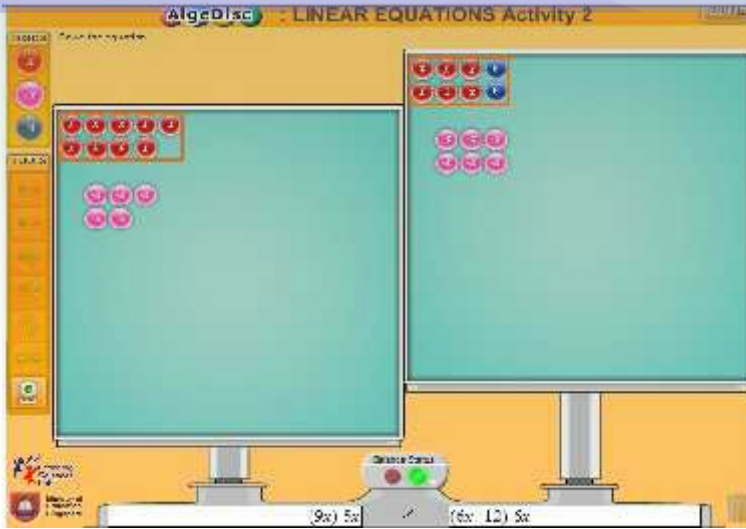

**Chapter 6 Post test**

<b>1</b>	$2x - 4 = 3(1 - 2x)$	<b>5</b>	$4(-2x + 3) = 2(x - 2)$
<b>2</b>	$3(8 + 5x) = -12 + 3x$	<b>6</b>	$2(4x) - (-2x + 6) = 0$
<b>3</b>	$3(4y - 1) = 7(2y - 5)$	<b>7</b>	$\frac{y}{3} + 1 = y - 1$
<b>4</b>	$5(x + 3) - 4(x - 2) = 0$	<b>8</b>	$10(x - 2) = \frac{2}{3}(6x + 6)$

**F. Printscreen of Algetools**

**G. Observation Notes for Lesson Study Cycle 1**

	<b>GROUPWORK / Positive Interdependence</b>	Yes / No	DESCRIPTION OF OBSERVATIONS / EXAMPLES
	<b>Problem Solving Process</b>		
	Does the pair work cooperatively to solve the problem?	Yes	<p>Check each other’s answers and discuss if necessary</p> <p>Work on different brackets before grouping terms            Student 1: I don’t know how you are doing            Student 2: This is my way.</p>
	Does the pair encourage each other in their respective role to solve the problem?	Y	Healthy discussions and the checking of answers were observed.
	Does the pair understand the task?	Y	<p>Able to remove brackets and flip the signs</p> <p>Can do with and without the Algediscs</p>
		N	<p>Put all the terms into 1 brackets of the playing mat</p> <p>Use the operations symbol cards for the operations within brackets</p> <p>Brought down all the terms in the playing mat when removing brackets without changing signs</p>

	Is the pair engaged in the task?	Y	Every students was on task
	How do the students differentiate like and unlike terms? Are they able to differentiate them?		Use of disc allow students to differentiate easily Students can confidently collect like terms and simplify.
	Are the students able to group the terms and use zero pairs correctly?	Y N	Able to group terms $-5x-3x=-7x$
	How do the students treat negative variables in the expressions?(How do students remove brackets)		Simply flip the signs whenever there are brackets  1 student wrote ‘ $-(4x+5) = +4x - 5$ ’. Do not see the invisible ‘+’ before $4x$ , thus take it as ‘-’, and after flipping becomes ‘+’ Students represent the expression $-(-y)$ using Algediscs as Operation + variable $[-(-y)]$ rather than simply using 1 AlgeDisc $[(-y)]$ . For the question $x-3y$ , one group represented it using Algediscs as $(x)-(-y)(y)(y)$ .
	Do you observe a certain pattern that students have when they simplify the expression?		Follow the 3 steps (remove bracket, flip sign if necessary, simply)  1 student wrote ‘ $-(4x+1) = -4x + (-1)$ ’

	Do the students check their solutions after they have simplified the expression?	N	But a few do look back at the question to see if they obtained the same answer if they did it without discs
	Others		Insufficient Algediscs for teachers eh ‘y’

**H. Observations Notes for lesson study cycle 2**

	<b>GROUPWORK / Positive Interdependance</b>	Yes / No	DESCRIPTION OF OBSERVATIONS / EXAMPLES
	<b>Problem Solving Process</b>		
	Does the pair (if any) work cooperatively to solve the problem?	N  Y	Most of the pairs were focused on their own screens and only communicated when they needed technical help with the software. (JJ)  When faced with difficulty in entering the problem into the software, pair consultation was often seen.
	Does the pair/ student understand the task?	Y	Some can understand the use of Algetools to balance the equations and to form zero pairs.

	Is the pair/ student engaged in the task?	Y	Students were mostly engaged once the they could start the task.(JJ)
	Do students show that they are confident in removing brackets in grouping like terms in operations of real numbers	Y	Students were able to figure out the mathematical steps of the process even if they were not able to figure out how to use the Algetools software to demonstrate how.(JJ)
	Are the students able to group the terms and use zero pairs correctly? Do students use their prior knowledge in Real numbers to apply in solving algebraic equations?	Y	Students know how many ‘1s’ to add in order to form zero pairs.
	Are the students dependent on the Algedisc/ Algetools?	N	The students prefer their own method of “flipping” terms when moving them from one side of an equation to another.(JJ)

## Implementation of Lesson Study to Improve Competences of Lecturers

Lily Maysari Angraini Ms

*Physics education department of STKIP Hamzanwadi Selong, East Lombok NTB, Indonesia.*

[lilyangraini@gmail.com](mailto:lilyangraini@gmail.com)

**Abstract:**

Lesson study is a cycle in which teachers work together to consider their long-term goal for student, bring those goal to life in actual “research lessons”, and collaboratively observe, discuss, and refine the lesson. From the definition, detectable seven of number keyword which can be analogy as an impact the implementation this model to improve the lecturers competences (i.e. personality abilities, social abilities professional abilities, and pedagogical abilities). The seven of number keyword are professional development, learning investigate, collaborative, continuity, collegiality, mutual learning, and study community. The purpose of this research to know the implementation of lesson study to improve competences of lecturers. Research held at physics education department of STKIP Hamzanwadi Selong in the topic optic and classical mechanics. The result showed that implementation of lesson study can improve competences of lecturers, i.e personality abilities, social abilities, professional abilities, and pedagogical abilities. Based on these result can be conclude that the implementation of lesson study can improve competences of lecturers at physics education department of STKIP Hamzanwadi Selong. From the result of the open class, lecturer can review and improve quality learning and make an easy and a fun learning for student’s motivation. So the result of their learning can be increase. Implementation lesson study in each topic of lesson better to be developed lecturer to become professional lecture, and will give positive affect to world of university which is produced prospective teachers. Therefore, lecturers hopely do the lesson study continuously.

**Keyword :**

Lesson Study, Lecturer Personality Ability, Lecturer Social Ability, Lecturer Professional Ability, and Pedagogical Ability.

## 1. INTRODUCTION

The view that has lasted a long time that puts learning as a process of information transfer or the transfer of knowledge from faculty to students getting a lot of criticism. Placement of lecturers as the only source of information to make the student or students are not as dynamic individual, but rather as a passive object so that the potential keindividualannya can not develop optimally. This is not in accordance with the nature of education is to empower human effort. Humans are powerless is man who can think creatively, independent and that can establish itself and its people. Therefore, we need a new paradigm of learning.

Gordon (Aunurrahman, 2011: 4) states that the development of the students is a goal to be achieved by all colleges and lecturers, and that means very wrong if the lecturer is only responsible for delivering the material to the eyes. Development of potential college students in the learning process should be conducted a comprehensive and integrated. Development potential of students disproportionately in turn will make education tend to be more concerned with the development of certain aspects of personality, is particular and partial.

This phenomenon delivering the World Bank in 2005 to do research related to the ratio of access and quality of education in Indonesia. Produced that education in Indonesia only reached levels of thinking (cognitive) low, remember, understand, and apply, whereas for levels of high thinking like analyzing, evaluating and creating still very low.

The same problems facing education courses High School Mathematics Teaching and Education (STKIP) Hamzanwadi-Selong. The learning process that has been applied is still dominated by a model of learning that is based on the philosophy of behaviorism, which is centered learning lecturer (teacher-centered learning), based on the subject matter, and assessment in the form of paper and pencil tests conducted at the end of each subject, which is based on procedural results and understanding of the concept. It is seen from the Unit Class Events compiled by each lecturer. Strategies, methods and media that applied dominated by lectures, discussions, question and answer, and administration tasks. Likewise with the information obtained from the journal lectures. Teaching and learning activities are carried out during one semester dominated by discussions, questions and answers and lectures

Based on interviews with several student education department of physics STKIP Hamzanwadi-Selong, learning is dominated by discussions, divide the topic / sub-chapter discussion that will be compiled into a paper, then presented in

accordance with the serial number of groups that have been determined, and sometimes students were assigned to make resume if the meeting is less than it should. Of the studies that have been done, it appears that the contents of the paper presented a copy of the student group or copy and paste the material or opinions that exist on the Internet (download), without an opinion or analysis of the material or the opinion. According Kindvatter, et al, (Paul Suparno, 2007: 129) discussion method is a method of learning with group discussion that is instructive, reflective, structured and shared with other students. The point is a conversation, where students with student talks, the exchange of ideas and ideas with others. However, in practice, many students are not able to express ideas / basic critical thinking related to the material discussed. So the ability to think critically as analyze, create hypotheses, forming the synthesis and evaluation of information not honed and trained.

From the description of some of the problems faced physical education courses STKIP Hamzanwadi Selong, it can be concluded that the real subject matter rooted in agueness hierarchy teaching and learning processes implemented. Planning, implementation and reflection of teaching and learning process is never carried out continuously, collegiality and accountability. This is because in general the teachers prefer to work alone in preparing and carrying out the course. In addition, the faculty has not been fully aware of the competencies that must be owned and developed pedagogical competence, social competence, competence personalities and professional competence are implemented in research, teaching and community service

The low awareness of their competence and must be developed to make faculty generally have a high ego, feel super, do not easily accept input for improvement of lectures. Though there are no lectures perfect, there is always room for improvement. Therefore, the necessary reforms and improvements to the mindset of lecturers so that they can collaborate and want bersharing with other professors and lectures are open to improvement. Lesson Study is an alternative approach that is appropriate to improve the mindset of the faculty in the lecture.

Lesson Study is a model of professional development education through collaborative learning assessment and sustainable, based on the principles of collegiality of mutual help in learning to build a learning community. By implementing Lesson Study in learning, will be able to provide opportunities for teachers and lecturers for learning how to learn and learn about teaching and as a means to develop the competences of the lecturers.

## 2. METHODS

This study is an action that uses qualitative descriptive approach. The study was conducted in physics education courses STKIP Hamzanwadi Selong in 6 subjects are subjects magnetic electricity, electronics 2, 1 basic physics, thermodynamics, optics and mechanics 2. Subjects were first semester students on basic physics course 1, 3 semester students on the subject of electric magnet, 4th semester students on courses 2 electronics, thermodynamics, optics, and mechanics 2. The experiment was conducted in the first half and odd semester 2012/2013 and the 2013/2014 academic year. The instrument used in this study include (1) sheet enforceability of measures lesson study covering the planning, implementation and reflection, (2) learning observation sheet, (3) faculty competence assessment rubric contains aspects of the assessment as the indicators of pedagogical competence, competence indicator professional, social competence indicators and indicators of competence personalities during the stages of lesson study, and video recording stages of lesson study.

## 3. RESULTS AND DISCUSSION

In this study, the data obtained is the result of observation of the observer.

### 3.1 Ability Pedagogical of Lecturer

Lesson planning activities undertaken collaboratively to improve the quality of lecturers in preparing Unit Class Event (SAP) and also can improve the ability of pedagogical faculty. Pedagogic ability lecturer assessed at each open class activities by parfa observers were present through the assessment rubric pedagogical ability consisting of four aspects of assessment, namely open lessons, conducting core, assessment and reflection, as well as supporting factors include the use of language, timing, sense confidence and appearance. Here are the results of the assessment of the observers associated with the ability of pedagogical faculty in each course:

Table 1.1 Results of pedagogical capability assessment

course	Open Class	aspects of Assessment	score	Total Score
Listrik Magnet	I	Opens Learning	2	59
		Do	3

Some reasons lesson study can improve the ability of edagogic faculty is:

- Lesson study is an alternative method that can improve the quality of student learning membelajarkan and activities. This is because a) the development of lesson study conducted and based on the results of "sharing" which is based on professional knowledge and teaching practices are implemented on the lecturer; b) the emphasis fundamentally a lesson study is the quality of student learning; c) be a focus of learning objectives and the main focal point in the classroom; d) lesson study will put the role of the faculty as a researcher learning (Lewis, 2002 in Syamsuri 2008: 31).
- Lesson study designed properly will produce a professional and innovative faculty. By

implementing lesson study the lecturers can: a) determining the learning objectives (lessons) lesson plans, teaching methods are effective; b) to review and improve the useful lessons for students; c) deepen the knowledge of teaching materials presented lecturers; d) determine the long-term goals to be achieved student; e) plan lessons berkolaboratif; f) carefully assess student learning and behavior; g) develop reliable knowledge learning; and h) to reflect on the teaching that the implementation is based on the views of students and colleagues (Lewis, 2002 in Syamsuri 2008: 32), so that teachers can know the learning is done by reflection from the point of view of the observer and student to be able to do a better learning innovation.

### 3.2 Personality Ability Lecturer

indicator	aspects of Assessment	Visible	Unvisible
Acting in accordance with the norms of religion, law, social and national culture	Develop cooperation and foster solidarity with colleagues regardless of the differences that exist (eg, ethnicity, religion and gender)	✓	
	Mutual respect and appreciate peers in accordance with the conditions and the presence of each.	✓	
Showed that adult personality and exemplary	Behave decently in the talk, look and act towards all students, and peers.	✓	
	Want to share their experiences with friends	✓	
	Able to manage learning that prove that lecturers respected by his students, so that all faculty and students always pay attention to actively participate in every lesson.	✓	
	Mature way of receiving feedback from learners and give learners the opportunity to participate in the learning process.	✓	
Work ethic, high responsibility and are proud to be an advanced faculty	Start and end on time learning	✓	

### 3.3 Social Abilities Lecturer

Indicator	aspects of Assessment	Visible	Unvisible
Be inclusive, to act objectively, and not discriminatory	professors treat students fairly, provide care and assistance according to the needs of each, regardless of the personal factor	✓	
	lecturers maintain good relations with peers and caring, as well as contribute positively to all formal and informal discussions with his employment	✓	
Communication with fellow faculty, staff, students and community	To actively participate in learning activities organized outside the campus and the community and can provide proof of participation.	✓	

### 3.4 Lecturer Professional Competence

Indicator	Aspects of assesment	Visible	Unvisible
Mastery of the material, structure, concepts and scientific mindset that supports the course of teaching	Lecturer standard mapping and basic competencies for the course of teaching, to identify teaching materials that are considered difficult, doing the planning and implementation of learning and estimate the time required allocation	✓	
Developing professionalism through effective action	Specifically the self-evaluation, complete and supported with examples of their own experiences.	✓	
	Having a learning journal, record input from colleagues or learning assessment	✓	

	results as evidence that describes performance.		
	Doing research, community service, developing the work, innovation, following the seminar and actively carry out continuous professional development.	✓	
	Harnessing ICT to communicate and ongoing professional development.	✓	

Implementation of lesson study in each study looks capable of increasing the competence of lecturers. According Hendayana, S, et al (2007) stated that the lesson study is a model of professional development of educators through collaborative assessment and sustainable pembelajaran based on the principles of collegiality and mutual learning to construct a learning community.

Based on the experience of researchers, as PIC lesson study in the department of physical education STKIP Hamzanwadi Selong, it appears that the more activity sharing between lesson study groups in terms of preparing the lesson plan including the preparation of materials can increase the confidence in implementing learning activities. Of positive inputs given by the observer can motivate lecturers in order to improve the learning process and choose innovative methods for improving the quality of subsequent learning.

The positive impact of the implementation of lesson study to improve the competence of lecturers include: 1) the communication that exists between lecturers, the better. The phenomenon that often occurs is reluctance to collaborate in the design implementation of learning, so that social komepetensi will be understood and applied in the relationship between peers and the surrounding environment. 2) faculty will strive to plan the best possible learning, choosing an innovative method, and think about what would be the learning objectives will be achieved; 3) lesson study also lokakarya PLEASE 2013 di Sekolah Tinggi Theologi Aletheia

**Abstract:** Firstly, education for special teachers is prepared only for inclusion setting, so that special teachers are the ones with special skills to educate the special children in exclusion setting. Inclusive education, gives new perspective about the nature of human and education. The question concerning how the professional special teachers in the inclusion setting should be. Universal prevalence, recognize two stages of education pursued by each profession, which are the academic education and professional education. In special education profession, this issue is also prevalent. To become a professional special teacher, although special teacher have bachelor, magister, or even doctor degree as their qualification (academic), they have to take professional education. Grant research of Dikti (2008-2009) find special teacher's professionalization via special education scholarly was illustrated in pyramid competencies, that consists of common basic subject, specificity, and professional subject. However, there is a problem, because bachelor degree is only in academic program, not professional, so that the peak of the pyramid that is about professionalism is lost in the context, because it is more feasible in profession program. This condition is more complex if it is associated with specialization context. Meanwhile, the needs of special teacher in inclusion setting was raised and it is become an urgency to revise a curriculum at three universities (UPI, UNJ, and UNJ). As LPTK department of Special Education FIP UPI, disappointed to re-design academic education and professional education, so that both of them is appertain and obtain a professional special teacher. This paper is reviewing about how a special teacher is prepared with respect to conceptual, contextual, and the application. Although, the focus of this study is on gifted teacher that had been either in exclusion nor inclusion setting. The 2013' curriculum has actually already led to inclusion; that essence need to explain intelligently so that it can be meaningful.

**Keywords:** special teacher, specialization, exclusion setting, academic program, professionalism

## 1. INTRODUCTION

The Special Teacher study program that developed and established in a community in a certain period of time must also be influenced by a certain context as well. The perspective on education, learning, and teaching are the most important issues in planning and implementing the study program for Special Teacher. A research conducted by Multi Years—that is funded by foundation of DP2M —Dikti that uses Sandwich approach, resulted on obtaining the empirical model of the professional special teachers. This result makes new alternatives to the institution on preparing the candidates to become the special teachers (Yuyus, et al; 2008-2010). This result, however, shows that what has been prepared in the S1 (bachelor degree) program concerning profession of special teachers has been excessive, which means there should be reconsideration because it is necessary for the candidates to go through vocational (professional) department to become a professional special teacher. Thus, there should be the addition on professional portion for the students in the special education department in S1, S2, and S3—bachelor, master, or doctoral degree—so that the portion of time and the Chs will be more effective.

In historical perspective, the Special Teacher study program was firstly developed for the teachers that work in exclusive setting both in segregative and integrative. The inclusive education perspective, however, keeps developing and then raises the awareness that the general and special teachers need to have competence in this field. The effort to establish the competence is based on the definition on teachers’ skills concerning on how they behave in the class and construct a syllabus and another teaching plan that focus in specific competency. The community demand, the available resources, social expectancy, needs, teachers’ role, as well as the schools’ authority will influence the development of teacher program whether the institution has to emphasize on vocation or profession. Every orientation offers certain perspective concerning the preparation on becoming teachers. Special and general teacher education program contain all those aspects, but there are differences on the emphasis as well as the focus (Calderhead & Shorrock, 1997 in Johnsen & Skjorten, 2001).

Being a special teacher, then, becomes a teacher with special expertise (specialist teachers). A special teacher, are required to have expertise and specialized skills, have a strong loyalty and commitment to their profession, as well as guided by a clear discipline to the knowledge. Every individual who is a special teacher is required to work according to professional standards. According to the concept of profession, the standards of the profession can be identified to; has the function and

social significance; based him/herself on the expertise and specific skills; has a code of conduct that must be followed and avoid the violations of the profession in the code of ethic; and there are implications in the form of services provided in return. The complexity and scope of special education requires the special teachers to master the level of disciplines and knowledge in special education, and skills required to serve children with special needs adequately. For those reasons, it is a must that there should be the efforts of individuals and career development through professional education and academic.

The question that needs wondering is that how the teachers’ professionalism on special education can be achieved. A research conducted by Multi Years—that is funded by foundation of DP2M-Dikti (2008) reports that there is a need for extra special teachers whose expertise is on inclusive education setting that has been the prime attention in doing revision of the curriculum in the department of special education in UPI, UNJ, and UNY. The problem concerning the revision on curriculum in inclusive setting is regarded as a controversial issue. Based on the interview with the experts, there is a rumor on the experts that are included in the department of special education about whether the program has to be based on the classification of the specialty, inter specialty, or without any classification at all. The tendency that appears in the three universities (UPI, UNJ, and UNY), is that on the inter specialty and without any classification at all; still the specialty context in UPI is prevail.

The curriculum in the special education department in UPI, UNJ, and UNY are different, yet, substantially has the same passion to revise the curriculum. This is in accordance with the momentum of the education in this country that is festive on the teachers’ certification as the effort to enhance the professional teachers’ quality. This momentum is so important in the education in this country, more specifically to the universities that produce teachers as the outcome. The strategic effort that can be done is to enhance the teachers’ quality in several competencies, either academically or professionally. For those reasons, the redesign on the curriculum concerning the education of the special teacher’s candidates is important. One of the things that need attention is the shift from medical model to social model with philosophical inclusion that implicates in the grand design of preparing the special teachers.

In the context of preparing the special teachers, the maternal object in the special education is the individual special children anywhere they are. The special education in an axiological sense has the values as the knowledge that has to be honored in the professional ethics with three primary functions:

prevention, intervention, and compensatory. The discipline in special education has a complex field; for that reason, it is a need to collaborate with another disciplines to create the area of congruence, that has the focus on the obstacles to learn, the obstacle in develop, and the needs in the special education, rather than to the disabilities. Because of that, the area of congruence in the special education include the spectrum that describe the obstacles to learn, the obstacle in develop, and the needs in the special education. The complexity and the breadth of the area covered by the special education signifies that the teachers in special education have the competencies and knowledge in special education and the skills and expertise to adequately take care on the special children.

The special education, based on the philosophy of education, has already had the requirements of discipline of knowledge because it has the ontology, epistemology, and axiology aspects. Ontologically or by nature, the special education is needed because there are the special children that need helping. Epistemologically, special education has the methodology to analyze the formal and material objects. Methodologically, the development of the special education has its own methodology to do research. The special education has the formal object as the obstacle to learn, moreover, the development for the special children includes: 1) motoric perception and mobility; 2) social, emotional, and attitude; 3) interaction, language, and communication; 4) development on talent and creativity.

The professional model of special teachers can be developed through the figure training in the special education that is hoped to prepare the graduates to be a competent teacher. The curriculum in the department of special education needs to develop the pyramid of competence that implicates on the general and basic courses, the specific and basic courses, the specialized courses, and the professional training. The model of curriculum implementation in special education by applying Sandwich approach has essentially accepted by all the parties. Sandwich approach consists of four integrative continual levels. The students are prepared before the practicum; also the result of the practicum will be discussed with the lecturers. If it is not satisfactory, the practicum will be repeated; the students are prepared with new materials, and then they applied the materials, and then there will be reflections.

Along with the birth of law No. 14/2005 about teacher and lecturer; it writes that the candidates to be professional teachers are required to have the academic quality of S1/ D IV and graduated from teacher profession education. This policy is in accordance with the universal requirement that

require two kinds of educations that has to be passed through in every profession, which is the academic and profession education. Academic education is the education that develops academic competences to master the foundation of education concerning the profession of teacher and ends up in the achievement of academic qualification that is embodied as the bachelor degree. While professional education is the formation and development of professional education tips through the application of academic competencies and the real practice. Academic education specializes to the theoretical field while professional education specializes to the application field.

The special teachers are required to be able to translate the complex ideas of the topic being discussed to be an easy-learned material. Some of the knowledge that have to be mastered are: content knowledge, pedagogical knowledge, teaching skills, and etc. the high expectancy on the special teachers in the one hand is the achievement, but in the other hand is the challenge to enhance the quality. From the aspect of quality, it is widely known that most of the special teachers have not fulfilled the minimum standard demanded by the community.

The fact that there are still the incompetent special teachers raised the question on how the education is held for these times. If we made the analogy with the profession as being a doctor, it can be imagined that there are many people who die because of the wrong hand of the incompetent doctors? How many special children who have not optimally developed because the teachers are incompetent? If the teachers are incompetent; how about the universities that educate those particular teachers?

## **2. Perspective of Teachers' Professionalism Gifted and Talented Children**

The concept about talented keeps changing dynamically, this implicates on the definition of gifted & talented children. The term of gifted and talented children are usually used by the academicians. The use of gifted & talented terminology is based on the perspective of its development. Moreover, this definition and terminology also depend on the context of the children. Other terminologies that are used sporadically are: CI+BI; genius; brilliant; excellent; bright; superior; and etc. This phenomena shows that there has not a consensus regarding the talented children. Whereas, the identification method and the education of the talented children depend substantially on the definition (Davis & Rimm,1998).

Another important thing that still debatable related to who or what special teacher that will be assigning to take care the talented children. Should it be that the special teacher literally special too. What competencies should be mastered by the special teachers so that they can take care the talented children. Those are the never ending debate, yet worth thinking. The essence is there in the context of professionalism. So the questions concerning the special teachers should be answered by facilitating the special teachers to become professional by education; this is what we called professionalism.

The particular attention to the context of professionalism should be alluded to the matter of how the special teachers are prepared to take care the talented children. This is a must since the special and talented children in the special schools need the professional teachers. The teachers decided the objective of the study, help to develop the values in the mind of the special and talented children, decide what lesson to be experienced by the special and talented children, decide the method and strategy in teaching and become the model to behave. Mandell and Fiscus (Sisk, 1987) reports that the talented children can react negatively as they express anger, contempt, or dejection if they are stress.

Davis (Sisk,1987) states the characteristics of the talented children as follow: democratic; kind and shares personal sympathy; patient; interested on many things; nice appearance; just; unbiased; humorous; consistent behavior; empathy; flexible; complimentary; and has mastery in certain subject. While according to Makert (1982), the special teacher has to be classified into three aspects: philosophy, professionalism; and personality.

The characteristics of philosophy is important since the way the special teacher teach can have the high impact on the approach they used to teach the talented children. If the special teacher sees the talented children as having a high intellectual ability, there will be more emphasize on giving assignments, creativity, and high achievement. The special teacher will approach the talented children by focusing on power and depending on the books and materials. In contrast, the special teacher that sees talented children in term of the strengths and the weaknesses will apply the personal approach on the talented children.

Strom (1983) states the philosophical conflicts that can be experienced by the special teachers of the talented children. The special teacher tends to think that the talented children can be success on their own so the teachers do not need to give personal attention to the talented children. Sometimes, the special teachers think that as long as the talented children get the high score and do not cause any trouble in class, they do not need to consider the other things

but the academic requirements. The impact of these kinds of attitudes resulted that the talented children perform below their competence. They should have been better than that.

According to Wellborn (Sisk,1987) the special teachers may face philosophical difficulties in developing children's creativity in the classroom. Many of talented children report that they are humiliated and find the subjects are not challenging at all. Plowman (Sisk,1987) differentiates ten different characteristics of the professional special teachers to take care the talented children, which are: a) they asses the talented children; b) they know the personality and the need of the talented children; c) they use the assessment data to make a program that applied differently to every talented children; d) they know the model of the curriculum that is important for the talented children's education; e) they are capable to think and utilize the group dynamic; f) they know many programs that can be applied to the talented children and also the interest and commitment to the learning process of the talented children; g) they know the rules and punishment with respect to the education of the talented children; h) they know and can guide the talented children as well as their parents; and i) they know the recent tendency and issues in the education of the talented children.

The personal characteristics of the special teachers for talented children include motivation, self-confidence, taste of humor, patience, wide interest, and flexibility. Lindsay (Sisk, 1987) concludes the characteristics of the special teachers who are successful in teaching the talented children include self-understanding and self-accepting, have the power of ego, have certain type of sensitivity and sympathy to others, have an above-average intellectual interest, and have the responsibility to what they do and the consequences they take. Other personal traits of the special teachers to the talented children are the empathy, embracing, originality, enthusiasm, and self-actualization. From those traits, like flexibility and originality, it is a must that the special teachers should be open-minded and have the creativity so that they can give a challenging and interesting impression on the talented children, not to mention their capability to develop the talented children's creativity as well.

Most of the programs about special teachers to talented children signify the competencies as follows: understand the personality and need of the talented children, have skills to develop the way of thinking, know the effective and cognitive needs of the talented children, have a creative problem-solving skill strategy, capable of using the learning strategy personally, have a master in proper teaching techniques for the talented children, capable of guiding and counseling to the talented children as

well as the parents, also have the ability to do research.

The presence of the academic and professional education raises the big agenda to do the redesign for the new curriculum for both of the educational systems. Above all, both of the two educational systems are so different in some ways. On the professional education, for example, there are still two ways which are PLPG and PPG (Training for Professional Teacher). Either PLPG or PPG need the curriculum that can embrace and develop the specific special education for it is comprehensively design and integrated for S1, S2, and S3 (Bachelor, master, and doctoral degree).

For these times, the objectives in the bachelor degree or S1 are to grasp the educational competency as the foundation of professionalism. Through lecturing, the students learn contextually as well as practically by internship, are hoped to be able to transfer the experience in learning to their way of thinking and attitude. The transfer process of learning is believed to be happen when the students: a) experience an activity in which there are conceptual elements inside; b) reflect the activity or listen to other reflecting their experiences in discussion and reflection; c) to abstract the practical knowledge ; and d) apply the result of the learning in the reality.

Reflecting on the assumptions and also the objective and the profile of the special teacher for the talented children, the management of the learning process in the classroom applies Sandwich approach. One thing that need to be emphasized is that the needs of the students who are the candidates of special teacher for the talented children to have the live experience in achieving and mastering the objectives of the study. The live experience is always related to the context of the talented children. From the institutional aspect, the approach of the basic curriculum as the part of the whole curriculum of the study program that initiate and are responsible for the developing the program to the institution. The challenge in this kind of program is the prerequisite of the competence development either in the sense of the resources or the personal continually. By extension, the students who are the candidate of the special teachers for the talented children should be assigned to compose their own syllabus which is the first basic step on the development of initiation and responsibility in learning for themselves as professionals.

Concerning to the relationship between the theory and the practice that can be done through multilevel approach which is continual and integrative (sandwich system), after certain stage is passed, there will be a chance for the students to practice again and then reflected again on the theory after the evaluation, it is continual. The briefing to

prepare the theoretical knowledge is done before the students are released to practice. The results of the practice then are analyzed, discussed, and then the supervisor (lecturer) does the debriefing. The materials for the discussion are used as a reflection in giving the new theory before the students are released to practice, and so it is for the next. The practice moves from simple to complex; from the orientation, the brief exercise, the complete exercise with supervising, until the students are left to teach by themselves.

Through the Sandwich approach, it is hoped that the transfer of the experiences in learning in the form of patterns of attitudes that are changeable. The transfer of knowledge is believed to be occurred when the students: a) experience an activity in which there are conceptual elements inside; b) reflect the activity or listen to other reflecting their experiences in discussion and reflection (debriefing) ; c) to abstract the practical knowledge ; and d) apply the result of the learning in the reality.

### 3. CONCLUSION

The presence of two stages in education that have to be passed in every profession, which are academic education and professional education triggers a research that focus on the possibilities of its development. Even though the curriculum in the Department of Special Education (UPI, UNJ, and UNY) is varied, substantially those curriculums have the spirit of innovation into inclusion. The structure of the curriculum in academic setting would rather be directed as a mosaic and continual elements which accommodate the future interest. So too with the curriculum in the professional setting, it is better if there is a redesign so there will be a proportional division, because in the bachelor degree or S1, the emphasis is on the preparation process to create the professional outcomes, especially with respect to the model of learning.

The professional model of special teachers for the talented children should be based on the reflection of the assumption, the program, and the profile as well as the objective of the special teacher for the talented children. For this reason, the thing that need emphasizing is the needs of the students who are the candidate of the special teachers for the talented children to have the live experience in achieving and mastering the knowledge that is targetted by the institution. The life experience is always related to the context of teaching the talented children. From the institutional aspect, the basic approach to curriculum as a part of the whole curriculum of a study program that put its initiative and responsible in developing the program to the institution. By extension, the students who are the candidate of the special teachers for the talented

children are responsible to advance their own knowledge in self-development as the professionals specialized for the talented children.

## **Students’ Actional Competence Reflected through Genre: Transforming Narrative into Drama Script *A Descriptive Study on Grade VIII Students***

Noeris Meiristiani

English Education Department, Pancasakti University, Jl. Halmahera No. 01, Tegal, Indonesia  
*noeris.meiristiani@gmail.com*

**Abstract:** Teaching English in junior high school is directed to the development of students’ communicative competence. In oral practice, to reach this ultimate goal, one important aspect is that students have to understand the knowledge of language functions. Therefore, they are able to convey and understand communicative intent. This ability refers to actional competence, as a sub-component in communicative competence. Exposing students to the knowledge of language functions can be done through a Narrative text. To practice the students’ oral skill, the Narrative text is transformed into a drama script since it allows the creation of contexts for different language uses. This research is aimed at identifying the types of mood in the drama script and examining the language functions of the mood types in communication. It was done under discourse analysis by applying a descriptive qualitative method. Drama scripts made by class VIII students were selected to get the data by considering the internal features of the text such as syntax, lexical choice and organization. Then, the clauses in the drama script were analyzed to find out the mood and the language functions. The results show that students use declarative, interrogative, imperative, and minor clause of mood types to realized language functions in drama script. The students’ actional competence is shown by the use of various language functions in terms of interpersonal exchange, information, opinions, feelings, suasion, problems and future scenarios. Furthermore, those language functions can indicate the social roles of the characters and the relationship among the characters.

**Keywords:** Actional Competence, Narrative Text, Drama Script

## 1 INTRODUCTION

By learning English in junior high school, students are expected to be able to communicate in spoken and written forms, so to some extent, it enables students to develop communicative competence. Communicative competence is defined as the capacity to use language appropriately in communication based on the setting, the roles of the participants, and the nature of the transaction (Richards, 2002 in Celce-Murcia et al., 1995). The communicative competence model proposed by Celce-Murcia (2007) has six facets; Sociocultural Competence, Linguistic Competence, Formulaic Competence, Interactional Competence, and Strategic Competence. And Discourse Competence is at the core of this idea, and it is basically one's ability to put words into an understandable phrase or sentence. This integrative framework suggests that even with a good grammatical or structural knowledge of the language, students will not be competent in the language until they learn the cultural aspects and implications of the language. Furthermore, Celce-Murcia and Olshtain (2000: 16) note that the Interactional Competence is extremely important since the performance of speech acts or speech act sets can differ considerably from language to language. This competence includes actional, conversational, and non-verbal/paralinguistic competences.

In classroom practice, those competences are developed through exposure of genres. Gerot and Wignell (1995: 17) defines genre 'as a culturally specific text-type which results from using language (written and spoken) to (help) accomplish something.' They add that genres are usually associated with particular purposes, particular stages—distinctive beginning, middles, and ends—and particular linguistic features. Gerot and Wignell (1995: 226) note that in secondary education genres do not occur in isolation; different curriculum areas employ particular selections and patterns of genres. They do this because they are trying to achieve different things.

Narrative is one of genres taught to junior high school students. Reading a Narrative text allows students to deal with actual or imaginary experiences in different ways as the social function, to comprehend the generic structure and the lexicogrammatical features. Teaching Narrative can also be extended to oral activity that requires students to role play social interaction with various language functions. Drama can be an alternative of oral activity since it provides context for meaning negotiation. Transforming Narrative into drama script takes students' progress into consideration. The students' communicative competence can be

indicated by their ability to use different language functions in the given context. Therefore, the students' actional competence in writing drama script is worth analyzed. A further implication of teaching Narrative in speaking is the development of students' actional competence which is going to be the focus of this study. This study is conducted to find out (1) the types of mood in the drama script and (2) to examine the language functions of the mood types in communication.

## 2 REVIEW OF RELATED LITERATURE

### 2.1 Text Transformation Exercise

In language teaching, a particular genre can be used to teach different areas of knowledge and skill. For example, a tourist brochure about a medium-sized town can be given for reading and discussing tasks, and then using some or all of the information and ideas contained in the text to create and encyclopedia entry about the town. Caudery (1998) calls such kind of activity as text transformation exercise. He adds that one important factor is the ability to select appropriate content and language to suit the communicative task on hand. There are ranges of suitable choices that a writer or speaker should made in order to create texts for different occasions and purposes.

Text transformation exercise may include the following activities Caudery (1998: 5) :

- reading and understanding the source text,
- noting the genre of the source text, including the identification of the reader/writer relationship and the text purpose,
- noting the results of the generic factors on the content, organization, and language of the source text,
- identifying the genre of the new text, and deciding on how generic factors will affect content, organization, and language of the text,
- selecting relevant material from the source text, and
- using this material to write the new text, taking into account the decisions made about appropriate content, organization, and language.

In practice, these activities sharpen the students' awareness of the need to consider more than surface-level accuracy. They do not merely require knowledge telling but knowledge transforming which belongs to higher order skill (Bereiter and Scardamalia, in Caudery: 1998)

## 2.2 Narrative and Drama

Narrative is a text-type whose purpose is, according to Gerot and Wignell (1994: 204), to amuse, entertain, and to deal with actual or vicarious experience in different ways. Narratives deal with problematic events which lead to a crisis or turning point of some kind, which in turn finds a resolution. Some examples of Narrative are tales, legends, and myths.

Meanwhile, the term drama in education refers to what can be taught through drama in drama and certain subject like language (Savela, 2009: 4). Therefore, drama can be an alternative to teach Narrative. Narrative's generic structure like orientation, evaluation, complication, resolution, and re-orientation can be presented through action and dialogue of the characters involved. In this context, Zafeiriadou (2009: 4) considers drama as a creative process and an a challenge for creative thought. Zafeiriadou (2009: 6) also justifies drama in the language context as it offers some benefits as follows:

- a. Drama fosters and sustains learners' motivation as it is fun and entertaining, and because it engages feelings, it can provide a rich experience of language for the participants.
- b. Drama as a process is learner-centred because it can only operate through active cooperation.
- c. As a social activity, drama embodies social and communal, as opposed to the purely individual, aspects of learning.
- d. Being a collaborative and participatory teaching approach, it contributes positively to the development of the learners' self-esteem and self-efficacy.
- e. Drama allows the creation of contexts for different language uses, thus fostering learners' language awareness. In a dramatic situation, learners use language in a communicative way (taking turns, interacting verbally, using body movements, gestures and facial expression, listening actively).

Savela (2009: 3) also believes that drama activities have values that students can learn. They can increase students' self-esteem, language skills and their abilities to express themselves by using their own creativity. In addition, they can develop social skills and make the students attain more cultural knowledge in an interesting way through a dramatic context. Moreover, drama activities can bestow equally children and adults benefits that are required in real life.

Through drama, Savela (2009: 11) adds that students learn to use regular speech. Therefore, the division between the organized language inside a classroom and the spontaneous language in the real world will narrow. This is achieved due to drama

engaging students in authentic real life situations. It is supported by Pyörälä's study (in Savela, 2009: 14) that it was the improvisational nature of the activities and acting in role which brought the students the ability to use spontaneous speech. In addition, Pyörälä noted that the students were able to use their language skills within a context and produce more sufficient speech than they would have initially thought.

Moreover, Clipson-Boyles in Savela (2009: 11) and Yue Hu (2011: 4) share a similar view by stating that drama puts language into context and helps students to process new words or expressions in an appropriate context. Thus, when students are obliged to participate in meaningful activities and use English, they strive to use normal everyday speech. As a result, students speak in English in order to fulfill the assignments and inadvertently practice their language skills.

According to Schiller (in Yue Hu, 2011: 5), most drama leads young people to learn about social life actively, and it also fosters their conflict resolution abilities and improves human relations. Drama facilitates students to deeply understand themselves and others. They will compare the characters in the drama and their own life in reality, thus drama has the potential to change students' thinking to deal with interpersonal relationships. Gaudart (in Yue Hu, 2011: 5) claims drama makes students inevitably immersed in a social milieu and create more experience for students learning how to get along with other people. Drama stimulates students to come up with ideas and put them together. They work together to create the scenario with new characters. Thus, the value of drama lies in the creative process and its effective opportunity for working with others.

## 2.3 Model of Communicative Competence

In creating drama scenario, the students' ability to use language to communicate is required. Savignon (1971, in Savignon, 2002: 3) uses the term "communicative competence" to characterize the ability of classroom language learners to interact with other speakers, to make meaning, as distinct from their ability to recite dialogues or perform on discrete-point tests of grammatical knowledge. Savignon (in Omaggio, 1986: 4) emphasizes that communicative competence is a dynamic process that depends on the negotiation of meaning between two or more persons who share some knowledge of the language.

Celce-Murcia et al. (1995: 10) propose an integrative view of communicative competence with five major components: (1) linguistic competent, (2) strategic competence, (3)

sociocultural competence, (4) actional competence, and (5) discourse competence. In 2007, Celce-Murcia (in Flowerdew, 2013 :7) revised and updated the framework of communicative competence as shown by the following figure:

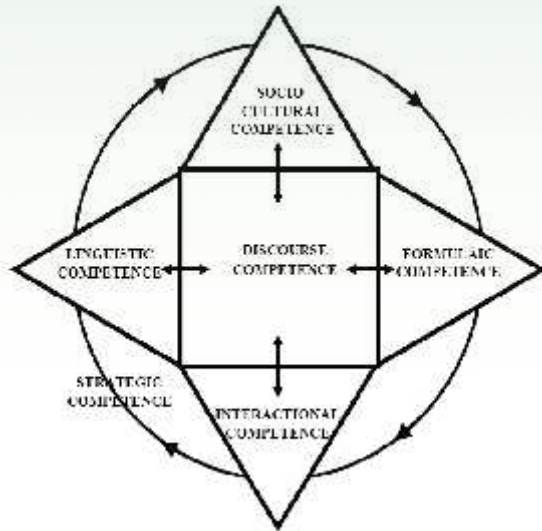

Figure 1. Schematic Representation of Communicative Competence

*Sociocultural competence* refers to the speaker's pragmatic knowledge which includes social contextual factors, such as the participants' age, gender, and status; stylistic appropriateness, such as politeness strategies; and cultural factors, including background knowledge about the target language group. *Linguistic competence* refers to knowledge and skill with regard to lexical items and rules of morphology, syntax, sentence grammar, syntax, and phonology. *Formulaic competence* is the counterpart to linguistic competence; it refers to the fixed, prefabricated chunks of language which do not behave in the generative way that grammatical items do. *Interactional competence* includes actional competence (the ability to perform speech acts) and conversational competence (the ability to operate the turn-taking system of conversation). *Strategic competence* consists of strategies for language learning or maintaining the flow of interaction. And the central role/controlling competence is *discourse competence* which refers to the selection, sequencing and arrangement of words, structures, and utterances to achieve a unified spoken message.

## 2.4 Actional Competence

Interactional competence is the bottom-up component that at least has three sub-components (Celce Murcia, 2007 in Flowerdew, 2013):

(1) *Actional Competence*: knowledge of how to perform common Speech Acts and Speech Act Sets in the target language involving interactions such as information exchanges, interpersonal exchanges, expression of opinions and feelings, etc.

(2) *Conversational Competence*: It consists of skills like opening and closing conversation, changing topics in conversation, etc.

(3) *Non-verbal/paralinguistic Competence* includes the kinesics behaviour, proxemics, haptic behaviour and non-linguistic utterances with interactional import.

Celce-Murcia et al. (1995) define actional competence as competence in conveying and understanding communicative intent, that is, matching actional intent with linguistic form based on the knowledge of inventory of verbal schemata that carry illocutionary force (speech acts and speech act sets). In addition, they noted that this conceptualization of actional competence is mainly restricted to oral communication.

The components of actional competence suggested by Celce-Murcia et al. (1995) are as follows:

### A. Knowledge of language functions

#### 1. Interpersonal exchange

- Greeting and leavetaking
- Making introductions, identifying oneself
- Extending, accepting and declining invitations and offers
- Making and breaking engagements
- Expressing and acknowledging gratitude
- Complimenting and congratulating
- Reacting to the interlocutor's speech: showing attention, interest, surprise, sympathy, happiness, disbelief, disappointment.

#### 2. Information

- Asking for and giving information
- Reporting (describing and narrating)
- Remembering
- Explaining and discussing

#### 3. Opinions

- Expressing and finding out about opinions and attitudes
- Agreeing and disagreeing
- Approving and disapproving
- Showing satisfaction and dissatisfaction

#### 4. Feelings

- Expressing and finding out about feelings: love, happiness, sadness, pleasure, anxiety, anger, embarrassment, pain, relief, fear, annoyance, surprise, etc.

#### 5. Suasion

- Suggesting, requesting and instructing

- Giving orders, advising and warning
  - Persuading, encouraging and discouraging
  - Asking for, granting and withholding permission
6. Problems
- Complaining and criticizing
  - Blaming and accusing
  - Admitting and denying
  - Regretting
  - Apologizing and forgiving
7. Future scenarios
- Expressing and finding out about wishes, hopes, and desires
  - Expressing and eliciting plans, goals, and intentions
  - Promising
  - Predicting and speculating
  - Discussing possibilities and capabilities of doing something.

#### B. Knowledge of speech act sets

In order to be able to use language functions in context, language learners need to be familiar with how speech acts are integrated into the higher levels of the communication system. For instance, the utterance “You look great today” serve not only as a description but functions mainly as a compliment and as such fulfills a social function. Social actions performed via utterances are what Celce-Murcia and Olshtain (2000: 24) called as speech acts.

### 3 METHODOLOGY

For the purpose of this study, only knowledge of language functions is analyzed which is realized by moves. A move is a unit after which speaker change could occur without turn transfer being seen an interruption and a move itself, most of the time, is realized by clauses (Eggins and Slade, 1997: 186).

Total of four drama scripts written by junior high school students of grade eight were selected. The selection was done by considering the contents in terms of the internal features of the text such as syntax, lexical choice and organization. Then, one script was analyzed to get the data. There are six roles in the script; one narrator and five characters. For the purpose of this study the dialogs among five characters were analyzed and the narrator’s part was left unanalyzed since it does not reflect the speaker’s personal feelings. The unit of analysis is move in the characters’ dialog.

In order to find out the students’ actional competence in role play exercise, a three-stage task was devised. In the first stage, the students were

required to read a Narrative entitled “The Golden Snail”. Next they were required to work in groups of six to create a drama from the narrative consisting of a narrator and five characters. The third stage was performing the drama by having role play representing the characters that each student had chosen.

Since this study is to find out mood types and their language functions, only the results of the second stage were employed as the data. First, the drama script was segmented into single turn and move to identify the mood types. Second, the language functions of the moves are examined based on the given context. Then, the final step is drawing conclusions.

### 4 FINDINGS AND DISCUSSION

The drama script is presented in eight scenes, so the analysis is conducted based on the sequence of the scenes. The narration on the scenes are presented to as originally taken from the script to provide context of the exchanges. There are five characters introduced in the drama namely Dewi Sekartaji, The King, The God Narada, Mbok Rondo, and Panji

Asmoro

Bangun.

Turn no	Speaker	Move	Mood (Clause Type)	Language Function
1	Dewi Sekartaji	(i)Why... do you love me.	-	(singing-starting a scene)
2	The King	(i)Ehm ... wow ... your voice is beautiful like your face. (ii)May I know you?	Declarative: full Modalized Interrogative: full	Complimenting Making introduction
3	Dewi Sekartaji	(i)Of Course. (ii)My name is Dewi Sekartaji.	Minor Declarative: full	Showing attention Identifying oneself
4	The King	(i>Your name is beautiful.	Declarative: full	Complimenting
5	Dewi Sekartaji	(i)Oh thank you.	Declarative: elliptical	Expressing gratitude
6	The King	(i)I love you Dewi Sekartaji. (ii)You are a perfect woman. (iii)May I marry you, please?	Declarative: full Declarative: full Modulated Interrogative: full	Expressing love Complimenting Requesting
7	Dewi Sekartaji	(i)I am sorry (ii)because I am married.	Declarative: full Declarative: full	Discouraging
8	The King	(i)Who is your husband?	Wh-Interrogative: full	Asking for information
9	Dewi Sekartaji	(i)My husband is Panji Asmoro Bangun.	Declarative: full	Identifying oneself
10	The King	(i)I do not care. (ii)You must marry me.	Declarative: full Modulated Declarative: full	Denying Instructing
11	Dewi Sekartaji	(i)Oh <i>can't</i> like that.	Declarative: elliptical	Disagreeing

The interaction in Scene 1 is dominated by declaratives to develop interpersonal exchanges like complimenting, identifying oneself, and expressing gratitude. The introduction of the characters is started by The King's moves by complimenting and making introduction using modalized interrogative. This mood choice sounds polite to seek Dewi's attention and is responded by declarative to identify herself. Two other moves of complimenting ('Your name is beautiful' and 'You are a perfect woman') are produced by The King to sustain the attention.

The declarative move of expressing love shows how The King wants to build a relationship with Dewi and is confirmed by requesting 'May I marry you, please?'. However, this modulated interrogative seems inappropriate since it tends to show probability instead of inclination of how Dewi is willing to marry The King. A response of discouraging is given by Dewi by saying that she was married which is actually to decline The King's proposal. The next moves show how the two characters contradict each other in this case.

Table 2. Mood types and language functions in Scene 2

Scene 2: The King kidnapped Dewi Sekartaji but when he kidnapped Dewi Sekartaji, suddenly Narada came.

Turn no	Speaker	Move	Mood (Clause Type)	Language Function
12	The God Narada	(i)Why do you cry? (ii)What happen with you?	Wh-Interrogative: full Wh-Interrogative: full	Finding out about sadness Finding out about sadness
13	Dewi Sekartaji	(i)The king kidnapped me. (ii)I must marry him but  (iii) I don't love him and (iv) I am married to Panji Asmoro Bangun. (v) Can you help me?  (iv) I want to be free from here and (v)I want to meet my husband.	Declarative: full Modulated Declarative: full Declarative: full Declarative: full  Modulated Interrogative: full Declarative: full Declarative: full	Narrating Narrating  Narrating  Requesting  Expressing hope Expressing hope
14	The God Narada	(i)What can I do for you?	Modulated Wh-Interrogative: full	Extending offer

In Scene 2, a new character is introduced by expressing interrogatives to find out Dewi's sadness. In her turn, Dewi uses moves for narrating her condition, followed by requesting and expressing hope. The modulated interrogative 'Can you help me?' is also to convey Dewi's expectation of Narada's capability to save her from her current condition. It is understood by Narada by extending offer.

Table 3. Mood types and language functions in Scene 3

Scene 3: Suddenly, The King came and saw Narada.

Turn no	Speaker	Move	Mood (Clause Type)	Language Function
15	The King	(i)Hi! (ii)Who are you? (iii)Don't touch my girl!	Minor Wh-Interrogative: full Imperative: full	Expressing anger Expressing anger Discouraging
16	The God Narada	(i)She is not your girl.	Declarative: full	Denying
17	The King	(i)It is not your <i>arrangement</i> .	Declarative: full	Expressing anger
18	The God Narada	(i)If you want her (ii)you must <i>adversary</i> me.	Declarative: full Modulated Declarative: full	Warning

Scene 3 shows that interaction between The King and Narada revolves around hostility. For example, wh-interrogative ‘*Who are you?*’ is not used to ask for information but to express anger by looking at the continuing moves that express discouraging, expressing anger, and warning.

However, two moves have problems with parts of speech (‘*arrangement*’ and ‘*adversary*’), which actually belongs to linguistic area.

Table 4. Mood types and language functions in Scene 4

Scene 4: The King Narada fought. Finally, The King lost and saved Dewi Sekartaji.

Turn no	Speaker	Move	Mood (Clause Type)	Language Function
19	Dewi Sekartaji	(i)Thank you so much my hero.	Declarative: elliptical	Expressing gratitude
20	The God Narada	(i)It is my duty to protect you. (ii)Why are you sad?	Declarative: full Wh-Interrogative: full	Acknowledging gratitude Finding out about sadness
21	Dewi Sekartaji	(i)I miss my husband. (ii)I want to meet him.	Declarative: full Declarative: full	Expressing longing Expressing longing
22	The God Narada	(i)All right (ii)if you want to meet your husband (iii) you must turn into a golden snail and (iv)you must also drift along the river.	Minor Declarative: full Modulated Declarative: full Modulated Declarative: full	Showing sympathy Advising  Advising
23	Dewi Sekartaji	(i)Ok. (ii)I'm ready. (iii)Goodbye my hero.	Minor Declarative: full Minor	Agreeing Agreeing Leavetaking
24	The God Narada	(i)Bim...salabim...abarak..... kadabrak	Minor	(magic spell)

The first move, Dewi's move, in Scene 4 is realized by declarative to express gratitude. It is acknowledged by Narada and continued with wh-interrogative to find out Dewi's sadness. The next moves express Dewi's feeling of longing. It is responded by Narada as a condition that needs his

power, once again, to save Dewi. The next Narada's declaratives conveys advising and agreed by Dewi. Therefore, this scene shows how Narada acts as a guardian for Dewi and how Dewi is being dependent on Narada's power.

Table 5. Mood types and language functions in Scene 5

Scene 5: Dewi Sekartaji was turned into a Golden Snail.

Turn no	Speaker	Move	Mood (Clause Type)	Language Function
25	Mbok Rondo	(i)Wow...there is a golden snail. (ii)It is very beautiful. (iii)I will bring it to house.  (iv)I will put it in jar.	Declarative: full Declarative: full Modulated Declarative: full Modulated Declarative: full	Expressing surprise Complimenting Expressing intention  Expressing intention

There is no interactive context in Scene 5. Instead a single turn is presented to introduce a new character, Mbok Rondo. Declaratives are used to express surprise, compliment, and express intention. Those are to show Mbok Rondo's

reaction over what she has just found (Golden Snail).

Table 6. Mood types and language functions in Scene 6

Scene 6: Since Mbok Rondo found a Golden Snail, many clumsy that happen.

Turn no	Speaker	Move	Mood (Clause Type)	Language Function
26	Mbok Rondo	(i)Who cooked this food? (ii)It is delicious ...nyam....nyam (iii)Who cleaned my house? (iv)I feel, just now, (iv)my house is very dirty. (v)I am confused.	Wh-Interrogative: full Declarative: full Wh-Interrogative: full Declarative: full Declarative: full Declarative: full	Expressing surprise Complimenting Expressing surprise Expressing confusion Expressing confusion

Scene 6 also presents only Mbok Rondo’s turn. Instead of for asking for information, wh-interrogatives are used to express surprise since

there is no moves that provide answers to her questions. Next, her feeling of confusion is expressed through declaratives.

Table 7. Mood types and language functions in Scene 7

Scene 7: One day, Mbok Rondo peeped at her home. Apparently, there was the princess that was cleaning the room and she was coming out and then Mbok Rondo crushed a jar and the princess could not turn into a Golden Snail.

Turn no	Speaker	Move	Mood (Clause Type)	Language Function
27	Mbok Rondo	(i)Who are you? (ii)You are very beautiful. (iii)Why could you change into golden snail?	Wh-Interrogative: full Declarative: full Modulated Wh-Interrogative; full	Asking for information Complimenting Asking for information
28	Dewi Sekartaji	(i)I am Dewi Sekartaji. (ii>Last time, I was kidnapped by the King. (iii)He wished to marry me but (iv)I am married and (v)suddenly Narada came and saved me. (vi)To meet my husband, I must change into a golden snail and drift along the river.	Declarative: full Declarative: full  Declarative: full Declarative: full Declarative: full  Modulated Declarative: full	Identifying oneself Narrating  Narrating Narrating  Narrating
29	Mbok Rondo	(i)Who is your husband?	Wh-Interrogative: full	Asking for information
30	Dewi Sekartaji	(ii)My Husband is Panji Asmoro Bangun.	Declarative: full	Identifying oneself

Scene 7 presents interaction between Mbok Rondo and Dewi Sekartaji. The first moves uses wh-interrogatives (‘Who are you’ and ‘Why could you change into golden snail?’) to ask for information about Dewi because it is the first time Mbok Rondo and Dewi meet. So, Dewi’s turn is

dominated by narrating and identify herself. Dewi’s long turn indicates that Mbok Rondo provides her opportunity to talk about herself and she acts as a good listener. Their interaction shows how they get acquainted and become closer.

Table 8. Mood types and language functions in Scene 8

Scene 8: At the time, Panji Asmoro searched his wife, wandered from one village to another.

Turn no	Speaker	Move	Mood (Clause Type)	Language Function
31	Panji Asmoro Bangun	(i)Excuse me, (ii)anybody home?	Minor Polar Interrogative: full	Asking for information
32	Mbok Rondo	(i)Oh yes. (ii)What’s up?	Minor Wh- Interrogative: full	Giving information Asking for information
33	Panji Asmoro Bangun	(i)Is there a beautiful princess here? (ii)Her name is Dewi Sekartaji.	Polar Interrogative: full Declarative: full	Asking for information Identifying oneself
34	Mbok Rondo	(i)There is. (ii)Dewi, come here, please!	Declarative: full Imperative: full	Giving information Requesting
35	Dewi Sekartaji	(i)What’s up Mbok?	Wh-Interrogative: full	Asking for information
36	Mbok Rondo	(i)Do you know him?	Polar Interrogative: full	Asking for information
37	Dewi Sekartaji	(ii)Oh my god darling, I miss you so much. (iii)He is my husband Mbok.	Declarative: full Declarative: full	Expressing longing Identifying oneself
38	Panji Asmoro Bangun	(i)I miss you too. (ii)How are you baby?	Declarative: full Wh-Interrogative: full	Expressing longing Asking for information
39	Dewi Sekartaji	(i)I’m fine. (ii)And you?	Declarative: full Wh-Interrogative: elliptical	Giving information Asking for information
40	Panji Asmoro Bangun	(i)I’m fine too. (ii)Baby I can’t leave without you. (iii)You are my soul mate so (iv)don’t go again!	Declarative: full Modulated Declarative: full Declarative: full Imperative: full	Giving information Admitting Requesting
41	Dewi Sekartaji	(i)I promise (ii)I will not go again. (iii)I will be more careful.	Declarative: full Modulated Declarative: full Modulated Declarative: full	Promising Promising
42	Panji Asmoro Bangun	(i)Baby let’s go back to our kingdom!	Imperative: full	Extending invitation
43	Dewi Sekartaji	(i)Darling, I can’t go without Mbok Rondo.	Modulated Declarative: full	Declining invitation/Asking for permission
44	Panji Asmoro Bangun	(i)Ok (ii)We will invite Mbok Rondo.	Minor Modulated Declarative: full	Granting Granting
45	Dewi Sekartaji	(i)Thank you darling.	Declarative: elliptical	Expressing gratitude
46	Mbok Rondo	(i)Oh I am very happy. (ii)Thank you.	Declarative: full Declarative: elliptical	Expressing happiness Expressing gratitude.

Scene 8 introduces Panji as another character in drama. The first turn is taken by Panji to ask for information about one’s existence. It is responded by Mbok Rondo with minor clause ‘Oh yes’ followed by wh-interrogative (‘What’s up?’) to let Panji tell his purpose of coming. However, this question is inappropriately used since it is usually used between close friends while the speakers here have just met at the first time. The next turns also involve information exchanges about someone like

‘Is there a beautiful princess here?’, ‘What’s up Mbok?’, and ‘Do you know him?’. The last question is asked by Mbok Rondo to Dewi, but Dewi’s turn is used for interacting with Panji to express longing. The next moves are realized by wh-interrogative and declaratives to exchange information between Panji and Dewi. These exchanges show their intimacy and close relationship between husband and wife that have just been set apart.

Then, an imperative (*‘Baby, let’s go back to our kingdom!’*) is conveyed by Panji and responded by Dewi by using modulated declarative (*‘Darling, I can’t go without Mbok Rondo’*). It has double language functions since Dewi is declining the invitation and asking for permission to take Mbok Rondo with them. It is found out by the moves for granting (*‘Ok’* and *‘We will invite Mbok Rondo’*).

The last moves function to express gratitude and happiness by Dewi and Mbok Rondo. They also show that Dewi and Mbok Rondo have made friends.

The results of the analysis can be summarized in the following table.

Table 9. Summary of mood types and language functions used in drama script

Mood (clause type)	Language functions	Knowledge of language functions
Declarative: full	Complimenting Identifying oneself Acknowledging gratitude Expressing love Expressing anger Discouraging Warning Denying Narrating Expressing hope Expressing longing Advising Agreeing Expressing surprise Expressing confusion Giving information Promising Expressing happiness	Interpersonal exchange Interpersonal exchange Interpersonal exchange Feeling Feeling Suasion Suasion Problem Information Future scenario Feeling Suasion Opinion Interpersonal exchange Feeling Information Future Scenario Feeling
Declarative: elliptical	Expressing gratitude Disagreeing	Interpersonal exchange Opinion
Modalized interrogative: full	Making introduction	Interpersonal exchange
Modulated declarative: full	Instructing Narrating Warning Advising Expressing intention Admitting Promising Declining invitation Asking for permission	Suasion Information Suasion Suasion Future Scenario Problem Future Scenario Interpersonal exchange Suasion

Polar interrogative: full	Asking for information	Information
Polar interrogative: elliptical	Asking for information	Information
Wh-interrogative: full	Asking for information Expressing anger Finding out about sadness Expressing surprise	Information Feeling Feeling Feeling
Wh-interrogative: elliptical	Asking for information	Information
Minor	Showing attention Expressing anger Showing sympathy Agreeing Leavetaking Giving information Granting	Interpersonal exchange Feeling Interpersonal exchange Opinion Interpersonal exchange Information Suasion

## 5 CONCLUSION

From the results and discussion in the previous chapter it can be concluded that students use declarative, interrogative, imperative, and minor clause of mood types to realized language functions in drama script.

The students' actional competence is shown by the use of various language functions in terms of (1) interpersonal exchange, (2) information, (3) opinions, (4) feelings, (5) suasion, (6) problems and (7) future scenarios. Those language functions are used to express the characters' intent in communication and further, they can indicate the social roles of the characters and the relationship among the characters.

## 6 ACKNOWLEDGEMENT

Noeris Meiristiani is currently an active lecturer in English Education Department of Pancasakti University Tegal, Indonesia.

<sup>3</sup>*public primary school, SDPN Setiabudhi, Bandung-Indonesia*

**Abstract:** Lesson study has implemented to study the six grade students analysis of electric circuit. Based on the class teacher findings, the students had difficulties on constructing electric circuit because in the former class the class teacher usually use general description such as picture, text with lecturing to teach electricity. Based on this, we tried to study how to overcome the student’s difficulties through lesson study. First in PLAN Session, the researcher, the lecturer and the class teacher discuss all the possibilities what student will react while the electricity learning process based on our former experiences. And we were agreed that the implementation should be practical cooperative work and the teacher should guide them by inquiry strategy. We also discuss students’ sitting arrangement. The students were divided in to three groups. In DO session the model teacher has implemented the lesson with the prepared learning materials. The number of students are 15 and divided into three groups. There were 8 observers with their cameras to record students’ activities and their cooperative work. In SEE session, we got interesting lesson learns such as all students were engage actively with the lesson because the learning material and the given problem made them challenged. We also got useful recommendations for future implementation.

**Keywords:** Lesson Study, Cooperative Learning

## 1. INTRODUCTION

Lesson study, the primary form of teachers' professional improvement focusing on instructional effectiveness in the classroom, is originated from Japan since a century. Currently it has disseminated through the world especially in Asia and America. In line with this Lewis (2009) stated that lesson study has spread rapidly in North America since 1999. Lesson study does not take place haphazardly rather it follows some steps. In line with this Lewis (2002) claimed that Lesson study is a cycle of instructional improvement in which teachers work together to: formulate goals for student learning and long-term development; collaboratively plan a "research lesson" designed to bring to life these goals; conduct the lesson in a classroom, with one team member teaching and others gathering evidence on student learning and development; reflect on and discuss the evidence gathered during the lesson, using it to improve the lesson, the unit, and instruction more generally; and if desired, teach, observe, and improve the lesson again in one or more additional classrooms

Even the concept of "Lesson Study" was introduced in Ethiopia it is not still implemented properly to the whole country educational system. Based on the triangular cooperation among JICA, Indonesian university of Education UPI and the government of Ethiopia, participants, teacher educators of college of teacher education from Ethiopia come to Indonesian University of Education (UPI) in order to take experience on Lesson Study. Since March 2011, Japan International Cooperation Agency (JICA) have been implementing technical cooperation project entitled "National Pilot Project For Improving Mathematics and Science education in Ethiopia (SMASEE) with federal Ministry of education of Ethiopia in term of Training program. The purpose of the training is to provide the participants from Ethiopia with an opportunity to improve the quality of Pre-service Education and Training (PRESET) in the field of Mathematics and Science education. The training program will also provide participants to exchange ideas, information and experience among themselves and the Indonesian counterpart. The training is for mathematics and science lecturer of college of teacher education in Ethiopia.

The training program has ten months duration in physics department, Indonesia University of Education (UPI). The training program is divided into three main activity as shown in picture 1. First (Yohannes) took the Subject-specific pedagogy in Masters degree program to deepen knowledge and practical skills. Second, undergraduate program to

have an experience in teaching-learning process in basic physics and Earth and Space science courses. and last Lesson Study (LS) program to obtain full understanding on lesson study that implemented ON campus and OFF campuses. In OFF campus activity me and other participants visited schools around UPI where lesson study was implemented in order to share experiences with lesson study experts, Teachers, and lecturers. at the end I can implement a lesson study.

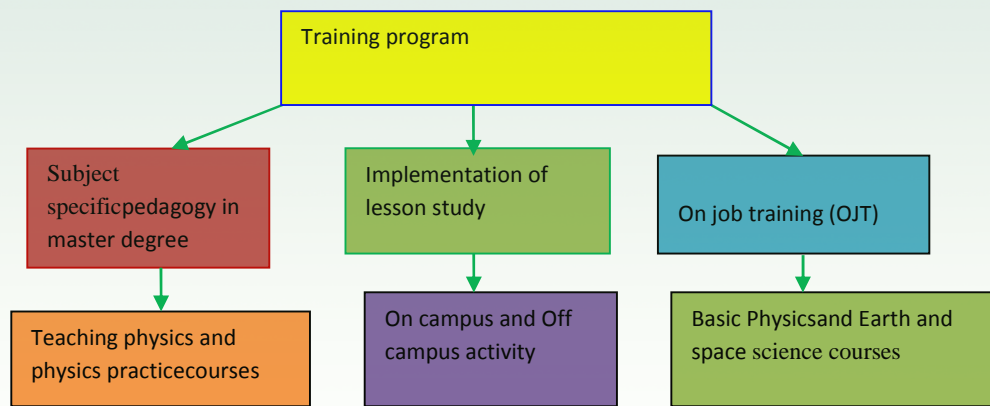

Figure 1 Training program of college teacher educator

In this paper, we describe implementation of Lesson study on Science in one of primary school in Bandung, west Java, Indonesia as part of training program to improve the quality of pre-service education and develop capacity of Physics educators.

## 2 THEORETICAL FRAME WORK

In this Lesson Study implementation from out of many methods we want to use Inquiry-based learning incorporating a cooperative learning approach to enhance sixth grade students' analysis of Electric circuit. Because Inquiry is a process by which children actively investigate their world through questioning and seeking answers to their questions. In line with this the national research council (2000 p 23) defined the Inquiry in education is a multifaceted activity that involves:

- making observations
- posing questions
- examining books and other sources of information to see what is already known
- planning investigations
- reviewing what is already known in light of experimental evidence
- using tools to gather, analyze, and interpret data
- proposing answers, explanations, and predictions
- communicating the results
- The role of science teachers in inquiry-based classrooms is to serve as facilitator of learning, guiding students through the inquiry process.

Heather Banchi and Randy Bell (2008) claimed that there are four levels of inquiry

1. *Confirmation Inquiry*: low level inquiry, very teacher focused, questions and procedures given by teacher. students outcome confirm the one which is known in advance

2. *Structured Inquiry*: is Less Teacher Focused, Question and procedure given by Teacher Outcome Not Known in Advance
3. *Guided Inquiry* this level of inquiry is learner focused inquiry. Questions given by teacher but procedure and outcome developed by learners
4. *Open inquiry*: is high level of inquiry, very Learner Focused. Learners form questions, design procedures for carrying out an inquiry, and communicate their results.

As Johnson, Johnson, and Smith (1991) suggested that cooperative learning is more than simply "working in groups," and should include: *Positive interdependence*; where team members are reliant on one another to achieve a common goal. *Individual accountability*; where each member of the group is held accountable for doing his or her share of the work. *face-to-face promotive interaction*; most of the tasks are performed through an interactive process in which each group member provides feedback, challenges one another, and teaches and encourages his or her group mates, *appropriate use of collaborative skills* where students are provided with the opportunity to develop and implement trust building leadership, decision making, communication, and conflict management skills. *group processing* in which team members establish group goals, assessment of their performance and they often identify changes that need to be made in order for the group to function more effectively

### 3 LESSON STUDY IMPLEMENTATION

#### 3.1 Plan session

We held the plan session in three meeting in S.D.P.N primary schools. On the first meeting the lecturer and trainee were introduced with the school principal and the class teacher and had discussion about the lesson study implementation as shown in figure 2. On the second meeting of school visit the trainee and the Lecturer were introduced with the six grade students as shown in figure 3, and made deep discussion with the class teacher about the Indonesian new curriculum, the actual situation of the student, the time when the lesson study will be implemented, and the area where the students had difficulties to understand. Based on physics teacher's finding the topic, Electric circuit was identified because in the former class the class teacher was usually used general description such as picture, text with lecturing and demonstration. We also assigned that (Mr. Yohannes) as the model teacher. When they assigned me to teach the lesson, we had anticipated that the language barrier (media of instruction) may be causing problem in communication between the teacher and students during the lesson. Based on the class teacher information the students can comprehend easy english delivered by teacher and read text with easy english, but he doubt about their english communication skill.

Figure 2. During Plan Session

Figure 3 . Meet with the students

Several ideas come from discussion like we should design the lesson interesting media that can be easily understood by the students like simulation and learning materials. To minimize the problems, at the end we agreed to use (1) simulation, (2) Preparing the learning material based on their daily life and (3) making students' worksheet in bilingual (both in english and indonesia version) In planning the lesson, our lesson goals were at the end of the lesson

the students be able to identify electrical components, construct simple circuit, understand between open and closed circuit, construct series and parallel circuit, understand the difference behavior between series and parallel circuit, and construct the combination of series and parallel circuits

We also agreed to prepare learning material, which is a circuit board that can be helped for students to connect simple circuit, series, and parallel connection in one and a work sheet containing two activities, the first activity was to verify simple circuit. This helps students to develop skill of constructing simple circuit, and to understand the components of the simple circuit. The second activity was to verify series and parallel connection this activity helps students to develop skills in constructing series and parallel connection and have understanding in differentiating between series and parallel connections based on circuit connection and its brightness. We also discussed about the appropriate teaching method that will be delivered. By considering the actual situation of the students, the learning material that we have and the nature of the identified topic, we agreed to apply Inquiry strategy on cooperative learning to enhance students' analysis of electric circuit. We selected inquiry based learning incorporates cooperative learning strategy based on the national research council (2000) cooperative learning can increase students involvement in the learning environment, Permitting students to work in group to solve problems can promote scientific inquiry and develop in students a feeling for “doing” science. Gets

students to work together, eliminating some of the competitiveness and isolation that can exist in most academic environments. To achieve the learning goals we divided the lesson into three parts: Introduction part, main part, and closing part. In the introduction part showing simulation to see how simple circuit works to motivate and engage the students with learning goals. In main activity giving learning materials that can help them *to solve four circuit problems that is related to simple, series, parallel and combination series and parallel circuit, and in the closing part* we give chance students to present their findings and results

### 3.2 Do session

The lesson had implemented based on the time scheduled. Before implementing the lesson, observers sit together to hear the teacher model explanation about learning goals and how he's going to achieve by presenting generally the lesson plan and learning material that are used during the learning process. The lesson plan and the worksheet used are attached in Appendix. (erase it) During implementation six observers had observed on students' detail activities. The learning process was recorded with three video cameras. We asked Observers to get detail information on:

- how students have been constructed simple electric circuit
- how students have been connected series and parallel connections
- how students analyze the difference between series and parallel connections
- sharing idea among the group members
- answering worksheet activities
- show willing in reflecting ideas in front of the class
- engaging students in an active way with learning materials
- evaluate whether the learning process meet with the intended goal
- questions raised by students and teacher respond

In the Introduction part the model teacher start the lesson by showing simulation about simple electric circuit, containing bulb, switch, battery, and cable and ask the students the following questions

- name each component of the simple electric circuit
- what happen to the bulb in open and closed circuit

In the main activity the model teacher made the students to analysis electric circuit by solving four problems: to do this the teacher gave the students circuit board as shown in figure 4. The holes are for

wire connections, the cross circles are lamp bases the power sign is batteries base and switches are already fixed on the board, black and red cables, batteries, bulbs. More over the bulbs in the board were represented by rooms like bath room, living room, and kitchen room

Problem 1. How to make Bath room lamp turn on

Problem 2. How to make Kitchen and Living room lamp turn on

Problem 3. How to make Kitchen and Bath room lamps turn on

Problem 4. Construct a circuit that makes all the three lamps are turn on In the closing activity the model teacher gave chance for students to present their result in front of the class, and the teacher with students together summarized the lesson.

figure4.Circuit board

### 3.3 See session

In SEE session as shown in fig.5 we observe and analyze the video and record findings from observers. Our finding when viewing the video and reading the observations during introduction time in opening part as shown in fig.6 most students were participating actively in answering oral questions and exited by simulation. In main activity as shown in fig.7 all students directly engaged learning process in closing part as shown in fig. 8 teacher ask students to present their finding in front of the class and at the end teacher and students together summerized the lesson.

Fig .5 during see session

Based on Observer-1,observer -2, and observer-3and video analysis on Group -1 We found At the beginning when the group started to construct simple circuit they were confused about the red and black colors of the cable with the hole, which issued to connected one cable with another, most members of the group said the black cable should fix with

black hole others said black cable should connect with red at the end with most of the group agreed to connect black cable with black hole when they did it the lamp light up. But one student from the group wanted to test the connection black cable with red hole but rejected by some members of the group they said already the lamp is turned on but other members said please let us give him chance to let him try.They agreed the student to test it he connected the black cable with red hole and black hole with red cable at the end the lamp light up the group member admired him clap for him and they called him “good boy”. In this experiment the group realized that the color of the cable has not effect to make the lamp turn on. In this experiment what we have seen is first the group raised conflict ideas explained it with supported evidence and gave appreciation and value for those who gave solutions for the problem in democratic way. In this experiment we got findings which are not predicted during plan session because when we make the circuit board for learning material we didn’t give attention for the colors of cables but the students raised it as a problem and solved by themselves.

The students were actively engaged with the learning material. In their daily life the students use switch on and off lamps in their house without realizing it. After the lesson the students got experience on constructing simple electric circuits, series and parallel connection. They also identified the difference between series and parallel connection based on the brightness of the bulbs.

Based on Observer-4,observer-5,and observer 6 and video analysis.group 2were concentrated how to solve the problem and they have solved the four problems, but observer-4 was focused on one

student, who was not even touching the learning material but was taking careful observation on activities took place on the learning material by his group members, at the end when the teacher gave some written questions to be answered based on the experiment already they have done, in one question his group member answered it wrongly. Later on observer-3 asked him that question again orally he answered it correctly, based on his observation. This student couldn't share his idea to his group members for his different answer instead he changed his correct answer by the wrong one because he couldn't get confidence for convincing others.

Based on observer-7, observer 8 and video analysis on group -3 we found that group 3 faced two challenges, the first challenge was while they were constructing simple circuit; the group constructed simple circuit correctly, but the bulb didn't give light after that they discussed where is their mistake they asked the teacher to bring another new lamp and gave them. When they replaced it the lamp light up. From this group the observer found that a problem is existed the group discussed about it and put hypothesis then after tested it finally confirmed their hypothesis was correct. The second challenge was when they construct series circuit they were confused and their connection were wrong. Even both switches were switched OFF the lamps were giving light. After the teacher helped them to follow the procedures in the worksheet they easily correct it

Figure 6. Simulation in introduction

Figure 7. Cooperative learning among students

Figure 8 Students 's presentation in front of the class

The observers suggested that there had been lack of learning materials. All students couldn't get the same chance while constructing a circuit due to limited number of learning materials. in each group there were six students with one learning material. To overcome this barrier more learning materials should be needed for the next lesson. It shown several students still were very eager on engaging the learning materials they were not listen when one presents in front of the class. Therefore the teacher should take serious follow up on students to listen presentation

#### 4 CONCLUSION

Our findings shown that the students' engagement on the learning material, work sheet, and simulation was accomplished successfully.

The lesson met the intended learning goals. The students could construct simple electric circuits, series circuit, and parallel circuit and its combination. They also developed understanding about; the materials they need to construct simple electric circuit, difference between open circuit and closed circuit, and the difference behavior of series and parallel circuits, The overall, our lesson shown a remarkable progress in students understanding by applying Inquiry strategy incorporating cooperative learning to enhance student's analysis of electric circuit

The recommendation are 1) if someone intend to use these learning materials, we suggested there should be enough learning materials therefore all student can engage. 2) To make the implementation effective teacher guidance through the process is needed. 3) because the learning material make all the student eager to explore, in the closing session when students present their result and teacher summarization in front of the class make sure all students are paying attention towards the presentation such as students sitting position, should facing in front of the class

## 5 ACKNOWLEDGEMENT

I (Yohannes) have deepest gratitude to JICA for helping me financial support during my training program in UPI

I (Yohannes) would like to thank physics department members and students in UPI for all their hard work and constructive comments in every step of the lesson study implementation

Last but not least we also thank to S.D.P.N setiabudhi public primary school, Bandung, Indonesia for their help starting from the beginning of lesson study implementation up to the end.

## Using *Botakoja* To Improve The Quality Of Students’ Storytelling Ability In Oral Expression Class

By:

Hermanto, M.Hum. and Siti Salamah, M.Hum.

Indonesian Language and Literature Education, Faculty of Education, UAD

### ABSTRACT

Abstract:

Oral Expression course is a compulsory subject for the first semester students of Indonesian Language and Literature Education Department, Faculty of Teacher Training and Education, Ahmad Dahlan University. The problems arising in the process of teaching and learning activities, among others, are: students’ sense of independence, confidence, and creativity which have not been maximized yet. This is certainly a major concern of all the faculty members in order to make sure that all students do achieve the competency. Hopefully, the improvement effort taken in solving the problem will become a major milestone in the implementation of Lesson Study activities in the Indonesian Language and Literature Education Department. The selecting of Oral Expression Course especially the Storytelling one is due to the fact that the course is one of the basic courses needed to achieve the competency and it is also a prerequisite course all students must take before they get the next course series i.e. Rhetoric Course. The study focuses on the success of the storytelling process by utilizing existing media easily found around the neighborhood. As a result, *BoTaKoJa* (*Boneka Tangan Tokoh Jogja/Jogja Figures Hand Puppet*) is chosen as an alternative media to help develop students’ creativity. The Lesson Study done involves six relevant lecturers and twenty-five first semester students of class B in the academic year of 2013-2014. The lecturers involved in the Lesson Study go through some following cycles: planning, implementing, and reflecting. The Lesson Study itself is performed in four cycles. The data are collected using observation sheets, filled out by observer lecturers, and student worksheets. The data are then analyzed descriptively. Based on the data analysis results, it is found that the use of *BoTaKoJa* during the Lesson Study activity can improve the students’ creativity, self-confidence, and courage in doing story-telling in the class. From the lecturer’s side, however, it is obvious that the learning atmosphere in the class is getting more favorable, the learning effectiveness is achieved, the positive learning environment is created, and the students’ creativity to practice storytelling emerges at last.

Keywords:

*Lesson Study, BoTaKoJa, and storytelling.*

### A. Introduction

Storytelling belongs to speaking skills. This skill has to be mastered by the Indonesian Language and Literature Education students because they will be an Indonesian teacher and most of the materials they will teach are related to speaking skills. Furthermore, storytelling ability is included as one of the learning indicators in Oral Expression course.

Based on the interview and observation done in the class of the Oral Expression course, it shows that the learning process and outcome are not as expected yet. Some of the problems the students have include lack of courage to perform the story-telling, creativity in preparing the supporting media for the story telling, techniques in doing the storytelling, and other supporting elements in storytelling. These factors are indeed challenges for the lecturer, in this case the lecturer needs to present and create such an atmosphere which enables to cultivate and develop the elements the students lack of in the class so that the students become confident, creative and innovative as expected.

Courage or self-confidence is an indicator of learning achievement. This becomes one of the initial factors in the learning process. From the lecturer's point of view, however, the lecturer feels that many of the students are not yet confident enough and quite shy in front of the class. In addition, lecturer also sees that the students still find it difficult to perform story-telling fluently and coherently in the class. The result of the interview from the lecturer is then supported by the results of interviews with the students taking the course. From the interview, they say they are shy, less confident, less fluent, and difficult to make sentences when performing the story-telling.

Based on the interview data above, it is obvious that it's necessary to have an improvement process to find solutions to minimize the problems. One of the possible solutions is by creating media to support the process of storytelling. Storytelling will be easier if it is supported by the mastery of materials and the use of media. One of the alternative media used in storytelling is *BoTaKoJa* (*Boneka Tangan Tokoh Jogja/ Jogja Figures Hand Puppet*). *BoTaKoJa* can be an effective media to trigger students'

creativity in order to develop the imaginative elements of the storytelling.

There are four figures in *BoTaKoJa*, they are *Mbah Bejo*, *Mbah Sri*, *Thole*, and *Genduk*. These four figures are the reflection of Yogyakarta local wisdoms. The reason of using Yogyakarta figures is that it is expected to instill positive characters and local wisdoms for Yogyakarta people.

The combination between storytelling and *BoTaKoJa* is hoped to give a more enjoyable learning atmosphere and to stimulate students' creativity to perform better in front of the class. Besides, the presence of stimulating learning process will be able to encourage the students to create and develop media needed to support the performing of the storytelling in front of the class.

### B. Supporting Factors in storytelling

Storytelling is part of speaking skills. Speaking is an ability to pronounce sounds of articulation or to pronounce words to express, state, deliver thoughts, ideas, and feelings (Arsyad and Mukti, 1997: 2.2). The main purpose of speaking is to communicate. In order to convey information effectively in communication, the speaker should deeply understand what will be delivered and know how to deliver it. The effectiveness of speaking is supported by linguistic and non linguistic factors. The linguistic factors are (1) the accuracy of speech, (2) the placement of stress, (3) dictions, and (4) the accuracy of speech target. The non linguistic factors are: (1) natural, calm and flexible attitude, (2) directing sight to the speaker, (3) willingness to face someone else's opinions, (4) gestures and proper expression, (5) fluency, (6) relevance/reasoning, and (7) and topic mastery (Arsyad and Mukti, 1997: 22).

Based on the need analysis conducted, it is known that a number of students find it difficult to orally tell with the media and perform it in front of the class. 75% of the students say that it is difficult and only 25% of the students feel that it is easy. Related to the the problems experienced by the students in storytelling, here are the data: 85% students feel of fear, shame, and nervousness, 10% students are not able to storytell smoothly, 80% students do not tell the story coherently, 70% students feel unconfident, 50% students

forget the story, and 75% students find it difficult to prepare the media of storytelling.

The data also show that students experience problems of both linguistic and non linguistic. However, based on the data, it's obvious that non linguistic problems dominate more than the linguistic ones. Thus, when teaching speaking skill, it's strongly suggested that the lecturer teaches the students not only the linguistic aspects but also the non linguistic ones. Non linguistic factors lead more into mental problems, vocal, media, and body language. By doing so, the students will master both factors balancedly.

**C. Selecting tasks in speaking practice**

There are many tasks that can be given to the students to measure their speaking skill in the target language. Whatever the form of the task is, it should allow the students not only to express their language competence but also to deliver their ideas, thoughts, feelings, or convey messages (Nurgiyantoro, 2011: 402). The tasks given can be in the form of image stimulus, sound stimulus, image and sound stimulus, and storytelling.

To be able to reveal the students' speaking skill, image can be used as a stimulus of good talk. This includes the use of learning media made from *BoTaKoJa*. It is useful to trigger students' creativity in speaking practice.

As *BoTaKoJa* can be used as a stimulus of creativity in storytelling process, picture media can be used as another media as a stimulus as well. Image stimulus used as a stimulus of speaking can be grouped into object image and story image. Object image is an image about particular object which independently stands and its existence does not require the help of another image. Story image, however, is picture series consisting of a number of interrelated image panels entirely forming a story (Nurgiyantoro, 2011: 402).

Story image contains an activity, reflects particular purpose or idea, meaningful and shows the sequence of story. The image panels may be with number or without numbers so that the participants themselves who will actively and logically determine the sequence of the story. Besides using image stimulus, students' speaking skill can also be stimulated through sound stimulus and visual and sound stimulus. Sound stimulus speaking task is closely related to listening skill test.

The relevance between these two competences should be emphasized in language learning so that the learning process can meet the demands of the whole language.

Based on the observation result in cycle four, it is found that the value of students' creativity improved which is indicated by each group preparing the materials and media used in the storytelling. Some students use media like hand puppet, drawing paper, and books containing fascinating stories. This way, the classroom atmosphere becomes more alive, enabling the students in the classroom, and minimizing the teacher's role during the teaching and learning process.

**D. Communicative approach in language skill**

Learning Indonesian language is regarded not successful or it still does not meet many parties' expectations. It fails. The causes of the failure of this have been studied by the experts and one of the factors is believed to be related to the fact that teaching Indonesian language gives more emphasis on the knowledge of the language or language structure rather than on the language skills (Sugono, 2008: 317). Students are only taught about grammar, but they are hardly given opportunities to use it in speaking practice. Therefore, it is necessary to apply communicative approach in language learning. There are several main principles of communicative approach (Anindyarini, 2007: 63), some of them are as follows: (a) The main purpose of language teaching is to help learners use the language to communicate, either communication uses language functions or grammatical structure, (b) Language is used in social context and should be in line with the setting, topic, and participants, (c) Learners should be largely given opportunities to reach the agreed meaning, which is trying to make them understand; (d) Learning should be able to reveal the opinions, ideas, and feelings. One of the purpose of communicative approach-based learning is to prepare the learners for such a meaningful interaction in the natural use of language (Wardani, 2002; 6.29).

**E. Implementation of Lesson Study in Oral Expression Course**

The lesson study is intended to improve the learning quality of Oral Expression course especially on storytelling

topic. The lesson Study was conducted in the first semester of class B in the academic year of 2013-2014. The students involved are 25 students. There were four lecturers involved in this activity i.e. two lecturers act as the observers and the other two lecturers served as the model lecturers. The lecturers involved were: Roni Sulistiyono, M.Pd., Titiek Suyatmi, M.Pd., Hermanto, M.Hum., and Denik Wirawati, M.Pd., while Wachid Eko Purwanto, M.A. and Iis Suwartini served as model lecturers. The documentation process was assigned to two students named Angga Yudik Arrasyid and Rofiq. These two who have been known having good skill in photography and documentery.

This study was conducted from 23 November 2013 up to 30 November 2013. This activity was divided into four cycles, each cycle was divided into three main activities i.e. planning, doing, and seeing. In Planning stage, the involved lecturers conducted problems identification during teaching and learning process and then designed the learning tools such as lesson plan, student worksheet, and observation sheet. Student worksheet functioned to asses and observe students' activities when performing storytelling in front of the class, while the observation sheet was used to assess students' activeness and would be done by the observers during the Doing stage. In Doing stage, the model lecturers did learning activities and other lecturers observed the students' learning process and observed the behavior of model lecturers. The next stage was Seeing or Reflecting the result of learning and observation towards students and model lecturers. The result of Seeing or Reflecting stage was used as the basis for improvement and planning of learning in the next cycle.

The data of the study were obtained using observation sheets managed by all lecturers involved in the second cycle of lesson study. Several positive points in this activity indicated that this lesson study was successful to improve the academic atmosphere in the Indonesian Language and Literature Department. The data were analyzed using descriptive method, then.

#### F. Learning Storytelling

Storytelling is one of the methods in language learning process, especially in the

topic about communication. Farida (2012: 123) states that storytelling is the oldest learning method. Oral tradition tells and creates great men throughout history. Since children world is a world of imagination, imaginative stories might be very effective to convey learning materials and moral values. Besides having fun, storytelling is beneficial to:

1. Add creativity and imagination,
2. Add insight, especially when the stories come from other countries or cultures,
3. Improve language, listening, and communication skill,
4. Improve conceptual ability and emotional quotient, and
5. Obtain relaxation and build emotional intimacy between teacher and students.

Storytelling does have its own challenges especially when it's used to deliver the materials. If a lecturer is able to do it well in front of the students, there are some supporting aspects in storytelling that can be well delivered as well. The supporting aspects delivered are: creating the atmosphere, vocal or sound, expression, timing, and fun ending.

The first aspect is creating the atmosphere. To do this, there are things which should be done by a storyteller i.e. determining the setting (quiet and comfortable), ensuring that the time is spare, leading the audiences to comfortably sit in front of the storyteller, saying “*wait, be patient*” to them who interrupt to ask, and also facing the audiences' eyes alternately. The second aspect is vocal or sound. This can be done by selecting simple sentences that are easily understood by the audience. The storyteller needs to ensure that the audience can hear the storyteller's voice and the tunes of the sound are in line with the situation of the story, and occasionally asks the audiences to imitate the storyteller's voice. The last aspect is expressions. The first thing to do with this aspect is ensuring that the storyteller knows about what will be told (mastery of the material), then expressing what the storyteller feels naturally and not excessively. The fourth is time management or timing. It is done through some things like having breaks at the right times so that it can emerge curiosity, changing the speed of the plot, giving various stressing such as tensed, relaxed, and sad. The last aspect is ending. Ending means that the storyteller should not

retell the climax, just tell it once. He should not be overdoing, state the moral values, and then end the story immediately.

**G. Application of *BoTaKoJa* in learning the storytelling**

*BoTaKoJa* stands for hand puppet of Jogjakarta figures. The background of selecting *BoTaKoJa* is based on the result of the discussion with the model lecturers of lesson study. The model lecturer used *BoTaKoJa* is Iis Suwartini, M.Pd. The stages done in the implementation of *BoTaKoJa* in learning storytelling are as follows:

1. The introduction of the figures

The characters performing in *BoTaKoJa* consist of four main characters. These four main characters are *Mbah Bejo*, *Mbah Sri*, *Thole*, and *Genduk*.

2. The introduction of the characters

The characters owned by these four characters are: *Mbah Bejo* is a typically Javanese who still upholds Javanese principles, patient, affectionate, and humble. *Mbah Sri* is a talkative, sometime stubborn, painstaking, and curious woman and she sometime really wants to know about someone else's business. *Thole* is described as a boy who is independent, sociable, good at reciting Al Quran, and always cheerful. The last character is *Genduk* who is usually called *Nduk*. *Genduk* acts as if she was very modern, curious, idler, and extravagant.

3. The values of local wisdoms

One of local wisdoms appearing in the story is the costumes worn by the characters, which are striped woven clothes, batik, bun, and *blangkon*. The characters which belong to Javanese wisdom and culture are patient, defenseless, and tolerant of the cultural diversity.

4. Techniques in playing *BoTaKoJa*

Generally the techniques in playing *BoTaKoJa* are the same as those applied in hand puppet. The difference is only on the way of storytelling and the storyteller understands the figures. In other case, however, the storyteller may only modify the figures.

After introducing the *BoTaKoJa*, the next step is to practise implementing

*BoTaKoJa* in lesson study especially in oral expression course on topic of storytelling. Here is the description of lesson study activities conducted on November 23th until 30th which consisted of 4 cycles. Except the model lecturers and the documentation staff, every lecturer involved used two sheets to monitor the activities of the students and the model lecturers. This activity was done in each cycle. To get the objective data, the observers were divided to observe particular group that had been formed. The observation result would be an authentic evidence of the lesson study implementation. The aspects observed during lesson study activity were as follows: Students' readiness in following the lecture, students' discipline during the lecture, students' courage in conveying opinions, the emergence of confidence when performing, the comprehensive performance, devices, media, and materials prepared by the students in storytelling, and their enthusiasm in following the lecture as well.

Another sheet was also distributed to the students. The sheets were worksheet and assessment sheet of the students' performance containing mastery of the storytelling materials, audience management, analogy or the relation between the story and the example, expressions, gestures or manners, creativity in terms of diction, and time management used in storytelling.

In the meeting of cycle one, the model lecturers demonstrated the use of *BoTaKoJa* in delivering storytelling topic. The model lecturers also explained about some techniques and requirement of storytelling. The students followed the storyline delivered by the lecturers. Some students gave questions in the last session when the model lecturers explained the material and techniques in storytelling.

There were some other findings of this cycle too. First, students were still confused about what was done. The second problem was about what story was going to be performed. The third one was about how to reduce the sense of nervousness when performing storytelling. Seeing this condition, then, the lecturers decided to take action by giving them a week longer to prepare and practice storytelling by using the existing media.

The second meeting was done by Iis Suwartini as the model lecturer. The

activities can be described as follows: since the previous meeting was emphasized on preparation and basic concepts of storytelling, in the second meeting, though, the students were asked to practice storytelling by using media they made themselves. There were five students groups who used media in storytelling. Group one used *Timi* puppet and also little puppet, group two used cut images like shadows, group three used picture story book, group four used cartoon movies which have been redubbed, and group five used puppets.

Based on the observation done by the observer, it can be concluded that students' creativity and courage is quite good. This is proven by the existence of students' good enthusiasm, students' readiness in following the lecture, students' discipline in joining the lecture, students' courage in conveying any opinions, the emergence of confidence when performing, the comprehensive performance, devices, media, and materials prepared by the students in storytelling, and also their high enthusiasm in following the lecture.

#### H. Conclusion

The application of *BoTaKoJa* in oral expression course on storytelling material brings such a positive impact. It can also emerge the students' creativity to develop media which is proven by students' creativity in developing various media, the improved confidence, and the vocal ability in storytelling. Therefore, it surely brings impact on the implantation of lesson study in the Indonesian Language and Literature Department especially as an effort to create a more enjoyable learning atmosphere and build such positive academic culture. By so doing, the indicators of learning achievement will easily be achieved and the better character of lecturers and students is accomplished.

### **ABSTRACT**

Electronics is one of the three technologies required for Part B of the written paper in the subject Design and Technology (D&T) and this can comprise up to 46% of the overall theory marks. Competency in electronics is important in enabling students to perform well in the subject. According to theories developed by James Jenkins, Jon Saphier and E. Skinner, engagement is seen as a crucial component in effective student behaviour or learning. Based on the Skillful Teacher Map of Pedagogical Knowledge (Fig.2), enhancing engagement is one of the principles of learning in impacting attention and engagement. Two electronic boards were designed and built for students to experiment, test and understand the use and applications of electronic components and circuits based on inquiry learning. Three research lessons were conducted for students from Secondary 3 Normal Technical class (3A1). Worksheets for these students were customised to their learning levels through the provision of scaffolding and guiding questions. The team adopted the 3 factors behind the choice of the learning strategy (Linda Darling Hammond, 2008); nature of (1) the materials to be learned, (2) the nature of the skills, knowledge and experiences that learners bring to the situation and (3) the goals of the learning situation and the assessments used to measure learning relative to these goals. The class was sub-divided into pairs or small groups for collaborative learning and discussion. A total of three research lessons were conducted, with each consecutive lesson a refinement of the previous lesson. In the final lesson, the seating arrangement was optimally planned after taking into consideration the student dynamics. The lab worksheets were further adapted to provide more scaffolding to allow students to make connections to their prior knowledge. Additional opportunities were provided for students to select the input/sensor type and to provide feedback. Based on observations during their search lesson, students were more engaged when experiencing such hands-on experiments. The main research lesson data was collected from Secondary 3 A1 students (N=15) using quantitative measures that included survey questionnaires and post-lesson reflections. The survey results showed positive responses. The findings are further substantiated through semi-structured interviews with 6 randomly selected students. After transcribing and coding, the interviews provide additional evidence to support the results of the survey. The use of the ACE Electronics Board has created a positive impact on the students' attention and engagement level in the teaching of Electronics in Design and Technology.

## 1 INTRODUCTION

### 1.1 Background of Study

The Normal Technical (NT) stream was introduced in 1994 to cater to the needs of lower ability students. This was also done to reduce the school drop out rate and to help ensure ten years of general education for all students. As the ministry had recognized that these students were less academically inclined, the NT stream was to prepare students for additional vocational training at the Institute of Technical Education (ITE).

Research done by NIE researcher have shown that the reasons behind their poor academic performance include low literacy levels, students creating multiple “centres of disruption” as a result of low attention span and constant negotiation between teachers and students. Additional research also revealed that the factors of Cohesion, Task Orientation and Satisfaction were important factors in students’ perception. It was shown that NT students progressed to higher levels, they tend to become less task oriented.

The NT curriculum was reviewed and revised in 2004. Emphasis was placed on making lessons practice oriented and the introduction of electives to develop students’ specific interest. None the less, research done by Albright in his work “Origins and Perceptions of the Normal Technical Stream” revealed that students tend to be more engaged when there was more hands-on involvement as compared to a traditional teacher centred model of learning. From the observation by teachers teaching normal technical classes, the students often have the following issues ranging from short attention span, poor reading and writing skills, family issues, poor self-confidence, presence of mild learning disabilities, classroom discipline and lack of intrinsic motivation in studies.

Earlier studies done regarding the motivation, self-esteem and study habits of normal technical students have also pointed to the above factors as causes for their poor academic performance. Some of the more significant factors will be mentioned briefly.

The poor English language literacy levels of NT students are largely inherited from their poor acquisition of English in their primary school years. Further more, research has shown that less than 20% of such students speak English at home. The comparatively low proficiency levels of students are seen as a main cause of the common feedback that NT students have problems understanding the lesson content taught in class. This is also

hampered by the use of technical or science related vocabularies that are often new and alien to NT students.

In addition to the above, the short attention span of NT students is often cited as a challenge for teachers. A number of NT students also pose discipline issues for teachers and their classmates alike when they interrupt lessons through various disruptive behaviour. The teacher has to manage such students while ensuring the lesson objectives are met. In connection with this, lessons have to be planned in such a way that there is a good mix of hands-on and teacher-centred instruction so as to maintain the attention of students.

Lastly, the low self-esteem or confidence levels of NT students can be attributed to negative perceptions from their schoolmates from other streams, parents and even themselves. Many a times, NT students give up on their work when they face the slightest difficulty in their academic work. Thus lessons and teaching packages have to be planned so that there is adequate scaffolding for NT student.

In Design and Technology lessons, Upper Secondary NT students have a reduced curriculum compared to the Normal Academic students, however they are still required to learn Electronics and be able to identify the electronic components and the few types of sensor or 555 (timer) circuits.

In order to find out more about the issues faced by 3 NT students in this topic the PLT members administered pre and post surveys on 3 A1 students taking Design and Technology so as to gather more data regarding their needs, aptitudes and suggestions. The ACE board learning package was designed with this in mind to encourage hands-on and collaborative learning. Relevant literature review, methods and results will be discussed in the following sections.

## 2 METHODOLOGY

### 2.1 Framework of Study

Linda Darling Hammond (2008) assessed the need for teachers to understand about the kind of teaching that produces powerful learning. In order for the D&T team of teachers to determine the Research Lesson Study (RLS) goal, the team deliberated on the importance of engaging the 3 NT students in the learning of electronics based on the findings in the earlier sections. The discussion was also supported by some analysts that meaningful learning cannot be met through passive, rote-oriented learning focused on basic skills and memorization of disconnected facts. Good &

Brophy (1986) termed “meaningful learning” explicitly as:

- Learning that enables critical thinking
- Flexible problem solving
- Transfer of skills and use of knowledge in new situations.

According to Linda Darling Hammond (2008) and Donovan & Bransford (2005), there are 3 fundamental and well-established principles of learning that are particularly important for the RLS team to know about these students learning.

The 3 fundamental principles of learning that are important for teaching are:

- Students come to the classroom with prior knowledge that must be addressed if teaching is to be effective ~ *if what they know and believe is not engaged, students may fail to grasp the new concepts and information that are taught, or they may learn them for purposes of a test but not to be able to apply them elsewhere, reverting to preconceptions outside the classroom. This means that teachers must understand what students are thinking and how to connect with their prior knowledge if they are to ensure real learning.*
- Students need to organize and use knowledge conceptually if they are to apply it beyond the classroom ~ *teachers must be able to structure the material to be learned so as to help students fit it into a conceptual map and teach it in ways that allow application and transfer to new situations.*
- Students learn more effectively if they understand how they learn and how to manage their own learning ~ *teachers can teach students how to use, arrange, and manage learning strategies, including the ability to predict outcomes, create explanations in order to improve understanding, note confusion or failures to comprehend, activate background knowledge, plan ahead, and apportion time and memory. Successful teachers provide carefully designed “scaffolds” to help students take each step in the learning journey with appropriate assistance, steps that vary for different students depending on their learning needs, approaches and prior knowledge.*

These three fundamental principles can be further expanded to seven ways in supporting the process of meaningful learning used by highly effective teachers.

- Creating ambitious and meaningful tasks that reflect how knowledge is used in the field.

- Engaging students in active learning so that they apply and test what they know.
- Drawing connections to students’ prior knowledge and experiences.
- Diagnosing students’ understanding in order to scaffold the learning process step by step.
- Assessing students’ learning continuously and adapting teaching to student needs
- Providing clear standards, constant feedback, and opportunities for work.
- Encouraging strategic and metacognitive thinking, so that students can learn to evaluate and guide their own learning.

The design of the RLS package through the ACE Electronic Boards (hands-on problem solving approach), drew skills of the students (e.g. learning experiences, assessing students’ learning, and class climate) from the class’s pre-lesson observations to create a meaningful authentic learning experience for the students. This authentic learning experience allows students to draw parallels between the relationship of their learning capacity and the external world and understand these two for a more systematic whole. In the process of their learning, students will acquire not only the real life knowledge but also the ability to link their learning in the classrooms with the world around them. Further to their search done by Hammond, the D&T team also considered the factors behind the choice of the learning strategy. The choice of the appropriate teaching strategy is crucial as different contexts require different kinds of learning.

The appropriateness of the use of the particular types of teaching strategies depends on these 3 factors in the model developed by James Jenkins in the “The Tetrahedral Model of learning”:

- The nature of the materials to be learned
- The nature of the skills, knowledge and experiences that learners bring to the situation.
- The goals of the learning situation and the assessments used to measure learning relative to these goals.

Figure 1

According to the studies we have done earlier, the 3 factors listed above are supported by the Map of Pedagogical Knowledge presented by Jon Saphier (2008) in his book “The Skillful Teacher”.

Figure 2

Jon Saphier defined in Fig.2 that management skills support and make possible instruction, curriculum skills design instruction, motivational skills empower instruction and instructional skills deliver the goods. Altogether, these areas of performance delineate teaching. The D&T team focused on the use of impacting students through “attention and engagement” (management skills). Concisely speaking, this will take effect when students are operating, responding, moving and discussing during the learning experience (instructional skills). In the context of the RLS lessons and the use of ICT such as real-time Moodle response, the environment and setting has been planned such that it encourages discussion in small groups (curriculum and motivational skills).

## 2.2 Research Learning Study (RLS) Learning Goal

The goal of the lesson is to engage the 3NT students in the learning of electronics through the ACE Electronics Board; that is to increase the reengagement level through experiential learning.

There are additional sub-objectives that support the over-arching goal. These objectives include engaging students and involving them (fun and enjoyable) through hands-on teaching and learning activities, and enhance students’ understanding of the electronic conceptual processes they are learning to increase their proficiency in answering electronic theory questions for the NT level.

In this RLS, the team will focus only on the 3 factors behind the choice of the learning strategy to achieve the goal. Specifically, the RLS seeks to find answers to the following questions:

- (1) Does the RLS (3NT students learning of electronics through the ACE Electronics

Board); (i) increase students’ engagement level? (ii) enhance students’ learning?

- (2) What is the impact of the RLS on each of the 3 factors: the nature of materials to be learnt; the nature of skills, knowledge and experiences that learners bring with them; and the goals of the learning situation and the assessments used to measure these goals.

## 2.3 Implementation

### 2.3.1 Pre-Lesson Observations

The team began the pre-lesson observations of Secondary 3 Normal Technical D&T class (N=15) on two separate occasions and this was carried out. The initial observations were beneficial for the team as it enabled the team to be able to identify behaviour, learning styles and needs of the secondary 3 Normal Technical students.

The first lesson (1st Pre-lesson Observation) covered basic electronic, series and parallel circuits and Ohm’s law concept with two electronics worksheets to sum up the lesson. Although the lesson was a recap of the students prior knowledge on electronics that were covered in their lower secondary science lessons and D&T lessons in previous years, the team noticed that the students were not able to keep up with the lessons. Observers noticed that about three-fourths of the students were not able to measure and calculate the total resistance of the lesson despite given formulas. Students were also not able to understand the strategies of doing cross multiplication for resistance of resistors connected in parallel. They were also confused by the numeric models for adding fractions with unlike denominators. From the observations and posing of questions to the students, the team discovered the reasons for the students’ problem in understanding the lesson although that was a recap lesson for them. The students were weak in their mathematics and science. Thus, the instructions and assignments given to students have to be simplified and scaffold so that students can comprehend the allocated tasks.

The team also noted the seating arrangement of the students. For the 1st lesson, the students were seated according to their choices. This was a factor that impeded learning as students who were able to understand the concepts taught were seated together. For example, students who are much vocal, and able to grasp concepts faster would prefer to sit together while student who are quieter were seated in another separate group. Being seated with familiar classmates also resulted in students engaging in their own conversations due to their short attention span. The weaker students were not able to follow the lesson very well. The class

was made up of mixed ability students with diverse learning needs. As such, they were often lost during the lesson and unable to follow the instructions of the lesson.

The next lesson (2nd Pre-lesson Observation) covered the learning of Transistor Sensing Circuit with the concepts of transistor with different sensors and current flow. The lesson was a progression of the previous lesson on Ohm's law and total resistance in a circuit. Before the concept of transistor was taught to the students, the students were given a short quiz to recap the previous lesson on the calculations of resistance and ohm's law. Students were also assigned pre-allocated seats to reduce the possibility of students being off-task during the lesson.

The lesson on Transistor Sensing Circuit was then introduced to the students. The lesson's instructions were simpler as compared to the previous lesson. Observers noticed students were not able to follow the lesson flow as the concept taught was new to the students. The students were also not able to stay focus for a long time during the theory lesson. Students started showing signs of restlessness and were distracted by the surroundings instead of following the lesson. Some students started engaging in their own conversations in the midst of the lesson while others started doodling in their effort to start focus during the lesson.

### 2.3.2 Pre-Survey Results

Apart of having pre-lesson observations, a pre-survey was conducted with the class to assess the students' learning and how they feel towards the electronic theory lessons that was taught. The survey seeks to give the Lesson Study team feedback and measurement through assessment for learning. It is shown that majority of the students felt it was difficult to learn electronics from the D&T textbook. In addition, they also shared their areas of concern in areas in terms of their understanding for the topic in electronics and how the teacher can make the lesson easier for them to understand the applications of electronics such as the use of hands-on activities and electronic circuit board to help them learn better.

1. Generally, rathe difficulty of learning electronic s from the D&T textbook.

Very easy	Easy	Difficult	Very difficult
0	2	10	0

2. Which aspect of electronics do you have problems understanding? (You can circle more than one).

Knowledge of component and symbols (e.g Capacitors, LDRs)	Type of circuit diagrams	Application of circuits. (e.g. Moisture sensor can be used in soil)	Calculation of V/R/I etc.
5	2	3	6

3. In what ways do you think the teachers can help you to learn the applications of electronic better? (You can circle more than one).

Additional Theory Lesson	Use of circuit boards to demonstrate	Hands on making of circuits	Use of past exam and test question
3	8	7	1

### 2.3.3 Pre-observation Debrief and Planning for Lesson 1

After the pre-lesson observations, the teams sat down and discussed about the lesson. There were some suggestions on how future lessons could be further improved. The team decided to improve and revise the lesson based on 3 factors of the lesson supported by the Map of Pedagogical Knowledge in Fig. 2:

1. Setting the class climate (Motivation)- Seating arrangement of the students  
The groupings of the students were rearranged such that a stronger student pair with a weaker student. These stronger students will act as buddies to the students paired with them. This arrangement promoted collaborative learning and enabled students to learn better among themselves.
2. Models of Teaching and Clarity (Instructional Strategies)- Scaffold instructions given to students to cater to the students learning ability. Shorter and clearer instructions were set for the students to aid them in following the lesson so that they were able to learn the concepts of electronics better. This would also help the students to tap on their prior knowledge.
3. Discipline and routines (Management)- Setting of class routines.  
The setting of classroom routines and discipline for the students ensured students were aware of the expectations of each lesson. Students were aware of the desired behaviour in class and were reminded to pay attention during the lesson.

In addition, the team also looked at the factors behind the choice of the learning strategy. The choice of the appropriate teaching strategy was required for different kind of learning. Adapted from the factors found in the model by Bransford et al. (2005), the team discussed about:

1. The nature of the materials to be learned (F1).
2. The nature of the skills, knowledge and experiences that learners bring to the situation (F2).
3. The goals of the learning situation and the assessments used to measure learning relative to these goals (F3).

The team felt that to better engage students in active learning, there was a need to have some hands-on activities. This would break the monotony of the theory lesson and the students would be fully engaged throughout the lesson. Having hands-on activities could also help students to learn to apply the knowledge that they have learnt in real-life contexts. The team felt that future lessons should include more hands-on activities to guide and evaluate their learning. Thus, the team decided to introduce the ACE Electronics Board for future lessons.

### 2.3.3.1 Research Lesson 1

The first research lesson was held and covered the use of transistors in sensing circuit (real-life applications) through the use of ACE Electronics Board. The students were required to record their observations in the Lab 1A worksheet through structured and scaffold investigative lab work. Students were required to tap on their prior knowledge on electronics before this research lesson.

Students were told to spend about 10-15 minutes of their time to complete a simple investigative activity on the types of resistor to recap on the previous lesson on resistors. The students were to identify the different types of resistors that they have learnt namely variable resistor, potentiometer, Light dependant Resistor (LDR) and fixed value resistor.

After which, instructions were given to the students to guide them in the hands-on activity (use of ACE Electronics Board). The class was tasked to work on the Lab 1A worksheet in pairs. Likewise, instructions were given in sets to help the students understand the tasks better and each member of the pair had a role to play in the activity. For example, one of the students would be in-charge of collecting the Lab worksheet, multi-meter and battery while his partner would be in-charge of collecting the ACE Electronics Board and the set of components

required for the activity. Students were asked with guided instructions to carry out a prior check on the equipment as part of the established classroom routines. This helped the teacher to set the class climate and prepare the students for the start of the hands-on activity.

The Lab 1A worksheet required the students to measure the resistance of the circuit with the use of a multi-meter when adjusting the potentiometer. This allowed students to build on the prior knowledge learnt in the pre-lesson observation on resistance. Students were then asked to test out the sensing circuit by adjusting the potentiometer and the Light Dependent Resistor (LDR) in the circuit. The students were able to follow the hands-on activity and recorded their observations in the lab worksheet.

### 2.3.3.2 Debrief for Research Lesson 1

Observers noticed that the students were engaged throughout the lesson as they were given a number of tasks in the hands-on activity. The students had to conduct the experiment and record their findings in the Lab worksheet. However, it was also observed that the students were not able to express their findings and observations in words to answer the questions in the Lab worksheet. Students faced some issues in completing and understanding the questions in Lab worksheet. In addition, students were also not able to answer the 3-2-1 reflection questions at the end of the lesson. Due to a lack of time, the lesson was not completed.

### 2.3.4 Planning for Research Lesson 2

Base on the debrief findings for research lesson 1, the team refined the next research lesson. The team included meaningful tasks in the next lesson so that students were able to reflect and relate their knowledge of the lesson. The team decided to improve on the questions in Lab 1B worksheet to help the students to tap on their prior knowledge and experiences. This enabled the students to answer the questions in the Lab worksheet as it was able to draw out the observations and knowledge from the students.

#### 2.3.4.1 Research Lesson 2

The second research lesson covered the use of sensing circuit (real-life applications) with the use of ACE electronics board. The students were required to record their observations in Lab 1B worksheet through structured and scaffold investigative lab work. Students were required to

tap on their prior knowledge on electronics before this research lesson.

Students were told to spend about 15 minutes of their time to complete a simple investigative worksheet together with a “Jig-Saw” activity. The activity allowed students to discuss with their peers the answers of the investigative worksheet 2 through the use of Moodle. However, students were not prepared and they were not able to recall the concepts learnt on the transistor. Thus, a lot of time was spent on this activity on investigative worksheet 2.

The same routines from the previous lesson were in place and each member of the pair had a role to play in the lab work. The Lab 1B worksheet required the students to measure the value of the current passing through the transistor with the use of a multi-meter. This task tapped on the students’ prior knowledge on Ohm’s Law as well as the similar concept on the measurement of the resistance and current values. Students still faced the same issue where they were not sure of what to do for this task in the worksheet.

The teacher conducted a demonstration of the tasks in Lab 1B worksheet before allowing the students to proceed in their pair work. This enabled the students to follow the lesson better as they were able to streamline their thinking processes and took note of the key observations in the Lab worksheet. The students were to draw connections from their prior knowledge and experiences and this helped to prepare them before they started using the Electronics Board for the other tasks in the Lab worksheet.

### 2.3.4.2 Debrief for Research Lesson 2

Observers noticed the students were more engaged in the second research lesson as they were more aware of the requirement of the tasks and the key observations that they had to take note. Students were tasked to predict and answer their answer real-time using Moodle. However, due to the time constraint, the students were not able to complete the lesson and worksheet. Like research lesson 1, students were still not able to answer the 3-2-1 reflection questions at the end of the lesson.

### 2.3.5 Planning for Research Lesson 3

Base on the debrief findings for research lesson 2, the team decided to relook at the questions in for Lab 1B worksheet and refine it for the next research lesson. The observers felt that the lesson was too ambitious. Although there were a lot of meaningful tasks to engage the students, the pace of the lesson was slow for the higher ability students. There was a suggestion to include some

higher order thinking questions to challenge and stretch the higher ability students in the next lesson. The team also concluded that the “summary” part of the lesson could be done through a concept map.

#### 2.3.5.1 Research Lesson 3

The third research lesson was carried out and covered the use of sensing circuit (real-life applications) with the use of ACE Electronics Board. Similar to Lab 1B worksheet, the students were required to answer a set of questions to tap on the students’ prior knowledge on electronics namely transistor. This was carried out on the Moodle platform where students were required to post their answers for the questions in real-time. In addition, the students were required to key their lab findings on the Moodle Forum to streamline the answering of questions. This allowed students to learn from one another as they see their fellow classmates’ answers in real time.

The teacher nominated a pair to demonstrate the connection of the ACE Electronics Board. This provided all the students with the opportunity to learn from this demonstrating pair and not repeat the common mistakes that they usually make when they are connecting the circuit. (e.g. some are unsure on how to connect the wires in the circuit) This helped to remember the connections of the circuit and they also recap how they should connect the multi-meter to get the required readings.

Each student pair was also given a different sensor, either a temperature sensor or moisture sensor, to promote higher order thinking in the lesson. This challenged the students to apply what they have learnt from the theory lessons as they were required to state one real-life application for the circuit that they were tasked to do as a pair. They were also required to draw the circuit diagram and describe how the circuit works when a different sensor is used.

At the end of the lesson, students were tasked to evaluate the hands-on activity and their understanding of electronics through a concept map. The students were guided on how the summary part of the concept map could be done (scaffold instructions). This helped students to understand the use of visual models to summarise their learning of electronics. The students were also required to sum up their learning through the 3-2-1 reflection questions. This time, the students were able to answer to the questions posted to them.

### 2.3.6 Conclusion and Debrief

After the 3rd research lesson, the team sat down to discuss the outcome of the lesson. The team felt the use of the electronic board and Moodle platform was effective as it helped the students to be able to understand better. In addition, the team felt the pace of lesson was able to help the higher ability students and lower ability students to keep up to the pace of the lesson. The use of many hands-on activities was able to retain the students' attention and their passion for learning in class. This motivates the studentsthe desire to do well and try answering higher order thinking questions.

### 3 RESULTSANDDISCUSSIONS

Data were collected via two methods: a survey questionnaire consisting of 20 questions clustered around each of the 3 factors and a semi-structured interview with 6 participants. The 6 participants were picked randomly after the 3rd research lesson study. The former, based on a 4-point Likert scale, provided some quantitative measures that were fully described using descriptive analysis. The interviews, on the other hand, were intended to provide qualitative findings that could be triangulated with the observations derived from the quantitative results. It also gave the team a more in-depth view of the 3 factors.

Clustering the 20 Survey Questions to the 3 Factors, the results are as follows:

Table1:ResultsofSurvey

Factor	Average Score (Scale 1-4)	% (n=11)
F1 -Content Type	3.55	87.5
F2 -'Sense of Skills' Knowledge Experience	3.19	77.3
F3 -Goal of Learning Motivation Achievement	3.17	77.3

For F1, one of the leading questions classified under the content type would be question12. It shows a representation of how students access their learning through observation of the workings of the circuits, recognise components better.

The semi-structured interview conducted with 6 students showed similar findings. One of the students, who initially face a lot of problems in understanding the symbols and workings of the circuit and how he was not able to verbalise the workings of the circuit, was able to do so after the usage of the hands-on electronics board. He shared his experience after the ACE electronic board, how it has benefitted him to be able to explain the workings of the circuit, explain the current flow and how the transistor was able to turn on.

For F2, one of the leading questions under the nature of skills/ knowledge/ experience would be question1. Students expressed how Electronic Board Practical lesson has helped students to better understand the electronic components used in the transistor circuit.

When probed during the interview, student A (an academically weak student) shared that the Electronic practical lesson helps them to understand more about the components such as transistors and moisture sensing circuits. In addition, student B (fast learner) felt the lesson was interesting and useful. Similarly, during the semi-structured interview, student C and D (students who have shorter attention span) also added that the lesson is fun, allowing them to explore further beyond the textbook, they get to learn new stuff like connecting the wires of the Electronics Board, observe the workings of the circuit and how they can use the knowledge that they have learnt to understand real life applications.

For F3, the key leading question would be question 10, classified under the Goals of learning situation & assessment. Students expressed how Practical lesson has helped me to rate their understanding the electronic components and ability to handle them.

In the semi-structured interview, some of the students shared their before and after experience of using the ACE electronic board. They initially faces a lot of problems in understanding the workings of the circuit and identifying electronics components in a circuit, was able to form links between the circuits learned and real-life applications after going through the ACE electronic board with the worksheets. This has helped them greatly to be able to rate their understanding of the Electronics topic.

In general, all students agreed that they were engaged in the activities of the lesson and were able to make connections between past and present learning experiences. The students were also able to actively explore the activity and verbalise their understanding of the concepts learnt by explaining the formal terms used in the lesson. Besides this, the electronics board has also enabled students to elaborate and extend their conceptual understanding and allows them to practice skills and behaviours. Lastly, students were able to assess their understanding and abilities through concluding activities such as 3-2-1 self-evaluation and the concept map. The research lesson studies allowed students to build their own understanding of new ideas and promoted self-directed learning (SDL) and collaborative learning (CoL).

To better appreciate the impact of engaging the 3NT Students in the Learning of Electronics through the ACE Electronics Board, the Lesson Study team also adopted “Seven ways used by teachers to support meaningful learning” to analyse the survey results. Prof Linda Darling Hammond suggests that the students learn more deeply and perform better on complex tasks if they have the opportunity to engage in more “authentic” learning—projects and activities that require them to employ subject knowledge to solve real-world problems. This was evident in the research lesson as students were engaged and excited to use the Electronics Board. The use of experiential learning has also allowed students to think vigorously and draw parallels beyond the classroom (real life applications). They were able to observe the different types of sensing circuits’ effects first hand (buzzer, light bulb, etc.) and the lively exchange between teacher and students have certainly enhanced the entire learning experience.

#### 4 CONCLUSIONS

The results showed evidently that the 3NT students were engaged in the learning of electronics through the ACE Electronics Board. Engaging the students through experiential learning has shown its effectiveness as the students were engaged in fun and enjoyable lesson through the hands-on teaching and learning activities with the use of the ACE Electronics Board.

The use of the RLS package received favourable feedback from the students as shown in the table of results from the survey substantiated by the interview of the students. The choice of appropriate teaching strategies enabled the team to craft lessons that were both structured and guided and provided scaffold in instructions to students. A good mix of hands-on activity with the use of observations in the lab worksheets provided meaningful interactions between the teacher and the students.

Overall, the use of the ACE Electronics Board in the teaching of Electronics has created a positive impact on the students’ attention and engagement level. Through the surveys and interviews, 3NT students have found the teaching package to be enjoyable and engaging. Teachers involved in the administering of the teaching package have found it to be beneficial and effective for students. The regular PLT sessions have also enhanced pedagogical knowledge among teacher members. The overall effectiveness and value of the package suggests that the package should be rolled out to subsequent cohorts of 3NT students so that they could also reap the benefits from the package.

#### 5 IMPLICATIONS

The team will extend the learning by tweaking the Sec 3 NT SOW to infuse the current RLS package into the coursework process to expose students to real design situations or needs relating to ‘electronics’ – design journal process and making in preparation for 4NT. The RLS package will also include HOT questions relating to everyday life.

In the everyday lessons, students are also taught to be more empathetic and sensitive about user needs and environment during designing and making of their product. Besides being an active contributor in the classroom, students are also encouraged to be concern citizen who identify needs of users in authentic learning environments.

Lastly, the use of ICT in lessons enhances the learning experience and makes the lesson more fun and enjoyable. With the aid of ICT, teachers are

able to receive instantaneous feedback during lessons. Students are also able to collaborate with each other to build their own understanding of new ideas to solve real-world problems.

## 6 REFLECTIONS

Through the numerous discussions and planning, the members have found the PLT immensely useful for them to gain new insights into the behaviour, traits and learning aptitudes of 3 NT students. While it was obvious that NT students require more scaffolding, hand holding and guided instructions in small chunks, the first PLT lesson was found to be of inadequate level for NT students despite having simplified it to suit their level. In addition, the importance of how classroom dynamics need to be engineered has left a deep impression on all PLT members. The observations of classroom dynamics (and related aspects such as tone of classroom, routines, obtaining of feedback and lesson instructional strategies) were instrumental for the success of lessons for Normal technical students.

It provides teachers with the platform to explore new ideas for improving the current teaching and learning resources to meet the needs of the students. ~ Chen Xinyi.

The lesson study provides teachers with the opportunity to create and design teaching resources by examining the students' thinking, understanding and learning. ~ Wilson Tay.

The research lesson could only get better with each consistent and subsequent review of each lesson with the team to list out the positive points and areas for improvements that might arise in the lesson. ~ Salahudeen

The entire duration of the lesson study also enables teachers to collaboratively plan a lesson and helps teachers to think about areas that one may not do so when planning alone. ~Tan Peng Yau

This entire process is insightful and beneficial as teachers witness the responses of the students while they worked through the tasks in the learning process. ~ Hafiz & Sahri

*Guru (KM) : "Iya ada perbedaanya, namun saya juga melihat saya masih lemah untuk mengajak siswa diskusi setelah saya meminta siswa ke depan untuk mempresentasikan hasil yang telah mereka buat. Jadi kurangnya diskusi kelas ya, aa anaknya".*

*G(KM) : "Terus siswa tidak lagi banyak mengalami kesalahan dalam prosedur karena mereka yang memprediksi sendiri hanya saja dengan seperti itu mereka belajar kesalahan yang mereka lakukan ketika prediksinya tidak sesuai dengan yang mereka lakukan".*

Based on series of eight lessons, teacher make self-reflection by using lesson analysis framework in each lesson. Teacher self-reflection can impact from one lesson to another lesson to give improvement for learning process. This study was gained teachers self reflection about concept' affirmation in apperception, time management, and experiment procedures.

#### 4 CONCLUSION

By using lesson analysis, teachers make reflection of learning process, understand the effectiveness and quality of learning and finding effective ways to help students for developing their competence. Teachers can solve their learning problems that occurred with more detail. Thus, that caused improvement and enhancement of learning knowledge. In addition, teachers also find appropriate learning materials for certain materials due to more complete picture of the obstacles and progress that occurs in the classroom. Then teacher will get a variety of new knowledge to implement their learning process better, through preparation, material domination, attitudes, and problem solving. This is in accordance with the opinion of Santagata and Angelici (2010) states that the framework lesson analysis designed to assist teachers in learning to reflect success in teaching. Lesson analysis gives teachers a variety of views to observation, reflection, and the study of learning in the classroom.

ARTICLE

**KNOWLEDGE MANAGEMENT MODEL IN  
MANAGERIAL COMPETENCE DEVELOPMENT  
FOR SMALL INDUSTRY BUSINESS  
AT WEST JAVA PROVINCE, INDONESIA**

By

**Prof. Dr. Tjutju Yuniarsih, SE, M.Pd  
Dr. Suwatno, M.Si  
Adman, S.Pd, M.Pd**

**ABSTRACT**

*This research was focused on the gaps of the capability of managerial competence among small industry holders at the province of West Java. There are many influencing factors to this managerial competence capability and this research was conducted to identify those factors and formulate an appropriate managerial competence profile for small business holders at West Java province.*

*The Soongsatitanon Theory about the factors of managerial competence was adopted in this research and so the other which was appropriate.*

*This research was conducted with quantitative approach by using the survey method and data analysis technique of MSA (Measure of Sampling Adequacy) factors analysis, to determine analyzed variables by Bartlett test of sphericity method. Research population includes all of small industry holders at West Java Province (198.478 small industry business). Research samples was determined by cluster random sampling, which will represent West Java Province, divided into 4 regions. Those are : Region 1 was represented by Sukabumi Regency, Region 2 was represented by Purwakarta Regency, Region 3 was represented by Cirebon Regency and Region 4 was represented by Bandung Regency with the amount of responses is 400.*

*The result of this research was dividing the condition of small industry holders at West Java Province into 3 parts, those are technical skill, human relations skill, and conceptual skill. Technical skills includes the lack of management knowledge understanding and technology application into their business. Human relations skill includes the lack of existing human resources development and motivation improvement to enhance human resource capability. Conceptual skill includes the lack of capability to identify, analyze and solve the problems, which had made weakness of competitive ability facing globalization era.*

*Managerial competence was formulated by 9 factors as stated by Soongsatitanon (2006), where those factors show high value to influence the managerial competence of small industry holders at West Java Province. Those are : understanding and designing business model (0,805), having advance future vision (0,782), systematic thought (0,765), capable to integrate and manage the resource (0,449), risk management (0,537), idea marketing (0,579), stakeholder management (0,541), lead and manage changes (0,734), developing human resources and value improvement (0,702).*

**Keywords : managerial competence, small and middle industry**

### A. Background

Small and Middle Industry activities have important role in every national economic activities, especially its role when Indonesia faced economical crisis, to hold society economical and social resistance. Their existence were holding big economical hopes especially as people income sources.

The amount of micro, small and middle industry business (UMKM) is the majority of business in Indonesia. There are about 50 millions business units of UMKM in Indonesia or 99% of total existing business units. From all UMKM units, recording to the Cooperative and Small & Middle Industry State Ministry (Kementerian Negara Koperasi dan UKM (source : BPS Provinsi Jawa Barat No. 18/05/32/Th. XI, 15 Mei 2009), the majority is micro business with the amount of 47.702.310 units or nearly 95% more. Small industry unit is about 2 millions units, and Middle Industry is about 120.000 units. Big industry is only about 4.527 units or about only 0,01%. With this huge number, it is clearly that small business take very strategic position in national economy in Indonesia.

Similar composition is revealed in many countries. For example in Japan, at 2007 the amount of small and middle industry reached 4,69 millions units (99,7%) compared with big industry which only about 13 thousands units (0,3%). Small and Middle industry in Japan had absorbed 30 millions employees (70,2%), while big industry absorbed 13,7 millions people (30,5%). The value of small and middle industry export reached 137 billions yen (51,1%) and big industry had about 131 billions yen (48,9%). It is reflected that small and middle industry had been main strong foundation of Japan economy.

In Thailand, although small and middle industry had not yet roled as main contribution, but it had contributed

significantly to export value which had reached 26,5% from total national export value. Small and middle industry in Singapore had contributed 47,5% of export, while in Malaysia reached 20 %.

In Indonesia, although the amount of small and middle industry units reach 99%, but the contribution to export values in 2003 was only 19%. It showed that the development of small and middle industry in Indonesia was slow.

According to Provincial Statistical Berau (BPS Provinsi Jawa Barat No. 18/05/32/Th. XI, 15 Mei 2009), low contribution of small and middle industry to export value reflected low capability of them. Generally, there are two main problems. First, financial problem and second, non-financial problem (management organization). Financial problems include :

- In-appropriate of available and accessible fund by UKM
- There no systematic approach to funding programme for UKM
- High transaction fees, because of very complicated credit procedure which takes much times for small fund
- Lack of access to formal funding sources, because of either lack of banking network at remote area, nor suitable information.
- High margin for investment and capital
- Un-bankable small business holders because of there are no transparency in financial management and lack of managerial and financial capability

The problems of management organization (non financial problems) include :

- Lack of information on production technology and quality control process, because of minimum chances to follow the technology development and lack of education and training.

- Lack of information on marketing because of limitation of accessible information by UKM regarding global market, also because of the low capability of UKM to provide product or services by market demand.
- Lack of human resources with appropriate skills.
- Lack of understanding to financial and accounting knowledge
- Limitation of business network for co-operation between small industry holders (marketing information system)

Almost all non-financial problems of UKM are oriented to low knowledge and managerial competence of small business holders. According to Statistic Center Berau, the small and middle business holders are graduated from Elementary School (70 %). In the other side, knowledge plays very important role for company improvement. The more advanced of company's and human resource's knowledge, they will get better competitive ability to enter global market.

One of important effort to enhance capacity and competence of small business holders is to improve their capability on science and technology, which are appropriate for their productivity and strengthening their competitive ability. With the trend of highly competitive business, technology development, dan customer's need improvement, the success of small and middle industry business will be determined by how they can develop themselves to become a learning organization for business innovation and managerial competence development. Therefore we need *knowledge management*, as an effort to identify, organize, develop and implement knowledge.

In every study regarding implementation of *knowledge management* in industry and organization, the conclusion is that the implementation of *knowledge*

*management* contribute positive influence to increase capability and competitive ability of the industry or organization itself. However, the implementation of *knowledge management* in small and middle industry at Indonesia is very limited. This is because of minimum study, research and model development for *knowledge management* implementation in small and middle industry sectors. This is why researchers determine the topic for this research.

## **B. Literature Study**

The discussion of *Knowledge management* (KM) was begun after the publishing of articles from Ikujiro Nonaka, titled *The Knowledge Creating Company* at Harvard Business Review, in 1991. This study was correlated with previous article from Peter F. Drucker, a management expert which oftenly called as modern management pioneer in 20<sup>th</sup> century, titled *The Coming of the New Organization* in 1988. KM had became important concept in management and scientific study topic. The implementation of KM in many multi-national companies had contributed positively to the concept development as important concept to be implemented in organization, to reach goals effectively and efficiently. (*Takwim*, 2008)

KM was first related specially to business by Tom Davenport in 1998 with his bestseller-book, *Working Knowledge: How Organizations Manage What They Know* published by Harvard Business School Press. By this book, Davenport can be acknowledged as pioneer of '*business knowledge management*' and motivate the business world to KM.

There are many studies related to big companies those implemented KM. The result is that the effectivity of KM was founded in big companies those had implemented KM. the analysis showed that implementation of KM in many big companies contributed to effectivity and efficiency of KM, to increase the

company's work and income. In the book *The Knowledge management Toolkit* published by Prentice Hall PTR, Amrit Tiwana (1999) quoted by Takwim, it is shortly described the results of some studies include study at airplane industry Rolls Royce, computer software company Platinum Technology Inc., consumption technology company Nortel Corporation, semi-conductor telecommunication company GaSronics and Texas Instruments, also medicine and nutrition company Monsanto. Tiwana showed the description of KM implementation and its effect to company work improvement, described by its production and sales. (Takwim, 2008)

KM is based on basic idea that the most precious resources in an organization is knowledge of people in the organization itself. This is not a new idea, because organization also means managing human resources. The new concept of KM is that focus of management is "knowledge". This focusing aspect is forced by the changes acceleration in business world dan development of global economy into the new era called "knowledge economy era".

There are many definitions of Knowledge management from many sources, but according to Bergeron (2003: 8), knowledge management was defined as: "Knowledge management (KM) is a deliberate, systematic business optimization strategy that selects, distills, stores, organizes, packages, and communicates information essential to the business of accompany in a manner that improves employee performance and corporate competitiveness.

Rao (2004:3) in *Knowledge Management Tools and Techniques*, defined KM as: "Knowledge management is a systematic discipline and a set of approaches to enable information and knowledge to grow, flow, and create value in an organization.

From some definitions of some

sources, it is concluded that KM is a system to create, collect, organize, distribute, and use knowledge in organization or individual, purposed to increase learning process and organization performance.

*Managerial Competence* is knowledge and capability those related with managerial capability needed to handle organization's tasks.

Refers to identification by Katz (1974) in Harvard Bussines Review, it is still believed there are 3 essential managerial skills: (1). *technical skill*, which is the capability to use knowledge and certain skill; (2). *human relations skill*, is capabality to interact, work, undertand and motivate the other person, individually or in group, and (3). *conceptual skill*, is mental capability to analize and diagnose a complex situation.

While Soongsatitanon (2006), stated there are 9 factors in managerial competence, include: (1) Understand and capable to design business model; (2) Have advance future vision; (3) Systematic thoughts; (4) Capable to integrate and manage resources; (5) Risk management; (6) Marketing idea; (7) Managing stakeholders; (8) Lead and manage changes; (9) Develop human resources and value improvement.

There are many definitions regarding small industry in Indonesia's Law, in *Undang-Undang No. 20/2008* about *Usaha Mikro, Kecil, dan Menengah*, Small Industry was defined as business which meet criterias such as : a) Own nett asset more that Rp. 50.000.000,00 (fifty millions rupiah) to the maximum of Rp 500.000.000,00 (five hundreds millions rupiah) excluding properties used as business house; or b) Have yearly omzettes more that Rp. 300.000.000,00 (three hundreds millions rupiah) to the maximum of Rp 2.500.000.000,00 (two billions and five hundreds millions rupiah); c) Independent, not as branch or company

expand owned, controlled or become direct and or indirect part of middle or big industry, and d) Forms individual business, informal or formal business company including co-operative.

According to data in Provincial Office of Co-operative, Small Industry and

Trading (Dinas Koperasi, UKM, dan Perindustrian Perdagangan Jawa Barat), the matrix of industry condition at West Java Province including classification, business unit amount, employee absorbance and investment from 2005 to 2007.

**Table 1**  
**Industry Condition at West Java Province**

Sektor Industri	Tahun 2005			Tahun 2006			Tahun 2007		
	Unit Usaha	Tenaga Kerja	Investasi (Rp)	Unit Usaha	Tenaga Kerja	Investasi (Rp)	Unit Usaha	Tenaga Kerja	Investasi (Rp)
Besar	276	3.176	40.861.696.000	84	7.602	567.821.273.372	95	8.498	615.949.973.177
Menengah	30	1.082	22.495.068.000	104	4.714	83.735.267.587	146	5.660	106.463.267.242

### C. Methodology

Research method used in first year is *explorative survey with quantitative approach*. The research subject includes small industry holders located at West java Province. Research instruments are poolings, interviews guideline and focus group discussion. Data analysis conducted quantitative analysis based on existing data group. Quantitative data analysis technique used SEM Anaylisis, with the SPSS computer programme support.

Overall, in 3 years of activities, this research used R & D method, through 4 D steps which are: *define, design, develop and disseminate*. *Define* and *design* steps were conducted in first years with the support of SPSS programme. In the second year, the research were directed for *develop* knowledge management model.

The results from first and second year had been followed up in the third year with *disseminating* step and implementing knowledge management model, also designing management information system that will support small industry holders understanding in West Java Province.

In the first year, we conducted managerial competence profile mapping of

small industry holders. This map will be used as basic input in designing knowledge management model, to develop managerial competence for small industry holders, based on literature study, field observation and focus group discussion, to determine an appropriate model suitable to small industry characteristics.

Refer to the research goals, the indicators or achievement parameters from this research are:

- a. Managerial competence on small industry level at research area West Java:
  1. Managerial competence existed at this time in small industry holders;
  2. Problems of managerial competence faced by small industry holders
- b. Concept and understanding of knowledge management:
  1. Identify the implementation of knowledge management by small industry holders at West Java;
  2. Define the principles and knowledge management model form in developing managerial competence for small industry holders;
  3. Formulation of knowledge management model in developing

managerial competence for small industry holders;

4. Design of management information system to support the implementation of knowledge management for small industry holders.

Along with the goals and indicators/achievement parameters, therefore the output of this research in first year is description about managerial competence profile of small industry holders at West Java Province.

The research population includes all registered small industry holders at Industry and Trading Associate of West Java (KADIN). Based on data in 2009, the population reached 198.478 units of small industry business.

Research sample was based on *cluster random sampling*, which was determined the representatives of West Java region, divided into 4 area:

- Region 1 was represented by Sukabumi Regency,*
- Region 2 was represented by Purwakarta Regency,*
- Region 3 was represented by Cirebon and*
- Region 4 was represented by Bandung Regency*

**D. Results**

Small and middle industry was identified as culinary and handycraft sectors. Based on data from Provincial Office of Co-operative, Small Industry and Trading (Dinas Koperasi, UKM, dan Perindustrian Perdagangan Jawa Barat), the matrix of industry condition at West Java Province including classification, business unit amount, employee absorbance and investment from 2005 to 2007.

This research was focusing on research goals which is the problem related to Managerial Competence faced by small industry holders. Managerial Competence is thre knowledge and capability related with many managerial ability those are needed to solve organizational tasks. In their business, those industry holders must have suitable capability.

The results from field obervation and data analysis, it could be described as follow : based on the table of *Rotated Component Matrix*, it is revealed the difference correlation between 9 research variables in *Managerial Competence* research, into 2 groups of factors, concluded in the next table :

**Table 2  
Rotated Component Matrix**

item	Factor loadings	Component
X <sub>1</sub>	0,805	1
X <sub>2</sub>	0,782	1
X <sub>3</sub>	0,765	1
X <sub>4</sub>	0,449	1
X <sub>5</sub>	0,537	2
X <sub>6</sub>	0,579	2
X <sub>7</sub>	0,541	2
X <sub>8</sub>	0,734	2
X <sub>9</sub>	0,702	2

Therefore, the 9 research indicators for *Managerial Competence* research variables, was reducted into 2 dominant factors :

1. Factor 1 includes variable : X<sub>1</sub>, X<sub>2</sub>, X<sub>3</sub>, X<sub>4</sub>
2. Faktor 2 includes variable : X<sub>5</sub>, X<sub>6</sub>, X<sub>7</sub>, X<sub>8</sub>, X<sub>9</sub>

Which :

X<sub>1</sub> = understanding and be able to design business model

X<sub>2</sub> = having advanced future vision

- X<sub>3</sub> = systematic thoughts
- X<sub>4</sub> = be able to integrate and manage resources
- X<sub>5</sub> = risk management
- X<sub>6</sub> = idea marketing
- X<sub>7</sub> = stakeholders management
- X<sub>8</sub> = lead and manage changes
- X<sub>9</sub> = develop human resources and value improvement

Managerial Competence is formed by 2 dominant factors such as internal and external factors. The internal factors relies inside the businessman character, including X<sub>1</sub> = understanding and be able to design business model, X<sub>2</sub> = having advanced future vision, X<sub>3</sub> = systematic thoughts and X<sub>4</sub> = be able to integrate and manage resources. External factors are important capability that a businessman must have. This external factors include X<sub>5</sub> = risk management, X<sub>6</sub> = idea marketing, X<sub>7</sub> = stakeholders management, X<sub>8</sub> = lead and manage changes, and X<sub>9</sub> = develop human resources and value improvement.

Based on above discussion, the real problem related to managerial competence of small industry holders at West Java are divided into 3 parts as follow : *technical skill*, *human relations skill*, and *conceptual skill*. Problems on technical skill include lack of understanding to management knowledge and technology application on running business. The

problems of human relations skill include the minimum development of existing human resources and lack of motivation to improve capability. And the problems of conceptual skill include low capability to identify, analyse and solve problems which are causing the weakness of business competitive ability, facing globalization era.

Managerial competence was formulated by 9 factors as stated by Soongsatitanon (2006), where those factors show high value to influence the managerial competence of small industry holders at West Java Province. Those are : understanding and designing business model (0,805), having advance future vision (0,782), systematic thought (0,765), capable to integrate and manage the resource (0,449), risk management (0,537), idea marketing (0,579), stakeholder management (0,541), lead and manage changes (0,734), developing human resources and value improvement (0,702).

**Table 3**

**The Measurement of Managerial Competence Forming Factors Value**

- X<sub>1</sub> = understanding and be able to design business model
- X<sub>2</sub> = having advanced future vision
- X<sub>3</sub> = systematic thoughts
- X<sub>4</sub> = be able to integrate and manage resources
- X<sub>5</sub> = risk management
- X<sub>6</sub> = idea marketing
- X<sub>7</sub> = stakeholders management
- X<sub>8</sub> = lead and manage changes
- X<sub>9</sub> = develop human resources and value improvement

Based on the result of this research, the important follow up to develop

managerial competence is knowledge management. Therefore this result will be

referred for knowledge management study that will support managerial competence factors.

Refers to the identification from Katz (1974) in Harvard Business Review, there are 3 essential managerial skills such as : 1. Technical skill, the capability to use certain knowledge and skills; 2. Human relations skill, capability to interact, work, understand and motivate other people, individually or in group; and 3. Conceptual skill, the mental capability to analyze and diagnose complex situation.

The analysis of field observation findings reveals that problems of managerial skills faced by small industry holders are related to those stated by Katz. In technical skill, small industry holders at West Java have weakness in knowledge and implementation of management and technology to support their business development, while this skill is the basic capability for small industry holders. At the other side, they still have lack of understanding to good management in their business such as organization structure, clear work procedures, also capital and income management. Beside those, the application of simple technology and use of traditional method are obstacles for them. This is influencing on the product that is worst than those using recent technology.

In human relations skill, small industry holders at West Java are lack of capability in human resources management in their business environment. Employee development to improve skills, especially in technology application is very low. Motivation given in minimum effort without continuous control and real follow up, such as rewards for employees for examples: bonus on good performance or staff promotion.

Conceptual skill became next problem for small industry holders at West Java. They lack of capability to identify, analyse and solve problems so they do not have understanding of recent market demands. The unsolved globalization effects have also affected to small industry

development at West Java and very low competitive ability.

The conclusion of research shows that global problems related to managerial competence are lack of understanding and identifying type of capability those are important for businessman to run his business. They usually learn from their experiences, and some are only hope from their fortune. They hold only on capital to run business, while in reality, a company with a manager who understand and apply managerial skills could develop better than those without managerial skills.

### **E. Conclusions**

The real problem related to managerial competence of small industry holders at West Java are divided into 3 parts as follow: *technical skill*, *human relations skill*, and *conceptual skill*. Problems on technical skill include lack of understanding to management knowledge and technology application on running business. The problems of human relations skill include the minimum development of existing human resources and lack of motivation to improve capability. And the problems of conceptual skill include low capability to identify, analyse and solve problems which are causing the weakness of business competitive ability, facing globalization era.

Managerial competence was formulated by 9 factors as stated by Soongsatitanon (2006), where those factors show high value to influence the managerial competence of small industry holders at West Java Province. Those are : understanding and designing business model (0,805), having advance future vision (0,782), systematic thought (0.765), capable to integrate and manage the resource (0,449), risk management (0,537), idea marketing (0,579), stakeholder management (0,541), lead and manage changes (0,734), developing human resources and value improvement (0,702).

The recommendation of this research to those who concern are:

1. The government via Ministry of Industry and Trading in national or regional level should support the industry holders to develop their business, understand and applicate managerial competence and have competitive ability in global market.
2. Educational institutions with purposes to make bright people of this nation, are hoped to transfer management knowledge and managerial competence to industry holders, to increase understanding and application of knowledge in early steps and produce well-educated businessmen.
3. The business holders who has important roles to improve national economy, must have willing to improve managerial competence to increase competitive ability in global market, and also proactively participate in knowledge and skill improvement activities from government or educational institutions.

Based on above recommendation, the implication of research will be proposed as follow:

1. The government must increase the dissemination of capital allowance for small industry holders, providing the training of managerial competence development for small industry holders and constructive control and assistance to business holders from beginning and its development.
2. Educational institutions give more education about managerial competence for business holders through seminars or trainings, and also support research on managerial competence which will support small industry sectors to solve their problems.
3. Business holders contribute and participate in seminars and trainings provided by government or educational institutions to improve knowledge and managerial competence, also to develop themselves by looking for knowledge on managerial competence via all media.

**Abstract:** The tendency of low interaction between teacher and student became the background of this study. The aim of this study is to analyze teacher-student collaboration in solubility product constant and colloid concept of chemistry learning. The subject of this research were one chemistry teacher and 27 students of XI IPA 2 SMA Laboratorium UPI. The type of this research was descriptive qualitative. The instrument that used in this research were observation sheet, video recorder. Ten times lessons were recorded by handy-cam and observed using observation sheet, and then made lesson transcript based on video lesson. Teacher and student's responses and questions analyzed using Hendayana lesson analysis framework to see the collaboration between teacher and student to improve pedagogical competence of teacher. The result of this research showed that the tendency of teacher response in solubility product constant lesson were INT (teacher interruption in group asking result and progress), MMR (teacher asking student to do something/procedure) and LJW (teacher answer student question directly). The tendency of teacher response in colloid lesson were MMR (teacher asking student to do something/procedure), LJW (teacher answer student question directly), and RPI (teacher answer by scientific question). Lesson analysis can be used to improve pedagogical competence of teacher especially to answer and response student's question and answer. It is importance for teacher to increase scientific question and reduce interruption to increase teacher-student collaboration.

**Keywords:** teacher-student collaboration, solubility product constant, colloid, chemistry learning

## 1 INTRODUCTION

In education there is interaction between learners and educators, the interaction of learners and educational resources that can take place in a situation of education, teaching, training, and guidance (Sukmadinata, 2006: 24). The importance of interaction between learners with educators will affect the learning process that can improve the quality of learning. To improve the interaction among students and student-teachers honed through experience and the establishment of collaborative learning community, that can be the vision and philosophy of the school reform. Learning community guarantees the right of every child's learning without exception, improving the quality of learning and the simultaneous achievement of quality and equity of learning but not only students but also teachers in the classroom (Sato, 2012: 19). Teachers collaboration to plot or no plot other subjects in order to improve the quality of learning to form a learning community. In the activities of learning community, according to Sato (2012: 19) there are three systems of collaborative learning in the classroom which are professional learning community and collegiality in the staffroom and participation of parents and communities. Building the learning community is to build a culture that facilitates its members to learn from each other,

mutual correction, mutual respect, mutual trust, mutual restraint ego. Building a culture of no moment, take a long time.

According to Vygotsky (1978: 32) the process of learning can occur in two phases: the first phase occurs when collaborating with others, and the second stage is done on an individual basis in which a process of internalization. During the process of interaction among teacher-students and among students, the following capabilities should be developed: mutual respect, test the truth of the statement the other hand, negotiate, and each adopted the idea that developing. The first stages of learning Vygotsky was started by a student who could not solve the problem alone, and then he had to ask the other students (Masaaki, 2012: 29). Teachers should be able to enable students to each member actually has a role in the group.

Each group should be given the opportunity to think for themselves, to work alone without any intervention from the teacher, if students are having difficulties, there will be collaboration between them. Thus, there will be a good and close relationship so that each student will be free to think and absorb the material without too much under pressure. The system can encourage students to collaborate for mutual learning (mutual learning) in

the classroom learning community in the learning community (Hendayana, *et. al.* 2013: 12).

Learning occurs when children work or learn to handle tasks that have not been studied, but the tasks are still within range of ability or the task is in the Zone of Proximal Development (ZPD / region proximal development) (Vygotsky, 1978: 34). The zone of proximal development is defined as the distance between the actual development and potential development. Vygotsky believes that higher mental function in general appears in the conversation on cooperation between individuals, before the higher mental functions were absorbed into the individual. How long it takes to build a culture of learning community has no limits (Hendayana, *et. al.* 2013: 11). In a learning community, communal reflection takes place so that the teacher can see for themselves how the learning is done during the learning process.

Lesson analysis developed by several experts including lessons according Fernandez analysis where the analysis focuses on teacher learning and student responses in learning. Previous lesson development analysis focussed on students in the learning phase. Matsubara's lesson analysis by focusing on the student's response and analysis by Hendayana and Hidayat lesson focuses on the interaction of teachers and students' responses (Hidayat, 2013: 7). In this study, researchers used variant of lesson analysis developed by Hendayana and Hidayat, this because in accordance to the characteristics of the class in Asia for self-reflection in order to identify the teacher-centered to student-centered.

In the subject matter that must be studied colloidal students, especially students of class XI second half, has the characteristics of a concept based on the concrete meaning can be expressed in real life, especially the application of the concept of colloid in everyday life, but also has the characteristics of colloidal material abstract with concrete examples. Students should be easier to understand this matter, but in fact the students have difficulty in understanding the colloidal material associated with many concepts and examples, as well as not being able to build relationships between existing concepts (Mutiasari, 2011: 3). Same with that said Oktariani (2011: 2) that, in the students' learning colloidal material has been unable to reconstruct the concept and the learning process is still dependent on the student's ability to memorize briefing information is then followed by doing exercises without being followed by the ability to understand the information that is memorized and connect with everyday life. This makes students' understanding of the material be comprehensive. Many students struggle to study chemistry, but often to no avail. This is because many of them do not build a proper understanding of the basic concepts of chemistry based on the educational experience of

students (Nakhleh, 1992: 192). The learning process chemicals also tend to emphasize aspects of any product without any aspect of the process. The nature of chemistry not only covers aspects of the product just like hooking facts, concepts and principles of chemistry. Chemistry is essentially also a process that involves scientific process skills and attitudes that are useful to acquire and develop knowledge of chemistry. In chemistry learning process, students and teachers involve in a series of activities in the order: observing phenomena and learn the facts, understand the models and theories, develop reasoning skills, and test chemical epistemology (Ahmad and Baradja, 2012: 6). One success key of the learning process variable is a qualified teacher. Teacher as educator is the figure who most associate and interact with the students compared to other personnel in the school. The teacher is responsible for planning and implementing the learning process, assessing learning outcomes, conduct guidance and training, conduct research and studies, and open communication with the public. Background of the above problems to tackle the problem, then it is time for teachers to try to make learning more fun in class two-way communication between students and teachers. So that students liked the chemistry lesson without being burdened with the collaboration of teachers and students in the material solubility product and colloidal systems in chemistry learning.

## 2 RESEARCH METHOD

Research method that is being used in this research is descriptive qualitative research methods. This research is focused on study about student-teacher collaboration on the solubility product constant and colloid concept in chemistry lesson. The research was conducted in there steps: 1). Analyzing instructional videos about solubility product constant and colloid concept in ten times of learning; 2) Analyzing the learning transcript's videos based on implementation in learning for student's responses analysis and anticipating teachers to the student's responses; and 3) Analyzing learning process based on the Hendayana's model framework to analyze the characteristics of collaboration among students and students-teachers. Subject on this research is students SMA Laboratorium Percontohan UPI class of XIIPA2, year 2013/2014 as initial respondents. There are a chemistry teacher and five researchers who becoming the observer. The instrument that used in this research consist of three kinds instruments: (1) Observation sheets, (2) Handycam, (3) Lesson analysis sheets. This observation sheets is done to obtain direct interaction between teacher and student, interaction and participation students during learning process. In addition, it is to obtaining the data and the facts about the difficulties of respondents in concept of

chemistry related to solubility and colloidal system of subject matters. Patterns of interaction and participation present on the format of observations. This format is referenced from research conducted by Dukmak (2009:271).

According to Hendayana (2013:9), lesson analysis is a method that is used to analyze the characteristic of learning process in the class in Indonesia, characteristic of interaction in the classroom with a student-centered learning and more to teacher self-reflection. In addition, according Matsubara (2012:40), lesson analysis is a method for analyze the learning process by using transcript that focus on students responses and learning situation.

Verbal data will be transcribed into written data. All the entire lesson videos that was recorded during implementation of learning process transcribed and refined to obtain the basic text from learning process that was observed. That basic text later used in coding step to obtain data of learning activities, interaction among students, interaction between students and teachers that would be appears during implementation study of solubility product constant and colloid subject.

### 3 RESULT AND DISCUSSION

The result of this research shows learning process that has done in solubility product constant and colloid subject matters based on Hendayana lesson analysis framework focus on analyzing the collaboration between students and teachers on the group session. The first lesson shows that the interaction and collaboration of teacher-student not good enough, it can be seen from the results of analysis lesson. Interaction is mostly done when the teacher-student grouping session is, the categorization LJW have not seen teachers interact with students. It can be seen from the following photo.

Figure 1. Teachers answer student's question directly.

In the second study was increasing and the difference pattern teacher-student collaboration is evident MPR from the frequency 81 categorization, categorization RPI occur with 61 frequency that is pretty good compared to the collaboration of The first lesson but still not significant.

In the third study in group interaction and collaboration sessions conducted teacher-student

looks more to the MPR categorization of the frequency 58. This shows that based on the results of this analysis lessons seen an increase in the pattern of teacher-student collaboration on categorization RPI where teachers more 31.

In the fourth lesson, the common ion effect and the effect of ph on solubility concept did not shift the pattern of interaction and collaboration are very significant, but the reduction of the pattern in which the teacher so teachers can do self-reflection on the categorization LJW of the four learning collaborative learning has yet trend still teacher-centered learning.

Figure 2. Teacher answers students question through scientific question.

In the fifth and sixth learning increased teacher-student interaction patterns are caused by the MPR characteristics of the material colloidal system is enough to give a fairly good collaboration patterns and students are doing and find experiment result without always guided teachers that learning tendencies already towards student-centered.

On learning the seven visible increase teacher-student interaction patterns on TPS categorization with frequency LJW categorization and the increased MPR and RPI, but generally occur fairly good collaboration between teachers and students in learning so that learning more focused on the students (student-centered). This is evident from the way students interact in a group when the presence of the teacher involved.

Figure 3. Teacher does interruption for students observation result.

In the eighth study showed an increase and shift pattern of significant collaboration on the categorization of the Assembly with the RPI, but the frequency of INT and MJL category sodium absorption ratio change significantly and includes patterns of interaction and collaboration are rarely performed teachers.

In learning to nine looks learning has been highly increased more significantly in the presence of a more effective learning between teachers and students where the teacher is to answer the questions asked by the students to return scientific questions for this is the level of teacher-student collaboration categorization is quite high.

Figure 4. teachers instruct students to do something procedures

On the tenth learning occurs collaboration and interaction is excellent between teacher-student learning so that trend more towards student-centered with the categorization of MMR and the RPI is still increasing and categorization LJW and INT were increased also in the last lesson of 10 times the learning undertaken by of the transcript of the video, the lesson by lesson analysis Hidayat & Hendayana occur fairly good collaboration between teacher-student.

#### 4 CONCLUSIONS

Lesson analysis could be used to increase the competence of teacher's pedagogy, especially to answer student's question and making anticipation for student's responses. This is important to teachers to develop any scientific questions and limit the interferences thus, collaboration between teachers and students in the chemistry lesson could be increased especially, and for the RPI category those are teachers answer the scientific question and present presence of good communication patterns between teachers and students.
