## PREFACE

On behalf of the Organizing Committee of World Association of Lesson Studies (WALS) 2014 International Conference, I would like to welcome all participants both local and overseas to the 8<sup>th</sup> annual conference at Indonesia University of Education in Bandung, Indonesia. The Bandung conference has attracted attention of international community around the globe. There are 782 registered participants from 29 countries with the largest contingent from Indonesia followed by Singapore, Japan, and Sweden.

The theme of WALS 2014 International Conference is **Becoming Reflective Educators and Professionals of Learning**. This theme reflects the continuity of efforts to be reflective educators and professional who never stop learning. Such is represented in the form knowledge, expertise, and other resources which are developed, invested, accumulated, and distributed to improve the quality of teaching and learning.

In this conference, educators and teachers from Africa, America, Asia, Australia and Europe continents come together to share their research and practices on improving the quality of teaching and learning, teacher education and development, school improvement, and learning community through Lesson and Learning Studies.

This proceeding is a collection of papers presented in the WALS 2014 International Conference. It covers 13 strands:

1. Teacher Professional Development
2. Action Research
3. Pedagogies and Teaching Strategies
4. Designing for Learning with Quality in Specific Subjects
5. Research on Lessons in Different Cultures
6. Issues about Leading Lesson Study
7. Learning Communities for School Reform
8. Developing Communities of Practices
9. Creating Knowledge in Practice
10. Student Learning and Development
11. Lesson and Learning Study in Pre-School
12. Lesson and Learning Study in Special Education settings
13. Lesson and Learning Study in Higher Education

We are sure that the papers and discussions from WALS 2014 International Conference will make a major contribution to the national and international dialogue on Lesson/Learning Studies. However, we would like to remind that the views expressed in the papers are those of each author alone and do not necessarily represent those of the organizing institutions or any of their affiliates.

I wish all of us a fruitful conference and opportunities to build networking during the conference. I hope you enjoy the conference and your time at UPI.

Sumar Hendayana, Ph.D.  
Chair  
Organizing Committee of WALS  
2014  
International Conference

# Welcome Message

On behalf of the Organizing Committee of World Association of Lesson Studies (WALS) 2014 International Conference, I would like to welcome all participants both local and overseas to the 8<sup>th</sup> annual conference at Indonesia University of Education in Bandung, Indonesia. This Bandung conference has attracted attention of international community around the globe to join WALS 2014 conference in Bandung . We have 782 registered participants from 29 countries with the largest contingent from Indonesia followed by Singapore, Japan, and Sweden. The theme of WALS conference this year is “Becoming Reflective Educators and Professionals of Learning” as we would like to emphasize the how importance it is for teachers and educators to always reflect and learn from their practices in order to improve their professionalism.

This conference program provides you with information about papers, speakers, and venues. Three hundred eighty-six papers will be shared and discussed during the three-day conference. Four papers will be presented by four recognized keynote speakers from United Kingdom, Japan, United States of America, and Indonesia. Ten papers will be shared on two plenary sessions by invited speakers. Participants have many choices to attend concurrent sessions of 372 papers consisting of symposium, workshop, poster, and paper presentations. In addition, the conference offers participants with optional school visits at all levels of education from pre-school to higher-education on November 28, 2014. During the school visit, participants may observe lessons and participate in a post class discussion.

Collaboration and partnership are the spirit of lesson study. WALS 2014 is made possible through the collaboration and partnership with the Directorate General of Higher Education and West Java Provincial Office of Education.

I wish all of us a fruitful conference and opportunities to build networking during four days of the WALS 2014 International Conference. I hope you enjoy the conference and your time at UPI.

Sumar Hendayana, Ph.D.  
Chair  
Organizing Committee of WALS 2014  
International  
Conference

It is with great pleasure that I welcome all of you to the World Association of Lesson Studies (WALS) 2014 annual conference in Bandung, Indonesia. WALS is privileged to work together with Indonesia University of Education in organizing this conference and to receive the support from Ministry of Higher Education, Research and Technology, Republic of Indonesia, West Java Provincial Office of Education, the Government of Bandung City, and Japan International Cooperation Agency (JICA). The Indonesia University of Education has been playing an important role in developing and disseminating Lesson Study across Indonesia as well as to other countries in Asia and Africa through technical cooperation with JICA.

The conference organizing team led by Dr. Sumar Hendayana from Indonesia University of Education has worked extremely hard to ensure the success of our annual conference. As of October 2014, the conference has drawn 819 delegates with the largest contingent from Indonesia (375) followed by Singapore (197), Japan (68), Sweden (48), Phillipines (18), Malaysia (16), Thailand (13), United Kingdom (11), China (8), Hong Kong (8) and Brunei (7). For the first time, African countries such as Ethiopia (7), Zambia (7) and Senegal (2), as well as Bangladesh are represented at a WALS annual conference. This outreach to new countries reflects the influence that Indonesia has in these countries as a result of the partnership they have with JICA and Japanese colleagues working in African countries. A total of 28 countries will be represented at WALS 2014 annual meeting in Bandung.

We look forward to the rich conversations among our delegates during the conference on the theme ***Becoming Reflective Educators and Professionals of Learning***. There are **304 papers, 50 posters, 9 workshops, 9 symposiums, 10 plenary sessions and 4 keynotes**. Our annual conferences bring teachers, academics, researchers and policy makers together to discuss lesson study research and practices and to learn from each other's work. We hope to see the development of professional and academic networks through mutual assistance and information exchange among our members at this meeting.

The success of WALS 2014 Bandung meeting is made possible by the dedication of the local organizing team led by WALS Executive Committee and Council Member, Dr. Sumar Hendayana from Indonesia University of Education. We want to thank them for their hard work over the last 2 years to provide an interesting and stimulating conference programme for all participants. We want to thank the Indonesia University of Education for hosting this conference. We are also thankful for the generous support from Ministry of Research, Technology, and Higher Education, Republic of Indonesia, West Java Provincial Office of Education, the Government of Bandung City and Japan International Cooperation Agency (JICA).

I wish all of you a fruitful and engaging time at WALS 2014.

Associate Professor  
President,  
World Association of Lesson Studies  
National Institute of Education,  
Nanyang Technological University, Singapore

On behalf of the West Java Provincial Office of Education, we welcome all the participants from Indonesia and overseas. One of the missions of the West Java Provincial Office of Education is improving the access and quality of education. One of the strategies in improving the quality of education is by implementing Lesson Study as a form of teacher continuing professional development through partnership with UPI that has been established since 2006 to develop and disseminate best practices on lesson study in West Java. Beginning with the piloting of lesson study in Sumedang District, lesson study then spread to 16 districts/cities in West Java. Thousands of teachers in West Java have enjoyed the benefits of Lesson Study for the improvement of the quality of education as activities in lesson study have updated their knowledge and skills in facilitating students' learning.

Activities in teacher professional development through lesson study are conducted at school so that the training for teachers becomes more contextual in solving problems at class levels, it does not require high expenses, and it does not cause teachers to abandon their students while participating in the training. Teachers become confident and accountable in teaching students and teaching-learning activities tend to shift from teacher-centered to student-centered while teacher sensitivity toward students experiencing learning problems has increased. In addition, teachers who have been accustomed to lesson study can adapt easily in implementing the Curriculum 2013 because teacher collaboration in analyzing lessons is not something new in lesson study. Teachers have been accustomed to analyzing lessons to stimulate students to think and reason, and build their knowledge so that students understand phenomenon and not to memorize facts.

At WALS 2014 Conference, West Java Provincial Office of Education has facilitated 200 teachers to participate in this conference and half of them present their papers to share their experiences in lesson study. Through this conference, we hope that teachers in West Java will gain more knowledge to even more optimize classroom teaching and learning. Last but not least, we hope that you enjoy the cool atmosphere of Bandung and the conference.

Prof. Dr. H. Moh. Wahyudin Zarkasyi, CPA  
Head of West Java Provincial Office of Education

On behalf of the Directorate of Learning and Student Affairs, Ministry of Higher Education, Research and Technology. We wish you the warmest welcome to all participants from various countries. We have facilitated forty-two LPTKs (Educational Institution for Teacher Training) from Aceh to Papua with grants to develop lesson study to improve the quality of learning in higher education since 2009. We collaborate with teaching and learning experts from UPI (Indonesia University of Education), UNY (State University of Yogyakarta), and UM (State University of Malang) to foster LPTKs in the Western, Central, and Eastern regions of Indonesia. The supports in the forms of block grants for three years have been put to good use by LPTKs to focus on the improvement of teaching and learning quality. In addition, LPTKs partner with neighboring schools to develop school-based lesson study in the third year.

Through lesson study, University lecturers collaborate with teachers to plan, implement lesson plans, and reflect the teaching and learning processes. We witness positive changes from the grant recipients such as lecturers have become more accountable and open to criticism in carrying out teaching and learning activities, and have become more confident in teaching students. There is also a paradigm shift in classroom teaching from teacher-centered to learner-centered, and a more harmonious relationship between LPTKs and schools. Results of the development of lesson study in grant-receiving LPTKs will be shared in WALS 2014 Conference. One of the characteristics of WALS 2014 International Conference is the addition of a new strand called Lesson Study in Higher Education Setting.

We hope that participants of WALS 2014 Conference can learn from each other and build international networks in enhancing the quality of education. Please enjoy your stay in Bandung and we hope you enjoy WALS 2014 Conference.

Dr. Ilah Sailah  
Director,  
Directorate of Learning and Student Affairs  
Ministry of Higher Education, Research and Technology

In this very happy occasion, on behalf of the Indonesia University of Education or Universitas Pendidikan Indonesia (UPI), I would like to welcome all the conference participants, both Indonesian and international participants, to our beautiful UPI campus in the city of Bandung. It is quite an honor for the Indonesia University of Education to host the World Association of Lesson Studies International Conference 2014. This conference is made possible through the cooperation between the Indonesia University of Education (UPI), Bandung City Office of Education, West Java Provincial Office of Education, Directorate of Higher Education, World Association of Lesson Studies (WALS), and Japan International Cooperation Agency (JICA). UPI has been the pioneer of the development of *Lesson Study* since 2006 together with JICA through the SISTTEMS Project (Strengthening In-service Teacher Training of Mathematics and Science at Secondary Level) and PELITA (Quality Improvement of SMP/MTs). At the beginning, we assigned 32 FPMIPA lecturers to collaborate with 500 mathematics and science teachers in 94 Junior High Schools to carry out innovation in mathematics and science learning through hands-on, mind-on, daily life by utilizing local materials as teaching materials in Sumedang District, West Java. Training teachers through lesson study puts more emphasizes on empowering teachers collegially than on instructing them to implement models of instruction. In Lesson Study, teachers and university lecturers collaboratively analyze teaching and learning through the cycle of *Plan, Do, See* to improve the quality of teaching and learning. From Sumedang District, we learned valuable lessons from the SISTTEMS Project that, among others, teacher improved their self-confidence and accountability in facilitating student's learning, collaboration between teachers and school leaders improved significantly, teaching and learning shifted from teacher-centered toward student-centered, teachers became more sensitive to and aware of students' learning problems, students were facilitated to learn collaboratively, student achievement gradually improved, and school image in the community improved significantly. Eventhough external supports have already ended, the schools in Sumedang District still continue to implement *Lesson Study* because the community realize the positive impacts of the practice of *Lesson Study*. Learning from the success of the implementation of *Lesson Study* in Sumedang District as a form of teacher professional development, UPI has expanded the target areas for *Lesson Study* in Indonesia. From 2008 to 2010, with the supports from Sampoerna Foundation, UPI trained 1500 teachers of mathematics, science education, Bahasa Indonesia, and English subjects in Karawang District (West Java province), Surabaya City, and Pasuruan District (East Java province). Since 2010, with the supports from the Directorate of Higher Education and the West Java Provincial Office of Education, UPI has trained 7,000 teachers of elementary, junior high, and senior high schools, and headmasters, and supervisors in 10 districts throughout the West Java province. In 2013, through the collaboration with the Government of Jambi Province, UPI trained 5,000 teachers of elementary, junior high, and senior high schools in 10 districts in Jambi province. In addition, UPI has also implemented the practice of *Lesson Study* to improve university courses in pre-service programs. We would like to extend our thanks and appreciation to all parties that have supported the organization of WALS International Conference 2014. Through this conference, let us strengthen our international network to share experiences and learn from each other to improve the quality of education through *Lesson Study*. We wish you all a fruitful and enjoyable WALS International Conference 2014!

Bandung, 24 November 2014

Prof. Dr. Sunaryo Kartadinata, M.Pd.  
Rector,  
Indonesia University of Education  
(Universitas Pendidikan Indonesia)

On behalf of the Government of the Republic of Indonesia, I happily welcome all the participants of the WALS (World Association of Lesson Studies) Conference from various countries. Welcome to Bandung, Indonesia! In this 21st century, we are facing a complex global competition characterized by the rapid development of technology and multicultural society, and therefore education should provide our students with life skills and career skills having characteristics of flexibility and adaptability, initiative and self-direction, social and cross-cultural skills, productivity and accountability, and leadership and responsibility. To help develop those skills, learning should be carried out in such a way that it can support creativity and innovation, critical thinking and problem solving, communication and collaboration, and information, media and ICT literacy. Therefore, the Government of Indonesia has revised the previous curriculum and developed a new curriculum known by Curriculum 2013 to be implemented comprehensively in 2014. Curriculum 2013 puts emphasis on learning processes because we believe that quality learning processes will result in quality student's achievement too. In learning, students must be facilitated to be able to build knowledge, not to be told. Consequently, the challenge for educators in the primary and secondary levels, and in the university level as well, is to change the paradigm in the classroom from teaching to learning. To implement the new curriculum, we have provided student's book, teacher's book, and we have trained the teachers, principals, and supervisors for one week in all levels of education. The one week training was meant for the socialization of the new curriculum which, afterwards, has to be followed up with continuous lesson studies.

Prof. Dr., Muhammad Nasir, Ph.D  
Minister of Higher Education, Research and  
Technology

Lesson study is a strategy to improve the quality of teaching and learning through studying the teaching and learning processes continuously by empowering teacher's potentials collaboratively and collegially. Lesson study emphasizes student-centered learning and trains high order thinking skills through daily life approach as well as utilizing local materials. Lesson study also functions as a continuous professional development. Lesson study activities are usually carried out at school so that these activities are relevant and are based on real classroom activities. The Government appreciates all the teachers who have implemented lesson study and we hope that the implementation of lesson study will improve the quality of classroom teaching and learning, and it ultimately will improve the quality of education in the country.

Lesson Study has been introduced in Indonesia since 2006 through the technical cooperation under the support from JICA. Although the supports from JICA ended in 2011, the practice of lesson study did not stop. Lesson study continued in various regions supported by regional government and universities. However, lesson study activities still need to be improved so that lesson study can affect the improvement of the quality of education in Indonesia. WALS 2014 conference organized by UPI has to be used well as a forum for learning from each other and for network building among educators from all over the world.

Last but not least, we would like to thank World Association of Lesson Studies (WALS) and UPI for organizing WALS 2014 conference. We hope that all participants of WALS 2014 conference will obtain invaluable lessons to improve the quality of education their own country.

We wish you a fruitful and enjoyable conference!

## The English Teachers' Perception of Lesson Study

Ade Sobandi, M.Pd.

*SMP Negeri 6 Kota Sukabumi, Jalan Pelda Suryanta No. 96 Kota Sukabumi, Indonesia*

*sobandi77neo@gmail.com*

**Abstract:** Your abstract should be This report is the study of the English Teachers' perception of Lesson Study, which investigated thirty English teachers in Kota Sukabumi. Lesson Study is cycle of professional development in which teachers work together in a team to plan a lesson, apply the lesson in the classroom and evaluate the process of learning through collegiality, and collaborative work. The aims of this study are to investigate the perception of the participants toward Lesson Study program, and to capture the process of Lesson Study implemented in Kota Sukabumi. The study employed a qualitative research design which embraces characteristics of a case study. The data were gathered from several data collection techniques: class observations, questionnaires and interviews to collect some supporting data. The result shows that the English Teachers' perception is positive and they fully understand the term of Lesson Study. However, there are some teachers who doubt about the effect of Lesson Study in developing teachers' professional competence. In the process of Lesson Study, somehow teachers' responsibility and motivation are not fully appeared and take into account that Lesson Study is not their need. They tended to come to the venue only if the headmaster or the district officer asked them to come. From the findings it is recommended that teachers should realize that they need to develop their teaching competence through certain ways which one of them is Lesson Study. Through Lesson Study teachers could learn from each other and recognize the way the students learn in the classroom.

**Keywords:** English teacher, perception, Lesson Study, Teacher professional development

### 1 INTRODUCTION

Among many education components, teachers are so essential that improving teachers' professional proficiency has become one of government's concerns. For many years, the government of Indonesia has attempted to enhance the quality of teachers through numerous programs along with the increasing budget allocation for improving education quality. Teachers are targeted for trainings, workshops, seminars, new method and approach try-outs.

One of the recent endeavors intended for educators in Indonesia is "the Lesson Study". Held by means of the technical cooperation between the Japan International Cooperation Agency (JICA) and three Indonesian leading teacher education institutions, in which UPI is one of them, Lesson Study (LS) is a form of professional development program to improve teachers' competencies and expertise (Suratno, 2012). It has been widely practiced in Japan and has been developed as an approach to improve teacher proficiency (Marsigit, 2007; Sutiadi, 2008; Suratno, 2012). Since its introduction in early 2000s in Indonesia, LS has been viewed as a promising and powerful approach

to teacher professional development and school improvement (Suratno et.al, 2009; Suratno 2012; Copriady 2013). LS is a community-based professional advancement effort where the participants work together as a team to achieve the objective of learning in the classroom which becomes one of the advantages of this program. Studies have indicated that teachers' working together with other teachers is beneficial in increasing teacher effectiveness (Garmston & Wellman, 1999; in Sickle, 2011). It is also in line with the statement of Bandura (2006) that the interactions that happen between people as they work together create synergies that make the work stronger than the collection of the individual talents.

Previous studies conducted by researchers such as; Fernandez (2002); Marsigit (2006); Sutiadi (2008); Suratno et.al (2009); Sickle (2011); Hendayana et.al. (2011); Shahreen and Khalid (2011); and Copriady (2013) show that teachers practicing LS often report a positive impact on their teaching practices and, as a result, students' learning from participation in the LS process. Furthermore, teachers' perception on LS showed positively perceived (Sutiadi, 2008). However, many teachers are still misled in understanding the concept of LS,

as Halilah (2011) found on her research in Kabupaten Bandung Barat, they could not explain comprehensively about LS. Suratno et.al (2009) also indicated that teachers still need assistance in comprehending and implementing LS.

Teachers misled perception about LS, somehow suspected to lead the result in reluctance to attending the program and averting to apply what is obtained from LS sessions in the classroom as well. It is the case in Kota Sukabumi that sometimes the participants of the LS put too much attention to the model teachers, while LS puts the emphasis on the students; participant teachers observe the students during the session not to the model teacher. Therefore, in the reflection session, the model teacher feels discouraged of criticism from the participant and unwilling to precede the program, and unfortunately this disinclination is contagious to other participants.

In contrast, teachers with a greater perception of teaching attitude are more likely to be more committed and invest more effort in their teaching, have more enthusiasm toward their teaching, be more willing to try new teaching pedagogy to better meet the needs of their students, and are more resilient to challenges (Tschannen-Moran & Hoy, 2001). That's why Isoda in Marsigit (2007) indicated that in the process of preservice teacher education, it is important to develop teacher's perspectives; and, learning to listen is a keyword for this approach.

This situation generates a challenge for the researcher to investigate the implementation of LS whether it is in the right track so that it would be advantageous for all, teachers, students, and schools. Therefore the study of teacher's perception on the implementation of LS is interesting to be investigated for the sake of increasing the quality of education in Indonesia. As the implementation of LS in Sukabumi, especially in English subject, it is necessary to reveal the implementation process on the teachers' side point of view. The study is intended to (1) investigate the perception of English teachers toward LS and (2) to know the process of LS program implemented in research site.

In line with the objectives of this study, there are three research questions as the main problem in this study. (1.) What is the perception of English teachers toward Lesson Study? And (2) How is the program of Lesson Study conducted in MGMP of English of Kota Sukabumi ?

## Perception

Perception, According to *Oxford Advance Learner's Dictionary* (1995: 305), means the way of seeing or understanding something. In this case, the English teachers' way of seeing and understanding of LS in Kota Sukabumi. Perception is the set of processes by which an individual becomes aware of and interprets information about the environment. It refers to the way we try to understand the world around us. We gather information through our five sense organs, but perception adds meaning to these sensory inputs (Bahrick 2009, Suparyanto 2011). Psychologically, Mussen (1973: 68) explains that perception is the process by which information acquired through the sensory receptor (eyes, ears, nose, and skin) is transformed into a percept of what we think, see, hear, smell, taste, or touch. He adds that perception is a creative process that involves much more than simple transformation of stimulus energy by the sensory receptors (see Mussen, P., and Mark R. Rosenzweig. 1973; Matlin W. M. 2003; Feldman, R. S. 1995; Slameto, 2003).

## The Definition of Lesson Study

Lesson Study, previously Lewis & Tsucida (1998) called it Research Lesson, is a direct translation for the Japanese term *jogyokenkyu*, which is composed of two words: *jogyo*, which means lesson, and *kenkyu*, which means study or research (Suratno, 2012; Fernandez, 2002; Yoshida, 1999). As denoted by this term, LS consists of the study or examination of teaching practice. They engage in a well-defined process that involves discussing lessons that they have first planned and observed together. These lessons are called *kenkyujogyo* (Lewis & Tsucida, 1998), which is simply a reversal of the term *jogyokenkyu* and thus literally means study or research lessons, or more specifically lessons that are the object of one's study. Study lessons are “studied” by carrying out the steps described next in an attempt to explore a research goal that the teachers have chosen to work on (e.g., understanding how to encourage students to be autonomous learners).

## Characteristics and Components of Lesson Study

Lesson study has many characteristics which are very beneficial for teacher and students to improve the effectiveness of teaching and learning activity in the classroom (Emilia, 2010 p. 8). These are the list

of characteristics of LS, which have been discussed by several researchers including Yoshida (1999); Takashi, Watanabe, Yoshida, and Krismawan as cited in Halilah (2011) and Emilia (2010 p. 8-9)

- a. LS keeps students at the heart of the process. LS provides the opportunity to the teacher to understand learning process.
- b. LS helps teachers see classroom practice (teaching and learning) in a concrete form. Teachers are helped to understand new teaching ideas and develop a clear image of what good teaching practice entails.
- c. LS is a form of research. LS offers chance to teachers to make their practice as a research and themselves as researcher. They can be testing hypothesis in the classroom, collecting student data, reflecting or analyzing.
- d. LS can provide a form of systemic and sustained professional development. LS is driven by teachers thus it can continuously develop their professionalism. Besides, teacher collaboration creates common understanding of instruction, curriculum, goals of education, etc. Thus, it makes consistent learning condition for students.
- e. LS is not just about time lesson. LS provides the opportunities for the teachers to partake in intensively thinking deeply about instruction, learning; curriculum, education, etc.

### The steps of Lesson Study

The steps of LS have been discussed by many educators. These include, Yoshida (1999); Cerbin and Kopp (2006 p. 251); Hendayana (2011) Susilo and Supriyatna cited in Emilia (2010:10) and from the study of Halilah (2011). Fernandez and Yoshida (2004 p. 7-9), on the other hand, also promote six steps for structuring a good LS, which are (1) Collaboratively Planning the Study Lesson, (2) Seeing the Study Lesson in Action, (3) Discussing the Study Lesson, (4) Revising the Lesson (Optional), (5) Teaching the New Version of the Lesson (Optional), and (6) Sharing Reflections about the New Version of the Lesson. While Hendayana (2006) simplified the steps of LS into three steps namely Plan, Do and See.

## 2 RESEARCH METHODOLOGY

This study is largely a qualitative research design taking on characteristics of a case study. The case study is considered as the appropriate research method for this study because it focuses on a particular phenomenon, situation or event (Cohen

et.al, 2007). In addition, as a type of qualitative study, it has some advantages in investigating a phenomenon in detail so that it can bring enlightenment (Alwasilah, 2002) to the people involved in the study and the readers of the research paper.

The site of this study is MGMP (English Teachers' Association) of Kota Sukabumi that serves as a forum for professional development and exchange of experiences in teaching innovations. Education Office of West Java Province intends to implement LS through MGMP-based. The participants of this study are 30 (thirty) English teachers of Junior High School in Kota Sukabumi who are involved in implementing LS at least for one semester.

To collect the data, three techniques are employed in this study; these are observation in the process of LS, questionnaire, interview and classroom observation.

## 3 FINDINGS AND DISCUSSION

The questionnaire and interview reveal that participating teachers have positive perception about lesson study. From the results, there is a clear indication that teachers in Indonesia show strong favour of MGMP-based lesson study since it provides their needs for continuous professional development that can strengthen sense of collegiality among teachers, because teachers have been kept isolated inside the closed door of their classrooms and left alone in dealing with the whatever problems they face. More than 85% of the respondents admit that participation in lesson study cycle has encouraged them to work collaboratively, thus lead them to form a stronger sense of collegiality. However, the positive perception has not come with a genuine need of lesson study proven by the attendance which has never been 100%. Moreover, the reflection sessions grow less exciting with fewer participants actively involving in discussions while the other become passive listeners. Further investigation is needed to investigate the reason of the increasing number of passive participants.

Furthermore, based on the interview, it is found that some teachers are being pessimistic of lesson study stating that it is just another government program running solely on government project grant. They think it will be better motivating if it is teacher-initiating program. They perceive that since it is a government project, it will soon die out once the grant over and another new program will commence before lesson study sustains its objectives.

It also revealed that senior teachers are less enthusiastic to attend a lesson study session. It might show that the teachers' seniority also plays a pivotal factor to inflict in lesson study. Fewer senior teachers attend the program than the younger teachers. When asked about their unwillingness, they respond that this activity is just not for them anymore. It is assumed that they are reluctant to move out of their comfort zone of teaching. Any change from their current method of teaching might be perceived as more work to do; and they think they are too old for new teaching “tricks”.

### **The process of Lesson Study**

To know the implementation of LS in English MGMP Kota Sukabumi observation is used to catch the actual condition of the program. The data show that LS is realized into 10 meetings.

In the planning phase, teachers practice cognitive empathy, looking at the subject matter from the student's point of view, working to understand how students learn. When planning the lesson, teachers try to anticipate how students will perceive, interpret and construe the subject matter and the lesson activities.

In *do* and *observation* phases, one member of the group teaches the lesson, and other group members attend the class to observe and collect evidence of student learning, thinking and engagement. Traditional classroom observations tend to focus on what the teacher does during the class period. Lesson study observations lessons focus on students and what they do in response to instruction.

After the lesson is taught, while it is still fresh in everybody's minds, the team members and the outside invited observers hold a debriefing meeting to discuss and analyze the lesson. Teams may want to establish a few ground rules for the discussion, e.g., focus on the lesson (not the teacher) and on analyzing what, how and why students learned or did not learn from the experience. During the debriefing participants offer their observations, interpretations and comments on the lesson. The purpose is to analyze and evaluate the lesson thoroughly in terms of student learning, thinking and engagement. After the debriefing, the team holds additional meetings to further organize and analyze their findings.

Lack of attention is clearly shown in the reflective discussion sessions. The same questions are repeatedly asked, which are only successful to demonstrate the participants' inattentiveness on the

previous sessions which already discussed the problems and had come up with the solutions.

### **Things to be concerned**

Based on the study which is in line with Harnita (2010) proposed, there are three things which should be considered in implementing Lesson Study.

#### **a. Understanding the culture**

Cultural factor is one of the factors mentioned by teachers in this study which they perceive as a significant factor in implementing lesson study. It is important to prepare proper culture to implement Lesson Study as teachers should be ready to accept critics, and has many guess in the class. One should be open-minded and motivated to elevate their quality through learning from others, share what they know and willing to change into better teacher.

#### **b. Understanding the concept**

The concept of lesson study centers at improving teachers' individual capacity by working collaboratively with colleagues and sharing experiences in classroom practice. Thus, it challenges teachers to move out from their comfort zone. It is about improving teachers' interaction, facilitating and supervising direct change in classroom practice and maintaining renewed expanded networks between schools-university-board of education.

#### **c. Understanding the cycle**

Instead of started with what the teachers are most comfortable teaching, lesson study cycle should be started with careful need analysis that the students mostly need and are lacking of. Then it followed by applying the lesson plan in the classroom which is observed by others. Finally the findings are discussed in reflection. And it is not an instant process that the result will be suddenly felt by the participants.

## **4 CONCLUSION**

The study showed that almost 90% of Indonesian teachers tend to have positive perception towards the lesson study concept which is MGMP adopting.

In summary, teachers learn mostly through collaborating with other teachers from Lesson Study especially in reflection session. They also plan together, apply the lesson and reflect what is going on in the classroom. They look closely at the students' activities, students' work, students' behavior, and share what they see to learn from the learning situation. Teachers in this study reported

that by working together and using the Lesson Study process they built a stronger set of teaching skills, became more aware of student learning needs, and developed strategies to meet those needs.

## Developing a Model of Microteaching Lesson Study for English Student Teachers

Fitri Budi Suryani

*Postgraduate Program, State University of Semarang, Semarang, Indonesia*  
[fitribudisuryani@gmail.com](mailto:fitribudisuryani@gmail.com)

**Abstract:** The low English proficiency of Indonesian students can be traced to the low quality of the English teachers. The efforts to increase the quality of English teachers should start from the institution producing English teachers through the courses required for completion of a teaching degree. One of the substantial courses is microteaching as a practicum course preparing English student teachers to engage in authentic practice. Combined with lesson study, microteaching results in microteaching lesson study, that is a combination of microteaching and lesson study in which the student teachers, following the cycles of lesson study, practise teaching in front of the small groups of their peers or K-12 students. Some recent studies on microteaching lesson study (Cavin, 2007; Molina, 2012; Wood and Cajkler, 2013) reveal that microteaching lesson study is effective to enhance student teachers' content knowledge, pedagogical knowledge, and soft skills. Unfortunately, among those studies none was conducted in English subject for English student teachers. This study aims at proposing to develop a model of microteaching lesson study for English student teachers. The methodology proposed is research and development.

**Keywords:** microteaching lesson study, English student teachers, research and development

### 1 INTRODUCTION

The 2012 English Proficiency Index that measured the average English language ability of adults in the countries around the world ranked Indonesia in the level of low proficiency, that is on the 27<sup>th</sup> rank among 54 countries (Education First, 2012: 5). Despite the fact that Indonesian students have learned English for at least six years in secondary school, one of the key factors that influence the success or failure in learning English is unquestionably the English teachers. Thus, the low English proficiency of Indonesian students can actually be traced to the low quality of the English teachers.

So far, many efforts have been taken to improve the quality of in-service English teachers through various programs sponsored by government or educational institutions from Indonesia and abroad. However, few, if not rarely, efforts are found dealing with the preservice English teachers. In fact, to increase the quality of English teachers, the efforts should be better started from the institution producing English teachers, that is teacher education.

Molina (2012) argues that teacher education is an area in need of reform if we want to increase the performance of students. Furthermore, Darling-Hammond (in Molina, 2012) asserts that below average student performance is also a result of the lack of teacher preparation. From several factors influencing teacher preparation, Molina (2012) states that one important component is the quality of the courses required for completion of a

teaching degree. One of those substantial courses is microteaching as a practicum course preparing English student teachers to engage in practice-based experiences.

Combined with lesson study, microteaching results in microteaching lesson study, that is a combination of microteaching and lesson study in which the student teachers, following the cycles of lesson study, practise teaching in front of the small groups of their peers or K-12 students. Microteaching lesson study is one various modification of lesson study and based on the principles of lesson study developed in Japan.

Some recent studies on microteaching lesson study (Cavin, 2007; Molina, 2012; Wood and Cajkler, 2013) reveal that microteaching lesson study is effective to enhance student teachers' content knowledge, pedagogical knowledge, and soft skills. Unfortunately, among those studies none was conducted in English subject for English student teachers. Most studies were in the fields of mathematics or science.

Moreover, as each phase of microteaching lesson study follows those of lesson study that requires different knowledge and skills and as not all English student teachers have experienced teaching, the implementation of microteaching lesson study for English student teachers might bring about some constraints. To cope with such constraints, the English student teachers need to be prepared in every phase of microteaching lesson study by raising their awareness in each phase.

Therefore, this study aims at proposing to develop a model of awareness raising-based

microteaching lesson study for English student teachers. The methodology proposed is research and development.

## 2 REVIEW TO RELATED LITERATURE LESSON STUDY

Originated in Japan, Murata (2007) states that lesson study is a collaboration-based teacher professional development approach. It is a process in which teachers progressively strive to improve their teaching methods by working with other teachers to examine and critique one another's teaching techniques Baba (2007: 31). This is in line with Cerbin and Kopp (2006: 250) who mention that lesson study is a teaching improvement and knowledge building process.

Dubin (2009: 31) asserts that the main objective of lesson study is not being able to come up with the best lesson. Instead, it is to engage teachers in a research process that will help them improve their teaching as lesson study provides a framework for teachers to think deeply about content and student learning as well as give them an opportunity to learn from each other. Fernandez and Yoshida (2004: 2) also note the same idea that through lesson study not only do teachers plan lessons together, but they also go on to observe these lessons unfold in actual classrooms and to discuss their observations.

In doing lesson study, Baba (2007: 2) cites that there are three main steps of lesson study, namely preparation, actual class, and class review sessions. Cheng and Yee (2012: 36) explain those three steps in detail into eight steps, i.e. (1) define a problem to guide the work, (2) plan the lesson, (3) teach and observe the lesson, (4) evaluate and reflect on the lesson, (5) revise the lesson, (6) teach and observe the revised lesson, (7) evaluate and reflect a second time, and (8) share the results.

### 2.1 The Benefits of Lesson Study

Murata (2007: 2) notes that lesson study incorporates many characteristics of effective professional development programs identified in prior research. Among those characteristics are site-based, practice-oriented, focused on student learning, collaboration-based, and research-oriented. Elipane (2012: vii) also emphasizes on collaboration as he states that “the essence of lesson study lies in the amount of intellectual and affective engagement of its participants who engender a spirit of collaboration- working on a shared goal that they themselves generated.”

McLaughlin and Talbert (in Cheng and Yee, 2012: 35) claim that one benefit of lesson study is that the teachers “are more likely to

innovate their teaching practice as they continually rethink their practice based on how students learn”. Another benefit of lesson study, according to Rock and Wilson (in Cheng and Yee, 2012: 36), is serving as “a catalyst to encourage teachers to become more reflective practitioners and to use what they learned to collegially revise and implement future lessons”.

Cerbin and Kopp (2006: 253) argue that lesson study embodies five elements of teaching, i.e. vision, design, interactions, outcomes, and analysis. Therefore, they state that lesson study is an effective way to promote long term teaching improvement since lesson study “ scaffolds reflective practice in which instructors carefully examine goals for student learning and development, design goal-oriented learning experiences, conduct a lesson, observe and analyze student learning and revise the lesson design to improve learning.”

Furthermore, Fernandez et al. (in Molina, 2012: 4) report the benefits of lesson study that include improved content knowledge for teachers, enhancement of teacher pedagogy, higher teacher self-efficacy and motivation, development of teacher ability to observe and focus on student learning, improved teacher reflection ability, and creation of collaborative networks for teachers.

### 2.2 Micro Teaching Lesson Study

Microteaching lesson study is a modification of lesson study to be used for preservice teachers at university level. Molina (2012: 3) explains that microteaching lesson study is similar to lesson study in that “microteaching lesson study engages preservice teachers in cycles of lesson development, implementation and revision of an assigned topic while teaching to small groups of their peers in their university classrooms or small groups of K-12 students”.

This is in line with Fernandez (in Molina, 2012: 20) who explains that microteaching lesson study “incorporates aspects of microteaching with central elements of lesson study”. This forms an experience that is designed to challenge preservice teachers' conceptions regarding teaching and learning while simultaneously encouraging their connection between theory and practice.

In addition, Molina (2012: 4) states that in microteaching lesson study, preservice teachers work in groups of at most three in conjunction with a microteaching lesson study mentor. The microteaching study mentor is the same as the outside specialist in lesson study because they are knowledgeable in the lesson content, content area teaching, and lesson study. The topic for microteaching lesson study is purposefully selected with an overarching student learning goal in mind.

Meanwhile, the aspect of microteaching that is taken for microteaching lesson study is that teaching small groups of peers or small groups of K-12 students. Other aspects include teaching a shortened lesson (approximately 25 to 30 minutes) and the use of video to capture teacher lesson for later analysis.

### 2.3 Previous Studies in Microteaching Lesson Study

Fernandez and Robinson (in Molina, 2012) in their 2006 research on microteaching lesson study for secondary Mathematics preservice teachers reveal that microteaching lesson study is beneficial for preservice teachers. Those preservice teachers felt the collaboration, analyses, and reflection on shared experiences were beneficial to their learning to teach.

The recent research by Fernandez in 2010 (in Molina, 2012), reported that Mathematics preservice teachers’ engagement in microteaching lesson study deepened their understanding of the content and enhanced their ability to teach. Other benefits include the development of preservice teachers’ ability to recognize teaching a lesson as a learning process not building a skill, textbooks are not the authority on curriculum, and preservice teachers began to integrate classroom management strategies into their lesson design.

### 2.4 Awareness Raising-Based Microteaching Lesson Study

Microteaching lesson study can be a valuable way to enhance student teachers’ content and pedagogical knowledge as well as to foster the collaborative reflective practices of student teachers and so prepare them to be creative autonomous teachers. Those benefits can only be achieved if student teachers can go through all phases of microteaching lesson study successfully.

In fact, each phase of microteaching lesson study that follows those of lesson study requires different knowledge and skills. In lesson planning phase, student teachers are required to have knowledge not only on planning a lesson but on how to cooperate with other peers to design research lesson as well. In observation phase, it takes knowledge of observation as well as fastidiousness to know what to observe. If student teachers do not succeed in this phase, it will hinder to improve their students’ learning and not enable them to do the next important influential phase, i.e. reflection, well.

Furthermore, as student teachers are not yet teachers and most of them have not experienced teaching, they are not yet internalized with the spirit of teaching and day-to-day teaching activities. This

means that they have not fully belonged to pedagogic communities practice yet (Wood and Cajkler, 20130). Thus, doing microteaching lesson study can be an overwhelming task for them as they must follow some phases in which each phase requires different skill and knowledge.

Gebhard et al. (1990: 25) suggest that “teacher educators need to be aware of how the interaction within and across each activity can enhance or hamper opportunities for student teachers to gain the investigative and decision-making skills they need to become more creative autonomous teachers”. In other words, it is utmost importance to provide student teachers with practices that will enable them to go through each phase successfully if microteaching lesson study is to reveal all its benefits and not hamper its advantages. This can be done by raising student teachers’ awareness in each phase

## 3 METHODS OF THE STUDY

### 3.1 Approach of the Study

The present study proposed belongs to the research and development method. Richey and Klein (2007: 1) call it developmental or development research, which then name it design and development research. They (2007: 1) define design and development research as:

“the systematic study of design, development and evaluation processes with the aim of establishing an empirical basis for the creation of instructional and non-instructional products and tools and new or enhanced models that govern their development”.

In conclusion, Richey and Klein (2007: 1) assert that design and development research is a way to establish new procedures, techniques, and tools based upon a methodical analysis of specific cases.

### 3.2 Research Procedure

Richey and Klein (2007: 39) mention that design and development research use a broad collection of traditional methods and strategies, both quantitative and qualitative. This view is in line with Ross and Morrison (in Richey and Klein, 2007: 42) who state that “quantitative and qualitative approaches are more useful when used together than when either is used alone...(and) when combined, are likely to yield a richer and more valid understanding”. Furthermore, Richey and Klein (2007: 40) explain that which methods to be selected and how these methods are employed depend on the nature of the research problem and question.

Therefore, this study employ both qualitative and quantitative methods. Meanwhile, for the steps in conducting the research, the cycle of research and development proposed by Borg and Gall (1983) will be adopted that consists of four phases, namely exploratory phase, model development phase, model field-testing phase, and dissemination phase.

### 3.3 Exploratory Phase

In the exploratory phase, the research and information collecting are conducted. The aim of this phase is to examine the existing model of microteaching lesson study for English student teachers and the weaknesses of the existing model. The method of the research used in this exploratory phase is qualitative method.

The data will include ten private universities in Central Java. The source of data will be available from the microteaching lecturers and the head of English Education department from those universities. Meanwhile, to collect the data, the instruments used will be documentation, questionnaire, and interview.

The output from this exploratory phase will be the existing model of microteaching lesson study, the weaknesses of that existing model, and the need analysis to develop a new model of microteaching lesson study for preservice English teachers.

#### 3.3.1 Model Development Phase

In the model development phase, the aim is to develop a preliminary model of microteaching lesson study based on the result from the exploratory phase. This is done through trying out the model of microteaching lesson study.

The mechanisms of this phase comprise of three steps. They are trying out the model of microteaching lesson study, monitoring and evaluating the process and the result, and revising the model of microteaching lesson study.

To conduct the try-out, the place will be the English Education Department of Muria Kudus University. This will be done in the even semester where the microteaching course is offered. This phase will involve the microteaching lecturers and the seventh semester students joining the microteaching course.

The data of this phase will be in the form of qualitative data, that is the effectiveness of the try-out of the model of microteaching lesson study. The instruments used to collect the data will include observation, questionnaire, focus group discussion, and interview. The output of this model development phase will be a model of awareness raising-based microteaching lesson study accompanied with the lesson plan for microteaching course.

#### 3.3.2 Model Field-Testing Phase

The model field-testing is the phase to test the model of awareness raising-based microteaching lesson study for English student teachers. The strategy used is true experiment design with control and experiment groups.

The subjects of this research will be the students taking the microteaching course at Muria Kudus University. The sample of the study will consist of two classes: the control and experimental groups. The output from this model field-testing is the model of awareness raising-based microteaching lesson study for English preservice teachers.

#### 3.3.3 Dissemination Phase

The last phase of the research is dissemination. Here, the model of awareness raising-based microteaching lesson study for English student teachers will be disseminated in academic seminar or conference either nationally or internationally. The result of the research will also be published in academic journal.

## Lesson Study, a Training Approach To Strengthen the Professional Competence of Teachers in Senegal

Alioune Badara DIOP<sup>1</sup>

<sup>1</sup> National Ministry of Education, Elementary Education Department, PREMST Project Manager,  
Hachamiyou Tall Street, P.O.Box 4025, Dakar, Sénégal  
badou65@yahoo.fr

**Abstract:** This paper reports on a case study of an initiative aiming at strengthening professional competence of primary school teachers in Senegal: Strengthening Mathematics, Science and Technology Education Project (PREMST). Training needs assessment of teachers revealed some challenges, which necessitated the birth of this Project. The identified problems are presented as the following:

- lethargy manifested in a great number of « Cellule d'Animation Pédagogique » (CAP, or Cluster training) ;
- poor mastery of subject contents ;
- lack of teaching materials along with difficulties of their use in classroom ;
- various challenges in teaching methods ;

PREMST was conceived as a part of solutions in the process of resolving these problems. In Phase 1, the emphasis was laid on the revitalization of Cluster training, by developing training modules and accompanying tools according to the training needs of teachers. In Phase 2, the Project initiated a lesson study model in the regions of Louga, Thies and Fatick in 2011 before expanding in eight regions out of fourteen in 2012.

The implementation of lesson study is well underway, and the model that is being built in this process gains the increasing support from various actors in education. Today, the challenge is still finalizing the model to have an effective tool in the management of teacher training.

**Keywords:** CAP, lesson study, empowerment

### 1 INTRODUCTION

In Senegal the Continuing Professional Development (CPD) of teachers is based on strategic options and regulations defined in the following statutes:

The improved service training of elementary teachers is a major challenge for achieving the objectives of the Ministry of National Education.

The new program called "Improvement of the Quality of Fairness and Transparency (PAQUET) Program has set the priorities in education and training :

- improving the quality of teaching/ learning,
- promoting the development of the teaching of science, technology and innovation.

The empowerment of teachers is a strategic option in enhancing their professional competence. In this context, the Project Strengthening the Teaching of Mathematics, Science and Technology (PREMST), with the assistance of Japan International Cooperation Agency (JICA), began in 2007 with the aim of building capacity of teachers to improve school performance.

With lesson study, adapted as a CPD model since 2011, teachers develop their skills before, during and after the implementation of a lesson.

In this process, the observation and discussion of lesson was conducted with a focus on one aspect and three indicators. It was strongly recommended

to respect the whole process of studying lessons, from the planning to the writing of records of discussion.

The experimentation underway in Senegal, beyond profits in the functioning of cells provides a professional capacity building of teachers. and strengthening the professional skills of teachers.

In this paper, after this introduction, I present:

- Challenges of our system
- PREMST's contribution
- Results obtained
- Prospects
- Conclusion

### 2 CHALLENGES OF OUR SYSTEM

The challenges identified by the Ministry of Education are:

- Low levels of mastery in mathematics and science (according to the results of SNERS 2012) which is confirmed by the results of the baseline study conducted by the Project at the beginning of phase 2 in 2012.
- The low quality of learning as evidenced by the completion rate is 66.6% in 2012 in Primary Education.

These results are not strangers to the multiple constraints such as:

- The weak professional qualification with the existence of a mass of teachers without

- initial training;
- Lack of effectiveness of initial and continuing training of teachers in particular;
  - The weak educational and administrative management at all levels;
  - The insufficient number of inspectors of education, who are in charge of providing pedagogical support to teachers;
  - The overcrowded classes not favoring close monitoring of students;
  - The weak learning assessment system.
  - lethargy manifested in a great number of “*Cellule d’Animation Pédagogique*” (CAP). CAP is a monthly meeting with a cluster of neighboring schools for mutual learning. The participation in CAP is a professional obligation for all teachers, as defined in the presidential decree 79-1165;

Training needs assessment of teachers revealed some challenges, which necessitated the birth of this Project. The identified problems are presented as the following:

- poor mastery of subject contents;
- lack of teaching materials along with difficulties of their use in classroom ;
- various challenges in teaching methods.

### 3. PREMST’S CONTRIBUTION

#### 3.1. Modules and tools

In response to these challenges, the project has undertaken a series of educational responses :

- Provide, based modules, the terms of practical implementation of psychological and pedagogical principles underlying the teaching-learning process and secondly to CAP within the framework of implementation of.
- Develop modules for managing large groups taking into account the technical implementation of sub-groups and communication within sub-groups and between sub-groups.
- Train teachers to develop and use a variety of assessment tools and quality-assurance tools.
- Train teachers on learner-centered pedagogy.
- Train teachers in effective use of the curriculum.

PREMST was conceived as a part of solutions in the process of resolving these problems. In Phase 1,

the emphasis was laid on the revitalization of CAP training, by developing training modules and accompanying tools according to the training needs of teachers.

A total of twelve modules were shared with teachers. Constraints in the organization of training sessions in face mode, among others, distance education has been proposed in the expansion areas during phase 2 of the project. The learning process begins with self- training modules for a month before the grouping performed in the CAP. This method puts the teachers to be trained in a new context of training. The teacher has a working time which allows him to prepare for reunification by the appropriation of content modules and by holding its training manual. The teacher has a working time which allows him to prepare for reunification by the appropriation of content modules and by holding its training manual. The reunion is a time for sharing learning experiences between the members of the cluster training.

The fact that the developed modules are highly appreciated by teachers, the National and Regional Teams demonstrates significant capacity to develop the training modules based on the teachers’ needs.

The relevance of the project is reflected by the modules adapted to the needs of teachers integrating the learner-centered approach in accordance with the principles of active methods practiced in classrooms. It is also reflected by the management system, which makes the most of the organizational system of education by way of training teachers through the existing structure of training, namely CAP. The training contents of program met the needs of teachers and are in accordance with the renewal of education program, called the Curriculum of Basic Education (CEB). CAPs are therefore revitalized in their operation, and the project reach in CAP was extended nation-wide in 2013.

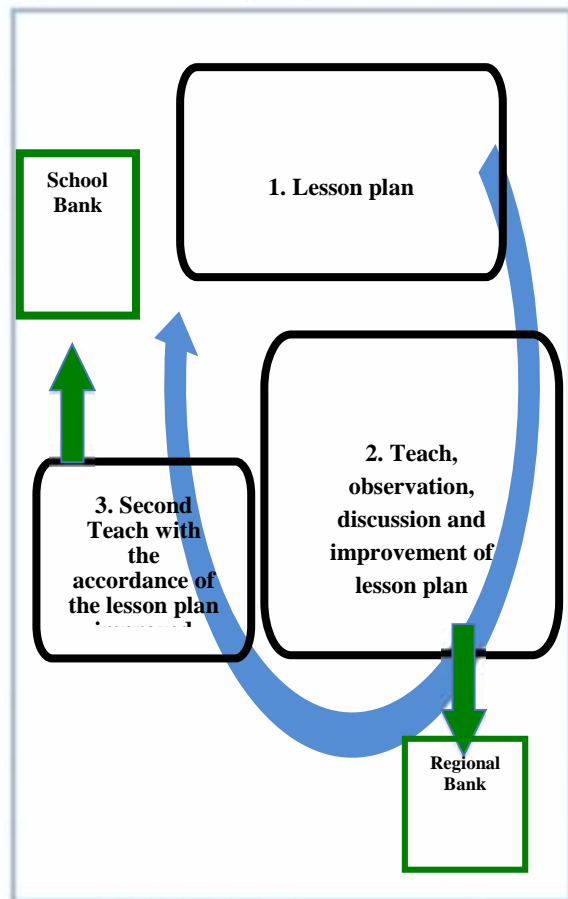

### 3.2. Lesson study’s model

#### 3.2.1. What is Lesson Study ?

The lesson study offers an innovative process involving teachers in the planning, the implementation of a lesson, and a critical analysis of this implementation in order to improve the quality of the lesson. The participation of resource persons gives an opportunity to discuss on the best classroom practices.

This device provides information on the process of professional development based on the examination of teacher practice. The goal is to make teachers able to work on the lessons to analyze the teaching / learning process and contribute to the improvement of student achievement .

Figure 1 : Lesson study’s cycle

#### 3.2.2. Annual planning

At the beginning of the academic year, three lessons are selected. considering the difficulties faced by teachers in science, mathematics or technology. Three cycles of lesson study are carried out every year One cycle of lesson study consists of 1) lesson preparation, 2) lesson observation, discussion and improvement of lesson plan, and 3) second implementation of lesson (See Figure 1). For each cycle, an aspect of focus is selected from the three aspects defined in the lesson observation sheet: 1) planning, 2) activities and attitudes of teachers, and 3) activities and attitudes of the learner. Furthermore, to guide the discussion after lesson observation, 3 out of 30 indicators in the lesson observation sheet are selected before preparing the lesson.

For a good analysis of the lesson, the comments focus on the items retained by the group. They must be objective and constructive.

#### 3.2.3. Step One : Preparing the Lesson

The planning is done, based on a number of proposals from the teachers in each CAP :

- What will be the aspect of focus?
- Which indicators should be selected for the focus of discussion?
- What is the level of control by the students hold in the lesson?
- What are the difficulties in conducting lessons, constraints related to the use of teaching materials ?

From these proposals, teachers choose the subject of the lesson.

A group of teachers writes a lesson plan and submit it to the discretion of other teachers in the school or any other person who can help them. One member is appointed to conduct a lesson in a classroom at the time of CAP training.

This approach provides professional development and offers the possibility to reduce the large gap observed in teachers' skills.

#### 3.2.3. Step two : Teach, observation, discussion and improvement of lesson plan

During the CAP training, 4 hours of training period is divided in seven different moments as the following:

##### 1st moment : Reminder of the aspect of focus in the lesson observation

The facilitator is responsible for reminding the participants the aspect and the items to be focused.

**2nd moment : Implementation and observation of the lesson**

A teacher implements the lesson. All participants observe and take notes of the progress of the lesson. The discussion is conducted in a plenary session after the lesson observation. These sessions are also opportunities to improve the capacity of facilitating a plenary session.

**3rd moment : Self-Assessment**

The teacher who conducted the lesson is called to do his self-evaluation, focusing on the indicators selected.

**4th moment : Analysis and proposals for improvement**

Working groups are formed to make suggestion for improving the lesson presented. Each group will make proposals for improvements.

**5th moment : Sharing synthesis and proposals**

In the plenary session, groups present their productions. The facilitator organizes exchanges with all participants and ensures the involvement of participants. The teaching team which was responsible for preparing the lesson plan must resist the temptation to be defensive in the analysis.

**6th moment : Summary of proposed improvements**

The facilitator conducts the synthesis of proposals for improvement.

**7th moment : Integration of proposed improvements**

Based on the summary of the facilitator as well as the proposals adopted by the whole group, the Secretary revises the lesson plan. The propositions that cannot be written in the lesson plan sheet are written in the record of discussion.

The improved lesson plan will be reproduced by each CAP member school for the second implementation of lesson.

**3.2.4. Third Step : Second Implementation of lesson**

The second implementation of lesson aims at consolidating achievements and strengthening the achievements of teaching teams. The head teacher of each school, in cooperation with its teaching staff, is

responsible for the implementation of the improved lesson, by organizing school-based training.

**3.2.5. Bank records:**

The work done around the lesson that has been the subject of the study is documented and disseminated. This requires:

- improved lesson plan, record of discussion accompanied by the film of lesson;
- selection of the best lesson plan sheets at the regional level;
- make booklets that are deposited in the libraries in different regional branches of the Ministry of Education.

**4. RESULTS OBTAINED**

**4.1. Quantitative component**

**4.1.1 Strengths and contributions**

The implementation of lesson study is well underway, and the model that is being built in this process gains the increasing support from various actors in education. This brought significant results as evidenced by the fact that 28,500 teachers in 700 CAPs are now covered in the eight targeted regions, and approximately 80% of these teachers actually participate in lesson study sessions. The fact that today practically all schools in these regions are involved in the practice of lesson study favorably prepares the smooth scale-up of the model nationwide. The number of teachers covered will be increased to 52,500 in 1,300 CAPs when the Project expands the lesson-study model nationwide in 2015. PREMST has the added value and has revitalized the CAPs.

CAP has become opportunities for contract teachers to prepare for their professional examinations obtaining of qualified teacher status. During these sessions , teachers observe and critique the performance of their colleagues.

By this means, CAP has become a model of horizontal training, which promotes mutual learning among teachers, as opposed to a vertical training model.

According to the mid-term evaluation report conducted by JICA, the teachers had actively participated in the training organized in the CAP, which led to the improvement in their behavior and their teaching competence. The results of monitoring and evaluation conducted by the project show that both indicators of Project Goal reached the target

level one year before its termination. The results of monitoring in the classroom in 5 departments have used the tool of the lesson observation in June 2013 show an average score of 1.55 (targeted goal : 1.50) indicating a satisfactory level for teachers.

(See **Table 3** below)

Table 3: Analysis of Lesson Observation

Indicators	Baseline		Increase
	(2011 Feb) (n=68)	June 2013 (n=46)	
Average score of teacher's Lesson Observation	1.36	1.55	0.19
Percentage of teacher obtained 1.5 or more	42.6%	54.3%	11.7

Source: BLS and Project M&E Report

#### 4.1.3. Weaknesses and difficulties

The main weaknesses are related to the time management assigned to the CAP training, considered too short for the volume of work to be done in groups. At the time of discussion, teachers have difficulties keeping the focus on the aspect and the items selected.

Grossly insufficient monitoring by supervisory staff and resource persons does not help teachers overcome these difficulties. The lack of monitoring and evaluation at all CAP sessions by the supervision body of inspection is one of the weaknesses of the training system, not limited to that of PREMST, but of Senegal in general. The monitoring and evaluation reports highlight these weaknesses. The reasons for this low rate are the lack of the means of transportation as well as frequent rescheduling of CAP.

In some schools, the workload of school due to overlapping of functions (Director and Head of class time) Directors prevent accompany the project activities properly.

During group work, the goal of group work as a tool to help kids is often not clear. It is therefore necessary to clarify the aim of the working group to address the learning of children.

Regarding the work on evaluating the quality of the lesson and improvement in CAPs , discussions are conducted. However, the facilitators had difficulties in synthesizing various observations and formulate final proposals to improve the lesson.

#### 4.2. Qualitative component

The school inspectors and departmental inspectors working with the inspections, members of teams (national, regional and local), school directors, and pedagogical teams have expressed their interest for the PREMST through their real involvement and participation. They have all confirmed that PREMST is an essential support to the development of quality education and a special appreciation was given to the techniques of class management used. Moreover, the methodology is recognised by all as efficient and it generates considerable changes in the operation of classic CAP as regards vulgarisation and appropriation of contents tackled. The level of replication of competencies acquired in classrooms have been judged as satisfactory especially with the use of ASEI / PDSI forms, the creation of substitution material and the good command of instruments used for geometrical figures.

With lesson study, the theory is complemented by class practice. However, the implementation of a more effective mechanism for monitoring is needed. With respect to the sustainability of PREMST, the various commitments of the Ministry of Education (political, technical and financial) show that PREMST is not isolated, it is attached to the policy and priorities of the Government of Senegal. It is necessary to recall the relevance of the program, which offers a rich array of services expected by the beneficiaries. We should also mention the satisfaction of the members of the body control and supervision to the base ( inspectors) who are ready to make a clear commitment in the footsteps of the PREMST and become more involved in the renewal of teaching practices mathematics, science and technology. Accordingly, PREMST has many chances to see these acquired last.

#### 5. PROSPECTS

The implementation of the lesson-study model is the opportunity for a technical dialogue between Senegal and Japanese experts. This is fueled by thoughts, dialogue, production and monitoring results on the ground consolidates the results and improves gradually and complete the model under construction by the end of the project. Interest given

to problem solving targeted as a part of the lesson study raises the commitment of teachers and supervisors, which ensures the success of the initiative.

The recommendations of the mid-term evaluation notes the necessity of improving the CAP training monitoring coverage by inspectors. Furthermore, to ensure the sustainability beyond project termination in 2015, it was recommended to:

- (1) Design central government activities that are necessary to maintain the PREMST CPD model in Regional, Departmental, CAP, and school level. This may include:
  - (a) the possibility of continuing the National Review Workshop every year after project termination;
  - (b) the Development of the terms of references of the Ministry of education to indicate its responsibility to maintain the model beyond 2015;
  - (c) Prepare a 3-5 year action plan, possibly commencing 2015.
- (2) Discuss the possibility of utilizing PREMST outputs (modules, model, personnel, etc.) in other activities within the ministry.

## 6. CONCLUSION

The lesson-study model that PREMST proposes is an important strategic option in the context of the implementation of the PAQUET. The difficulties encountered in the field must be considered and be resolved. They challenge not only the policy makers on policy issues, but also the technicians of Education with respect to their ability to provide the right managerial and technical measures to the difficulties faced by teachers.

If the quality of learning experiences some significant progress with the implementation of PREMST, there remain challenges in the implementation of these innovative practices in mathematics, science and technology.

The paradigm shift in terms of classroom practice remains to be done, especially because of the conservative nature of teachers. Efforts are being made to improve the monitoring of the implementation of activities. The prospect remains the completion of the construction of the model advocated by the PREMST. The paradigm shift in terms of classroom practice remains to be done, especially because of the conservative nature of teachers. Efforts are being made to improve the monitoring of the implementation of activities. The prospect remains the completion of the construction of the model advocated by the PREMST.

It is also necessary to open the technical dialogue with other countries for improving further the lesson study model of Senegal, which is still under construction.

**Abstract:**

The purpose of this study is to identify the effectiveness of teaching practice program in providing the technical education teachers based on the Context, Input, Process and Product Model. The evaluation based on the CIPP Model from input, process and product, which was introduced by Stufflebeam in year 1971. Total of 127 students from program Technical and Engineering Education were chosen as a respondent by using random sampling. The pilot study was done in order to determine reliability and suitability of the questionnaire. The data were analyzed using SPSS version 16 software and findings were presented in the form of the frequency, percentage, mean and standard deviations. The inferential statistic such as Pearson Correlation was used to identify the relationship between the knowledge, skills, experiences, generic skills, confident, achievement, and attitude with the teachers trainee achievement. The ANOVA was used to identify the significant differences between the knowledge, skills, experiences, generic skills, confident, achievement, and students attitude according to Technical and Engineering Education program 4 SPA, 4 SPE, 4 SPJ, and 4 SPH. Therefore, the research suggested that more effort have to be done to improve towards the effectiveness teaching practice program in providing the technical education based on the Context, Input, Process and Product Model.

knowledge, skills, experiences, generic skills, confident, achievement, and students attitude)

### 1 INTRODUCTION

According to Abdul Raof Dalip ( 1991), teaching is a very important component in a teacher training program. Through teacher training, trainees will be able to show and practice behavior - behavior intended to teach effectively and try to use all the theories that have been exposed to during the course of their education. In addition, teaching can provide a lot of opportunity and opportunity to all student teachers to gain early experience before they enter the teaching profession to be applied later. In the course of teaching practice, trainees receive instruction, guidance, opinion, advice, criticism and formative and summative evaluation of teaching as a supervisory process towards more effective teaching.

According to Abdul Hamid Awang ( 1979 ) teachers' training has become an important part of any system of teacher training. It is a requirement that required every student to teacher training. This training was the first opportunity for the students to try practicing the theories, methods and approaches available in the lecture rooms. Success of teaching depends on the harmonious relationship and understanding that exists between the headmaster, teachers and students of teacher training supervisor

'A. All difficulties and problems related teaching practices can be developed to overcome if there is cooperation and understanding between them.

During teaching practice run, student teachers are guided and supervised by supervisors specially appointed by the university. In addition to carrying out the task of guiding and supervising, supervisor also assigned to formative and summative evaluation of the performance of student teachers ( Omar Shariff, et al, 1994). Trainee teachers must try to show that he has such factors as the foundation of education, mastery of academic subject matter, the use of pedagogical principles and character expected. With this supply then one is eligible to practice and practice the skills taught in the classroom. Although the student teacher is observed and evaluated for various administrative purposes, but the rationale for supervision is to improve teaching. The goal is to produce teachers competent authority.

Thus, teaching is carried out in a university in Malaysia is a student teacher in training for a period of time to gain experience teaching in real classrooms in schools. In the process of producing future teachers efficient and totally dedicated to his work, it is hoped that future teachers will be aware of the responsibilities and requirements for training. This fits with the philosophy of supervision is an

overreach process toward the formation of an individual that has the properties of a noble educator.

Effectiveness Training Program Teaches In Preparing Teachers for Technical Education Model Based on Context, Input, Process and Product. Training program organized by Universiti Teknologi Malaysia is one of the conditions required for the teacher to be eligible to become a teacher. Teaching practice was the first opportunity for prospective teachers to practice the theories, methods and approaches derived from lectures.

According to Kamaruddin ( 1986 ) teaching is an important course in the teaching program. In this program, trainee teachers in teaching and learning situations are real. In its interactions with the teaching and learning situations, they have the opportunity to foster teaching competence, broaden and gain insights in the theory and practice of teaching and learning. This program will certainly help the trainees when they go out to teach later. Teaching was the beginning of the teacher trainees to gain experience in schools, particularly teaching experience, know the real school environment and matters related to the management of secondary schools. Teaching practice also exposes trainees to appreciate the meaning of the teaching profession and enjoy teaching job with an open mind. Run for 12 weeks teaching practice, have yet to determine the ability of a student teacher to teach in a real school. As is known, the issue of teacher quality is often questioned and debated by members of the public and educators. According to Siew (2003 ) states that all people yearn for a proper education for their children that grow well in the area of cognitive, effective and psychomotor. So, no wonder people are very interested and concerned about teachers who are entrusted to provide knowledge and skills and guidance to their children whether qualified or not.

According to T. Subahan Mohd Meerah (1991), academic knowledge is in the individual, However high, not enough to make it an effective future teachers. This is because the effective delivery of knowledge covering the same matters of guidance, training, and example, through the process of teaching and learning, a key measure or indicator showing the actual work of a teacher. There are two questions that have arisen, namely the first is what are the characteristics that should be present in a person to be called a teacher a good teacher. Secondly, the teaching practice as conducted now able to setup and initial experience of trainee teachers before they actually entered the teaching life later.

According to Abdul Raof Dalip ( 1991), teaching is an important aspect of teacher education programs. Teaching is seen as the culmination of

training in preparing a student teacher himself qualified and competent teachers. Training teaches trainees the opportunity to gain practical experience in the classroom than what he has learned in class. In other words, during their teaching practice, teacher trainees to use their educational theories and principles of teaching and learning in real situations in the classroom.

According to T Subahan Mohd Meerah ( 1991), again, teaching emphasizes the teaching of a subject. While teaching professionals claim is more than that. Now teachers face many social pressures. Among others, the problems related to the discipline and the demands of parents and the community are concerned about academic achievement. With the training program must take into account the ability of student teachers in academic and all aspects of education.

According to him, in the course of teaching in schools is not just to ' teach ' only. They shall carry out all forms of teaching that allows students to gain knowledge, to preserve knowledge, do exercises mastered by the students, including giving them the competence to understand, noting the lesson, do the exercises or tests, to do a project on the subject being taught and expected to deliver education through subjects taught. In addition, an efficient trainees must master the subject is taught to ensure effective teaching. Therefore, student teachers need to have more knowledge before becoming a teacher of the caliber. Experience a 12-week student teacher teaching practice is not enough to make them become a teacher of the caliber.

According to Mohd Salleh Width (1998 ) training in the teaching profession is not enough. Although they had attended and received training in teaching but when they become practicing teachers mostly less fully. So the authority of a teacher from the discredited by society.

To demonstrate the effectiveness of teacher training, trainee teachers should look for opportunities to learn specific skills as much as possible. Each teacher who teaches training for several weeks should acquire skills in the teaching profession. Trainee teachers should take the opportunity to learn teaching skills of trained and experienced teachers in the school are housed. It is important that student teachers have some sort of skills to deliver effectively. According to Abdul Raof Dalip ( 1991) stated a student teacher started the lesson will be taught skills, asking questions, using examples, using the blackboard, close the lesson, use of teaching aids, and reinforced by various stimuli. Skills like these that have earned during their teaching practice because these skills are necessary so that the teacher can handle high-quality education. The question is whether the

teacher trainees undergoing 12 weeks of teaching practice in schools designated the opportunity to learn the skills that have been disclosed.

According to Ibrahim (2001), an effective training program is a training program that can be fully practiced in the workplace. This factor is important in ensuring that the skills gained can be applied to actual experience in everyday life and in the working world soon.

Thus, the student teacher should be very hard to overcome the deficiencies remaining in teaching. This is important in ensuring the effectiveness of teaching practices in providing technical education teachers.

## 2 OBJECTIVES OF THE STUDY

There are several factors identified cause of non-effectiveness of teaching students of Technical Education and Engineering. Therefore, the purpose of this study is to achieve several objectives. Among the objectives to be achieved are :

- Identifying effective teaching of input dimensions of knowledge and skills in Technical and Engineering Education in providing technical education teachers based on the Model Context, Input, Process and Product.
- Identify the effectiveness of the teaching dimension of experience, generic skills and confidence of Technical Education and Engineering in providing technical education teachers based on the Model Context, Input, Process and Product.
- Identify the effectiveness of teaching from the product dimension achievements and attitude of Technical Education and Engineering in providing technical education teachers based on Model Context, Input, Process and Product.
- Identify whether there is a significant correlation between the effectiveness of the teaching of input dimensions of knowledge and skills in Technical Education and teacher training Engineering student achievement 4 years of Technical Education and Engineering.
- Identify whether there is a significant correlation between the effectiveness of the teaching of the process dimension of experience, generic skills and confidence of Technical Education and teacher training Engineering student achievement 4 years of Technical Education and Engineering.
- Identify whether there is a significant correlation between the effectiveness of the teaching of the product dimension of the achievement and attitudes of Technical Education and teacher training Engineering

student achievement 4 years of Technical Education and Engineering.

- Identify whether there is a significant difference between the knowledge, skills, experience, generic skills, confidence, achievement and attitudes of students in Technical and Engineering Education program 4 SPA, 4 SPE, 4 SPJ, and 4 SPH.

## 3 METHODOLOGY

This study aimed to gather information and data on the training program of the student and Technical Education Engineering by the 4 SPA, 4 SPE, 4 SPJ, and 4 SPH. The data collected to determine the effectiveness of the teaching of aspects can be provide the knowledge, skills, experience, generic skills, confidence, achievement and attitudes. This design was chosen due to appropriatereview the effectiveness of teaching practices in providing education teachersModel based technical Context, Input, Process and Product.

### 3.1 Population and samples

The population of this study was the students of the Faculty of Education of the Technical Education and Engineering students in the 4 SPA, 4 SPE, 4 SPJ, and 4 SPH at Universiti Teknologi Malaysia Skudai, Johor, which has undergone a 12-week teaching practice in schools designated. The study population consisted of 184 students trained to teach consists of 4 SPA, 4 SPE, 4 SPJ, and 4 SPH. Hence, the number of samples is 127.

The sample in this research has used simple random sampling method. Researchers want effectiveness of the training program in providing technical education teachers based on the Model Context, Input, Process and Product. The participants were students from the Faculty of Education at the University of Technology Malaysia. Then the researchers want to focus on student 4 of Technical Education and training Engineering teaches only. Therefore, the respondents were students in 4 SPA, 4 SPE, 4 SPJ and 4 SPH. Azizi (2007) how to make a random selection is to write each name or code on different slips of paper. Furthermore, the slip of paper folded, put in a container and shaken. After that, every slip is achieved by randomly until ready access to the required number of 127.

Determination of sample size in this study is based on the method used by Krejcie and Morgan (1970) in Azizi Yahaya (2007). according to Krejcie and Morgan, the procedure for determining the sample size is based on the following formula:

$$S = \frac{X^2 NP (1-P)}{d^2 (N-P)} + X^2 P (1-P)$$

- S = sample size
- X<sup>2</sup> = Table Chi-square value for 1 degree of freedom in required confidence level 0.05 (3841)
- N = size of the population
- P = ratio of population (estimated to be 0.50 to the maximum sample size)
- d = degree of accuracy is expressed as a ratio of 0:05

**3.2 Intrumentation**

The researchers used questionnaire techniques to obtain feedback and data collection. According to Mc Millan & Schumacher (1984), states that the survey study is very popular by using questionnaire technique apart from interview techniques . The use of questionnaires can also improve the accuracy and authority granted by the sample as it is not influenced by the researcher (Mohd Najib , 1999) . This also coincides with the views of Colombo Palan (1984) asserted that the questionnaire is an instrument that is often used by researchers in descriptive studies .

Syed Arabi (1992) noted that the use of a questionnaire to study the format is very suitable because it is more practical, efficient and saves time as well as learning . Even the questionnaire to avoid bias to the interviewer situations where it gives an opportunity to the respondent an opportunity to think when giving answers. In addition, the researchers feel that this questionnaire will help achieve the objectives of the study with more accurate and efficient .

This is consistent with the opinion of the Wolf ( 1998), which explains that the construction of the questionnaire was based on several assumptions which respondents answered questions freely without harassment , personality researchers did not influence the respondent , the respondent voluntarily and sincerely answer the items in the questionnaire , the respondents have knowledge or experience sufficient to answer the items in the questionnaire , respondents were able to read and understand the items in the questionnaire , the questionnaire is easy to answer and low cost compared to traditional interviews.

**3.2.1 Construction of the questionnaire**

Researchers divided the questionnaire into two parts; part A and part B. Part A involves the respondent's background and family. Part B involves items that answer the research questions being studied by researchers in terms of confidence , skills, generic skills , knowledge , experience , performance and attitude.

➤ **Section A**

Part A contains questions related to the background of te students . Respondents or subjects required

mark ( ) in the box provided for accurate and relevant to the respondent 's own self. The respondents were asked to mark ( ) on the information himself , gender, race, course , grade and name of school teaching practice during training.

➤ **Section B**

The effectiveness of the training program in preparing teachers technical education based on Model Context, Input, Process and Product in terms of the seven aspects of the knowledge, skill , experience, generic skills, confidence, achievement and attitude .

In part B of the questionnaire , the items are arranged according to research questions to be studied by the researchers of the knowledge, skill, experience, generic skills, confidence, achievement and attitude. All items are made up of positive and negative items items . For more detail, Table 3.2 shows the numbers of items that represent the questions contained in the questionnaire that was distributed .

Part B contains 56 items representing seven study variables such as knowledge , skills, experience, generic skills , confidence , achievement and attitude . All the variables are represented by 8 items . For more detail, Table 3.2 shows the numbers of items that represent the questions contained in the questionnaire that was distributed .

Table 3.1 Item according to the research questions

Division	Variables	Number Item
1	Knowledge	1,2,3,4,5,6,7,8
2	Skills	9,10,11,12,13,14,15,16
3	Experience	17,18,19,20,21,22,23,24
4	Generic skills	25,26,27,28,29,30,31,32
5	Confidence	33,34,35,36,37,38,39,40
6	Achievements	41,42,43,44,45,46,47,48
7	Attitudes	49,50,51,52,53,54,55,56

In this study , the Likert scale is used to facilitate the respondents reply . According to Najib (1999), a Likert scale was used in which the respondent and the subject is required to mark their answers on a statement on a scale from one extreme to the other extreme . Researchers have classified the Likert scale into 5 categories for ease of analysis Respondents must indicate ( ) the most appropriate answer according to their knowledge and experience . Table 3.4 shows the scores and the symbols used for the Likert scale used in this study .

**Table 3.2** Likert Scale

Level		Skor
Strongly Agree	SA	5
Agree	A	4
Uncertain	U	3
Disagree	DA	2
Strongly Disagree	SDA	1

➤ **Pilot Studies**

This pilot study is a study conducted by questionnaire used in the actual study to ensure the reliability of the questionnaire used . Azizi (2006) , a pilot study questionnaire at this level is useful for revealing the confusion and other problematic questions that exist in the questionnaire . This pilot study is designed to:

- Identify problems relating to the understanding and interpretations of the items contained in the questionnaire.
- Soliciting feedback to improve the items and questions contained in the questionnaire.
- To study the long- time required to respond to the items in the questionnaire.

The pilot study involved 10 students who were randomly selected among 4 SPH . Ten students selected 4 SPH , would not be involved in the questionnaire that will be distributed later to avoid the same answer . Based on the analysis of the pilot study , we found a Cronbach Alpha value is 0.93. Referring to Table 3.9 , the value of 0.93 is high. This indicates that the questionnaire can be used and need not be changed.

**4. RESULT**

The data analyzed is important in determining the outcome of an investigation. In this study, data were analyzed using descriptive and inferential analysis. All data are processed using the Statistical Packages for the Social Sciences Version 16 (SPSS).

The analysis below is discussed in percentage and frequency, mean and standard deviation, dimension Input That Knowledge.

Table 1 The distribution of respondents by percentage, mean, and standard deviation standard input dimension of knowledge (n = 127)

Item	Statement	SA (%)	A (%)	U (%)	DA (%)	SDA (%)	Mean	SD
1	I am able to increase their knowledge through the subjects taught after teaching practice.	11.4 (7)	71.7 (37)	14.4 (7)	1.5 (0)	0 (0)	3.23	0.47
2	I am able to increase their knowledge through the subjects taught after teaching practice.	18.9 (14)	61.4 (37)	19.6 (14)	1.1 (0)	0 (0)	3.12	0.77
3	I have always been aware of the current issues.	27.6 (14)	21.1 (11)	14 (7)	4 (2)	3 (1)	4.28	0.58
4	I have always been aware of the current issues.	20.1 (7)	65.4 (37)	14 (7)	1.5 (0)	0 (0)	3.22	0.50
5	I have always been aware of the current issues.	31.5 (14)	61.4 (37)	14 (7)	8.8 (4)	0 (0)	3.28	0.56
6	I am able to increase their knowledge through the subjects taught after teaching practice.	20.1 (7)	65.4 (37)	14 (7)	1.5 (0)	0 (0)	3.21	0.55
7	I am able to increase their knowledge through the subjects taught after teaching practice.	10.1 (7)	65.4 (37)	14 (7)	1.5 (0)	0 (0)	3.21	0.51
8	I am able to increase their knowledge through the subjects taught after teaching practice.	18.5 (14)	65.7 (38)	14 (7)	1.2 (0)	0 (0)	3.19	0.71

**Overall Mean: 4:03 Standard Deviation: 12:40**

Table 1 shows the number of respondents by percentage, mean, and standard deviation of input dimensions of knowledge. The results show that the items recorded the highest mean score and standard deviation 0:54 4:28 is the state. "I have always been aware of the current issues. "Mean is the item with the second highest mean score and standard deviation 0:55 4:25 for the statement" I am able to increase their knowledge through the subjects taught after teaching practice. "The overall mean and standard deviation of 4:03 obtained is 0.40. The overall dimension of the input at a high level of knowledge.

Table 2 Distribution of respondents according to the level, frequency and percent input dimension of knowledge

Level	Frequency	Percentage
Low	2	0.8
Moderate	17	13.4
High	109	85.8
<b>Total</b>	<b>127</b>	<b>100.0</b>

Table 2 shows the distribution of respondents by low-level, high sederhana input dimension of knowledge. It can be seen the majority of respondents were at the highest level with 109 people with 85.8 per cent and 13.4 per cent of 17 at the intermediate level. The remaining respondents, two respondents were in low level of 0.8 percent. The Skills That Dimension Input

Table 3 The distribution of respondents by percentage, mean, and standard deviation of input dimensions of skills (n = 127)

Item	Statement	SA % n	A % n	UD % n	DA % n	SDA % n	Mean	SD
9	I am skilled in handling the general classroom	14.7 (18)	19.7 (24)	8.3 (10)	11.1 (13)	0 (0)	4.08	0.58
10	I am skilled in handling the complex class	8.2 (10)	12.8 (16)	3.9 (5)	1.8 (2)	0 (0)	4.15	0.25
11	I am skilled in handling the students with special needs	20.5 (26)	11.7 (15)	7.9 (10)	0 (0)	0 (0)	4.11	0.47
12	I am skilled in handling the progress of my class	22 (28)	19.1 (24)	7.9 (10)	0 (0)	0 (0)	4.14	0.28
13	I am skilled in handling the students during practical periods	27.6 (35)	19.3 (24)	2.4 (3)	0.8 (1)	0 (0)	4.14	0.15
14	I am skilled in handling the teaching aids such as OHP and models efficiently and effectively	26.8 (34)	18.3 (23)	3.1 (4)	1.9 (2)	0 (0)	4.11	0.47
15	I am skilled in handling the students with different abilities	22.8 (29)	14.8 (19)	11.2 (14)	1.8 (2)	0 (0)	4.10	0.58
16	I can say that my skills in better than my colleagues	14.5 (18)	11.7 (15)	13.4 (17)	22.8 (29)	3.2 (4)	3.41	1.17

**Overall Mean: 4:05 Standard Deviation: 12:38**

Table 2 shows the number of respondents by percentage, mean, and standard deviation of input dimensions of kemahiran.dapatan show items recorded the highest mean score and standard deviation 0.53 4:24 which states, "I am well versed in the demonstration while making practical projects." Represented the second highest mean the item with a mean score of 4.20 and a standard deviation of 0:57 for the statement "I am skilled in handling teaching aids such as OHP and models efficiently and effectively." Overall, the obtained mean is 4.05 and the standard deviation is 12:38. The overall dimension of the input high-level skills.

Table 4 Distribution of respondents, frequency, and percent input dimension of skills

Level	Frequency	Percentage
Low	0	0
Moderate	15	11.8
High	112	88.2
<b>Total</b>	<b>127</b>	<b>100.0</b>

Table 4 shows the distribution of respondents according to low, medium and high input dimensions of skill. It can be seen the majority of respondents were at the highest level with 112 people with 88.2 percent and 11.8 percent of those 15 are at a moderate level. The remaining respondents, two respondents were in low level of 0.8 percent.

Process Dimension: Experience

Table 5 The distribution of respondents by percentage, mean, and standard deviation of the process dimension of experience (n = 127)

Item	Statement	SA % n	A % n	UD % n	DA % n	SDA % n	Mean	SD
17	I was able to experience to adapt to the school community after their teaching practice	24.4 (31)	60.3 (76)	1.0 (1)	0.4 (0)	0 (0)	4.16	0.60
18	I was able to experience to handle the students during their teaching practice	15.9 (20)	22.4 (28)	4.7 (6)	1.9 (2)	0 (0)	4.08	0.66
19	I was able to experience to get opportunity to do the lesson plan for the teaching practice	24.9 (31)	69.4 (88)	1.9 (2)	0.8 (1)	0 (0)	4.14	0.58
20	I was able to experience to attend the school activities after their teaching practice	22 (28)	19.1 (24)	7.9 (10)	0 (0)	0 (0)	4.15	0.51
21	I was able to experience to attend the school activities after their teaching practice	18.9 (24)	4.8 (6)	2.4 (3)	0 (0)	0 (0)	4.01	0.54
22	I was able to experience to get the practical skills after the teaching practice	23.1 (29)	71.1 (90)	0 (0)	0 (0)	0 (0)	4.17	0.52
23	I had the opportunity to gain experience by participating in activities outside school organized by the school	28.8 (36)	61.4 (78)	0 (0)	0 (0)	0 (0)	4.16	0.66
24	I had the opportunity to gain experience by participating in activities outside school organized by the school	17.9 (23)	54.7 (70)	14 (18)	14.4 (18)	0 (0)	3.22	1.17

**Overall Mean: 4:02 Standard Deviation: 12:37**

Table 5 shows the number of respondents by percentage, mean, and standard deviation of the process dimension of experience. The results show that the items recorded the highest mean score and standard deviation 0:56 4:24 is saying, "I was able to experience in the classroom after their teaching practice." Mean is the item with the second highest mean score and standard deviation 0.66 4:16 for the statement "I have an opportunity to experience by participating teachers' motivational programs organized by the school." Overall obtained was 4:02 mean and a standard deviation of 0.37. The overall dimension of the input at a high level of knowledge.

Table 5 Distribution of respondents according to the level, frequency, and percent dimension of the process of experience

Level	Frequency	Percentage
Low	0	0
Moderate	12	9.4
High	115	90.6
<b>Total</b>	<b>127</b>	<b>100.0</b>

Table 5 shows the distribution of respondents according to low, medium and high dimension of the experience. It can be seen the majority of respondents were at the highest level with 115 people with 90.6 percent and 12 of 9.4 percent at the intermediate level.

From the Dimension Input That Generic Skills

Table 6 The distribution of respondents by percentage, mean, and standard deviation of input dimensions of generic skills (n = 127)

Item	Statement	SA %	A %	TD %	DA %	SD %	MEAN	SD
25	The verbal communication skills are used in communication	40.2 (51)	48.0 (61)	11.4 (14)	0	0	4.11	0.67
26	The smart in using interpersonal communication	18.1 (23)	45.3 (58)	11.8 (15)	0	0	4.05	0.58
27	I am not confident in communication with students during teaching process	25.2 (32)	44.4 (57)	11.8 (15)	0	0	4.01	0.61
28	I am confident in communication with students	25.2 (32)	44.4 (57)	11.8 (15)	0	0	4.11	0.60
29	I managed to communicate with students of various levels	25.2 (32)	44.4 (57)	11.8 (15)	0	0	4.13	0.60
30	I can convey information to all students	31.5 (40)	47.3 (60)	11.8 (15)	0	0	4.20	0.60
31	I managed to create a group discussion among students during the process of R & D.	20.4 (26)	42.4 (54)	11.8 (15)	0	0	4.22	0.59
32	I can answer questions related to the scope of values	17.9 (23)	42.5 (54)	11.8 (15)	0	0	3.97	1.18

**Overall Mean: 4:01 Standard Deviation: 12:39**

Table 6 shows the number of respondents by percentage, mean, and standard deviation of input dimensions of generic skills. The results show that the items recorded the highest mean score and standard deviation 0.60 4:25 is saying, "I can communicate verbally with the students." Mean second highest score of the item represented by the mean 4:22 and standard deviation 0.59 for the statement "I managed to create a group discussion between students in the process of R & D." Overall, the mean obtained was 4:01 and the standard deviation is 0.39. The overall dimension of the input high-level generic skills.

Table 7 Distribution of respondents according to their frequency and the percentage of the dimension of the generic skills

Level	Frequency	Percentage
Low	0	0
Moderate	18	14.2
High	109	85.8
<b>Total</b>	<b>127</b>	<b>100.0</b>

Table 7 shows the distribution of respondents according to low, medium and high dimension of the generic skills. It can be seen the majority of respondents were at the highest level with 109 people with 85.8 percent and 14.2 percent of 18 is moderate.

**From Dimension Process That Confidence**

Table 8 The distribution of respondents by percentage, mean, and The standard deviation of the process dimension of confidence (n = 127)

Item	Statement	SA %	A %	TD %	DA %	SD %	MEAN	SD
17	I am confident in managing classroom effectively	15.7 (20)	79.5 (101)	4.7 (6)	0	0	4.11	0.4
24	I am confident in handling teaching and learning during the class.	18.1 (23)	79.0 (100)	2.9 (4)	0	0	4.14	0.46
25	I am confident in solving discipline problems	17.3 (22)	85.7 (109)	3.2 (4)	0	0	3.99	0.66
26	I am confident in the use of non-verbal	21.6 (28)	79.9 (101)	4.4 (6)	0	0	4.16	0.21
27	I believe using techniques that are appropriate to student's ability	27.6 (35)	69.3 (89)	3.5 (5)	0	0	4.17	0.45
28	I believe in trying something new in R & D.	23.6 (30)	70.1 (89)	5.2 (7)	0	0	4.17	0.45
29	I am confident with the ability of characteristics.	28 (36)	71.7 (91)	1.6 (2)	0	0	4.21	0.41
40	I can answer questions related to the scope of values	17.9 (23)	42.5 (54)	11.8 (15)	0	0	3.99	1.09

**Overall Mean: 4:01 Standard Deviation: 12:36**

Table 8 the distribution of the number of respondents by percentage, mean, and standard deviation of the process dimension of confidence. The results show that the items recorded the highest mean score and standard deviation 0:51 4:23 is saying, "I am confident with the abilities it themselves." Mean is the item with the second highest mean score of 4.20 and a standard deviation of 0.58 for the statement "I am confident in using the techniques of teaching appropriate to the student's ability." Overall mean obtained was 4:01 and the standard deviation is 0.36. The overall dimension of the input at a high level of confidence.

**Product Dimensions That Achievement**

Table 10 The distribution of respondents by percentage, mean, and standard deviation of the product dimension of performance (n = 127)

Item	Statement	SA %	A %	TD %	DA %	SD %	MEAN	SD
41	I feel able to implement based on the concept in the high level of learning/teaching practice	16.5 (21)	73.4 (93)	4.7 (6)	3.6 (5)	0	4.07	0.72
42	I can answer questions related to the scope of values	24.4 (31)	48.8 (62)	11.8 (15)	11.1 (14)	0	4.11	1.1
43	My teaching practice is not always in their own best interest	25.8 (33)	47.3 (60)	11.8 (15)	11.1 (14)	0	4.04	0.81
44	I follow the advice given by the lecturers to get an excellent result	31.5 (40)	47.3 (60)	11.8 (15)	11.1 (14)	0	4.29	0.57
45	I followed the advice given by the lecturers to get an excellent result	26.2 (33)	48.8 (62)	11.8 (15)	11.1 (14)	0	4.04	0.65
46	I followed the advice given by the lecturers to get an excellent result	26.7 (34)	48.8 (62)	11.8 (15)	11.1 (14)	0	4.22	0.65
47	I get a good grade based on the concept that I give during the teaching practice	26.8 (34)	48.8 (62)	11.8 (15)	11.1 (14)	0	4.13	0.75
48	I follow the advice given by the lecturers to get an excellent result	31.5 (40)	47.3 (60)	11.8 (15)	11.1 (14)	0	4.29	0.57

**Overall Mean: 4:15 Standard Deviation: 12:42**

Table 10 shows the number of respondents by percentage, mean, and standard deviation of the product dimension of achievement. The results show that the items recorded the highest mean score and standard deviation 0:56 4:30 is saying, "I follow the advice given by the lecturers to get an excellent result." Mean second highest score of the item represented by the mean standard deviation of 4:29 and 0:57 for the statement "I strive to do their

best in training taught to get an excellent result. "Overall mean obtained was 4.15 and the standard deviation is 0.42. The overall dimensions of performance products at the highest level.

**From Dimension Products That Attitude**

Table 12: Distribution of the respondents by percentage, mean, and The standard deviation of the product dimension of attitude (n = 127)

Item	Statement	SA % (n)	A % (n)	LD % (n)	DS % (n)	SDA % (n)	MPAN	SD
40	I view a good teacher as secondary students.	18.1 (23)	68.5 (87)	11.3 (15)	1.6 (2)	0	4.03	0.60
39	I am a teacher who always maintain.	29 (37)	61 (78)	10.7 (14)	0.4 (1)	0	4.11	0.67
38	I am a person who good teacher act.	23.1 (30)	63 (81)	9.9 (13)	0	0	4.29	0.54
32	I am a teacher of discipline.	24.1 (31)	61 (78)	8 (10)	1.1 (1)	0	4.12	0.64
33	I am able to adhere to the school community.	26 (33)	62.2 (79)	1.7 (2)	9.8 (13)	0	4.19	0.57
31	I am concerned about the welfare of students.	26 (33)	65.5 (84)	8.9 (11)	0.8 (1)	0	4.7	0.48
35	I have a responsibility that with the career of a teacher.	21.1 (27)	62.2 (79)	11 (14)	1.1 (1)	2.1 (3)	4.09	0.67
34	I am not prepared to accept criticism from others.	15.1 (20)	38.6 (49)	1.1 (1)	26 (33)	8.1 (11)	3.97	1.04

**Overall Mean: 4:05 Standard Deviation: 12:43**

Table 12. Shows the number of respondents by percentage, mean, and standard deviation of the product dimension of attitude. The results show that the items recorded the highest mean score and standard deviation 0:54 4:29 is stating "the second highest mean is represented by an item with a mean score of 4.20 and a standard deviation of 0.58 for the statement" I am concerned about the welfare of students. "Overall mean obtained was 4:05 and the standard deviation is 0.43. The overall dimensions of performance products at the highest level.

**Teaching Effectiveness Program With Performance Teaching**

**Teaching Achievement**

In this section, the results of the study presented. The statistical methods used is the Pearson correlation. The results are reported based on the study objectives. The results showed that there is no relationship with this conclusion, there was no significant correlation between the effectiveness of the dimensions of input, process and product performance training. 4th year students of Engineering and Technical Education.

Table 14 Analysis of the relationship between the effectiveness of the input dimension knowledge and achievement, teaching training

Achievement in teaching Practice	Significant	Pearson, r
Knowledge	0.208	-0.112

\* Significant at the 0.05 significance level

Table 14 shows the relationship between the effectiveness of input dimensions of knowledge and achievement training. The strength of the relationship between independent variables and the dependent variable can be identified by reference to Guilford guidelines included in chapter three. The value of 'p' is 0.208 which is higher than the 'p' set of 0.05. Thus, the null hypothesis is accepted and there is no significant correlation between the effectiveness of input dimensions of knowledge and achievement training. From the table above it can be seen that the strength of the relationship between the effectiveness of input dimensions of teaching knowledge and achievement is very weak with the 'r' is -0.112. The correlation coefficient ( r ) showed a negative relationship between the effectiveness of input dimensions of knowledge and achievement of teaching practice is an inverse relationship.

Table 15 Analysis of the relationship between the effectiveness of the input dimension teaching skills and achievement

Achievement in teaching Practice	Significant	Pearson, r
Skill	0.558	-0.052

\* Significant at the 0.05 significance level

Table 15 shows the relationship between the effectiveness of input dimensions of achievement skills training. The strength of the relationship between independent variables and the dependent variable can be identified by reference to Guilford guidelines included in chapter three. The value of 'p' is 0.558 which is higher than the 'p' set of 0.05. Thus, the null hypothesis is accepted and there is no significant correlation between the effectiveness of input dimensions of teaching skills and achievement. From the table above it can be seen that the strength of the relationship between the effectiveness of input dimensions of teaching skills and achievement is very weak with the 'r' is -0.052. The correlation coefficient ( r ) showed a negative relationship between the effectiveness of input dimensions of teaching skills and achievement is an inverse relationship.

Table 16 Analysis of the relationship between the effectiveness of the process dimension namely the achievement of teaching experience

Achievement in teaching Practice	Significant	Pearson, r
Experience	0.717	-0.032

\* Significant at the 0.05 significance level

Table 16 shows the relationship between the effectiveness of input dimensions of knowledge and achievement training. The strength of the relationship between independent variables and the dependent variable can be identified by reference to Guilford guidelines included in chapter three. The value of 'p' is 0.717 which is higher than the 'p' set of 0.05. Thus, the null hypothesis is accepted and there is no significant correlation between the effectiveness of the process dimension of teaching experience and achievement. From the table above it can be seen that the strength of the relationship between the effectiveness of the process dimension of teaching experience and achievement is very weak with the 'r' is -0.032. The correlation coefficient (r) showed a negative relationship between the effectiveness of the process dimension of teaching practice experience and achievement is an inverse relationship.

Table 17 Analysis of the relationship between the effectiveness of the process dimension achievement of generic skills teaching

Achievement in teaching Practice	Significant	Pearson, r
Students Generic skills	0.416	-0.073

\* Significant at the 0.05 significance level

Table 17 shows the relationship between the effectiveness of the process dimension of generic skills in teaching practice achievement. The strength of the relationship between independent variables and the dependent variable can be identified by reference to Guilford guidelines included in chapter three. The value of 'p' is 0.416 which is more quality than the 'p' set of 0.05. Thus, the null hypothesis is accepted and there is no relationship between effectiveness and significant dimension to the process of generic skills in teaching practice achievement. From the table above it can be seen that the strength of the relationship between the effectiveness of the process dimension of the generic skills with achievement in teaching practice is very weak with the 'r' is -0.073. The correlation coefficient (r) showed a negative relationship between the effectiveness of the process dimension of generic

skills and achievement in teaching practice is an inverse relationship.

Table 18 Analysis of the relationship between the effectiveness of the process dimension of confidence with Achievement in teaching Practice

Achievement in teaching Practice	Significant	Pearson, r
Students Confident	0.211	-0.112

\* Significant at the 0.05 significance level

Table 18 shows the relationship between the effectiveness of the process dimension of confidence with Achievement in teaching Practice. The strength of the relationship between independent variables and the dependent variable can be identified by reference to Guilford guidelines included in chapter three. The value of 'p' is 0.211 which is better quality than the 'p' set of 0.05. Thus, the null hypothesis is accepted and there is no relationship between effectiveness and significant dimension to the process of confidence in teaching Practice Achievement. From the table above it can be seen that the strength of the relationship between the effectiveness of the process dimension of confidence with Achievement in Practice teaching is very weak with the 'r' is -0.112. The correlation coefficient (r) showed a negative relationship between the effectiveness of the process dimension of confidence with Achievement in Practice teaching is an inverse relationship.

Table 19 Analysis of the relationship between the effectiveness of the product dimension Students Achievement and achievement in teaching Practice

Achievement in teaching Practice	Significant	Pearson, r
Students Achievement	0.036	-0.187

\* Significant at the 0.05 significance level

Table 19 shows the relationship between the effectiveness of the product dimension students achievement and achievement in teaching Practice. The strength of the relationship between independent variables and the dependent variable can be identified by reference to Guilford guidelines included in chapter three. The value of 'p' is 0.036 which is more low than the 'p' set of 0.05. Thus, the null hypothesis is rejected and this means that there is a relationship between efficacy and significant dimension to the product of students achievement with achievement in teaching practice. From the table above it can be seen that

the strength of the relationship between the effectiveness of the process dimension of students achievement and achievement in Practice teaching is very weak with the 'r' is -0.187. The correlation coefficient (r) showed a negative relationship.

Table 20 Analysis of the relationship between the effectiveness of the process dimension the attitude of Achievement in teaching Practice

Achievement in teaching Practice	Significant	Pearson, r
Attitude	0.364	-0.081

\* Significant at the 0.05 significance level

Table 20 shows the relationship between the effectiveness of the product dimension of attitudes to teaching and Achievement in Practice. The strength of the relationship between independent variables and the dependent variable can be identified by reference to Guilford guidelines included in chapter three. The value of 'p' is 0.364 which is more quality than the 'p' set of 0.05. Thus, the null hypothesis is accepted and there is no relationship between effectiveness and significant dimension of the process of teaching attitude of Achievement in Practice. From the table above it can be seen that the strength of the relationship between the effectiveness of the process dimension of attitude Achievement in Practice teaching is very weak with the 'r' is -0.081. The correlation coefficient (r) showed a negative relationship between the effectiveness of the product dimension of attitude with Achievement in Practice teaching is an inverse relationship.

Teaching Effectiveness Program of Training and Technical Education Engineering SPA 4, 4 SPE, 4 SPJ, and 4 SPH

In this section, the results of the study presented. The statistical methods used were ANOVA. The results are reported based on the study objectives. The results showed no significant difference then with this conclusion, no significant differences according to the program of Technical Education and Engineering 4 SPA, 4 SPE, 4 SPJ, and 4 SPH.

Table 21 ANOVA analysis were significant differences between students' knowledge, Skill, Experience, Generic Skill, Confident, Achievement and Attitude according to the program of Technical Education and Engineering 4 SPA, 4 SPE, 4 SPJ, and SPH.

Skill	2.038	0.112
Experience	1.927	0.129
Generic Skill	1.605	0.192
Confident	2.009	0.116
Achievement	1.050	0.373
Attitude	2.552	0.059

\* Significant at the 0.05 significance level

Based on Table 21, using anova analysis, the results of the hypothesis shows that the students' knowledge,  $F= 2.329$   $p= 0.072 < 0.05$ , Skill,  $F= 2.038$   $p= 0.112, < 0.05$ , Experience,  $F= 1.927, p= 0.129, < 0.05$ . Generic Skill  $F=1.605$   $p= 0.192, < 0.05$ , Confident,  $F= 2.009$   $p=0.116, < 0.05$ , Achievement,  $F= 1.050, p= 0.373, < 0.05$  and Attitude  $F= 2.552, p= 0.059, < 0.05$  value of 'p' the significance level set was 0.05. The value of 'p' is higher than 0.05. This means that all the null hypothesis is accepted, then there is no significant difference between the students' knowledge, Skill, Experience, Generic Skill, Confident, Achievement and Attitude in Technical and Engineering Education program 4 SPA, 4 SPE, 4 SPJ, and 4 SPH.

## 5. CONCLUSION

One of the professional development program is meant to teach a training program for prospective teachers who take special education degree as offered by UTM Faculty of Education. Prospective teachers should be evaluated and reviewed its effectiveness for improving the quality of education as set out by the Inspectorate in 2001. Furthermore, this is supported by Abdul Ghafar (2003), states that teaching is one of the important aspects of teacher training courses. Teachers said teachers are trained teachers who have completed their studies in teacher training colleges or educational institutions. When they are exposed to a variety of courses related to teacher knowledge and education. Teaching course not perfect if not followed by practical training.

Education is one of the key factors in achieving the National Mission and teachers play an important role in ensuring this success. Therefore, teachers need to understand, commitment and a strong commitment in implementing new initiatives and approaches in their effort to improve the quality of education as expressed through the Education Development Master Plan 2006-2010 in the fifth thrust of dignifying the Teaching Profession. Actually teaching provides an opportunity for prospective teachers to identify more closely with the duties of a teacher in the classroom and their roles as teachers.

**Abstract :** Lesson Study, an approach practiced by Japanese teachers to improve their teaching practices has gained much publicity in late. In Malaysia, Lesson Study started off by researchers merely for their research projects and postgraduate dissertations. In the year 2011, the Teacher Education Division of the Ministry of Education Malaysia initiated and implemented Lesson Study in 289 schools nationwide with a goal to improve teachers' teaching practices. This move has indeed sparked strong interest and helped to promote Lesson Study in Malaysia. This paper aims to present and discuss the route taken as well as the future path for Lesson Study to evolve in Malaysia. It was not a steady start but an imperative move in the context of teacher professional development. It was a challenge to change teachers' mindset and the teaching norms that has sturdy engrained in the school working culture. Nevertheless, positive and encouraging signs were noted when teachers acknowledged that they have gained and learned much while working together with their peers. Research findings thus far have suggested that the school administrators have a very prominent role to promote the practice of Lesson Study. It is very important that Lesson Study be carried out by the teachers not merely for the sake of instruction from the higher authorities but rather the awareness to improve their teaching. Hence, it is timely that practicing teachers learn to shoulder the professional responsibility of their own development to enhance their teaching practices.

**Keywords :** teacher professional development, collaborative culture, teachers' mindset, time constraint

### 1. INTRODUCTION

Lesson Study is a form of teacher professional development practised decades ago in Japan. According to the literature, Lesson Study was already well established in the 1960s (Fernandez & Yoshida, 2004). Small groups of teachers (4 or 5 teachers) would meet regularly, to plan, implement, evaluate, and revise lesson plan collaboratively. It is organized and initiated by the teachers themselves as study groups at school or district level to improve teaching competency. In Japanese term, it is known as *kenkyuu jugyou*, which means *research lessons* or *Lesson Study*. The main purpose of Lesson Study is to enhance teachers' pedagogical knowledge and skills through peers' review, critique and collaboration among teachers (Shimahara, 1998). It is an on-going practice as a form of teacher professional development especially in elementary schools throughout Japan.

Research studies seem to share a common vision and view of effective professional development. In examining and exploring issues pertaining to teacher professional development, a consensus on principles of effective professional

development was achieved (Darling-Hammond & McLaughlin, 1995; Loucks-Horsley et al., 1996; Guskey, 1997; Hawley & Valli, 1999; Elmore, 2002). It suggested the principles of effective professional development as follows :

- Focus on student learning and outcome
- Opportunities for teachers to develop knowledge and teaching skills
- Based on collaborative problem solving
- School-based
- On-going and continuous support

When comparing the literature of effective professional development and process of Lesson Study, it seems clear and obvious that Lesson Study holds a promising and innovative approach to enhance teacher professional development. Although Lesson Study is widely practiced in Japan, and had shown considerable success in some countries, the same may not necessarily be true in the Malaysian context due to the cultural and educational system differences. It is noted that Lesson Study practice requires teachers' commitments, dedications and strong desires to excel and improve teaching knowledge and skills. Hence, when Lesson Study is implemented in the real context, this could be an

indirect evaluation of the Malaysian teachers' professionalism.

## 2 LESSON STUDY IN MALAYSIA

The development and growth of Lesson Study in Malaysia can be divided and discussed in three major parts: postgraduate studies, research based projects and programmes initiated or carried out by the Ministry of Education Malaysia (MOE).

### 2.1 Postgraduate Studies

Lesson Study started off in 2003 when Chiew and Lim (2003) piloted the Lesson Study with a group of five trainee mathematics teachers who were undergoing teaching practicum in a secondary school. Adopting the Japanese model of Lesson Study as elaborated by Yoshida (1999), positive feedbacks were given by the trainee teachers who expressed that they have gained much more confidence and their pedagogical content knowledge was enhanced through the Lesson Study process. Encouraged by the positive outcomes, a Lesson Study research study was conducted in two secondary schools over a one-year period for doctoral dissertation (Chiew, 2009). The aim was to investigate the influence of Lesson Study as well as the feasibility of implementing Lesson Study as a professional development programme for mathematics teachers in the Malaysian school context. The findings indicated both positive and negative responses. Among the positive responses were through group discussions and observing other teachers teach, the participating teachers claimed that they have gained and enhanced both their mathematical content knowledge and pedagogical knowledge. They also expressed that their reflective practice was enhanced when engaging in the Lesson Study process. In addition, the participating teachers also reported that Lesson Study has promoted a collaborative culture that enhances professional collegial bonds within their mathematics colleagues. However, several constraints highlighted by the participating teachers in implementing Lesson Study were (i) time factor, (ii) heavy school workload, (iii) shyness and reluctance to be observed by colleagues and (iv) teachers' attitude and commitment.

Similarly, Ong's (2010) doctoral study involved ten mathematics teachers in two different schools and data was collected over a period of fifteen months. The study found that the experienced mathematics teachers moved away from routine factual questions which focused on procedures and final answers which were used in the beginning and by the end of the study, they were able to generate

questions to probe the pupils' thinking. They used more probing and guiding questions and began to plan their questions that they wanted to ask. In that way, they worked towards reducing pupils' misconceptions through rich scaffolding questions. Conversely, only one of the three novice teachers showed changes in his questioning techniques while the other two showed a lack of confidence to change. Hence, the study concluded that changes gradually took place over multiple lesson study cycles as the participants built mathematical knowledge and questioning techniques.

In her master degree, Goh (2007) explored how mathematical thinking could be enhanced through Lesson Study collaboration in a Chinese Primary school. Despite some positive results, she claimed that teachers' commitment and time constraints are the main challenges to implement Lesson Study. All the above postgraduate studies were supervised by Prof. Lim Chap Sam of Universiti Sains Malaysia, Penang and we acknowledged that there are other postgraduate dissertations related to Lesson Study which are either on-going or had been completed in other public universities in Malaysia.

### 2.2 Research Based Projects

Using a research grant provided, an evaluation of Lesson Study implementation as a professional development programme was conducted by Lim in 2004 (see Lim, White & Chiew, 2005). This study acknowledged the positive outcomes of Lesson Study as highlighted in many other researches related to Lesson Study. In addition, the challenges faced in Lesson Study implementation could be reduced with strong support from the school administrators. Subsequently, Lim (2006) introduced Lesson Study to her 86 pre-service mathematics teachers with the aim to promote peer collaboration. The finding was similar with time factor as the major constraint for Lesson Study implementation. In another research study involving eight pre-service mathematics teachers in one of the teacher education institutes, the participants reflected that Lesson Study has enhanced their pedagogical content knowledge through self-reflection by means of sharing and exchanging of teaching ideas among them during their 12-week practicum. This has helped to build their self-confidence in preparing and writing of detailed lesson plans during their practicum (Chiew & Jong, 2009).

Another small scale research project that adopted Lesson Study as a tool for promoting the innovative use of Geometer's Sketchpad [GSP] in mathematics teaching and learning was carried out by Lim and her team during 2007-2009. For this

project, three secondary schools were involved and the challenges and constraints encountered in the implementation were within expectation. Similar to the earlier studies, the findings of this study reflected positive outcomes in several areas: (i) increase teachers' knowledge and skills, (ii) encourage sharing among teachers, (iii) making mathematics lessons more interesting, (iv) motivate teachers to explore new teaching ideas, (v) fostering collegial relationship, and (vi) opportunities for mentoring among the teachers. Compiling the teachers' experiences and the products of GSP templates, a book edited by Lim and Kor (2010) was published together with a sample video of how to carry out Lesson Study.

In 2006, under the Asia Pacific Economic Cooperation [APEC] – Lesson Study project, 11 APEC countries were initially invited to pilot Lesson Study in their respective economies and Malaysia was one of the participating economies. This project was further expanded to include 19 economies in 2007 and subsequently 21 economies in 2008. In the first year, the theme was "Innovation and Good Practice for Teaching and Learning Mathematics through Lesson Study"; the theme for the second year was "Innovative Teaching Mathematics through Lesson Study: Focusing on Mathematical Thinking" while the third year's theme was "Focus on Mathematical Communication". In line with this international project, a number of small scale research studies were carried out in a number of primary and secondary schools in Northern Malaysia and the findings were shared through international symposium organised by the Khon Kaen University of Thailand (see Lim, 2007; Lim, Chiew & Chew, 2008; Lim, Chiew & Chew, 2010; Lim, Chiew & Chew, 2011).

In 2008, with collaboration between Universiti Sains Malaysia (USM) and SEAMEO-RECSAM, another Lesson Study project had taken off which involved 10 primary schools in Penang. As reported in Cheah and Lim (2010), a series of workshops were given to familiarize the participants about the concept of Lesson Study, mathematical thinking and communication before the actual implementation of Lesson Study in the respective schools. Even though at the end of the project, four of the ten primary schools withdrew half-way, all the remaining six schools completed one to two cycles of Lesson Study. Their responses spelled out positively about Lesson Study despite of the time constraint and other challenges that remain a hurdle for implementation of Lesson Study in Malaysia. Subsequently, we also acknowledged that there are other research projects involving Lesson Study being conducted by educators and researchers in Malaysia.

## 2.3 Programmes Initiated by the MOE

As mentioned earlier, Lesson Study started with small scale research projects initiated by researchers as well as postgraduate students for their dissertations. Despite the findings disseminated earlier through research seminars and conferences, it was in 2011 that the Teacher Education Division (TED) of the MOE began showing strong interest in implementing Lesson Study to improve teachers' quality in teaching. Hence, the positive reports and outcomes from the research studies involving Lesson Study are indeed fruitful as it provided some initial and useful information for its implementation.

In early 2011, the steering committee met several times to discuss and plan the Lesson Study implementation. The project commenced in mid April 2011 whereby Lesson Study workshops were conducted in six respective zones: namely Central and South, East, North, Perak, Sabah and Sarawak. Four subjects: English, History, Science and Mathematics were targeted as these subjects are generally weak among the students. The participants for the workshops were Head of Panel of respective subject identified and officers from the district education office. Due to logistic constraint, only one subject from the 289 schools was accorded but the Lesson Study coordinator (*teacher who attended the workshop are duly appointed*) was encouraged to disseminate the concept and practice of Lesson Study to other subjects as well in the school. Prior to the workshop at each zone, a one-day briefing was conducted by the officer-in-charge of the programme: Sitti Haishah Abd Rahman (*one of the co-writer*) to the respective school principals and officers from the state education departments. The aim was to inform the principals about the Lesson Study programme as the support from the school administrators is a very crucial factor for the success as highlighted in research studies.

For this initial project, each school was mandated to carry out two Lesson Studies in the subject that had been identified. At the school level, teachers in the Lesson Study group were required to carry out the Lesson Study processes as informed in the workshop. In addition, a knowledgeable others (*excellent teachers or lecturers from teacher education institutes*) were invited and engaged in the teaching observation and reflection of the lesson. At the end of each cycle, the Lesson Study coordinator was required to submit a report to the district education office. The district education offices and state education departments would then forwarded it to the steering committee of the TED at the end of the year. Despite several constraints and challenges faced in its implementation, this programme yielded

considerable success (Sitti Haishah et. al., 2011). In addition, an Open-Class Teaching was held at SEAMEO-RECSAM, Penang to expose more teachers about this Lesson Study initiative.

Based on the outcomes of the Lesson Study implementation in 2011, a slight modification was made to the programme. It was renamed as *Professional Learning Communities* (PLC) and in addition, three other collaborative tools were added besides Lesson Study: *Learning Walks*, *Teacher Sharing Session* and *Peer Coaching*. Due to logistic constraint, only 107 schools were involved in 2012 and this was closely monitored by the officer-in-charge: Jeffri Mat Yasim (*one of the co-writer*) of the TED with support from the district education offices. The number of schools involved was then increased to 300 in 2013 and it was 394 schools in 2014. To date, the total number of schools involved in this initiative is approximately 1090 but it is merely ten percent of the number of schools in Malaysia. Concurrently, Lesson Study was also being initiated by other educational agencies of the MOE such as the Curriculum Development Division as one of the strategies to improve teachers’ teaching.

Undeniably, the TED has been working vigorously and actively promoting and disseminating the concept of Lesson Study as a school-based teacher professional development. Under the newly Malaysian Education Blueprint 2013-2025, the Professional Learning Communities will be highly promoted as one of the agenda for teacher professional development whereby Lesson Study has been identified as one of the main collaborative tools (Ministry of Education Malaysia, 2012).

### 3 LESSON STUDY: THE JOURNEY AHEAD

We acknowledged that Lesson Study in Malaysia has a long journey ahead due to the current vast reforms in education. On the positive side, the MOE has acknowledged the importance and significance of teacher professional development to improve teachers’ teaching. As stated in the McKinsey report (2007), “no education system can exceed the quality of its teachers.” The Lesson Study implemented thus far has actually bears some fruits. Several district education offices have mandated the schools within their jurisdiction to implement Lesson Study based on the encouraging feedback and results from the programme. There are also some schools through the school administrators’ own initiatives carrying out Lesson Study on their own accord. These reflected a very imperative fact, that the role of

higher authorities is very significant to the success of Lesson Study implementation in Malaysia. Secondly, these self-initiatives taken have suggested the positive perceptions of Lesson Study among educators and school administrators as a strategy and approach to improve teachers’ teaching practices.

Moreover, under the *District Transformation Programme* (DTP), excellent and experience teachers are being recruited and promoted as *School Improvement Specialist Coaches* (SISC+) since 2013. Their main tasks are to assist, coach and work together with school teachers to improve teaching practices. The Lesson Study model seems to provide a good structured framework for the teachers working together that aim to enhance students’ learning in the classroom. In fact, Lesson Study should be employed together with several other projects and programmes by the MOE. For instance, school teachers could work together in promoting *Higher Order Thinking Skills* (HOTS) among the students through the Lesson Study. It is definitely not an easy task for teachers to plan and inculcate the skills of higher thinking in teaching and Lesson Study could provide the platform for teachers to learn together in engaging higher order thinking skills among the students.

Nevertheless, despite the positive outcomes as reported by most district education offices, we observed and admitted the challenges in implementing Lesson Study. The constraints encountered are within expectations which are rather similar to the findings of research studies conducted earlier. Based on the studies conducted on Lesson Study, there were much consistency found with regards to the constraints and challenges. Chiew and Lim (2010) pointed out three main challenges: (i) time constraint, (ii) teacher’s heavy workload, and (iii) teacher’s perception of teaching observation. In fact, these factors were somehow expected due to the misconceptions and cultural factors in one’s education system. Chiew (2009) argued that much of the constraints were actually due to the lack of awareness about the importance of professional development among the Malaysian teachers. It was indeed paradoxical to observe that these teachers expressed to have gained much benefit through the Lesson Study process, yet at the same time, they were not willing to work beyond the school working hours. In addition, we observed that the degree of impacts or influences were somehow varied and limited due to the constraints faced in the Lesson Study implementation. It was noted that participating teachers who were committed and ready to embrace in Lesson Study process were found to gain far more benefits compared to other participants in the group (Chiew, 2009; Ong, 2010). Our experiences and knowledge gained thus

indicated that the change or impacts on teachers' teaching practices in general, would require much more time such as engaging in a few Lesson Study cycles over a period of three or four years before any significant changes or enhancement could become apparent.

Consequently, our immediate concern is to strengthen the monitoring system of the Lesson Study implementation. For instance, we are hesitant if the Lesson Study has been carried out according to the operating procedure outlined in the workshop. Merely relying on paper reports from the district education offices is deemed insufficient due to lack of commitment from some of the district education offices in monitoring of the Lesson Study implementation in the schools. As such, the aspects of being voluntary, life-long learning and self-initiative by the teachers to improve and commit themselves in professional development remain as main challenges that are yet to be realised in Malaysia.

### 3 IMPLICATIONS AND CONCLUSION

Although the outcomes thus far have been encouraging, the impacts of Lesson Study actually been cushioned by constraints in the implementation. As with any model of teacher professional development, the success of Lesson Study lies heavily on the teachers' commitment and attitude change towards their professional development. Hence, in some cases, the Lesson Study practice is not able to sustain among the teachers after a period of implementation. Nonetheless, despite these challenges, there is optimism for Lesson Study to thrive in the Malaysian schools. One of the supporting factors for smooth implementation of Lesson Study is the strong support and commitment from the school administrators (Chiew, 2009). With support from the top administration, it will certainly facilitate the implementation of Lesson Study in schools, particularly in terms of flexibility of time tabling and arrangement for group discussion.

Due to situational context, it is difficult to evaluate the effectiveness of any professional development programme as the nature of teacher professional development is rather long-term and developmental. Lesson Study posed to be alternative model of teacher professional development in Malaysia in long-term but these required a paradigm shift in teacher professional development which is yet to be observed in the Malaysian context. As mentioned earlier, the aspects of being voluntary, self-initiative and life-long learning by the teachers

are traits needed to overcome the challenges for Lesson Study implementation. To conclude, we strongly believe that Lesson Study poses to be a potential and promising model for teacher professional development in Malaysia.

**Abstract:** The purpose of the research was to develop the guided inquiry learning tools for blended learning through Lesson Study (LS) to improve the quality of the genetics learning processes. The learning tools are syllabus, lesson plan and teaching materials. The research involved 5 lecturers and 1 student who are members of the LS team. Subjects were 54 Biology students who took genetics and divided into two classes, namely class A for the first LS and class B for the second LS. Data was obtained from the 13 LS activities in each class for 11 genetic materials conducted in April-July 2013. Data analysis was performed using descriptive-qualitative approach. The results showed that the input for the development of learning tools were: 1) the syntax of the guided inquiry need to be modified by adding "the students should consult to the lecturers before communicate the inquiry results to other groups"; 2) the students' activities should be adapted to the syntax of modified guided inquiry; 3) the formulation of the practical activity objectives should be more operational; 4) the concept definition should not be written in instructional materials but replaced it with an image so that the students will formulate their own definition. In terms of the implementation of the learning process the inputs were: 1) the students should consult the lecturers before doing the presentation; 2) the lecturers should provide guidance to all groups, not concentrated in certain groups; 3) the students should be motivated to actively submit questions with contextual examples. 4) students' understanding should be made clear by the use of the video that are relevant to the topic; 5) the presented inquiry results should be uploaded to the web in words and power point for blended learning. The results of research and development showed improvement in the quality of the learning processes of genetics. This is demonstrated by: 1) increase concentration of students' learning; 2) increase abilities of students' working together in groups; 3) increase abilities and experience of the lecturers in conducting guided inquiry using blended learning; 3) increase confidence of the lecturers when implementing the learning processes.

**Keywords:** Blended Learning, Genetics, Guided Inquiry, Lesson Study

### 1. INTRODUCTION

Communication skills, problem solving, information access and management, decision-making, collaboration, cooperation and the use of a variety of advanced electronic technology need to be mastered by college students (Galbreath, 1999). Therefore, the learning process should be conducted interactively, inspiringly, excitingly, and challengingly, motivating students to actively participate and provide enough space for initiative, creativity, and independence according to their talents, interests, and physical and psychological development of students (Law No. 20 of 2003 on National Education System).

The fact, so far, shows that the practice of teaching in IKIP (Teachers Training College) PGRI Jember is still beyond the expectation, based on the preliminary survey conducted on October 12, 2012. Of the 15 biology lecturers surveyed, most of them still put students as the objects of study and still often use learning strategies which are dominated by

the lecturer. Furthermore, sharing between lecturers also has not been conducted, and they are rarely use information technology as a learning medium. Student innovation and creativity are also less developed to process information and find their own knowledge definition. The learning processes as mentioned above lead a number of problems, that is, the student learning outcome is less maximal and is not in line with the expectation. Students tend to memorize in learning, especially in the study of genetics, and they cannot connect one concept with other concepts well. In addition, students are still less critical of the problems associated with the genetics development which gives positive and negative impacts to society.

Based on the background and the problems as above, lecturers are required to make innovations in the learning process. One innovation that can be done by lecturers is to develop learning tools that can enhance the learning process. This study develops the guided inquiry learning tools on the

basis of blended learning through lesson study for genetics courses.

The guided inquiry learning on the basis of blended learning not only develops the interaction of learners but also provides a positive learning environment (Koesnandar, 2008). Guided inquiry learning on the basis of blended learning can also make students become more motivated and interested because they can do a lot of activities, access multimedia and other innovative devices through information technology.

The implementation of guided inquiry learning on the basis of blended learning can be developed to improve the quality of the learning system, which converts the conventional learning system into the constructivist learning system supported by information technology. Implementation of guided inquiry learning on the basis of blended learning can develop a number of students' process skills such as observing, formulating problems, formulating hypotheses, designing experiments, collecting and analyzing data and interpreting data, drawing conclusions based on authentic evidences and communicating the results of their inquiry activities (Schepler, et al 2003; MONE 2003a). Kulthau (2007) says that through the implementation of guided inquiry, students can conduct an investigation, exploration, searching, researching, teaching and learning.

The implementation of lesson study can help lecturers observe, pay attention to students with learning difficulties, either independently or in groups (Karim, 2006), especially to those who have low academic ability. The observations were analyzed and discussed with the team of Lesson Study to improve further learning process, so that students with high academic ability can assist students who have low academic ability, and students with low academic ability can be in the same level as those with high academic ability. Through the implementation of Lesson Study, lecturers are able to provide information and share experiences each other for their professional development (Cerbin, W & Kopp, B. 2006).

## 2. METHODOLOGY

Development of guided inquiry learning tools on the basis of blended learning through Lesson Study for genetics courses followed 4D developed by Thiagarajan (1974), which consisted of 4 stages with some modifications. The flow chart of the development of learning tools modified from 4D Thiagarajan is shown on Figure 1.

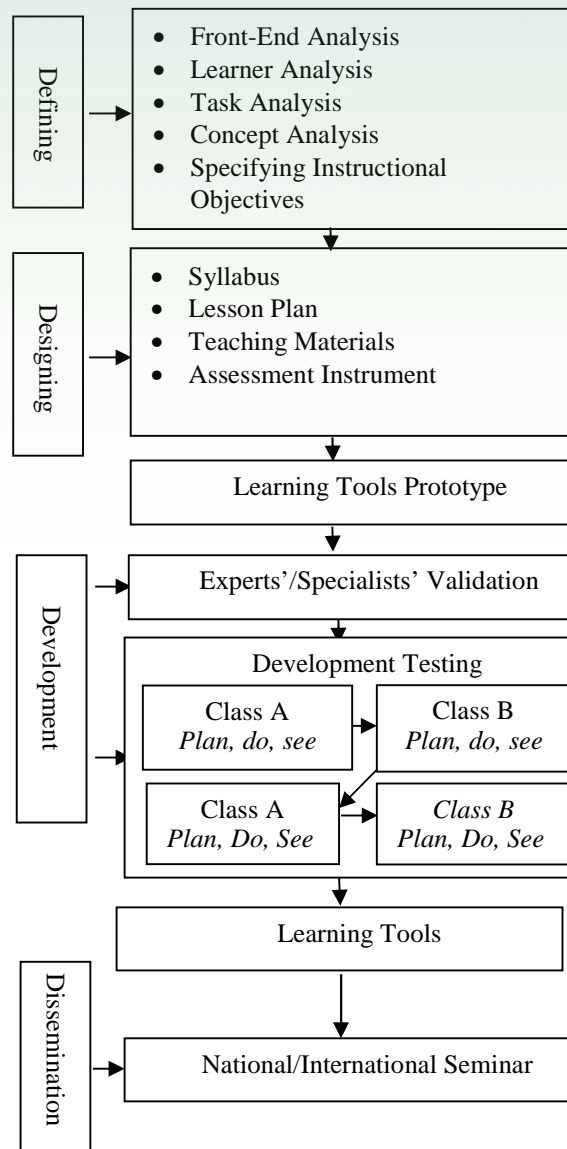

Figure 1. Flow chart of Learning Tool Development Modified from 4D Thiagarajan.

Research subjects in this study were 54 students majoring in biology education FPMIPA (Mathematics and Science Education Faculty) of IKIP (Teacher Training and Education College) PGRI Jember who took genetics courses. Research subjects were divided into two classes, class A and class B.

The developed learning tools were validated by experts/specialists. Data validated of the experts were analyzed qualitatively-descriptively. The learning tools were said good and fit for use if they reached at least 70% of the experts' consensus. LS activities were carried out within 10 cycles with 13

meetings for 10 subjects of genetics. The first LS activities were conducted in class A, and then the results of LS activity reflection in class A were used to be bases for improvement of the learning process in class B.

### 3. RESULTS AND DISCUSSION

To obtain a learning tool that met valid and reliable criteria, the researcher applied the procedures of Research and Development of modified 4D models Thiagarajan.

#### 3.1. Define stage

The step of defining was started by the activities of: 1) Front-end analysis which aimed to identify the fundamental problems needed in the development of learning tools. The problems that needed management in the study of genetics were the method of presentation of teaching materials and teaching practice that utilized multimedia technology information. PPT teaching materials that have been developed so far were only for fulfilling the lecturers' necessities during the learning process, but the teaching materials for the students were less developed. PPT teaching materials for students learning could be developed by completing the audio-visual, so that they could be learnt anywhere and anytime. PPT teaching materials for students can be uploaded to e-learning web or stored in the form of a compact disk or a flash disk that can be accessed and studied at any time by the students. Uploading the teaching materials to e-learning web directly trained and made the students familiar with the utilization and the use of information technology which is currently growing rapidly. 2) Learner analysis was carried out by examining the students' characteristics, that is, the backgrounds of academic skills (knowledge), the students' cognitive development, the individuals' skills related to the topic of learning, and genetic learning media. Within the last three years, students' learning outcome for the course of genetics was in average of 65 with C category. In 2009, the number of students who took genetics course was 82 who got marks of A (18.5%), B (37.4%), C (41%), and D (3.1%). In 2010, the number of students who took genetics course was 68 who obtained the marks of A (7.3%), B (23.5%), C (57.4%), and D (11.8%). In 2011, the total of students who followed genetics course was 59, who gained the marks of A (6.8%), B (20.3%), C (59.3%), and D (13.6%). The results are used as a frame of reference in the achievement of learning

objectives. 3) Task analysis aimed to identify the whole skills in the learning process. The researchers assessed the skills and conducted experiments in the course of genetics such as skills in doing the crossing in *Drosophila*. 4) Concept analysis was undertaken to identify the major concepts of the materials to be taught. The concepts were then arranged systematically and linked between one concept and other relevant concepts in order to form a complex concept that could be used as a means of achieving basic competencies and competency standards. The results of concept analysis for genetics course were arranged in 11 subjects in sequence from the first subject to the eleventh subject namely: genetics, Mendelian genetics, probability theory and mathematical completion in genetics, patterns of properties inheritance out of Mendelian genetics, sex linkage, sexing, crossovers and chromosome maps, chromosomal abnormalities, gene expression, population genetics, and recombinant DNA technology. These concepts were arranged systematically from the simple/basic concepts to the complex ones. 5) Specifying instructional objectives is a summary of the concept analysis and task analysis to determine the behavior of objects in the form of competence standards, basic competence and indicator. The behavior of an object was the basis for composing a test which was then integrated into the developed learning materials. Standards of competence and basic competence were illustrated clearly and completely in the syllabus and lesson plan.

#### 3.2. Design Stage

The stage of designing was performed through lesson study especially in the plan stage. At this stage, the designing of learning tools prototype was carried out which included the syllabus composition, lesson plans, teaching materials and assessment instruments. The format of learning tools prototype was used or adapted with the format developed by the National Education Standards. The format that was developed is shown in Figure 2 and Figure 3 as follows:

Figure 3. Lesson Plan Format

Specification of assessment instrument produced was in the form of questionnaire to measure learning motivation and scientific attitudes. Observation sheet was to measure learning motivation, scientific attitudes, and motor skills. Essay test and rubrics were to measure cognitive learning and critical thinking skills.

The developed assessment instruments were validated by experts/specialists and were also tried out to students who had taken genetics course in total of 58 students. Data resulted from try-out were analyzed to determine the validity and reliability. The analysis showed that 65 questionnaire items of learning motivation were all valid and reliable, 50 items of questionnaire on scientific attitudes were all valid and reliable, and of the 22 essay test items, 20 were valid and reliable, while 2 were not.

### 3.3. Development Stage

Development stage was started with the experts' validation on the developed learning tools. The results of the tools validation are shown on Table 1.

Table 1. Mean Value Results of Validation on Guided Inquiry Learning Tools on the Basis of Blended Learning for Genetics Course

Type of Tools	Mean Value of Validation					Average
	Validator I	Validator II	Validator III	Validator IV	Validator V	
Syllabus	88.71%	93.55%	89.52%	-	-	90.59%
Lesson Plan	87.47%	77.65%	88.86%	-	-	84.66%
Teaching Materials	79.95%	71.92%	-	84.82%	-	78.90%
Assessment						
Instruments:	85.11%	94.44%	88.89%	-	-	89.15%
• Motivation	85.11%	94.44%	88.89%	-	-	89.15%
• Scientific Attitude	91.67%	100%	87.50%	-	-	93.06%
• Critical Thinking Skills	85.71%	100%	89.29%	-	-	91.67%
• Psychomotor Skill						
• Cognitive Learning Outcome	82.50%	100%	88.89%	-	-	90.46%
WFR Blended Learning	-	-	-	-	79.2%	79.2%

In general, the results of the validation by experts/specialists were in good category, so that the learning tools developed can be used with little revisions, i.e.: 1) In the future, the practicum activities should be based on hands-on activity. 2) It is suggested to distinguish the concepts of gene, DNA and chromosomes for prokaryotic cells with the concept of gene, DNA and chromosomes of eukaryotic cells. 3) Be careful with the use of genetic symbols. 4) Please clarify with pictures on non-disjunction material.

The tools that had been validated by experts were then tested for tool development on the research subjects i.e. 54 students of IKIP PGRI Jember who took genetics course divided into two study groups, namely group A and group B. Development test was intended for the improvement of learning tools, and to see whether there was an increase in cognitive learning outcomes of the students. Development test of learning tool application was the second stage (*do*) and third stage (*see*) of the Lesson Study activities. Lesson Study activities were carried out within 10 cycles with 13 meetings for 10 subjects. Lesson Study activities were conducted from April to July, 2013. The results of Lesson Study activity reflection as the tool development test obtained: 1) The concept definition should not be described in the teaching materials but be replaced with images, so that the students would formulate the concept definition by themselves. 2) Students should consult the lecturer prior to the presentation. 3) Lecturer provided fair supervision to all groups in order not to be concentrated in a certain group. 4) The student group was motivated to actively give questions with contextual examples. 5) The student concept understanding of student learning was made clear by the use of the video that was relevant to the topic. 6) The results of the presented discussion were uploaded to Blended Learning in documents of *words* and *power point*.

In development test, pre-test was first conducted to determine the preliminary ability of the research subjects, and post test after development test was conducted to identify the increase in learning outcome after the learning process using the developed learning tools. The mean values of learning outcomes in class A and B are shown in Table 2.

Table 2. The Mean Value of Pre-Test and Post-Test

Assessed Aspects	Class	Pre-Test		Post-Test		Increase (%)
		Value	Category	Value	Category	
Motivation	A	58.50	Fair	90.38	Very high	31.94
	B	56.68	Fair	89.08	Very high	33.23
Scientific Attitude	A	59.36	Low	90.07	Very high	51.22
	B	59.09	Low	93.51	Very high	58.25
Cognitive Learning Outcome	A	47.96	Very low	79.11	High	64.95
	B	45.75	Very low	76.00	High	66.19
Critical Thinking Skill	A	45.66	Very low	67.26	Fair	47.31
	B	44.72	Very low	66.52	Fair	48.75

In general, Table 2 shows that there is an increase in all assessed aspects. The increases in motivation, scientific attitude, cognitive learning outcome and critical thinking skill in class B were higher than those in class A. This happened because the learning process in class B was conducted based on the results of reflection of the learning process in class A, so that the strengths and weaknesses found in class A were fixed in the learning process in class B. The implementation of guided-inquiry learning strategy on the basis of Blended learning could help students perform a variety of activities ranging from observing, questioning, explaining, designing and testing the hypothesis that optimally involved the whole student's ability to seek and investigate systematically, critically, logically and could formulate their own inventions. In line with this, Joyce *et al* (2000); Nurhadi *et al* (2004); Wahab Jeffri (2007); Handoko (2007); Bodzin *et al* (2007) argue that the implementation of the guided-inquiry on the basis of Blended learning is effective to improve thinking skills, attitudes, cognitive learning outcomes, and student leaning motivation. Wahyudin's study (2010) showed that student interest and understanding increase from 72.90% to 76.81% after the application of guided-inquiry strategy assisted by multimedia. In addition, because the implementation of genetics learning tools are based on Blended Learning, students find it helpful to access more literatures, to give broader learning rooms, to provide longer study time, as well as to provide an opportunity for students to explore and find the concepts of genetics by themselves through inquiry and use of information technology. The study by Rathomy Baisa (2010) indicates that 78.35% of the students feel interested and motivated in the learning which uses internet media.

### 3.4. Disseminate Stage

Dissemination stage was a late stage of development. Phase dissemination was done to promote the development of products that can be received by users, either individually or in group, or system. Dissemination was performed through a process of transmission to the relevant learning practitioners in particular forums such as seminar or scientific journal publication.

## D. CONCLUSIONS

Based on the validation by the expert and analysis of the test results, it can be concluded that the development of genetics learning on the basis of blended learning through lesson study can improve the quality of learning process of genetics course. This is indicated by the presence of: 1) an increase in of student concentration during the learning process; 2) an increase in ability to work together in student groups; 3) an increase in lecturers' and students' ability and experience in conducting inquiry using Blended Learning; 4) an increase in lecturer confidence when implementing the learning process.

## E. ACKNOWLEDGEMENT

Researchers would like to thank: 1) Prof. Dra. Herawati Susilo, M.Sc., Ph.D., Professor Dr Henie Mimien Irawati Al Muhdar, M.Si., Dr. Fatchur Rohman, M.Si, as the supervisor who has patiently provided guidance and direction until the research was well-completed; 2) Rector of PGRI Jember, who has provided opportunities for researchers to conduct research in Biology Education of IKIP PGRI Jember; 3) Partners in Lesson Study Team who have helped and provided input for improvement of learning tools that were developed during the process of Lesson Study activities.

# The Implementation of Students Achievement Division (Stad) Combined with Lesson Study-Based Mind Mapping In General Biology Course To Improve Motivation and Concept Comprehension of Students In University of Muhammadiyah Malang

Elly Purwanti<sup>1</sup>, Tince Koroh<sup>2</sup>

<sup>1</sup>*purwantielly@gmail.com*

<sup>2</sup>*tincekoroh@yahoo.co.id*

**Abstract:** STAD (Student Teams-Achievement Division) is effective to improve student learning motivation, because STAD gives significance to reward structure as reinforcement towards what have been done by students. The reward is one aspect to increase motivation. Mind mapping is a method to manage information holistically. Mind mapping may be used to: restore information, organize information, make priority, learn to comprehend information within context, conduct a review on learning material, and retain information completely. In order to answer concept comprehension problem, the writer tried to combine STAD model with Mind Mapping. This study aimed at: (1) improving students learning motivation in general biology course at University of Muhammadiyah Malang, as well as (2) improving students' concept comprehension in general biology course at University of Muhammadiyah Malang. This study was a Classroom Action Research (CAR) Lesson Study (LS) based with two cycles. The study result showed that: 1) the implementation of STAD combined with Mind Mapping had a high learning feasibility with these steps (Plan, Do, See) derived from LS that were used for betterment in each meeting, 2) the implementation of STAD combined with Mind Mapping was proven to increase motivation and concept comprehension. For further research, the combination of STAD-Mind Mapping requires clear instructions and a better time management.

**Keywords:** STAD, Mind Mapping, Learning Motivation, Concept Comprehension

## 1 INTRODUCTION

Teaching is about delivering knowledge to students. As the consequence of this definition, students are passive because they tend to only receive information given by their teacher. Therefore, it is a teacher centered teaching (Sardiman, 2001:45). Teachers are aware of their role when they meet their students. To improve the teaching and learning quality, teachers are expected to have skill to select and apply teaching method for effective teaching (Hamalik, 2001). Hence, teachers are seen as agents of modernization in every field of life. The main effort from teacher is through education program for students.

Based on this statement, teaching quality is directly linked to the use of optimal teaching model which means in order to achieve high quality teaching, each education course or subject has to be organized with suitable organizational strategy. In addition, the knowledge should be delivered with proper strategy (Berg in Prayekti, 2006:2).

According to the survey result and the interview with the lecturer of general biology course in University of Muhammadiyah Malang held on September 16-19, 2013, it was concluded that

students' activeness and participation in learning process was quite low. There was also a lack of motivation to do self-learning; students were less motivated to study biology. Studying biology was considered boring because it required a lot of memorizing and complicated processes. Besides, students were likely to become passive and silent during the lesson. When the lecturer asked questions, students gave minimum response. Students had difficulty to connect theoretical concept of biology to the pragmatic application of the knowledge in daily life. When biological problems were introduced, students could not solve the problems. Students' various background study also influenced the knowledge acquisition, as they might come from vocational school majoring in cooking, sport, and so on.

One of the cooperative learning models which have broad application is STAD (Student Teams-Achievement Division) model. STAD is the easiest cooperative learning model compared to the other models of teaching. STAD is proven to be effective to improve students' learning motivation because STAD focuses on reward system as reinforcement

tool. The reward itself may function as a motivation booster.

Mind mapping is a teaching method used to manage information thoroughly. Holistically, mind mapping can be used to: keep information, organize information, make a priority, comprehend information in its particular context, review material, memorize information holistically, therefore, to answer the problem regarding concept comprehension, the writer tries to incorporate the STAD model and mind mapping.

STAD cooperative learning model would be implemented by the use of mind mapping teaching strategy. The aim of this corporation is for students to gain chances to have class discussion in solving the problem in students' work sheet. Another benefit of using mind mapping will be seen by the time students explain their mind map designed by their group in front of the class. By presenting, students are expected to overcome their low learning motivation and strengthen their concept comprehension. Students are more interested in creative writing technique with colors rather than the boring one. By this collaboration, it is expected that students' learning motivation can be increased so that their learning outcome improves as well.

Based on this assertion, the writer was interested in conducting a Classroom Action Research (CAR) on the basis of Lesson Study (LS) under the title of "the implementation of student achievement division (STAD) combined with lesson study-based mind mapping in general biology course to improve motivation and concept comprehension of students in University of Muhammadiyah Malang".

## 2 RESEARCH METHOD

This study was a Classroom Action Research (CAR) based on Lesson Study (LS), conducted in two cycles. In this context, a cycle means a whole set of activities ranging from planning, doing, observing, and reflecting.

The combination of CAR and LS design can be seen in Table 1 as follow:

CAR	LS	Activities
<ul style="list-style-type: none"> <li>Planning</li> </ul>	Plan	<ul style="list-style-type: none"> <li>Identifying problem and its cause</li> <li>Designing lesson plans/study scenarios</li> <li>Creating research instrument in the form of observation sheet</li> <li>Making Mind Mapping scoring rubric</li> <li>Preparing evaluation tool and authentic assessment</li> </ul>
<ul style="list-style-type: none"> <li>Action</li> <li>Observation</li> </ul>	Do	<ul style="list-style-type: none"> <li>Conducting activities as written in lesson plans</li> <li>Observing students</li> </ul>

		activities as the form of the researcher treatment during the learning process <ul style="list-style-type: none"> <li>Using research instrument to measure the achievement in each step of the activities:                             <ul style="list-style-type: none"> <li>Study achievement sheet of STAD and Mind Mapping</li> <li>Monitoring sheet for (Plan, Do, See) Lesson Study</li> <li>Observation sheet of students motivation</li> </ul> </li> </ul>
<ul style="list-style-type: none"> <li>Reflection</li> </ul>	See	<ul style="list-style-type: none"> <li>Analyzing the observation result based on reflective discussion and collected instrument</li> <li>Offering feedback from the observer for lesson plan betterment and for further cycle improvement</li> </ul>

This study was conducted in Biology Education Department, University of Muhammadiyah Malang, Academic year 2013-2014, on odd semester, September-November 2013. The study subjects were students of B offering who were taking General Biology course in Biology Education Department at University of Muhammadiyah Malang academic year 2013-2014. The total participants were 42 students.

This study was a Classroom Action Research-Lesson Study that was conducted collaboratively. Cycle I consisted of two meetings and each meeting comprised *Plan, Do, See* stages. Cycle II consisted of two meetings and each meeting also comprised *Plan, Do, See* stages.

The data collection techniques were observation, motivation questionnaire, and concept comprehension scoring rubric.

The data analysis technique was a descriptive quantitative based on the available formula as below:

### ➤ Observation Analysis

The data from the observation were analyzed by describing the activities done during the lesson.

### ➤ Students' motivation questionnaire analysis

Students' motivation was measured by motivation questionnaire, where the scoring criteria involved:

Absolutely Agree

Agree

Disagree

Absolutely Disagree

The total score derived from the students in the scoring rubric for creative thinking would be converted in percentage, by applying the following formula:

$$\% \text{ motivation} = \frac{\sigma}{t_i} \times 100\%$$

- Concept Comprehension Scoring Analysis  
Students' concept comprehension was measured by essay test and mind mapping result; the following was the scoring criteria:

$$\frac{\% \text{ concept comprehension}}{\frac{T \ S \ p \ c \ +M \ m}{2}} \times 100\%$$

### 3 RESULT AND DISCUSSION

The CAR Lesson Study based activities were conducted in two cycles, cycle I and II, where each cycle consisted of two meetings. Cycle I was done in two meetings on Tuesday October 8 and 16, 2013. The main learning material was Bio-molecule and living creature characteristics.

On Tuesday October 8, 2013, the study was conducted in 3 x 50 minute period. In the first meeting, the introduction began with exploring the knowledge of human origin, about living bio-molecule through probing and staging questions. The lecturer played a video on biological molecular structure and function, and then he/she showed a picture on his/her PowerPoint slides about macro-molecular while asking “What is this picture about?”, “Why do scientists study macro-molecular?”

The lecturer asked students to sit in groups as many as 6 groups. He/she distributed the work sheet and asked students to conduct group discussion and to answer the problem in a mind mapping. During this activity, the lecturer observed the learning of each group and guided them in discussion part. When the group discussion and mind map drawing finished, they pasted the mind mapping on the white board. Afterwards, the lecturer chose one mind mapping which represented the most comprehensive concept to be discussed all together. The next phase was question and answer session among the groups based on the presentation. The following activity was a game in which students were asked to directly answer the questions delivered by the lecturer.

The lecturer provided conclusion for the given material and informed students the following week's material on making resume about living creatures. The observation result showed that students were quite able to follow the lesson, they were enthusiastic, and they were also highly motivated due to the use of game during the lesson. Students were able to study appropriately, however, some students sitting at the back row seemed to be busy while following the lesson stages; they still gossiped to each other. The predicted cause of the behavior was that students had covered the material before; therefore, one of the suitable efforts for the lecturer to overcome this problem was to give more strict instruction or warning so as students followed the activities more seriously. The lecturer should be able to control the class. Another point was that the use of

mind mapping could improve students' motivation to stay focus during the lesson. Time management should be considered by the lecturer as well.

In the second meeting, the class was conducted similar to the previous week that was to divide the class into groups, to discuss the material in groups, and to draw a mind map based on the discussion result. In the second meeting, students were identified to be more focused; only some groups did not stay focus. Students' motivation was increasing; students were used to making the mind map. The following description was the observation result from the second meeting: the ‘do’ activity had been conducted smoothly; students were motivated in following the lesson. It was proven by students' willingness to bring textbooks related to the lesson, their willingness to work in groups, and they were more focused on studying although some students did not fully fit the proper condition. By video broadcast and mind mapping, it was expected that students were helped in comprehending materials. In the beginning of the cycle, students might be less passionate due to the extra assignment loads from other subjects.

In cycle I reflection, students were highly motivated. This condition was correctly predicted since they were semester 1 students, so that their passion to join and participate in activities during the lesson was quite high already. Hence, the model lecturer should find a suitable assignment construct to give more motivation during apperception or whilst activities. In this stage, students' concept understanding was quite low but their creativity for mind mapping was excellent. Therefore, the solution for the model lecturer was to manage time allotment to give proper concept emphasis on the material. In order to comprehend the resume assignment concept, structured or outlined assignment points should be previously determined to keep the students' focus in understanding the concept. Students had enough courage to express their opinions, but they often felt in doubt and were afraid of making mistakes. It was a job for the model lecturer to motivate students to eliminate their doubt and improve confidence to state their opinions.

Cycle II of CAR-Lesson Study based was conducted in two meetings; they were on October 23 and 30, 2013. In the third meeting, apperception activity was to be the focus, so as to motivate the students. The writer also paid more attention to time allotment and game which was designed for the whole groups, not only for several groups. The model lecturer applied STAD combined with Lesson Study-based mind mapping.

In pre-activities, the lecturer greeted the students while asking if they were ready to start the lesson. Some students indicated their less readiness to receive material as they were busy doing some

assignments from other lecturers. The model lecturer kept on motivating students to follow the lesson. In the next step, the lecturer delivered materials and broadcasted a video as a–perception; the broadcasted video was about cell movements from various kinds of cells. The lecturer asked some questions, “What can you find from the video? What kinds of activities you notice? Explain the definition of cells based on your understanding related to the previous video”. It was expected that students answered all the questions thoroughly and the lecturer proceeded to explain the objective of today’s lesson.

The lecturer asked students to sit in groups as many as 6 groups and distributed the work sheet to each group. They started the discussion and drew their answers in mind mapping. During this period, the lecturer observed students’ work and guided students in discussion session. The group which finished the mind mapping might paste their work on the white board; the lecturer chose the most appropriate mind mapping and appointed the group to lead class discussion and question and answer session. Afterwards, students played game by answering some questions from the lecturer directly.

In the third meeting, students gained focus towards the materials, there was an increase in group work, they were enthusiastic to follow the lesson but there were some students who were still passive and lack of seriousness in designing a mind mapping. The predicted cause was the lack of class control from the lecturer; more strict treatment and distributive control should be performed by the lecturer. The reflection result from that meeting gave the writer plenty of lessons on the importance of motivation for students as well as the significance of time management in a course.

In the fourth meeting in cycle II, the material was about cell division. In this session, the lecturer paid more attention to students’ concept comprehension by presenting a video with appropriate time duration to avoid boredom. The result showed that students comprehended the concept more after the video broadcast and there was also an indication of creativity improvement.

The reflection result showed that apperception was required to motivate students to join the lesson and to assert the material concept.

Learning implementation reflection captured the achievement of STAD learning combined with mind mapping. The reflection proved that this combined teaching method could increase students’ motivation and their concept comprehension. The most highlighted point was to witness students’ self-improvement through the implementation of the combined method. This success could be achieved with the help of other lecturers as observers who always gave constructive suggestions and criticisms.

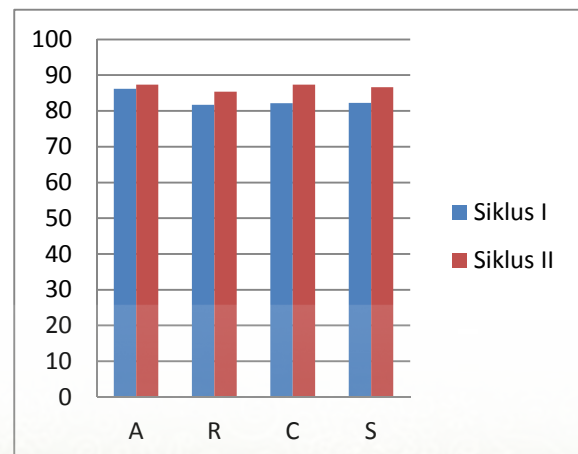

### 3.1 Students Learning Motivation

The data of students learning motivation was derived from learning motivation questionnaires that were designed based on motivation improvement strategy (ARCS model). The analysis was done by calculating the score of each aspect, and after the calculation, the scores were classified into five categories; very poor, poor, fair, good, very good. By the end of the calculation process, classical scoring classification was performed to find out classical score for holistic assessment of motivation. The questionnaire result after the treatment in cycle I and II for B class, Biology Education Department, University of Muhammadiyah Malang can be seen in Table 4.1. Tabel 4.1 The Mean Score of Motivation Aspect (%) per-cycle and its improvement for students of B class, Biology Education Department, University of Muhammadiyah Malang.

MotivationAspe cts	Cycle I	Cycle II	Improveme nt (%)
A	86.2	87.4	1.2
R	81.73	85.38	3.65
C	82.17	87.40	5.23
S	82.27	86.63	4.36
Categories	Verygo od	Verygo od	

Based on table 4.1, there was significant improvement for classical students’ motivation by the use of STAD model combined with mind mapping. The analysis result of students’ motivation questionnaires showed that, in every aspect, students’ motivation grew and increased, in line with the expected achievement set by the researcher. The expected achievement was a cooperative learning activity through STAD learning combined with mind mapping to increase students’ motivation in learning biology. The increase of students’ motivation can be drawn in a graph in Picture 4.3.

Graph 4.1 Students’ Motivation Improvement from Cycle I to Cycle II

### 3.2 Students Concept Comprehension Motivation

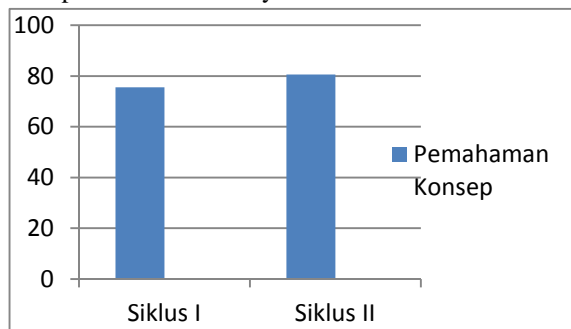

STAD learning combined with mind mapping could increase students learning result. This concept understanding can be derived from the test score in Cycle I and II

Tabel 4.2 Percentage Data of Students Concept Comprehension for B Class, Biology Education Department, University of Muhammadiyah Malang.

Objectives	Cycle I	Cycle II	Improvement (%)
Concept comprehension	75.5	80.6	5.1
Score conversion	B+	A	

Based on table 4.2, it was stated that the improvement percentage was 5.1 %; however, if it was converted into score, the improvement was significant especially for concept comprehension. The analysis result based on concept comprehension scoring rubric showed that the result was in line with the expectation of the researcher. Cooperative learning activities by the use of STAD learning combined with mind mapping would increase students' motivation in learning biology. The improvement of students' concept comprehension can be described in Graph in Picture 4.4.

Graph 4.2. The Improvement of Students' Concept Comprehension from Cycle I to II

### 4 CONCLUSION

1. Based on the implementation of STAD combined with mind mapping, there was an increase in students' learning motivation for B class, Biology Education Department, University of Muhammadiyah Malang with the following details: Attention improvement (1.2%), Relevance improvement (3.65%), Confidence improvement (5.23%), and Satisfaction improvement (4.36%).
2. Based on the implementation of STAD combined with Mind mapping, it was concluded that this

method could increase students' concept comprehension, especially for B class, Biology Education Department, University of Muhammadiyah Malang with the following details: Cycle I: 75.5, and Cycle II: 80.5; therefore, there was 5.1 increase in comprehension.

### 5 SUGGESTIONS

Based on the conducted research, several suggestions need to be proposed:

- For Lecturers
  - The implementation of STAD combined with mind mapping needs clearer instructions in order to be easily understood by the students for meeting the effectiveness purpose.
- For Students
  - Students should work in team and minimize individual work.
  - Students should submit the group work results on time.
  - Students should not feel shy and in doubt to ask questions if there is any information they do not understand during the activities.
- For Further Researchers
  - The implementation of STAD combined with mind mapping should be improved; in this study, only two cycles were performed by the researcher with a lot of changings in developing mind mapping; hence, it is recommended that lecturers or teachers be more creative in designing mind mapping.
  - If this combined method is implemented, it is better for the researcher to pay more attention to time management.

## **Developing Eries Learning Model to Improve Students-Teacher Basic Teaching Skills Through The Implementation of Lesson Study**

(Research & Development on Teaching Learning Strategy Lecture in Indonesian Language and Literature Study Program, Faculty of Teacher Training and Educational Sciences, Pakuan University)

Dr. Eri Sarimanah, M.Pd.

*Language and Literature Study Program*

*Faculty of Teacher Training and Educational Sciences, Pakuan University*

*sarimanah.herty@gmail.com*

**Abstract:** This study is aimed at developing ERIES learning model to improve semester V student-teacher's basic teaching skills in Teaching Learning Strategy lecture in Indonesian Language and Literature Study Program. Through the implementation of Lesson Study, ERIES model was developed by Exploration, Reflection, Interaction, Elaboration, and Summary steps. The method applied in the study is Research and Development and the approach used is qualitative and quantitative. Qualitative data were gained from needs analysis and response to the developed product, while quantitative data were gained from the test of the product and the effectiveness of the model. Research result shows that ERIES learning model is needed by student-teacher. Structurally this model is valid, relevant and fit the principles of learning model development both in its substance and its structure. Based on the try-out result from experimental research, ERIES learning model is effective to improve student-teacher's basic teaching skills. The achievement is better than non-ERIES learning model.

**Keywords:** learning model, basic teaching skills, ERIES model

### **1. INTRODUCTION**

#### **1.1 Background of the Study**

The implementation of Curriculum 2013 that focuses on the change orientation to active, creative, and innovative students center learning needs teacher's skill in facilitating the learning process. Learning will be productive if the lecturer is able to apply basic teaching skill such as opening and closing the lesson, delivering questions, explaining, reinforcing, and managing the class. These teaching skills can be gained through serious practice.

Teacher Education Institution has a task to produce skillful teachers in making effective learning. One of the activities given in the class is practicing the basic teaching skills in Teaching Learning Strategy subject. In this subject, one of the competencies that should be possessed by the students is applying basic teaching skill as the skill needed for practice teaching in real schools as a real teacher.

Based on the observation found in Teaching Learning Strategy subject, many students still have problems in practicing

the basic teaching skills. The problems are among other: they are shy to practice, they do not know what to say in front of the classroom, they do not know the aspects in each of the teaching skill that should be practiced, and they are careless in analysing basic competence and learning goal. It affects on difficulty to develop basic teaching skills. One of the ideas that the researcher will apply is developing learning model that is found through the implementation of lesson study.

Basically lesson study is one of the efforts to increase the teacher's quality and professionalism in facilitating the learning process. Lesson study is an activity that can develop a learning society which consistently and systematically do self development both individually and managerially.

It is hoped that through lesson study the researcher can develop a learning model which optimally can practice basic teaching skills for student-teacher in Teaching Learning Strategy subject.

Based on the description, it needs a design for lesson planning model. ERIES as a learning model through the implementation of lesson study is one of alternatives that can be applied by the student-teacher to develop basic teaching skills. Therefore, the researcher is interested in conducting the research and development for ERIES learning model to the 5th semester students of Indonesian Language and Literature study program of Faculty of Teacher Training and Educational Sciences of Pakuan University.

## 1.2 Research Focus

This research is focused on the development of ERIES learning model through the implementation of lesson study.

## 2. RESEARCH PROBLEM

Based on the background of the study and research focus, the researcher states the problem: “How to develop ERIES learning model in semester 5 of Indonesian Language and Literature study program of Faculty of Teacher Training and Educational Sciences through the implementation of Lesson Study?”

## 3. THEORETICAL FOUNDATION

### 3.1 The Nature of Model Development

Research and Development is a research method used to produce certain product and evaluate the effectiveness of the product. As stated by Gall and Borg that research and development in education is an industrial based development model in which the research finding is used to plan new product and procedure which then is tested in the field, evaluated and revised until until fulfilling certain criteria that is effective and qualified.<sup>1</sup>

Research and Development emphasizes on useful and beneficial product as a form of expansion, addition and innovation from the available product. To produce certain product, it needs research that focuses on need analysis, and to test the effectiveness of the product so it can function effectively. The product of education and learning can

be in the form of learning model development.

Model development is an effort to find a new formulation based on the principles and certain method to produce a new expected formulaion. The result of model development is an instructional system consisting of goal, material, learning strategy, learning media, and evaluation developed to achieve certain learning goal.

Besides, learning model development covers the steps of analyzing, designing, applying, and evaluating. The process of model development is an activity to revise the previous learning design or model to become a new model that can be applied in the learning process.

Learning model development is a systematic way in identifying, developing, and evaluating a set of materials and strategy led to achieve a certain education.<sup>2</sup> Learning model consists of a series of activities which include (1) planning, (2) developing, (3) evaluating learning system that is being developed so that after having several revision, the learning system can satisfy the learning developer. The product of learning model development is a learning system which consists of materials and teaching learning strategy developed empirically and consistently to achieve certain learning goal.

Learning model is a form or special character of learning activity done by the teacher from the beginning until the end. The learning form is something that shows thinking pattern as a whole connected concept.<sup>3</sup> It is called as thinking pattern because model can be defined as aseries of approach, strategy, method, thechnique, and unified and complete learning tactic.

According to Gustafson, model hels us conceptualize reality representation.<sup>4</sup> In

<sup>2</sup> Twelker, Paul A., Urbach, Floyd D., & Buck, James E. *The Systematic Development of Instruction* ( Stanford: ERIC Clearinghouse on Media and Technology, 1972), h.6.

<sup>3</sup> Benny A. Pribadi, *Model desain Sistem Pembelajaran*, (Jakarta:Dian rakyat, 2009),h.86

<sup>4</sup> Ken L. Gustafson and Robert Maribe Branch, *Survey of Instructional Development Model*. (Fourth Edition) (New York: Eric Clearinghouse on Information & Technology Syracuse, 2002), h. 1

<sup>1</sup> Meredith D. Gall, Joyce P. Gall, Walter R. Borg, *Educational Research: An Introduction*, (Boston: Longman, Pearson, 2003), h. 569

accordance with the reality, learning activity can be formed through various pattern or model which is caused by various condition and characteristics/conception of learning component. The conception starts from a specific thing such as formulating learning goal, developing learning material, choosing learning method and media and making evaluation, until the more common one such as education. Learning model is the conceptual framework that explains a systematic procedure in organizing learning experience to achieve certain learning goal and function as a guide for learning designer and teacher in planning the teaching learning activity.<sup>5</sup> Thus, model is a pattern that shows synergic activity of the components to achieve the learning result.

### 3.2 The Nature of Lesson Study

Lesson study is a model of educator profession development through analyzing learning collaboratively and continuously based on collegiality principles and mutual learning to develop learning community.<sup>6</sup> Lesson study leadership model can be used as teaching leading model for teacher or lecturer to their students and is an effort to improve the quality and teacher professionalism in facilitating the learning process.

Based on the explanation it is important to design text-based learning plan model for Bahasa Indonesia subject in implementing curriculum 2013. The lesson study based syntax learning design is one alternative model that can be used by teachers or student-teacher to improve the ability to plan a teaching learning activity.

According to Lewis if a teacher want to improve learning, he should collaborate with other teachers to plan, observe and reflect the learning that has been done.<sup>7</sup>

Therefore, lesson study is done in three stages: plan, do, see. The three stages are done continuously. In other words lesson study is a way to improve the quality of education that never ends (continuous improvement)

The improvement of teacher professionalism is bottom-up because the learning development is done by considering suggestion, critique and advice from observers that are analyzed collaboratively and continuously.

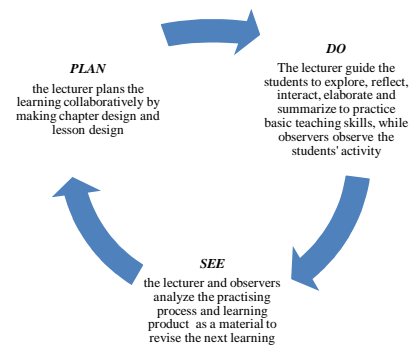

The pattern of lesson study learning that is developed is shown in the following picture:

In implementing lesson study based learning, in do activity, observing by some observers, the students explore various learning video enthusiastically.

### 4. RESEARCH METHOD

This research applies research and development method and done to the 5th semester students of Indonesian language and Literature study program in Teaching Learning Strategy subject.

The development of this learning model is based on the analysis of document, observation, and learning process. The

research is started by need analysis that consists of document analysis and learning process analysis. The instrument used in this research is observation and questionnaire that has been discussed with experts and the target is providing information about learning components

[guide to lesson study](http://www.lessonresearch.net/briefguide.pdf). Philadelphia: Research for better schools. Online. [www.lessonresearch.net/briefguide.pdf](http://www.lessonresearch.net/briefguide.pdf).

with the characteristic of needed learning model. Then synthesizing information about the need of basic teaching skills. The product is the list of basic teaching skills components, need analysis instrument, the characteristic of model used, perception about the available model and the model that will be developed.

## 5. RESEARCH RESULT AND DISCUSSION

### 5.1 Description of Plan, Do, See in each cycle

After doing the step of research and development started from need analysis, development, and implementation, the lesson study based learning planning model is considered to be finished. This learning model is called lesson study based ERIES learning model.

In implementing lesson study, ERIES learning model is planned integratedly through plan, do, see. During the plan, the lecturer model team formulate chapter design and lesson design. The plan stage is developed after the second, third, and fourth cycle. In do stage the learning activity through ERIES can be seen because ERIES is born from dominant activity that are often done by the students, but there is no name for it. This continuously develops from cycle to cycle. Based on the observation, this learning activity develops in the second, third, and fourth cycle. The students show the mental involvement in doing the activities such as to explore, reflect, interact, elaborate, and summarize in practicing basic teaching skills. The learning documents such as chapter design and lesson design is revised, and suggestion given during the see after the class ends is directly done. It is done to solve the problems found in the class. All observers give feed back based on their observation. The result of see is a new lesson design as the revised learning plan to be done in the next cycle.

Based on the research finding, ERIES is a learning model that is properly developed based on the indicator used. Expert evaluation result shows proper learning model to be used in Teaching Learning Strategy subject. Lesson study based ERIES learning model has been tried out and has fulfilled all model component stated by experts. Lesson study based ERIES learning model has been validated

and has followed a series of continuous research activity process to get the valid final product.

The learning is started by pretest and ended by post test. After fulfilling the t-test with the result of normal test result and homogenous data, it shows that the pretest and the posttest are significantly different. It indicates that lesson study based ERIES learning model is effective to improve the students' average score to practice basic teaching skills.

It can be concluded that the effective test result of learning model with experiment and control group. The analysis of t-test shows that lesson study based ERIES to the 5th semester students of Indonesian Language and Literature study program is effective and suitable to be used as a learning model in Teaching Learning Strategy subject.

The finding is based on observation result, the class with lesson study makes the students to be active and become independent learner to practice teaching. The class with lesson study is a new experience for them, in which they enjoy learning and feel satisfied in doing the learning activity. They are mentally involved actively to explore, reflect, interact, elaborate, and summarize in doing the task. Lesson study based ERIES learning model gives a new experience for the students.

The following table is the lesson study based ERIES learning model:

Table 1. Lesson study based ERIES learning model design

Lesson Study	Model Stage	Lecturer's activities	Students' activities
<b>Plan</b>	The lecturer collaboratively plans chapter design and lesson design	<ul style="list-style-type: none"> <li>• Material orientation</li> <li>• Material exploration and elaboration</li> <li>• Planning TLA through ERIES model</li> <li>• Providing learning video</li> </ul>	<ul style="list-style-type: none"> <li>• Reading lesson design written by the lecturer</li> <li>• Reading various references</li> </ul>
<b>Do</b>	➤ <b>Eksplorasi</b>	<ul style="list-style-type: none"> <li>• showing learning video related to basic teaching skills that should be mastered by the students.</li> <li>• Guiding the students who find difficulties in finding aspect/components basic teaching skills based on their observation</li> </ul>	<ul style="list-style-type: none"> <li>• Exploring the components of basic teaching skills from the video</li> </ul>
	➤ <b>Reflection</b>	<ul style="list-style-type: none"> <li>• Guiding the students to do reflection</li> </ul>	<ul style="list-style-type: none"> <li>• Reflecting various components of basic teaching skills they found</li> <li>• Associating the video with the schemata related to the learning process.</li> <li>• Explaining the components of basic teaching skills from the video they watch.</li> </ul>
	➤ <b>Interaction</b>	<ul style="list-style-type: none"> <li>• Organizing the students to discuss and interact to each other</li> </ul>	<ul style="list-style-type: none"> <li>• Interacting with their team mates related to the components of basic teaching skills</li> <li>• Discussing and jotting down important information related to basic teaching skills.</li> </ul>
	➤ <b>Elaborasi</b>	<ul style="list-style-type: none"> <li>• Guiding the students to practice basic teaching skills</li> </ul>	<ul style="list-style-type: none"> <li>• Explaining the components of basic teaching skills they found.</li> <li>• Practicing the aspects of basic teaching skills in front of the classroom</li> <li>• Observing other students and taking notes about their friends who practice the basic teaching skills</li> <li>• The lecturer helps the students who have problem to practice basic teaching skills.</li> </ul>
	➤ <b>Summarize</b>	<ul style="list-style-type: none"> <li>• The students get the reinforcement about basic teaching skills they need as a teacher</li> </ul>	<ul style="list-style-type: none"> <li>• The students make a summary and take notes about feedback upon the basic teaching skills practice</li> </ul>
<b>See</b>	<ul style="list-style-type: none"> <li>• The lecturer, the observers and the students reflect to analyze the weakness of the learning process and teaching practice; revising the mistakes for a better learning in the future. It produces revision design in the see stage covering the learning tools, learning stages, and evaluation.</li> </ul>		

## 6 CONCLUSION

ERIES model is developed through the implementation of lesson study in this research is a conceptual framework that consist of propostions as a guideline for the student-teacher to practice basic teaching skills, which cover opening and closing the lesson, explaining, asking, reinforcing, and managing the class. ERIES stage in do focuses on learning activity upon students' activities. By applying ERIES learning in Teaching Learning Strategy it is expected to produce the student-teacher who are able to create teaching learning process that produces the students who are active, creative, and innovative. The government's expectation to create smart, outstanding, and competitive students might be achieved.

# The Use Of Silent Way Method And Cooperative Learning In Optimizing Lesson Study By Utilizing Plain Media As Learning Innovation

Amrin Hi. Saban

*English Department of Educational Faculty  
Muhammadiyah University of North Maluku, Ternate, Indonesia  
email: amrinsaban@yahoo.com*

**Abstract:** Such the development of technology, it does not mean to back up our daily activity, this is also the activity in learning process. Due to insufficient of budget to cause the facilities needed. But, it cannot be considered as a reason to make not innovation by utilizing media around us. The utilizing plain media constitutes one of important thing and does support learning process which make comfortable activity if joined appropriate method and technique with characteristic of lesson or subject. The writer aims at conveying the importance of a lecturer or teacher to be innovation in learning to make comfortable process in learning activity. This thing is important to be done in order to make the students enjoy the learning activity, if the lecturer or teacher uses one method repeatedly and no innovation, the students will get boring to join the activity. Lesson Study was done by using Silent Way method and Cooperative Learning. These methods chosen because in its implementation, one emphasized thing is the use of media as the mean of learning. While cooperative is an approach or method which how the students are cooperative to discuss among them in group also with the lecturer or teacher. By the analysis of the reflection journal (instrument) during four cycles of the lesson study, it shown that the implementation of lesson study by utilizing plain media and combined that methods made the interesting and comfortable for the learning activity.

**Keywords:** lesson study, silent way, plain media, innovation

## 1 INTRODUCTION

### 1.1 Background

In the effort to improve the quality of education at the university and at school, the government has a lot of money to support all government programs that are related to the process of improving the quality of education. However, the reality is so great that the education budget has not been able to make even improve the quality of education that happens is a lot of educational institutions are unkempt and broken because it did not have sufficient treatment costs. On the other hand, the policy makers who manage the budget could not be trusted that there is abuse of authority to enrich them through corruption of the education budget. Efforts to improve the quality of school education and university level in order to be good, in fact did not perform as expected due to mismanagement of the budget.

Along with the development of technology, a teacher or a lecturer is required to always innovate to create a learning process that is not boring in this case fun learning. The point is a teacher or lecturer should creatively make learning which students

become interested, feel enjoy by using media, whether it is the media that are categorized high-tech or simple media all around us (around the school / college, tourism objects, classroom model, and so on). But sometimes some of us insist that the best learning innovation is high tech. Though, it does not guarantee the quality of learning for the better if we use it only as a means of facilitating our work. If we teach in remote areas that do not have a category of high tech facilities, we will have difficulty in developing learning media if we do not take advantage of other media that is still simple.

Therefore, the problem of lack of education budget and the lack of high-tech media, should not be the reason for educators both teachers and lecturers not to innovate in order to improve the quality of learning through learning innovation. Through innovations that made towards learning, is expected to give additional value in terms of improving the quality of education.

### 1.2 Identification of the Problem

From the description on the background above, it can be found a few things that the reason for the lack

of innovation and learning done by teachers and lecturers and it is not interesting learning process for students, which is actually two things is an important issue in order to improve the quality of learning, which is one factor important of increasing the quality of education. Those things are:

- a. The lack of government support through education budget.
- b. Educational budget corrupted by educational stakeholders.
- c. Inadequate means of learning (no high tech).
- d. Lack of simple media using around us as an innovative learning.
- e. The students are not interested in the learning process.

It must be admitted that the lack of government support and uneven in terms of the education budget. Because first and foremost factor in improving the quality of education is a considerable cost to prepare a complete tool for improving the quality of education through innovative learning with a variety of processes. Besides corruption, the distribution of the educational budget is also uneven so many areas far from urban areas often do not get help from government. In the absence of government support through the education budget, then there would be no increase in the quality of learning for the better. So, if teachers and lecturers are not creative in going around the lack of those facilities, it is certain that the quality of learning will not get progress.

### 1.3 Scope of the Problem

Based on the identification of the problem above, the researcher only focuses on the last two points, namely "Lack of Simple Media Utilization around Us and Students Are Not Interested Existing Learning". For readers, these two points might be considered unimportant, but from the perspective of researcher, the use of simple media is a very supportive learning tool, which can make learning becomes fun and not boring if joined by appropriate methods and techniques as the character of the subject. Another reason which makes researcher paid attention to this issue is because it is still in the active period of the course so that the time available has not been possible to do research outside, thus, also the unavailability of cost so the researcher decided to do a research through lesson study.

### 1.4 Formulation of the Problem

The exposure to background problems, and identify and then limitation the problems mentioned above, can be raised formulation of the problem as follow:

1. Do the silent way method and cooperative learning make learning interesting by using plain media?

On learning that has been done before, with question and answer technique, most of the students are very passive because just listening without responding to what is described. Therefore, the researcher, in this case as well as a lecturer on the implementation of model of lesson study makes learning design by utilizing a simple media (carton paper). Simple media is chosen, because not always the category of high tech media able to facilitate the learning process, even though IT-based media if not creative lecturer or teacher still learning to innovate will not be interesting. That is why; the researcher tries to use this simple media as innovations to improve the quality of learning by silent way and cooperative learning method.

## 1.5 Library Review

Related research has ever done before is "Lecturer Professional Development Through Lesson Study Implementation" which describes some of the reasons why the lesson study must be developed in college (Nahjiah and Gay, 2012: 14-15), including:

- a. Lesson study is an effective way to improve quality of learning.
- b. Lesson Study will produce a professional and innovative lecturer.
- c. Improve collaboration among educators in learning.
- d. Improving writing skills scientific papers or textbooks.

Learning innovation is a renewal on various aspects of learning so that learning becomes more optimal. Various aspects of learning can be the target of reform, among others; instructional media, methods and learning method (Sailah, 2012: 10).

Silent way based on the premise that the teacher should be silent as much as possible in the classroom but the learner should be encouraged to produce as much language as possible. Silent way shares a great deal with other learning theories and educational Philosophies. In a silent way, Gattegno's work could be stated as follow: (1) learning is facilitated if the learner discovers or creates rather than remembers and repeats what is to be learned. (2) Learning is facilitated by accompanying (mediating) physical objects. (3) Learning is facilitated by problem solving involving the material to be learned (Richard and Rodgers, 2001: 81).

The goal of teachers who use silent way is that

students should be Able to use the language for self-expression-to express Reviews their thought, perceptions, and feelings. In order to do this, they need to develop independence from the teacher, to develop Reviews their own inner criteria for correctness. Students Become Independent by relying on themselves. The teacher, therefore, should give them only what they absolutely need to promote Reviews their learning (Freeman, 2000: 64).

Cooperative learning is an approach to teaching that makes maximum use of cooperative activities involving pairs and small groups of learners in the classroom (Richard and Rodgers, 2001: 192).

Cooperative learning refers to a wide variety of teaching methods in which students work in small groups to help one other in learning the subject matter. In the cooperative classroom, students are expected to help one another, discuss and argue with others to hone the knowledge that they control the time and closes gaps in understanding each (Slavin, 2008: 4).

Cooperative or collaborative learning essentially involves learning from each other students in groups. But it is not the group configuration that makes cooperative learning distinctive; it is the way that students and teachers work together that is important. In cooperative learning, teachers teach students collaborative or social skills so that they can work together more effectively (Freeman, 2000: 164).

### 1.6 Objective

In this paper, the writer wants to communicate the importance of a lecturer or teacher do learning innovation so that the learning process is not boring. This is important thing to be done because the students must feel bored if we only rely on one method repeatedly. Conventional method (preach and question-answer), for example, if we use constantly, students definitely get lazy and passive to the learning process that we are going to do. Therefore, the writer conducted a study of innovation by using a simple media in the form of carton paper design as a student worksheet. The writer uses this as a simple media, exciting learning tool that should not be categorized as a high-tech, but with a few simple instruments can make learning enjoyable stay as long as lecturers and teachers are always willing to innovate.

## 2 METHOD

Lesson study is done by using a silent way and cooperative learning, silent way chosen because this method one of which emphasizes the use of media as a learning tool. Cooperative learning is a method how the students to cooperate among them to form groups also with a teacher or lecturer in a learning process.

Subjects were used as sources of data in this lesson study are the fifth semester students of English language program of Muhammadiyah University of North Maluku was 22 people. The numbers of cycles in the implementation of lesson study are four cycles.

The instrument was used in this study was the students' reflection journal. Data collection technique was done after the lesson study finished the lecturer/ researcher provided reflection journal sheet to be filled. On reflection journal, there were three questions for students to answer, which of the three questions it will be known whether the methods and techniques used effectively or not. Three forms of inquiry submitted; 1. What do you think about the learning process today? 2. Do you understand the lesson today? 3. What are the things that you have not understood the lesson today? Reflection journal division performed every cycle.

Data were analyzed by using categorization, in which this is done by matching the students' answers to a theme / topic at each cycle.

## 3 RESULTS AND DISCUSSIONS

The first cycle was conducted on 27 November 2013 at 10.00 to 11.30, performed at dean's room. The *Plan* step, the modeling lecturer was Amrin Hi. Saban, SS, M.Pd.BI and the moderator was Syamsudim Hi. Adam, SS,M.Pd and consisted of seven observers. At this stage, the lecturer gave a brief overview of the material that would be discussed in class that "the function of literature as education and amusement". At the stage *Do*, activity began with an explanation of the steps to be taken by the students to the student worksheet that had been given. At the opening of this first cycle there were some students who seemed confused because the first lessons study for them. At the time of the core activities, the students were divided into five groups, each group consisted of four to five people. Each group had been given a handout material and ten minutes to discuss. After that, each group was represented by its chairman came forward to present the results of the discussion in accordance with the

instructions contained in the students' worksheet. At the end of the activity, the students seemed so excited when finished presenting the results of their discussion. At the stage of *See*, after the observation made by the observers, seemed that there some students who were not active, did not understand the explanation, and the explanation was still confused for the students. This could be known from the notes of the observer for students who need to be considered by the modeling lecturer including: (1). Students need more detail explanations about what to do. (2). Students need to be visited during the discussion to ask if they already know or not. (3). they need to be given an example that has to do with the material to be discussed.

The second cycle was conducted on 28 November 2013 at 11:00 to 12:00 with six observers. The *Plan* carried out in the faculty room, where the lecturer briefly described the model of the material that would be given to students was about the "early modern English literature". In this theme the students are asked to find out the model of education during the early modern English literature consisting of three levels, namely; vernacular elementary school, grammar school, and universities. At the stage *Do* began with greetings, asking the student condition, followed by instructions on what to do in this second lesson study refer to the handout that had been given. Then, in the main activities of the students are asked to discover important facts about education in three levels (elementary vernacular school, grammar school, and universities), then wrote it on students' worksheet which had been provided, then present it. Chairman of the group represented her/his friends presented the results of their findings as in the first cycle. At the end of the activity, the lecturer gave reinforcement and concluded it with a reinforcement material that had been discussed.

The third meeting was held on 4 December 2013 with seven observers from 10.00 to 11.30 ran well, and the topic was "the elements of literature (character, plot, point of view)." On stage *Plan*, modeling lecturer gave little bit explanation of the learning process would be performed by the students later. Where in this cycle, the modeling lecturer was using students' worksheet form of carton paper that contains a table of the elements of literary stories that had been written and the students were asked to choose keywords which given and matched. At the stage *Do*, the modeling lecturer gave some idea about the steps to be taken by students with carton paper and boxes that contain that keyword. Then the students were asked to take a box containing the

keywords in accordance with the group. Students took an existing piece boxed keywords then discussed together and identify compatibility. Students seemed happy with this method. This could be seen from their enthusiasm to perform matching between elements of literary elements with key words. At the stage *See*, there some students who were still confused with the pre-activities to be carried out, after seeing other friends began steps then they became understanding of the activities. It seemed that some students need to be given a detail explanation gradually in order to help them easy to understand. The friends in the group must always help to explain to their friends who do not understand yet. Students need to be given an assessment of their results so that it motivates them to be more active in the learning process was done. Finally, color paperboard used to make tables should contrast with the color paperboard used for writing key words to make it looked attractive.

The fourth cycle was conducted on 5 December 2013 the number of observers to eight people and is still the connection of the third cycle. So the fourth cycle theme is still about elements of literature story (setting, conflict, theme, and ending)." At the *Plan* was done in the faculty room, modeling lecturer briefed that the activity students still like the third cycle but keywords that had been placed in an open box is replaced with a sealed envelope. At the stage *Do*, lecturer provided direction what should be done by the students. Then each group moved forward to take keywords but might not be ripped. Then students were given five minutes to read the handout materials related to the elements of literary stories. After the material was closed back and opened the envelope to take the key words. They were given three minutes to identify the key words. After that every person from each group moved ahead by bringing a keyword and matched with table cardboard taped to the whiteboard by means stick with glue. At the stage of *See*, the observers noted there still some students who were confused when modelling lecturer gave explanation of pre-activity about what to do, others than that there any student was sleepy and unspirit. But in general, the students were so enthusiastic to follow to the end, and they were very interested in learning method used by modelling lecturer. By the all cycles, it can be concluded that the atmosphere of the rooms were comfortable and also the good time make the students to be active or not in following the learning process. (see the tables and photos in Appendix)

In the first cycle with the topic "function of literature", the presences of 19 students from 22

students were active. In this phase, the model lecturer asked the students to identify the function of literature in the world of education and entertainment. Students were asked to complete worksheets that had been provided with submitted instruction. Then each group represented by one person came forward to present their identification. Once completed, the lecturer provided reflection journal sheet to request a response from the learning methods and techniques used in the first cycle. Upon reflection journal retrieved and analyzed can be found answers consisting of; twelve people answered "interesting and understand", and seven people answered "less of interesting and do not understand."

In the second cycle, the discussed topic was the "Early Modern English Literature." In this second cycle, the lecturer chose the media also still like the first cycle was LKS. In this phase, students were asked to identify any problems that were on the three levels of education in Early Modern English Literature. Three levels it is; Vernacular Elementary School, Grammar School, and Universities. After the learning process that began with the *Plan, Do, and See*, and then continued to give the student journal reflections were taken and analyzed, the results showed that; of the 15 students in attendance, 11 people answered "interesting and understand" while 4 people answered "less attractive and do not understand."

In the third cycle, the theme is "Elements of Literature" (character, plot, and point of view). In this third cycle, lecturer was using simple media namely five carton papers as the students' worksheet according to the number of groups. In paperboard was made table of the elements of literature and then students were asked to match the key words that had been provided in the column corresponding to the given instructions. Previously, lecturer gave five minutes to each group to discuss the key words in connection with literary elements and then they put it on the table according to the columns that were considered compatible with the selected keywords. After all the keywords attached conformed to the fit, then counted how many keywords are correct according to the literary elements of the existing columns. In this phase the obvious enthusiasm was so high that students vying tried expeditiously as possible to match the keywords in each column are available. After completion of the learning process, model lecturer provided a journal reflection to be filled to request students' feedback about the methods used in this third cycle. After analyzing, it was found as the result of the second cycle, that of

the 15 people present there are 11 people answered "interesting and understand" and 4 people answered "less attractive and do not understand."

In the fourth cycle, both the theme and the media used remain the same as third cycle but different focus; setting, conflict, theme, ending, as well as the methods and techniques of implementation of the same, in which students were asked to discuss five minutes of key words and then match the literary elements in table columns that exist in the media (paper carton). After completion of the learning process, students were given a journal reflection to give feedback on learning in this fourth cycle. From the review of the student journal in the fourth cycle, the result that; of student attendance 15 people, found 13 people answered "interesting and understand" and 2 answered "boring and less understood."

Discussion of the results described above demonstrates that the use of a silent way by utilizing a simple media (paper carton) shown a very significant increase in interested in the learning process was done. Thus it could be said that "the students were very interested in the silent way method used in the learning process."

## 4 CONCLUSIONS AND SUGGESTIONS

### 4.1 Conclusion

In accordance with the results of the analysis contained in the points table discussion on the above it can be concluded that in one cycle, of the 19 people present there were twelve students said that interested in learning process that takes place and seven students are less / not interested in the methods was used. In the second cycle, the presence of students decreased by 15, but interested in the learning process remains stable, at 11 people said are interested in these methods, so the decline in the number of student attendance is not followed by a decline in the interest of students in the learning process. In the third cycle, the result remains the same as the second cycle that students who attend in 15, 11 students expressed very interesting learning and 4 students say less attractive. In the last or fourth cycle, the number of student attendance remains of 15 people, but an increase in interest in the very means that 13 people say very interesting learning while only two people who say that the learning process is very tedious.

## 4.2 Suggestion

Based on these conclusions, the writer have some suggestions that may be considered by the organizers or the person in charge of lesson study, namely, about the time of the implementation of lesson study would not set a schedule during the daytime, because it can affect the enthusiasm of students to participate in the learning process (lesson study). The reason there are students that when given a reflective journal for responding to questions even answer is not in accordance with the questions but the answers like "hungry, sleepy, tired, and others." And the implementation time of lesson study set out during the daytime also affects the amount of students' attendant, is evident from the first cycle of the presence of 19 people decreased to 15 people in the second cycle, third, and fourth. Next for the observer so that the learning process (lesson study) took place, hopefully the observers not always in-out because it is very disturbing concentration of lesson study participants. Finally for all the organizers of the implementation of lesson study, both modeling lecturer, observer, or the stakeholder expected to continue to support the responsible implementation of lesson study because it proved very effective in improving the understanding of students in the learning process and of course very enjoyable.

## An Investigation to Novice English Teachers' Self-Consideration Upon Their Decision of Joining Teacher Study Group: A Case Study in Bandar Lampung, Indonesia

Feni Munifatullah  
Universitas Lampung

**Abstract:** Personality traits and personal reference of three NETs are observed through in-depth interview, participants' account through individual log book, and observation during initial group sessions. The result of the investigation signifies that introverts have more or less equal possibility to join group with the extroverts. In spite of suggestion that extroverts are likely to succeed a group work, this finding offers different idea. Personal reference that does not support their participation in TSG does not instantly drive NETs to decide to not joining TSG. On the contrary, they take the challenge and participate voluntarily.

**Keywords:** Personality, Past Experience, Self-Directedness, Andragogy

### 1. INTRODUCTION

This is an initial report of investigation to Novice English Teachers (NETs)' participation in a small group discussion termed as Teacher Study Group (TSG) as a professional development activity. The foci of the study is to observe NETs knowledge, or cognitive aspects, when it is utilized, generated, and formulated (or even reformulated) during a voluntary sessions in a study group. The knowledge obtained and possessed by NETs is in the form of concepts, principles, and theories from pre-service education. However, when it is applied in teaching practice, those types of knowledge are reformulated and rearticulated in the form of actions such as instructions, material selection, and strategies of assessment. To articulate appropriate forms of knowledge in particular occasion of teaching, NETs have to be fully aware of what they do. Only then can NETs be addressed as teachers who have understanding on their subjects (Cochran-Smith & Lytle, 1999; Darling-Hammond & Bransford, 2005).

The understanding on subject matter cannot be realized unless NETs process concepts and theories in an active way of adult learning or education (Cole, 1996) (Freeman, 2001). It cannot be denied that inside the in-service period or working period lies down an excellent opportunity for them to keep developing their knowledge. This is based on the assumption that knowledge develops and evolves during human life time as they keep interacting with their societies (Cole, 1996). With this perspective bear in mind, NETs have to develop their knowledge and they still have plenty of time to do it. Also, this is interpreted that NETs just begin their quest on a long journey toward their expertise and they need learning experience or education both formal and informal during the proces (Craft, 2000).

Discussing about learning experience or opportunity for developing their selves, there are many forms of in-service professional development programs that can be offered (Richards & Farrell, 2005). From different programs, study group is selected as it provides safe environment for teachers to speak, offers continuous effort for teacher development, and obliges collaboration from diverse members from different background and capacities. Different member backgrounds allows peers and more knowledgeable others (person) share knowledge and understanding (Johnson, 2009) (Hargreaves, 1994) (Kooy, 2006) (Lantolf, 2000).

### 2. DISCUSSION

In forming the study group, the researcher set several criteria for the member of the group selection. The participants are particular individuals who in the time of study currently (Yin, 2003) have:

- a. Teach English in Bandarlampung area to narrow the geographical area into a city where access of information is nearly adequate.
- b. Bachelor degree from English Education Department or English Literature with additional education training certificate (AKTA IV) because only the NETs with this qualification have studied both content (English language) and pedagogy.
- c. Never or rarely join any professional development program in or out of their workplace.
- d. Their schools supply minimum or no support for professional development
- e. Teaching in junior high schools, considering that in junior high the teaching of English starts to be obliged. The researcher assumes that the types of understanding they will develop is the basic and the easiest one.

- f. Just begin teaching after graduation up to 5 years in teaching because age is an important factor for the study. The study expects fresh graduate, young adult NETs will join the group.
- g. Teach seventh or eighth graders to limit the curricular aspects which will be discussed in the group
- h. They are willing to participate. This is important to show their willingness to learn
- i. They bring recommendation from the principal, this is part of ethical consideration and to indicate cooperative attitude from administrator of each NETs school

Fulfilling criterion no.8 “they are willing to participate. This is important to show their willingness to learn” the researcher executed the following steps. First, when the researcher met with potential participants, she described what the researcher and the participants to be would do in the study group. This included the explanation on how the session would be adjusted and inserted within their working hours to not disturb their routines. However, as they did not quite comprehend the concept of continuing professional development, they rarely ask questions. In fact, most participants did not ask anything but passively follow what the researcher planned. When they are asked what to do in group, they could not decide as so many things in class were problematic for them. As the result, the topic was then explored through interviews. After assuring that minimum risk would happen and many advantages could be gained, participants were ready to form the group. In this initial stage, less information could be collected to see why they were willing to participate.

When this issue arose back after TSG had finished discussing a topic, there was some more information on participants’ willingness to participate. Regarding the importance of self-directedness in professional education, aspects related to intra-individual matter have to be taken into account. In this article, the investigated intra-individual aspects consist of personality traits and personal reference.

Personality of the participants was observed through questionnaire and their behavior in group sessions. The result of the questionnaire was scaled using *Bales Symlog Frame* (Bales & Polley, 2010) which is publicly used in internet. This calculation is strengthened by inserting the result of Big Five Inventory (John & Srivastava, 1999). Personal preference is also observed through interview regarding their past experience. The experience will be categorized into three categories; too little experience, negative experience, and positive experience (Forsyth, 2006). Accumulative result will be related to their acceptance upon their involvement and participation in TSG.

The Symlog Frame indicates that the three participants in TSG are categorized as *Down, Positive, and Forward* (DPF) in High Evaluation. DPF and UPB are in middle potency while DP is in low potency. However, DPF has low activity while UPB has high one. This finding is also shown during TSG sessions in which DPF and DP participants has fewer talk and activity compared to the UPB participant. Down and Backward are indicated by negative scores, while Zero means that the score is zero and is not labeled. Up and Forward are indicated by positive scores.

<i>Down, Positive, Forward</i> (DPF)	<i>Down, Positive, Zero</i> (DP)	<i>Up, Positive, Backward</i> (UPB)
<b><i>Salvation Through Love.</i></b> Equalitarian, submissive, conformist. Sorrowful but forgiving; love is the master cure for deviance. Religious; anti-sex and anti-aggression. Low interaction and only toward specific others; non-entertaining but socially positive. Good worker and group member; practical, responsible, high will control, stable.	<b><i>Trust in the Goodness of Others.</i></b> Equalitarian, understanding, undominating. Believes people are good, truthful, dependable. Tender-minded. Low interaction and mainly toward individuals rather than group. Asks for opinions, friendly. Calm, stable, mature, responsible, low aggressiveness and sexuality.	<b><i>Emotional Supportiveness and Warmth.</i></b> Favors relativism, permissiveness, equalitarianism; encouragement of young growth. Warm, personal, well-liked, non-anxious, entertaining, receives attention. Enthusiastic, talkative, extroverted, poised, spontaneous, confident.

More explanation to complete categories in detail can be seen in: <http://www.indiana.edu/~claswork/locked/S439/BalesTypes.html> last updated November 23, 2000.

The BFI shows UPB participant as having an extraversion traits. He has gregariousness (sociable) Assertiveness (forceful) Activity (energetic) Excitement-seeking (adventurous)

Positive emotions (enthusiastic) Warmth (outgoing), the UPF participant as agreeableness as she has Agreeableness vs. antagonism Trust (forgiving) Straightforwardness (not demanding) Altruism (warm) Compliance (not stubborn) Modesty (not show-off) Tender-mindedness (sympathetic), and the DP as a conscientiousness because she tends to have Conscientiousness vs. lack of direction Competence (efficient) Order (organized) Dutifulness (not careless) Achievement striving (thorough) Self-discipline (not lazy) Deliberation (not impulsive). During the interview, the Extrovert admits that he is an extrovert person, while the conscientiousness also declares that she is an introvert person.

From two parameters, it seems that the most potential person who is likely to join the group is UPB-extrovert participant. The other two are unlikely to support the group (Stangor, 2004). However, these results do not match to the situation where all three different types of person voluntarily participate the group. Personal preference drawn from personal experience also signifies genuine result. The UPB-extrovert participant is a person who is very skillful in organization, familiar with public spaces, discussions, dialogues, and meets many progressive people. He has positive experience in working in group.

The UPF agreeable participant has mixed experience, both positive and negative. She actively involved in school organization but she felt that there was a critical incident in which she pondered and concluded that she was lack of responsibility and fairness. As the consequence, she could not “save” her friend from school punishment and decided not to get involved in public organization. She never joined any student organization in her college years. In this case, she enjoyed positive experience in public space in the beginning while later she had a negative one. The last person in the group, the DP conscientious person has a deep personal negative experience when her father died. She admit that she loses her cheerfulness after her father passed away and she became a very closed and quiet person ever since. This character influence what she does, especially when it involves a public decision making like in teacher meeting. She thinks that she will wait people talk first and agree on any part that she feels she is agreeing with.

With variety of personal experience, these three people still accepted the challenge to join the professional development activities. Negative experience does not prevent two participants to

participate in TSG. Andragogy supplies principles that may be owned by the participants so that they join TSG. The principles are the need to know, self-directed learning, prior experience, readiness to learn, orientation to learning and problem solving, and motivation to learn. The internal motivation from personality traits (the need to know) and personal experience (prior experience) indicate that they are not the influencing factors in joining the group (Knowles, Holton, & Swanson, 2005).

### 3. CONCLUSION

The report indicates the varieties of personality traits and personal experience. Personal traits show three different traits and less different behavior in group while personal experience indicates that there are complete types of experience owned by each of them.

This background will be brought by participants into TSG process. This finding is related to the second part of the investigated aspect in the study, which is necessarily part of learning process in group from adult learning or education perspective. Further, the study might be able to examine group in its interaction and how each participant with their characteristics plays different roles. This diverse background will merge and the researcher has not known yet whether the merging process will lead them to transformation and new comprehension or stagnant development in cognition.

## Lesson Study in Primary Science: The Story of Gagas Ceria School

Evi Octavia Manurung<sup>1</sup>, Risyani Nur Apriani<sup>2</sup>, Fitriani Ratnasari Dewi<sup>3</sup> and Ike Nurhayati<sup>4</sup>

<sup>1</sup>GagasCeria Primary School, Malabar 61, Bandung, Indonesia

<sup>2</sup>GagasCeria Primary School, Malabar 61, Bandung, Indonesia

<sup>3</sup>GagasCeria Primary School, Malabar 61, Bandung, Indonesia

**Abstract:** This presentation portrays the progress and challenge of Lesson Study practice as experienced by science teacher group at GagasCeria primary school. Our school has undertaken self-directed Lesson Study since last five years. Hence, its development depicts consecutive changes that started from focusing teacher's teaching, grasping student(s) learning to establishing professional learning community. Specifically, the authors elucidate the 'story of adaptation' to describe 'local proof route' in practice. By observing and analyzing on the case of conductivity at grade 4, the authors explicate substantial changes in the way the science team design and reflect on the lesson. The key features in lesson designing are: 1) interrogating and selecting big ideas of the content taught; 2) scrutinizing scientific skills embedded; 3) carefully representing the content; 4) predicting possible students' responses and learning obstacles; and 5) anticipating and focusing on scaffolding strategies. In addition, key tenets for post-lesson discussion are: 1) examining effectiveness of science representation, group work, teaching sequences and students' conceptual development; 2) analyzing classroom vignettes through video clip; and 3) assessing students' work. Finally, we conclude with two 'existence proof': 1) the importance of understanding and embodying students' learning; and 2) the orientation towards improving daily practice rather than achieving the best one.

**Keywords:** Lesson Study, science instruction, lesson design, reflective practice, primary school.

### 1 INTRODUCTION

Science is subject which learning the natural phenomena which have an abstract concept. It is become a challenge for science teacher in gagasceria primary school to finding out how to present a lesson comprehensible and meaningful in daily life. Depart from these problems, the institution of school trying to improve the teaching quality of the teachers with following lesson study

This series of lesson study in primary GagasCeria changes from year to year. Beginning with a walk on his own without the assistance of any institution, teachers in GagasCeria primary school consistently implement lesson study and were scheduled at the beginning of school year. At that time the planning was done only by the teacher models. Then when the reflection, observer focus on how the teacher's teach. In the following year is almost the same as the previous year, but there is some help from the level team to prepare the tools and material for teaching and when reflection, the observer focuses on how teacher give an assessment for the students. It's occur for 4 years, GagasCeria primary school practising lesson study independently. Overall, the lesson study gave positive impact on the improvement of teaching

quality. But there are some things that still need to be evaluated among other things, a judgment against the teacher models. If there is a situation that is not good in the classroom, then the error is always the teacher models. Teacher models also get a personal assessment of how to comment on the nature of the child, or how to manage the classroom. In addition, upon reflection points Observer revealed that an inspiration, such a technique to divide the group, the way teachers get students' attention.

Consistency in the implementation of lesson study in primary GagasCeria and are considered to have high initiative in organizing the lesson study without getting any financial assistance from the institution able to attract the attention of the lesson study experts from UPI and Japan. In March 2012, a lecturer from UPI, Mr. Tatang Suratno were then invited Prof. Ancient Hiroyuki (Aichi University, Japan) and Dr. Masami Kawano (Tokyo University Japan) to hold Lesson Study in GagasCeria. Quickly SD GagasCeria information about this spread to the experts at the University of Indonesia and JICA, one of them is Ryo Suzuki. Starting from here then Mr Tatang Suratno and Ryo Suzuki became a team of experts who provide guidance throughout the planning process of lesson study conducted by a team of science teachers. Mentoring dilakukan oleh JICA expert and lecturer UPI has changed the way

of thinking of teachers in planning lessons. Teachers are encouraged to think like the students in the class. This experience got on when planning classroom 3. Then continue on the next lesson plan in class 4. Topics discussed are the propagation of heat (conduction) which will be described in the next chapter.

## 2 UNDERSTANDING OF LESSON STUDY ACCORDING TO SOME EXPERTS

According to Sukarna (2010), Lesson Study is a joint study of the learning process by themselves and the learning of others, from preparation through implementation of learning and reflect on the learning.

Ozawa (2009) stated that the lesson study is teacher activities for teachers to improve their teaching through their collaboration. Lesson study is a cyclical process and involves lesson planning (Plan), the presentation of the lesson (Do), and reflect on lessons (check) to improve the next lesson (Action).

### 2.1 Stages in the Lesson Study

*Lesson Study* is a system of activities and philosophies. So far in Indonesia, *Lesson study* was introduced as an activity comprising the steps of "Plan-Do-See-Act". (Fisianty, 2013).

#### 1. Plan

In the planning phase, teachers will collaborate to conduct lesson study planning or design of learning together. This stage is the stage in which each teacher to discuss and explore the lesson material, each studying a variety of media or props as well as how to run the stages of core activities.

#### 2. Implementation (do)

At this stage expected, both the teacher models or observers find problems occurred that could be discussed for mutual learning process on reflection.

#### 3. Reflection (See)

The third stage is a very important stage for further efforts to improve the learning process will depend on the analysis of the participants based on observations of teaching practices implemented.

#### 4. Follow Up (Act)

From the results of the reflection can be obtained a number of important new data for the repair and improvement of the learning process, both at the individual level and managerial.

### 2.2 The implementation phase of lesson studying grade 4

Based on the above presentation of the lesson study and its stages, a team of science teacher perform these steps in class 4 with a heat transfer material.

#### 2.2.1 Plan

In the plan there are five things that must be considered, namely:

##### 1. Interrogating and selecting big ideas of the content taught

Prior to the learning design, teacher discussions about big ideas and learning goals, then set the material to be taught. Then the material was analyzed by means of links between the content material that has been learned in the previous level with the material to be studied at its current level. After a thorough discussion long enough, eventually the team set a conduction material that will be taught to students at an open lesson. While learning goals:

- Students understand that heat can propagate
- Students can distinguish medium/object that can conduct heat to medium/object that can not conduct heat.

##### 2. Scrutinizing scientific skills embedded

Once the material and learning objectives are set, teams of teachers discuss what skills will be developed in the conduction material. Based on the learning objectives, skills to be developed observing and analyzing.

##### 3. Carefully representing the content

Having the skill set to be developed, then a team of teachers assign what activities can develop skills observing and analyzing. In a set of learning activities, teacher teams are very careful in choosing a material that is not one of the students to focus on capturing the concept of material that will be taught. One way to define learning activities that have been conducted in elementary science teacher team *GagasCeria* is to conduct an experiment involving non-subject teachers IPA as experimenter. In the first experiment, a team of science teacher supply various kinds of metal, namely iron, aluminum, and copper. In the beginning all participants were given the same heated iron metal. In this experiment takes

a long time to hold the iron was hot. In addition, although heated together, there is a time difference when the participants feel the heat. Then participants performed a second experiment, the metal heats buttered then affixed to beads. In this experiment more noticeable heat propagation process is marked by the fall of the beads one by one in order from closest to the heat source to the farthest. From these two experiments, the team took the lesson that the sensitivity of the sense of touch every person is different. It is less able to visualize the process of heat propagation occurs. Therefore, the team then agreed on a second trial will be conducted in the classroom.

4. Predicting possible students' responses and learning obstacles

Having established learning activities, teachers make learning steps. On measures of learning, the teacher explained the activities to be carried out to students, referral to student questions, student responses, and the anticipation of students' responses were less precise. When making predictions of student response, positioning itself as a student teacher, which means she thinks appropriate to the age of 4<sup>th</sup> graders.

5. Anticipating and focusing on scaffolding strategies

Anticipation becomes very important in the learning process of the students, as it helps to direct the focus back on learning objectives students. Teacher's ability to make predictions of the response varied greatly determines child anticipation to do if it actually happened while in the field in order to achieve the learning objectives. At the time of formulating the measures of learning, the teacher actually been made to anticipate and respond to students by focusing less precise. For example, when students conducting metal observed demonstration smeared margarine and taped playhouse and then heated over a candle, the teacher gives direction question, "Is the playhouse coincide?" Then the teacher made the student response prediction "No / yes." For children who responded "yes", the team made in the form of proving anticipation. For those who responded "no" go to question the direction of the next.

**2.2.2 Pre Open Lesson**

Having a set of steps, the next step is a test of that which has been created through microteaching. Microteaching aims to see the stage of what is still needed to be in order to provide better

for the purpose of instruction learning achieved. The teacher taught in accordance with the measures that have been made. Observer activity that occur in the classroom, as the student the efficacy of the tools and materials, collaboration in the study and the lesson.

Based on pre-open discussion lesson, they get some note, namely:

1. Demonstration activities by showing melting butter on a spoon dipped in hot water is done. However, the necessary questions to focus children's attention: "What happens if butter smeared on a metal bead attached heated?"
2. After conducting a series of experiments in each group, the teacher models will perform demonstration experiments on wood. This is to avoid the danger of highly flammable wood as well as more 'condition' experiments on the concept of a weak conductor. The demonstration was guided by the question "Is the wood the same thing will happen as in the metal?"
3. To associate the concept of conduction with the context of everyday life, the teacher will show the model with wooden handles. These activities will be guided by the question "Why does this pot using two different materials? ". Then the children were asked to discuss with their group mates. The activities of this discussion it is important to facilitate the process of exchanging ideas. At that time they were expected to have started experimenting with connecting link between the metal and wood with a wood-handled pan display.

**2.2.3 Implementation (Do)**

Lesson should be conducted in accordance with the result of the study on the reflection pre-open lesson. A team of observers from observing four aspects during the lesson in the open it is the students, the efficacy of the tools and materials, collaboration in the study and the lesson.

In general, the acquisition held in accordance with a plan. The demonstration and the trial run smoothly. However, there is something interesting in lesson study held at 4, namely:

1. When children described the trial. Some of the children there is confusion to describing the results of experiment. Apparently they were still riveted on the picture a model exemplified.

2. The one group that long awaiting of beads, any member of a group that an initiative to close the heat source told the beads and finally fell.
3. The events beyond belief, the teacher aroused auction on a skewer. Skewer burning and beads are dropped. The students responded, “fire!” but students even be able to conclude that the transfer heat, but far more than a metal.

#### 2.2.4 Post Lesson Design (See)

This stage is very important that the improvement process would depend from an analysis of the participants of the lesson based on observation by. Therefore on this stage vitally necessary inputs from an observer good fellow teachers or from experts. In addition, key tenets for post-lesson discussion are:

1. Examining effectiveness of science representation, group work, teaching sequences and students’ conceptual development.
2. Analyzing classroom vignettes through video clip.
3. Assessing students’ work.

During post lesson design found several inputs, such as:

1. Prof. Ono of Japan provide feedback on scientific approach based on a phenomenon pertaining to everyday life. For example by means of bares saucepans early in learning while asking essentials question “Why saucepans the doorknob made of the wood?”
2. Prof. Maeda of Japan warned the importance of variable control. At a spoon metal inserted into glass containing hot water, should any variable comparison. For example, one more spoon from wood or metal fixed spoon but inserted into glass contains water cold.
3. Prof. Maeda ask question “Why choose melted margarine for?” She argues margarine takes longer to melted. Hence, a team of teachers selecting a more effective for learning with roombutter.
4. An observer team of elementary GagasCeria provide input of pictures. Models are not teachers should give an instance of pictures on board because some students tend to follow the teachers not drawing based on the observation. So better tools and materials are stored at table fixed betatesting students and so students draw with see tools and materials are in sight.

#### 2.2.5 Follow Up (Act)

After all, given input of observer Prof. Ono given the challenge for science teacher in a school for teaching the conduction of another in order to look at how the students in the school after undergoing repair education planning.

They agreed to focus on three things. First of all, conjures the beginning, are showing a breech-loading wood. Second, providing variable control, that which is smeared margarine spoon into the water hot and cold water. In practice, we change margarine with roombutter it is easier to melt. Third, the tools and materials remain deposited in the experiments in order to facilitate students while describing the results of observations. Fourth, the deepening discussions with iron smeared roombutter showed that affixed beads. The purpose of the discussion was asked the students to berhipotesis. A model student aimed to predict what will happen in beads.

From beginning to end in this school students could understand matter well. Whereas when asked describing the results of observations they had lost. However, they try to depict the results of observations by utilizing instrument materials are stored at table. The changes that result obtained from reflection making teaching better than before. Students can more easily catch material delivered.

### 3 CONCLUSIONS

Finally, we conclude with two ‘existence proof’:

1. The importance of understanding and embodying students’ learning.

The orientation towards improving daily practice rather than achieving the best one.

**Abstract:** Successful learning is determined by well made planning. Planning can assist teachers in implementing a structured learning and focus on the learning objectives. Therefore, teachers need to have good skills in planning a lesson. The series of lesson study conducted by GagasCeria Elementary School mathematics team brought a major change in the thought process in designing a lesson. Initially, the teacher's only focuses on the personal viewpoint not consider a child's perspective and the selection of material that is essential. Teachers only focus on the learning sequence and activities not on the conceptual development or considering the learners as a subject. Through Lesson Study, math team plan together and do a lot of in-depth discussion on the objectives and learning materials, predicted responses by learners, learning material, conceptual development, learning sequence, and student collaboration that occur. In the planning session, the team tries to predict the possibilities that occur related to the child's response, and trying to anticipate. After the lesson is conducted, the team re-assembled for reflection. The team evaluates the achievement of learning objectives and determines the follow-up needs to be done to improve the lesson. Various opinions were delivered during this discussion that enrich the thinking of teachers

**Keywords:** mathematics, lesson study, thinking process

### 1 INTRODUCTION

The development of science and technology as well as changes in the view of education requires teachers to be more innovative in designing a lesson. This means that teachers must make changes in setting and implementing the learning. Learning is implemented using approach or methods vary with other learning resources that meet the educational elements.

Planning is basically decided an action or activities to achieve a goal. In order to decide precisely teachers must have the ability to predict the possibilities that could happen.

As we know, lesson is the interaction between teacher and students to achieve the learning objectives. The purpose of learning itself is a means to develop a student's ability by encourage students to think. When thinking, students will integrate all the skills and knowledge that he had to build a whole

new experience. So in other words, lesson is a way teachers do to prepare the new experiences for students.

In planning a lessons, teachers are expected to prepare materials, using the learning media, using an approach or method of lesson, and make an assessment or evaluation within a certain period of time to achieve learning objectives that have been defined.

Children of primary school age, their level of thinking is still in the realm of concrete. They can think logically if the things are concrete or using manipulative. So at this age, they still need tangible thing to understand a concept. They will also more easily to understand something if they do it directly or directly involved during the learning. Children also cannot be separated from the world of play. The needs to play and move are still very high. In addition, children are happier when working in groups. So, the activities of the group will further

motivate them to learn rather than individual activities.

Based on statements above, a good learning is the learning that can facilitate students to gain new experiences through the process of thinking. Lessons will go well if carefully planned. Teachers must be able to organize materials, media and methods of learning into an activity that develop students by regard to student characteristics. Therefore, the math team of Gagasceria as teachers felt that planning played an important role in the success of a lesson.

As a teacher, Gagasceria math team also trying to make a good plan in the hopes lesson to be going well and the students were able to understand the concept or the material being studied. In planning lesson, math team of Gagasceria trying to explore a variety of learning resources such as books, movies, or props related to the lesson material. The team tries to deepen the knowledge of mathematics curriculum materials by studying and reading a lot of books. As a math teacher, math team of Gagasceria often faces difficulty to teach the steps in the mastery of the material or procedure to resolve the problem. From the book we read, Gagasceria math team trying to learn the steps or procedures and trying to apply it when conduct a lesson.

In designing the lesson, the team is also considering the student characteristics. Gagasceria math team tried to design fun activities for students. The team tries to learn learning methods that are fun and trying to apply it in the classroom. The team usually packed activities in the form of a game. The team expect the activity will gain interest and increase student motivation in learning because students can learn while playing. To facilitate the students' level of thinking that are still concrete, the team also attempted to use a lot of props hoping students will easily understand the material being studied. In fact, sometimes the team made their own props, which is expected to help students to learn.

The lesson indeed running fun. The kids look happy and active in learning. They like to study mathematics because a lot of activity in the form of games and lots of props are used. But behind it, the team feels there is something lacking. When team evaluating, it turns out that the students are still have many difficulties while doing math exercises. In other words, they enjoy the learning activities that are carried out, but have difficulty understanding the material or concepts learned.

Based on the lesson that has been done, Gagasceria math team find various problems. Learning objectives specified in the learning is not achieved well. Though the math team of Gagasceria've been trying to plan a fun lesson method for children and props also been widely used during the learning. The team also has been trying to apply things get from various sources varied

learning. Children also seemed to enjoy lesson mathematics in the classroom. But apparently students still find it difficult to understand the concept.

This makes the math team want to find the root of the problem and find a solution to solve these problems. Gagasceria math team wants to make improvements so that the team can make the planning that can optimize the ability of students in mathematics. Therefore, the team wanted to improve lesson of mathematics by performing a variety of ways such as: lesson study by math team, discussions with competent expert, implementation of lesson outcomes from the discussion.

## 2 STUDY BY MATH TEAM

Based on existing problems, we took the initiative to try to do a lesson study team limited to elementary mathematics Gagasceria Bandung. Team members take turns to be a teacher model and conduct lesson in each class. The team hopes that through the activities of this lesson study, all team members can learn from each other and discuss.

Teachers whose turn it into a model, will do the planning and preparation of their own lesson. Teachers should determine their own model of the material or learning objectives to be achieved, the learning method or props are used, and also the learning sequence that will be done.

During open lesson, other team members will be observers. It will observed all the processes that occur during the learning. After lesson, the team immediately conducts an evaluation. In this evaluation, the team discussed the positive and negative things that occur during lesson. However, from the discussions that took place, the main concern was what is done by the teacher. Teams more emphasis on classroom management performed by the models teacher. From this discussion usually the team will agree on what good things that can be replicated or applied in their respective classes.

All members of the team already had a turn to be the model teacher. From a series of lesson study already done, the team feels there is an improvement in every lesson conducted. Based on the evaluation, the team found that classroom management is increasing. But the team still has difficulty to improve students' understanding of the material or the concept being studied. Classroom management looks more orderly such as how to organize sitting arrangement of students, the criteria for students collaboration, how to divide the material to make it more effective tool, how to motivate students with a positive appraisal, giving instructions look even better.

Based on the results of this evaluation, the team along with the school component trying to discuss

what caused the difficulties in students understands the material. It turns out from the discussions conducted, the team realized that the team members already have the same viewpoint on learning. This leads to our point of view not much different. Therefore, the team having trouble finding the root of the problems occurred in the teaching of mathematics in GagasCeria elementary school.

### **3 DISCUSSION WITH EXPERT IN THE FIELD OF EDUCATION**

#### **3.1 Visitor from Japan**

In March 2012, GagasCeria elementary school gets a visit from Dr.Masami. He is an education expert from Japan who actively conducts research on learning in school. Dr. Masami observes the lesson conduct in third grade. The lesson was about the measurement of time.

Planning is carried out by teacher in the same grade from various subjects. The planning is not focused on the content. Team discussion more emphasis on what material will be taught, how to encounter and how to shape its activities. For in-depth analysis of teaching materials are not discussed in the team but just thought by the teacher models. No discussion or questions from peers or other related material that would be difficulties experienced by children. The planning focus on the flow of activities. Actually, that day activities are a review before assessment. But since this is an open lesson, then the unthinkable by most members of the team are activities that "scene", not as usual. The idea of the activities students do exercises in class, on the desk each individually or in groups directly rebuffed. It was decided that the activity was Challenge Post. Students will work on various issues which are stored in a particular post. Students are divided into several groups. Distribution of the group is based by the students' ability in solving mathematical problems. Students will be instructed where questions are stored. Not all questions were given to each group, but depending on the student's ability. Students will be in groups looking for posts about the places stored in accordance with the map provided by the teacher. The posts are not only near the class but deployed at various places in the school. Students are asked to solve the problems in each post within a certain time. If student hear a bell, students will move on to the next post. Upon completion, students are invited to perform classical discussion in class to discuss the perceived problems that are still difficult to resolve. The students were very enthusiastic to follow the activities and trying to complete the assigned task well. Every sound of a bell, the students seemed

eager to run to the next post. They did not look tired or complain despite having to go up and down stairs.

The team felt that they plan successful lesson because the children look happy and enthusiastic. However, the comments given by Prof. Masami turned out beyond our expectations. He declared that "the children are happy to take part in the learning of mathematics but do they really learn math?"

This statement makes us really shocked and trying to think more deeply. What is the cause? Is this the root of the problems that we've been looking for? We want students to enjoy learning mathematics, but it turns out we were stuck in this situation. We just focus on designing attractive packaging activities for children instead of what will children learn. We tried a variety of methods and materials to create a variety of tools to make children interested in learning. In practice, it is the children become enthusiastic about learning mathematics. But the enthusiasm of children while doing activities is not a big influence on their understanding of the concepts or the material being studied. There are still many children who have difficulty in learning mathematics.

Starting from here we feel that we need to cooperate with outsiders to study and improve the teaching of mathematics in GagasCeria Primary School.

#### **3.2 Discussion with Prof. Didi Suryadi, Tatang Suratno, and Endang Mulyana**

On one occasion, we met with the school academics that focus on improving teacher quality through lesson study. The school formed a partnership to provide guidance for math team. We were accompanied by Prof. Didi Suryadi, Mr. Tatang Suratno and Mr. Endang Mulyana. Assistance began in September 2012. At first the team thought, mentoring will do in the form of lectures and question and answer. The team imagine there will be many explanations of how to design appropriate learning, what is a more effective method used to teach math, how to make children quickly understand the concept, etc. Then there will be a question and answer session about the learning activities such as: what is the difficulty teacher are currently face during teaching and teacher will immediately find an answer that they can apply in the classroom. But it turns out we were not quite right. Mentoring sessions occur the form of discussion. And from this discussion session we got a lot of enlightenment. The team get much insight from discussion to make good planning.

At the beginning of the discussion session, the companion provides many questions that we never imagined before. But the question made us think a lot

about what the team've done to teach mathematics. Have we fully understood the philosophy of mathematics? Do we believe that math right? Do we really understand the material and learning objectives of mathematics? Do we really know our children are taught? And many other questions.

From some of the discussions, there was a discussion that makes the team way of thinking changed. We were very shocked when Prof. Didi Suryadi shows a picture of a frog who shared his experience on the land to a fish. The frog tells about a cow and human it sees. But apparently what is told by the frog caught differently by the fish. The image of cows and humans in the frog's head is very much different from the image of cattle and humans in the head of the fish. Though the frog had tried to tell clearly what it saw. And there is nothing wrong with his explanation. But because the fish never went ashore, he thought cows and humans, is also a kind of fish with different variations.

This story turned out to be an analogy of practice we've done in class. Through this story, the team starts to see the answer of our question. Our mindset as teachers must be very different from the mindset of a child as a student. Perhaps as a teacher, we've tried to explain the material clearly. We also tried to make the tool material that we think will allow children to learn. But, what if it was not? The material that we provide may be can help us to teach. But for a child it can be a thing that is confusing or meaningless. We think that we have prepared a tool material will allow the child to learn. But apparently, according to the kids it's just a fun thing to play. Apparently when designing learning, we have to get into the mindset of the child and trying to think as a child so we can know what the child felt about learning. And create a learning path that makes kids think. Thus, we will also be able to predict the possibilities that occur during the learning. What the difficulties that will be experienced by the child and how do we prepare appropriate responses or actions to help the difficulties experienced by the child.

### 3.3 Lesson study seminar and workshop in Japan

One of the math team members have the opportunity to follow seminars and workshops Straightening Mathematics and Science for 3 weeks in Naruto, Japan in November 2012 led by Prof. Gerrit Stols, Prof. J.M.Rogan, and Prof.Yumiko Ono. Two things were given to the participants of the workshop which until now have been and still the team use during planning a lesson is a list of things that need to be considered when planning a lesson and lesson tree. By making tree lesson we can see the learning goal (for example problems should be resolved by

students) and also prior knowledge students should have mastered in order to understand the teaching materials.

## 3.4 Open Lesson

### 3.4.1 Planning session

#### ➤ Determine the main concept

In one of the next open lesson, the team tried to implement new things they have learned. Accompanied by Mr. Endang Mulyana and Mr. Tatang Suratno, the team tried to design a study to identify the basic shape in the figure.

Preparation begins with a discussion of the concept and content to be taught and the activities that will be carried out. In this discussion, Mr. Endang asking questions to challenge the thinking of the teachers. Determine the main concept to be taught is not as easy as imagined. What comes to mind is to read the indicators and look for activities that approximately suitable for children. It turns out there are things to consider such as what does the relation between material being taught in class today with a previous class or grade. Well ... the teachers have to know the spiral curriculum so that teacher can find the substance of the material to be taught. By mapping these materials, we can find the essence of the material, so that the material to be taught not to collide with the previous material and can be the basis for a class or support skills afterwards. Mapping of material can be done by making a lesson tree. In this lesson tree, we describe what skills children should possess before studying the material (stored in the root of the tree) and what skills will be obtained after the child learn the material (stored in the branches of a tree).

In this lesson, children are expected to recognize the basic shape (square, rectangle, triangle, circle and half circle) contained in a figure.

#### ➤ Learning Squence

After the lesson tree is complete, the team began designing learning squence. The team are starting to plan some activities that can stimulate children to think. Activities are designed to be related and should reinforce the understanding of concept that has been obtained in the previous activity. There differences of opinion about what activities are going to do. Some suggest that the child should be given a paper, and then they should cut into shapes. After that, the child will be asked to reunite the pieces that have been cut earlier. From this activity, the child is able to understand the concept of area. The area will not be increased or decreased, despite being divided into sections or shapes. By looking at the ability of second graders were mostly don't have good skill to cut, it is predicted to be a lot of trouble when cutting

out and there is the possibility of some form of missing because one tucked or scissors so that it will be difficult for the children. In addition, the core of the matter is to identify the basic shapes that form a figure. Another suggestion that the child will be play puzzle shapes. This puzzle shaped kinds of images consisting of several basic shapes they have learned. From this activity, the student is expected to recognize what kind of shapes by observing the characteristics of the it's shape.

After discussing the advantages and disadvantages of each activity, it was decided that the activity will be puzzle shape. The hope of this activity, in addition to building a child's concept of identification basic shape that make up a figure can also stimulate the creativity of children.

Based on the main activity is playing a puzzle shape, we tried to design the apperception that can build interest in the child and can be the bridge to get into teaching. From video of mathematics learning in Japan, the team was inspired to make activity cards. Teachers will provide 5 cards with each picture contain a square, rectangle, triangle, circle, and semicircle. Teachers will call 5 children to make an educated guess about each card. Each student was asked to name the characteristics of basic shape contained in the card. After his friend can guess, the teacher will ask the student to name objects that had that shape. From this activity tem expected that many children will involved and bring the student learning to identify shapes.

➤ Learning Material

After learning squnce is established, the team began to create a learning material needed. Initially we make basic shapes of a certain size, and then started to make compound figure to identify. We choose to forms animals figure. Apparently after we try to another teacher and to 5<sup>th</sup> grader we learnt that this material is less effective tool because for one compound figure, basic shapes used can vary. It was felt to be difficult for children and takes a long time to make. And the teacher will find it difficult to estimate how many basic shapes needed. Based on these considerations, the team finally decided to design a basic shapes that will always be used in any figure. When designing any figure, children were asked to use all the available basic shapes.

➤ Do

For this lesson we had 2 cycles and attend by Prof. Yumiko Ono and Abe Sensei. For the first cycle, the lesson successfully done according to plan. The student very enthusias engaged in the apperception. When the student had to identifying shapes, the time it takes sooner than expected. At first the teacher that conducts the lesson was confused, deciding what to do. Then the teacher think there should be a challenging activity to reinforce the child's

understanding of the shape. And in the remaining time, the teacher uses it to explore the combined forms. For example, what basic shape that can be form into rectangular or circular shape? This activity was to make children enthusiastic and getting to know the characteristics of the basic shapes. It turn out the ability to know the characteristics of basic shapes strengthen student ability to identify basic shapes that form a compound figure.

➤ Post Lesson Discussion

After the implementation of the first cycle, we conduct a joint evaluation. It turns out that the activities carried out much easier for the student so that much time left. Changes to be made are the time to identify accelerated and children make shapes and present in front of friends.

Implementation of the second cycle, in contrast with cycle 1. It appears that many children experience difficulty in identifying basic shape of a compound figure. Activities that was improvised by teacher in cycle 1 turns out is important to build the children's ability to recognize the characteristic of shapes. And this is the ability to support the child in identifying the shapes that build a compound figure.

From the evaluation, it turns out the plan is not necessarily good for 2 classes because the characteristics of the class is different. As teachers, we must know the characteristics of our children so that we know what is right for them. In addition, many things learned from this evaluation. Apparently when planning, as teachers we have to think about everything we choose. Starting from the content, learning sequence, the development of concepts, tools and materials, and prediction of response by the student. The teacher need to think about the impact on the student.

## 4 CONCLUSION

Based on a series of lesson study, the team felt a lot of changes that occur in the planning a lesson.

➤ Originally when designing a lesson, teachers pay attention to the characteristics of the child, to find attractive packaging activities for students. Teachers do not try to understand the mind of a child. So that teachers can not understand why the child having trouble mastering the material. When the teacher tried to design the program with the mindset of a child, the teacher not only can predict events that are interesting to children, but teachers can also imagine the thought process that will be experienced by the child. Therefore, teachers will be able to predict the likelihood that will happen. For example, difficulties that may be

experienced by the student and the teacher can devise strategies to help the child.

- In planning lessons, teachers must understand the material that will be learned during the learning. Teachers can not only know the indicators contained in the course curriculum. Teachers should be able to draw the essence of the material to be taught. Teachers should conduct the material spiral curriculum mapping. In other words, the teacher must know the link that will connect material taught in previous class, today class and the next class, so will avoid the buildup of material. The material learnt in the previous class can be the basis for learning material that will be taught. And the material can be taught to master the material that will support in class afterwards.
- In designing a learning sequence, the teacher should address the linkages between activities chosen. Not to be biased or activity is not sustainable. Because understanding the concept of a child being built will be thrown. Teachers should choose activities that are interrelated and reinforce the concept of development in the child's head.
- In selecting teaching methods, learning resources, materials or tools teachers cannot just take the

exact same or copy a lesson plan. Teachers must adapt according to the needs of children in each class. Since each class has different characteristics. A good method of learning can be done in a one classroom but may not be effective for another class.

These changes are now always done by a team of mathematics in making a lesson plan. This change turned out to be a positive impact on learning process in the classroom. More effective learning and students' understanding of concepts or materials studied increases.

**Abstract:** April 2013, there was a science lesson study in grade 3 at GagasCeria primary school which would discuss about the reason why a flood could happen. At the beginning, science teachers' team designed the demonstration kit. The demonstration kit was a small village inside a cube transparent aquarium. In one occasion, an education expert who assisted science teachers' team delivered a question due to the demonstration kit, "What make you sure the demonstration kit could help pupils get better understanding in flood concept?" At that time, the science teacher' team could answer the question but they were doubt by their own answers. The expert assist by giving knowledge that before designing a model kit, teacher should know what main core would be delivered to pupils. A model kit which would be designed by teacher should correlate flood concept with previous concept so it would help pupils to get better understanding and it also ought to help pupils to achieve the learning objective(s). After got better understanding in designing model kit, the teachers discuss how to use the model kit effectively. Teachers discuss the questions that would be delivered to pupils and predicted what responds could come from pupils. Pupils' responds sometimes would not align with learning objective(s), in this session teachers also discuss what aid(s) that teachers should give so the model kit could help pupils engage to concept conveniently. In post lesson discussion session, another education expert assist teachers to evaluate weather the model kit worked effectively in assisting pupils' understanding through pictures that pupils made during observation in science learning.

**Keywords:** lesson study, science learning, model kit

### 1 INTRODUCTION

Improving teachers' quality has become GagasCeria management's concern through the time. Lesson study is one path that has been chosen by GagasCeria management to develop its teachers ability. In other to achieve GagasCeria's goal, it involved education expert to escalate teachers' quality.

In school year of 2011/2012, 4<sup>th</sup> grade science teacher conducted lesson study about pressure effect on volume and shape. At the planning session, 4<sup>th</sup> grade science teacher was assisted by science team of GagasCeria Primary School. The team made list what media would be used during experiment, such as clay, colored water, and balloon. The purpose of using clay was to show the effect of pressure. Pressure in solid state would change the shape but not volume of the clay. Clay would be covered by wrapping plastic and put in a certain water volume.

Colored water was put in a holed plastic bottle. The lowest hole would cause high pressure so the water which went out from the lowest hole would reach the farthest. After no water left inside the plastic bottle, students would measure the volume of water inside plastic bottle. It would show that pressure on liquid state would not change shape and volume.

Pressure in gas state was shown by using balloon. Students would be asked to blow balloon. They would touch the balloon while gas was pumping inside the balloon. This experiment would explain pressure in gas state would change shape and volume.

After science team chose the media, we designed instruction. The team was only focus in sentences structure which would make students understood when they read it so goal learning would be achieved.

There were some difficulties that were found in "do session", such as there were so many

equipments on students' desk, so the equipments could be distracters. Besides that, some of the students did not understand what they read in the instruction. Students found difficulties when they tried to make conclusion from the experiment that they conducted.

Reflection for the first teaching learning process was focused to the clay. At the first day, clay was covered by plastic so it was hard to observe what happen to the clay when students pressed the clay. So the science team made up one mind to open the plastic for the second teaching, so that it would be convenient for student to observe what will happen to the clay if they pressed clay. Since second teaching, the science team was gathering to reflect about teaching learning that has just conducted. Some conclusion, from the discussion:

1. Apperception was not quite effective to engage students about pressure effect on shape and volume.
2. Instruction was too long.
3. Uncovered clay could show the effect of pressure to solid state shape but the clay dissolved in water so it was hard to observe the volume which was shown by number in measurement glass.
4. Teacher only prepared for media/model kit but there was no trial for the media.

## 2 ASSISTANCE FROM EXPERT

As a continuation of the reflection sessions that have been done, science team finally got help from Universitas Pendidikan Indonesia (UPI) expert. He asked science team to carry through reflection by putting media used to conduct experiment about effect of pressure on shape and volume. Obstacles encountered during the learning process performed by 4<sup>th</sup> science teacher were:

1. The instruction sheet was too long allowing multiple interpretations occur in the process of understanding it on students' mind. It brought on different perceptions of each student. Differences in students' perceptions caused experiments conducted between the onet group with other groups resulted vary conclusions since every student could focus on different thing.
2. In order to guide students to be able to deduce from the experiments conducted, it may be other alternatives, for instance giving a demonstration to the students how to do the experiment.

At the next meeting, UPI expert showed instructional video of a Japanese teacher who joined JICA. In the video, JICA expert SR asked students

to gather in front of the class to surround him. Students who were in the front position were asked to sit on the floor so that students who stood behind the first line could see what activities carried out by the teacher. The video showed an experiment proving that sound is caused by vibration. The teacher utilized a simple trumpet made of paper. On one side is a hole for the intake of air while the other side shaped like a rectangular sheet of paper that if there was air moving through it, there would be sound and part of the rectangular sheet would be moving. First, students looked carefully at teacher explanation, and then they conducted experiment independently.

The video showed that teachers know exactly what he wanted to achieve from the learning process. Media used to prove that the noise generated from the vibrating has also been considered carefully so that students do not need to make the media, but the trumpets has been made by teacher . Students would focus in observing what would happen on the square sheet at one end of a trumpet.

At the next meeting, UPI expert provided all the equipment which was needed to prove that the noise generated from the vibrating. Science team tried to make papered trumpet as media to prove that when the object produces sound, it also meant the object is vibrating. When setting up the media/models to be used, the team encountered difficulties. Not all trumpet sounded. This experience could actually be used to consider whether the media would be made by the student or would be made by the teacher.

## 3 LESSON STUDY AFTER EXPERT'S ASSISTANCE: MOCKUP FLOODING

In April 2013, 3<sup>rd</sup> science teacher would conduct lesson study about flood. Objective learning from this concept knew the influence of human behavior on the natural decay. Furthermore, the aim of this topic is persuading students to put garbage in rubbish bin in order to avoid flood. In this occasion, 3<sup>rd</sup> grade science teacher revealed her difficulty in explaining flooding 3<sup>rd</sup> grade last year. Students seemed confused to distinguish between flood and erosion. The first idea was to build a village mockup. Science team provided an aquarium, clay, and wooden blocks. Wooden blocks were arranged as village foundation. Wooden blocks would be covered with clay in order to form land and river. There were higher and lower ground, so students

could observe water will flow from high to low ground. There were several obstacles that were found during making flood mock up, for instance; 1) the flood mock up were too heavy so it needed several persons to carry it from teacher room to class room, 2) it took long time to dry the clay, 3) the clay might crack when it dried, 4) the flood mock up could not visualize the effect of garbage on waterways.

### 3.1 Systematic Thinking: Triangular Thinking

UPI expert found that science team got discomposure when the team should connect among objective learning, how to deliver content, it's content. He assisted the team used triangular thinking.

Figure 1. Triangular Thinking

When a teacher designed a lesson, he/she should understand the connection among content, learning objectives, and how student would learn in the classroom. Steps in designing a lesson based on triangular thinking: 1) teacher should connect flood with previous concept that has been learnt (content), 2) teacher should connect between previous concept and objectives learning (substance), 3) method of delivering content to students.

From discussion, science team decided that water's flow concept could be the basic knowledge to deliver flood concept. Water could flow streamlined on waterway when there were no garbage, but the water would get hindrance when there were some garbage inside the drain. When there were a lot of garbage inside drain, water would not flow streamlined. Thus, in wet season, it would be possible that drain could not accommodate volume of water.

When the science team already understood the concept that should be delivered to students, the team teams focused on strategy to assist student achieve objectives learning.

Science team tried to visualize drain used plastic bottle. Water would flow through the bottle and

some would be putted inside it. Because there was some garbage inside plastic bottle, water flow would be clogged. 600 ml plastic bottle was cut sloping at the bottom as a water way to enter the bottle. So as students could observe water flow inside the bottle clearly, the team decided to make blue colored water. To sort the garbage, science team decided fabric, cotton, and gravels. That garbage provided obvious comparison between unfilled rubbish and filled rubbish drains.

### 3.2 Post Lesson Discussion at Soka Primary School: A New Insight to Design a Lesson

Science team got opportunity to participate in Mathematics open lesson about symmetry at Soka primary school. At the post lesson discussion, there was enlighten insight to improve lesson study and teachers' quality at GagasCeria primary school. As a teacher, he/she ought to imagine what response would come out from student so teacher could predict the anticipation. Thus, teacher would be able to assist students to achieve objectives learning from experiment that has designed by science team.

This new insight was implemented in designing flood lesson. Table below shows lesson design that was made by GagasCeria science team in designing flood lesson.

Table 1. Flood Lesson Design

Topic : Flood  
Objective learning : Students could understand the concept of water flow, blockage, and overflow

No.	Students' Activity	Question	Anticipation of Students' Responds
1.	Observing the water flow on a plastic bottle through demonstration.	a. What happens to the water? (Water moves / out of the bottle) b. What is the name of water movement? (Flowing) c. How	Fall dropping thick book

		What is the flow? (The water could flow streamline d)	
2.	Observing demonstrations severely blocked water flow of garbage.	a. What about flow? (small water flow, water flow clogged / blocked) b. Why the water flow is different? (no garbage that block the flow of water)	The number of different bins little trash can clog the water flow There is a little trash, the trash is so much So, and may we put out the trash even a little bit in drain?
3.	Observing the overflow of water due to blockage of garbage.	a. What happens when water is added clogged plastic bottle? (The water overflowed out)	<ul style="list-style-type: none"> <li>▪ Water spilled</li> <li>▪ The water is everywhere</li> <li>▪ Water flows everywhere</li> <li>▪ The bottle full of water</li> </ul>
4.	Summing concept: water flow will cause the water overflows	<ul style="list-style-type: none"> <li>▪ So, the water flows streamlined if there is no clogged.</li> <li>▪ So, the water will not flow streamlined if there is a blockage.</li> </ul>	<ul style="list-style-type: none"> <li>▪ If there is no garbage inside bottle, water will come out swiftly.</li> <li>▪ If the bottle clogged, the water will not flow out swiftly and out of the top of the bottle remind students to the term overflow</li> </ul>
5.	Students do the experiment		
6.	Students write a report experiments about flood		
7.	Connecting concepts to daily life <ul style="list-style-type: none"> <li>▪ Not littering is one way to preserve the environment.</li> </ul>	(Do demonstration again) Reflection questions: <ul style="list-style-type: none"> <li>▪ Imagine this bottle is the drain in</li> </ul>	

		front of your house! <ul style="list-style-type: none"> <li>▪ How to keep the flow of water in the drain streamline?</li> </ul>	
--	--	--	--

### 3.3 Tuesday (April 16, 2013, 07.35 am): Flood

Figure 2. Situation during demonstration

At the “do” session, 3<sup>rd</sup> science teacher held demonstration in front of class. Teacher utilized two tables to conduct so that students could see flood demonstration clearly. This idea come out after watching JICA expert SR teaching video.

Teacher began to do one by one phase of activity, as already planned. Students focused and enthusiastic watched every phase of flood demonstration. As a result of detail and specific designing the lesson, it assisted teacher to guide students to achieve goal learning at that meeting.

Furthermore, students conduct experiments in each group. They observed the water flow and took note based on their observation on their notebook.

At the closing, students were given guide which would connect between water flow and their life. Teacher engaged students to imagine if the plastic bottle is a drain in front of their house what would happen if there is a lot of garbage inside it during wet season.

### 3.4 Student S vs. Student R

It was time session for PLD (Post Lesson Discussion). On this occasion, the JICA expert SR said that the preparation that 3<sup>rd</sup> grade teacher and science team have been was good. Using the blue water could present flooding and the flow of water in the plastic bottle so it could be clearly seen. After observing water flow, students had to draw and write

on their own note book. The notebook could substitute blank worksheet so students' would be able to think creatively when using a note book (blank worksheet).

Furthermore the expert SR invited us to determine the follow-up step in order to develop better learning. He invited us to see the difference images of two students. They are student S and student R. We read the same conclusions about the concept of water flow, either from the writings of student S or student R. Then, the expert SR directed us to observe in more detail and compare the two images of the two students more carefully. He invited us to see the significance of the two images. We were invited to see the difference of the two images, while conduct same experiment. The expert tried to dig in and help us to be able to see the difference of the two images. Although they conducted same experiment, both student could understand the concept of flood, but the result of observation could be different.

His JICA expert guidance, finally science team can see the difference in the picture of student S and student R. The first image that science team observed is the student R's image. There were 3 images experiments that he drew. The first image was plastic bottle A that contains only water. The second image was bottling plastic B containing cotton, cloth, and water. And the third picture is a plastic bottle C containing cotton, cloth, gravel, and water. All the bottles in a tilted position. Student R illustrated the same water flow from three different experiments in each bottle. The amount of water flow that he drew was same. After discussion about drawing and conclusion that has made by student R, science team found if student R could not distinguish the flow of water went out of the plastic bottle although he could describe the condition of garbage were different in his three plastic bottle images. Science team also discussed what was the reason that made student R had trouble distinguishing the flow of water went out from plastic bottle. Perhaps he did not focus when performing an experiment, or student R have different focus while observing the experiment.

Then science team saw student S's observation. Student S describes the three different water flows from each treatment. Plastic bottle A was not clogged, the water flow swiftly. Plastic bottle B with little obstruction, the water flow was not as big as water that went out from plastic bottle A, and plastic bottle C with a lot of blockage, the water flow small. We saw the Student S was able to understand the concept of flow and barriers, so he could observe

and draw in accordance with the expectations of teachers' plan. He already understood, if different clogge wolud affect different stream of water coming out.

The expert SR invited us to find things that can make students' understood the concept of flow and obstructions such as student S did. The expert SR explained that if the sstudent S focuses on water flow out of the plastic bottle so that he could do the observations well. While student R focus on the way he poured water into a plastic bottle, so he did not focus on the water that went out of a plastic bottle. Science team continued the discussion and concluded about the importance of providing a comparison between the experiments when students observe the empty plastic bottle with a plastic bottle containing garbage. If this is done, the teacher could train students' scientific thinking by comparing both experiments and discover the difference.

The expert SR also reminded of the importance of adding the story ideas are more meaningful for students. Drains could be made as a sewer to build the story. Students are invited to take out the trash and then put the trash.

Through this way, students will be able to imagine the concept of flooding if teacher analogied daily phenomena to serve experimental material.

PLD session with the expert provided a lot of insights for science team. Science team got a lot of insights on how to plan a lesson. Not just good planning, but what could teachers do to students to achieve learning goals that teacher wants. Science team also were very aware of the importance of predicting responses and anticipateng of the students in the class. The presence of a comparison in a science experiment also made a very interesting insight for science team, so that students could make observations and scientific thinking processed by comparing and finding differences.

### 3.5 A Bit of Enlightenment

In August 2013, two JICA experts visited Gagasceria primary school. They would like to share knowledge on scientific approach. Science is used to explain a phenomenon occurring around the human life; in brief science is all around us.

The experts shared how Japanese teachers did science learning. In Japan, teacher usually begins learning process by giving phenomena occurred around the students' lives so that students are encouraged to be bound with the lesson.

The topic that was chose to bring out implementation of scientific approach was corrosion

of ironed nail. At the experiment, Japanese teacher provided two test tubes that have been filled with iron nails. The first tube was filled with water, while the second tube filled with salt water. The tubes which are filled with iron nails and water would be used as a control variable. The aim of this experiment was to compare velocity of corrosion between control variable and ironed nail in second tube. Comparing is one skill which could develop by implementing scientific approach. From this experiment pupils would be able to conclude that salt water would increase the corrosion velocity of iron.

Accomplishing scientific approach to develop scientific thinking skill in order to increase Indonesian human resources quality will be not easy but it doesn't mean unattainable.

Being professional teacher would not be achieved instantly. Being a teacher means being a leader. A teacher will be the decision makers in many occasions such as determining the learning process in class. He/she will be the person who could invite students to be active or passive learners. All authority is in a teacher. Positioning his/herself as a student will help him/her in designing a lesson so that pupils will be more engage in learning process.

#### 4 CONCLUSION

Thee cycle of lesson study science team has enlightened science team in planning, implementation, and evaluateing learning stage. As a teacher, it is important to think the students' responses in order to make predictions and anticipation in planning class activities. Although the responses which come out from students could be different with the predictions, at least teacher knows how to respond them. This helps teachers to guide students in order to achieve learning objectives.

A teacher needs to test the media in "planning" session before asking students to conduct experiment using the media. This stage helps teacher to know the obstacle that will be experienced by students in the class room during the experiment.

The presence of control variables in a science experiment is important for students to build observations and thinking skill by comparing and finding the difference of the object that being observed.

North Vista Primary School, Singapore  
nvtps@moe.edu.sg

**Abstract:** Over the last 5 years, North Vista Primary School (NVTPS) has made use of lesson study as a way to develop teachers professionally. The school propagates the notion of Community of Learners which is undergirded by the view of the child as protagonist; the teacher as researcher; the environment as third teacher and parents/community as partners. This presentation reports on the learning experiences of a Primary One Team in the school involving 10 teachers, who used lesson study to mediate curriculum innovation to enhance student learning in the English Language. Through lesson study, the team was engaged in exploring curriculum innovation to enhance the Shared Book Approach (SBA) to deepen children’s understanding of the characters in the fictional texts. The presentation will involve the sharing of the teachers’ learning through the process of working together through two consecutive cycles of collaborative planning, research lessons and post-lesson reflection.

### 1 INTRODUCTION

#### 1.1 About Stellar

Strategies for English Language Learning and Reading, or STELLAR, is a national programme for helping Singapore children improve their language and learning through the provision of standardised guides and materials. The three teaching strategies used in lower primary are the Shared Reading Experience via Shared Book Approach (SBA), the Shared Writing Experiences via the Modified Language Experience Approach (MLEA) and Language activities in Learning Centres via Learning Centres (LC) (Figures 1 & 2). As part of the Shared Book Approach, the teacher uses a Big Book in class to engage children and model reading aloud. Through questioning techniques, the teacher will get the children to respond to the books while also teaching grammar, vocabulary, punctuation and concepts of print.

Figure 1. Three teaching strategies used in lower primary in STELLAR Programme (Ministry of Education Singapore, 2008)

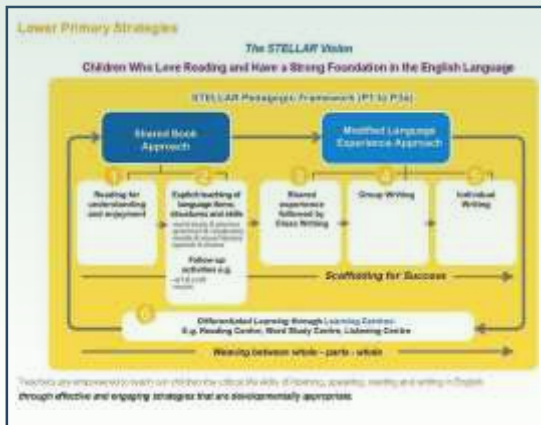

Figure 2. STELLAR Pedagogic Framework (Ministry of Education Singapore, 2008)

### 1.2 The Lesson

Currently in English curriculum for Primary level, students are required to come up with reason, rationale or justification for their choice of adjectives to study a character. This is parallel to the Ministry of Education English Language Syllabus for primary schools which states that under the section on ‘Text Response’, students are expected to identify and study characters and their actions. A pre-test was conducted and it was found that many students were able to communicate the adjectives (character traits) used on a character but failed to clearly and correctly state the reason to support their answers. As such, the team wanted to come up with strategies to improve students’ ability to identify correct character trait and give suitable reason for the choice of character trait. The team leveraged on our school’s readers’ workshop structure to promote literacy.

### 1.3 Readers’ Workshop

The Readers’ Workshop in North Vista Primary School provides our students with a supportive environment that involves them in an authentic reading experience that focuses on their strengths and needs of individual student, teachers modelling reading behaviours, providing direct instructions that focuses on acquisition of text specific comprehension skills and strategies through a process of mini-lesson, group and individual work (Figure 3). One of the outcomes of this lesson is for students to apply critical reading and viewing by focusing on implied meaning, higher order thinking, judgement and evaluation.

Figure 3. North Vista Primary School, Readers Workshop

The team decided to integrate the STELLAR Pedagogic Framework (Figure 2) to our school Readers’ Workshop as one of the strategies to augment students’ learning. The team decided to include a concept map to scaffold their learning on the book read in the Shared Book Approach (SBA). SBA is conducted in two parts, SBA 1 and SBA 2. During SBA 1, pupils are first introduced to a Big Book title to read for understanding and enjoyment. It is at SBA 2 that we start the explicit teaching of language items, structures and skills.

## 2 METHOD

The objective of the study was to teach pupils how to aptly describe a character in a book with an adjective (character trait) and provide reason, rationale or justification for their choice. The overarching goal that we want to see is that our students will become confident writers, to translate reading into writing skills.

### 2.1 Subjects

The lesson was conducted within 60 minutes. It was conducted in two primary one classrooms of 30 students each. There were 30 pupils of mixed abilities in each classroom.

### 2.2 Procedure

In formulating relevant ideas for the lesson planned, the teacher used concept map to elicit responses from students and build their semantic knowledge on the topic discussed. It served as a visual organiser that enriches students’ understanding of the topic discussed and helped them to organise new

information too. In this study, we used a Big Book entitled “Smarty Pants” by Joy Cowley.

The current practice in SBA1 is to ask questions verbally based on the cover of the Big Book and to make predictions. But what we added in was the use of concept map. In SBA1, before introducing the new Big Book entitled “Smarty Pants”, teachers elicited personal responses from pupils and furnished the concept map on ‘Clown’ (Appendix3). Students were then shown a short video on a clown’s performance. The teacher then got students’ responses about clowns based on the video shown and built on the concept map.

In SBA2, where the focus of the lesson plan was on, the research teacher started off with re-reading of familiar Big Book, ‘Smarty Pants’. The teacher proceeded with the explicit teaching of the lessons by asking questions to scaffold pupils understanding by eliciting the character traits of the main character in the book who is Smarty Pants. The teacher adopted the strategy “I-do. We-do. You-Do” which was originally created by Pearson & Gallagher (1983) in their Gradual Release Model framework. In this framework, there is a gradual release of responsibility model of instruction from the teacher to the students. (Do refer to the lesson plan in Appendix1 for detailed steps and list of questions asked during the lesson). At the end of the lesson, students were to complete a worksheet individually (Appendix4).

### 2.3 Post Cycle 1 Observation and Refinement

Some observations were made after the first cycle. Firstly, the teacher’s questioning techniques played a vital role in scaffolding students’ understanding of the book read and these were clearly exhibited. Secondly, it was noted that some students were able to state the actions of the character but due to lack of vocabulary, they were not able to use the accurate character traits. There were also students who were able to state the character trait of the main character but were not able to give accurate evidence from the book to support their choice. It was agreed upon during our post conference that students could be supported more to help them see the link between the actions and character traits used to describe it.

As we found it was necessary to revise some of the guiding questions in the lesson plan for Cycle 2, we decided to include differentiated instructions and

worksheets for that lesson. Students were also shown two more examples (outside the storybook context) to provide better understanding on the matter. The weaker students needed to be supported by exposing them to different character traits so that they could build up their vocabulary. Therefore, after reading a story students were asked to describe what each of the characters was “really like” and the teacher creates a chart of the students’ response (Manyak, 2007). This brain storming process prompts students to analyse the characters and provide the teacher with a rich context in which to teach new vocabulary. Thus, the teacher adopted an anchor chart to record the character traits from the students. The teacher had introduced this anchor chart in everyday discussion in class prior to Cycle 2. Students built up on the chart together as a class. As for the better students, they could be stretched further to infer what could the character be thinking or how he` was feeling, even though those are not stated in the story. The worksheets prepared were of varied difficulty level to suit the students’ abilities.

The team also decided to use of multiple IWBs to allow the research teacher to teach multi-sensory and multi-model style of lessons which will allow pupils to see the connection between the character and the word describe them. This style of teaching is closer to the multimedia world within which the students live and as such produces a heightened level of engagement in students (Beeland, 2002). ICT was infused in Cycle 2 also to promote collaborative and self-directed learning. This could be achieved by using the immersive living classroom. The immersive living classroom consists of 4 connected interactive walls.

In this cycle too, learning intentions of the lesson and success criteria were clearly displayed in one of the 4 panels. Sharing learning intention and success criteria is an essential part of assessment for learning as it helps students to take responsibility for their own learning and assessment (Smith, 2007). This was also for students to check their learning itinerary for the lesson. At certain points during the lesson, students were brought back to check their understanding and learning against the success criteria listed.

The use of immersive living classroom also enabled distinct differentiated instructions and activities to take place so that learners of different abilities could benefit fully from the lesson conducted, besides having differentiated worksheets. It also enhanced 21CC and teaching and learning experiences both for the teacher and students respectively.

Revised lesson plan for Cycle 2 is in Appendix2.

### 2.3 Post Cycle 1 Observation

Based on the observation during Cycle 2, students were seen to have learnt better with clearer instructions given. Students were fully engaged in student-centred activities using the immersive living classroom which also brought about self-directed learning. It was also observed that as in Cycle 1, teacher’s questioning techniques had helped the students to scaffold their thinking to make learning more meaningful for them. The inclusion of the two other examples in the teaching slides (Appendix 11) provided clearer examples to the students to match the correct character trait to the evidence given, scaffolding students’ learning even more.

Teacher observers agreed that the use of the anchor chart helped the students a lot especially the lower achieving pupils. They were able to refer to it and chances of them recognising the character traits were higher.

There were also differentiated worksheets prepared for each group (Appendixes 6, 7&8), which the students did after they had their hands on the activities on the panels.

## 3 ANALYSIS

ICT has a particular role to play through supporting dynamic and multiple representations of information. Collaboration around ICT activities has been shown to have the potential to increase pupils understanding and interest in the character study lesson.

Pre-tests and post-tests were administered before and after both cycles. Students’ responses in the tests of the two classes were analysed at the end of the intervention to evaluate the impact of the character study.

As indicated in Table 1, the pre-test mean scores of the two classes were 1.32 and 1.29. For the post-test, the students in the two groups scored 2.41 and 2.29 respectively, both of which are higher than the pre-test.

### 3.1 Results

Table 1. Comparison of results Pre and Post Test

	n = 30		n = 30	
	Pre-test	Post-test	Pre-test	Post-test
Mean score	1.32	2.41	1.29	2.29
Difference in mean scores	1.09		1.00	

Thus, both classes showed marked improvements of 1.09 and 1.00 in their mean scores.

Table 2. Differences in Improvements in Post Test Scores

Classes	No. of Students who showed improvements	Percentage
A	22 out of 30	73.3 %
B	21 out of 30	70.0 %

As shown in Table 2, more than 70% of the students in each of the classes improved their total scores in the post-test as compared to the pre-test. By sampling their answers, the project team also discovered that the intervention strategies were effective in helping them to better understand the character study especially in linking the character study to the reasons.

## 4 DISCUSSION

Based on the above results, using various strategies to teach character study and justifying the character trait of their choice to the evidence found in the story, has shown some improvement in their power of reasoning and writing skills. In the course of the intervention, they were taught the logic of their answers and to substantiate their character traits answers with facts. This approach worked well for the Higher Achieving (HA) and Middle Achieving (MA) groups but did not work as well for the Lower Achieving (LA) student group. For the latter, they need to have a better vocabulary to improve on their reasoning.

Although the project cycle had completed, the teachers felt that their adoption of effective questioning techniques through differentiated instructions to guide students has helped them to become more successful writers. A teacher felt that with the use of higher cognitive questions, coupled with longer wait-time given to the students, they were able to give more in-depth responses. Teachers felt the “I do, We do, You do” lesson framework had helped the students to have more confidence in answering the character trait questions. In short, the strategies used had enabled the teachers to understand the pupils’ metacognition and guide them in their thinking and reasoning more systematically.

## 5 RECOMMENDATIONS

The scope and depth of the lesson plan and the resources can be improved further. In Cycle 2, the order of the questions in the worksheets for MA and HA students should be paid attention to. The MA students dutifully started off by drawing the picture required in question 1 (See Appendix7). Thus, observation on how the MA students perform after the explicit teaching could not be recorded.

With regards to the use of character trait anchor chart, teachers should keep the end goal in mind. The elicitation of words to build up the anchor chart should take into account the character traits which could be used to describe the character, Mr Smarty Pants. Alternatively, teachers could use the words in the anchor chart to craft the sentences used in the activity sheet. This process could be tightened to facilitate the scaffolding.

In LA students' worksheet, it was observed that the students could do the task (Appendix6) by looking at the contextual clues instead of using their understanding based on the lesson just taught. They could be further stretched by asking them to use colour coding to identify the actions and the character traits on the same worksheet.

As for the HA students' worksheets, teacher observers agreed that there was a broken link as the activity done on the interactive wall did not complement the worksheets given to them even though they were able to accomplish the task on the interactive wall. Choice of passages used should be longer so that the HA students could draw inference from the contextual clues to conclude something about the character traits rather than them given 2 passages with five characters in them. All those being said, it is recommended that the time frame for intervention be increased so students can be assigned more practice exercises in describing character traits of increasing level of complexity.

## 6 CONCLUSION

This project shows that scaffolding students understanding of the character trait has indeed helped the Primary 1 students especially the HA and MA to express the character traits with correct supporting reasoning or evidences. Differentiated instructions and questioning techniques can also motivate passive learners to be more proactive and participative in their own learning. The strategies used in this intervention have proved to be effective and will continue to be adopted in the school's Reader's Workshop to complement the STELLAR programme.

**Lesson Plan  
Cycle 2**

Date : 25 May 2014  
 Time : (60 minutes)  
 Teacher / Class : P1

**I. Goal of the Lesson Study Group:**

To develop confident readers and writers who are able to describe a character using character traits and say why it is so.

**II. Lesson Information**

**Name of the unit / lesson** : Big Book Title – ‘Smarty Pants’  
**Lesson Objectives** : To describe character using an adjective and state why it is.  
**Key Student Outcomes** : Pupils should be able describe a character using an adjective and state why it is so.

**Learning Intention**

We are learning to use describing words to talk about a person in the story.

**Success Criteria**

1. When I look at the picture, I can describe the actions of the character.
2. Looking at the actions, I can describe the character.
3. I will be able to give a reason why I use the word to describe the character.

**Lesson Description :**

The screenshot shows an interactive wall interface. At the top left, there are two green buttons labeled "Edit" and "Reset". To the right of these buttons is a red progress bar with the number "56" in white. In the top right corner, there is a green circular button with a white question mark and a small yellow padlock icon. The main area of the wall displays six brown circular tiles with white letters: "e", "a", "n", "t", "u", and "r". Below the tiles, the text reads: "Smarty Pants is a \_\_\_\_ lover because he flies the aeroplane to see the world." At the bottom left of the main area, there is a green button labeled "Clue". At the bottom center, there is a blue link labeled "Extend Page".

*Anagram – Middle Ability (HA) group’s activity on the interactive wall.*

Appendix 10

Read the following carefully, then match the characters with their behavioral traits on the next page.

The match was on! Alex strode forward and looked ready for anything. Kaelie was fidgeting as she awaited her turn. The card was pulled and both students answered at the same time. It was a tie! The final mach of the year was a tie!

Carlos congratulated the girls and returned to his seat. Jasmine high-fived her team-mates. Billy Bob groaned and shouted for another turn, he then sat down and glared around the room.

Read the short story given to you and as a group, match the Characters below with the character traits

Name	Trait with Proof
<input type="text"/>	Confident because he was ready for his turn. <span style="float: right;">Billy Bob</span>
<input type="text"/>	Disappointed because he groaned. <span style="float: right;">Kaelie</span>
<input type="text"/>	Nervous because she was fidgeting. <span style="float: right;">Jasmine</span>
<input type="text"/>	Good sport because he congratulated the girls. <span style="float: right;">Carlos</span>
<input type="text"/>	Cheerful because she high-fived her teammates. <span style="float: right;">Alex</span>

## Programmed Assistance With Lesson Study In Mathematics Learning In Junior High School Based On The Curriculum 2013

Iwan Junaedi

Mathematics Department of Semarang State University  
iwanjunmat@gmail.com

**Abstract:** The Curriculum 2013 will be applied to all grade levels at every educational institution. However, not all teachers get a learning training based on the curriculum 2013. The main problem in this research is how the programmed assistance with Lesson Study in mathematics learning in Junior High School based on the Curriculum 2013. The research approach used in this study is qualitative approach. The research subject is math teachers in Muhammadiyah Junior High School in Semarang City who have never received any training of the Curriculum 2013. The results of the research are that (1) it could describe the ability of the math teachers in planning, implementation, and assessment of mathematics learning based on the curriculum 2013, (2) it obtained various models of lesson plan and learning media based on the curriculum 2013, and (3) it described the barriers to the implementation of the Curriculum 2013 in Muhammadiyah Junior High School in Semarang City in mathematics learning.

**Keywords:** Implementation of the curriculum 2014, Mathematics Learning, Lesson Study.

### 1 INTRODUCTION

Education has important role in human life since it determines the development and character of human. Whether a nation is well developed or less developed could be seen from the development of its education. A nation which has good education would results people with good character and civilized. One of the factors determining the education direction of a country is the school curriculum.

Curriculum as an education planning has a central position in all education activities. It determines the education process and result. Thus, constructing curriculum needs strong foundations so that the curriculum as the basis and purpose of education could be accountable.

Within a certain period, the Indonesian school curriculum always changes. The change aims to improve and to enhance the education quality in schools. One of the reasons of the change of Indonesian curriculum is based on the result of Trends in International Mathematics and Science Study (TIMSS) and Program for International Student Assessment (PISA) which are not satisfying. The report of TIMSS and PISA describe that in 2007 the Indonesian students were scored 397 which means that the ability of

Indonesian students in solving non-routine problems (mathematical problems) was very low. The next result of TIMSS in 2011 gave score of 386 for Indonesia. It means that the Indonesian students' achievement was not satisfying (Mullis, *et al.*, 2009; Mullis, *et al.*, 2012; Kemdikbud, 2014). This condition suggests that the Indonesian education particularly in mathematics field needs to be improved.

In 2013, the government of Indonesia converted the 2006 curriculum into the 2013 curriculum. The regulation of Indonesian Ministry of Education and Culture number 81A/2013 explains that the implementation of the 2013 curriculum shall be gradually implemented. The implementation in 2013/2014 academic year involved the selected schools. Then, all of schools in Indonesia would be involved in the implementation of the 2013 curriculum in 2014/2015 academic year.

Nevertheless, though the curriculum has been designed very well, the quality improvement would not be reached unless the teachers implement the learning based on the purposes given in the curriculum. According to Danim (2002), teacher has important role and is the key of education quality improvement success. Teacher should be ready to implement

learning based on the curriculum set by government.

Based on the result of interview toward the mathematics teacher of SMP Muhammadiyah 1 Semarang, we know that: (1) until May 2014, there are many new teachers in Muhammadiyah schools in Semarang City who have not joined the 2013 curriculum training; in fact, all schools are obliged to implement the 2013 curriculum start from July 2013, (2) there are teachers who have joined the 2013 curriculum training but they are less confident in practicing it, (3) in general, teachers find difficulties in doing the assessment based on the 2013 curriculum because the learning assessment is too complex.

The problems faced by mathematics teachers in Muhammadiyah schools in Semarang City in implementing the 2013 curriculum need to be solved. One of the ways to help teachers is using lesson study. Through lesson study, teachers collaborate to discuss the class based learning problems. According to Ylonen and Norwich (2013), LessonStudy facilitates the following: (1) collaborative opportunities to share knowledge and skills with colleagues, (2) sharing of risk in innovating about teaching and more willingness to learn from errors, (3) solidarity between teachers that affirms capabilities to innovate about lesson teaching, (4) dedicated time to reflect, plan and problem solve in a supportive public setting, (5) honest and constructive observations of research lessons to each other, (6) a micro-focus on the learning of 1-2 students to enable a greater depth of analysis, and (7) more awareness of their implicit teaching knowledge (practitioner knowledge). Dudley (2012) also suggests the same thing; lesson Study works successfully in a system that expects teachers and school leaders to improve professional knowledge and practice through systematic use of collaborative, and in query-based teacher learning approaches.

The organized guidance using lesson study in this research means that the teachers who have joined the 2013 curriculum training and those who have not join the training make a collaboration to design a learning, to implement, to observe, and to discuss the learning. This activity is scheduled such that each teacher will not abandon their duty to teach when they should gather to discuss the design, the observation, and the reflection of the learning.

Based on the background described above, a main research question can be formulized on how the organized guidance using lesson study helps junior high school mathematics teacher to

implement the 2013 curriculum. The main research question could be formulized for more detail into several research questions as follows: (1) how could the mathematics teachers' ability in constructing plan, implementing, and constructing assessment of mathematics learning based on the 2013 curriculum be described? (2) whatkinds of learning products could be produced in the organized guidance using lesson study based on the 2013 curriculum? and (3) what is the hindrance which may occur in the implementation of 2013 curriculum in junior high school mathematics learning in Semarang City?

The advantages of this research are: (1) teachers were assisted to implement the 2013 curriculum at school, (2) the learning problems could be raised in which the government could use them as a reference to build training program of 2013 curriculum, and (3) the learning products such as lesson plan and students' worksheet resulted from the teachers collaboration could be the model of learning device for the others.

## 2 METHOD

The approach used in this research was qualitative approach. Since this is a qualitative research, then the main research instrument is the researcher himself. Researcher was involved together with the research subject. The research subjects were mathematics teachers from 9 junior high schools in Semarang City.

The data in this research is qualitative data which was gained through observation, interview, and documentation. The observation was conducted during the lesson study, namely began with “Plan”, “Do”, and “See”. The interview was conducted in the end discussion of “Plan” and “See”. The document used in this research include all notes resulted from “Plan” and “See”, lesson plan, and students' worksheet.

The validity of the research data was confirmed through data triangulation. The triangulation aims to avoid any bias data resulted from the observation, interview, questionnaire, and documentation. This method was used to cross-check the data as well as to check the truth of the information gained before. The data analysis in this research used the plot of Mills & Hubbermen model(1984) which includes: (1) data collection, (2) data reduction, (3) data display, and (4) conclusion drawing/verifying.

### 3 FINDING AND DISCUSSION

The organized guidance using lesson study of the 2013 curriculum implementation was started by some mathematics teachers in Muhammadiyah junior high schools in Semarang City built work groups consisting of 4-5 teachers for each cluster. The work group consisted of teachers coming from the near schools each other. At least one of the members of each group should have joined the training of the 2013 curriculum implementation. The member who has joined the training has duty to guide his or her colleague to implement the 2013 curriculum in the planning, implementation, and assessment of learning.

Each team designed activities for “Plan”, “Do”, and “See” stages. The activities schedule was made based on the following rule: (1) for the first open class, the one who become model teacher would be those who have joined the 2013 curriculum training; the rest of member could be observer during the learning, (2) for the second and the third open class, the one who become model teacher shall be those who have not joined the training, and (3) the lesson plan, media, and students’ worksheet used in the open class were drafted by the model teacher and then discussed together in “Plan” activities with all members.

#### 3.1 Description of The Mathematics Teacher Ability In Constructing Lesson Plan

The first Plan activity was started by discussing draft of lesson plan built by model teacher who has joined the 2013 curriculum training. The material discussed in the first Plan activity was the Basic Competence 3.1: Comparing and ordering some integers and fractions as well as applying operation on integer and fraction by using various operation properties.

In the first Plan discussion, the teacher model shared a lot of his experiences on how to construct lesson plan based on the 2013 curriculum. While the other team members asked many questions about the core competence in mathematics subject. For instance, whether the first core competence (KI-1) and the second core competence (KI-2) are always included in the lesson plan, which was then answered “Yes” by the teacher model. Besides, the team discussed a lot about lesson plan format based on the 2013 curriculum. The result of the discussion is presented at the Table 1 below.

Table 1. Description of The First Lesson Plan Discussion

No	Aspect discussed	Discussion note
1	Lesson Plan Format	The first topic discussed was the format of the lesson plan. The solution of this topic could be gained by referring the attachment of regulation of the Ministry of Education and Culture Number 58/2014 about the lesson plan format.
2	The core competence (KI 1-4)	The discussion focused on how to implement the KI-1 dan KI-2 in mathematics learning which shall appear in all learning. The discussion agreed that all learning should accommodate the KI-1 and KI-2.
3	The indicator of the basic competence (KD)	The difficulty during the discussion was when they tried to construct indicators for KD within KI-4.
4	Learning Method/Approach	Discussing a lot about the scientific approach in designing the mathematics learning, since it deals with how mathematics should be learned through “Observing”, “Questioning”, “Associating”, “Experimenting” and “Networking/Communicating”
5	Learning Result Evaluation	This discussion in this step was not deeply conducted because the teacher model has not mastered some evaluation model which are suitable with the 2013 curriculum.

In general, the discussion in the first Plan activities was dominated by sharing activities from the model teacher who has joined the 2013 curriculum training, while the rest of the members asked about the components in the lesson plan, especially when they should design the mathematics learning.

The interview toward some team members who have not joined the training gave information that the difficulty in making lesson plan was on how to design observation activities for mathematics object using scientific approach. The other difficulty was on how to design students’ activities such that they could engage in reasoning activities. The difficulty in designing observation and reasoning activities happened among team members though some of them have joined training. Gersten (as quoted by Christin, 2011) suggested that knowledge about how to teach mathematics determine the innovation of

learning. Thus, if the teachers are less innovative then the lesson plan is difficult to be constructively developed.

The first Plan discussion has given a worth experience for every team member because they got real experience in planning a learning instead of just listening to a talk. All of team members showed strong spirit to analyze the implementation of mathematics learning in the scheduled open class.

The second Plan activity was started by discussing the lesson plan draft built by teacher who has not join the training of 2013 curriculum. The lesson plan draft was made based on the team experience in the first cycle after discussion in See activities. The second lesson plan was made by teacher model 2. The material was Basic Competence 3.2: Explaining the definition of set, subset, complement of set, operation of set, and showing the example and non example of the set.

Based on the reflection of the first cycle of See activities, things which should be concerned are: (1) the students' activities of observing, associating, and communicating about integer did not particularly emerge as the focus of the 2013 curriculum learning, (2) the mathematics object taught was still too abstract, (3) the assessment activities was not optimal in measuring every basic competence, and (4) it was too much showing power point presentation so that the students were passive. Based on the first cycle of See activities, the participants made lesson plan for the next learning. The improvement of the lesson plan is given in the following Table 2 below.

Table 2. Description of The Second Lesson Plan Discussion

No	Aspect discussed	Discussion result
1	Indicator of Basic Competence	The model teacher has not been perfect yet in constructing draft of lesson plan particularly in the indicator of basic competence. The indicator was then improved based on the team discussion.
2	Learning method/approach	The observing activity of set was design by observing set of things in the classroom. The students were asked to identify and to make list of the set of "things in the classroom which have three sides and four sides" by themselves.
3	Learning result evaluation	The learning evaluation was made in simple way so that it would not be complicated.
4	Learning media	Power point was chosen as learning

		media which function to confirm the definition of set and to show the worksheet.
--	--	--

Based on the Table 1 and 2, it can be seen that there were changes of teachers' ability in constructing lesson plan. The second Plan discussion has focused on how the mathematics content should be and how to make the students learn by using scientific approach.

The third Plan activity was started by discussing the lesson plan draft constructed by the third model teacher who has not joined the 2013 curriculum training. The third lesson plan draft was made based on the experience in the first and the second cycle. The material for the third Plan was the Basic Competence 3.6 "Identifying the properties of plane figures and using them to determine its perimeter and area".

The discussion of the third Plan was based on the See discussion result of the second cycle. The discussion contents in the second cycle are: (1) teachers need to provide teaching aid to be used in the observation activities, (2) the evaluation made in the second cycle was too wide so that teacher was difficult to do authentic assessment; Thus, it was recommended to make the assessment instrument more detail for the next learning, (3) the students worksheet need to be made in simple way, and (4) the learning media would be better if it was not only power point, but also more various. The description of the discussion result of the third Plan activities is presented in the following Table 3 below.

Table 3. The Description of the Third Lesson Plan Discussion Result

No	Aspect discussed	Discussion result
1	Learning Approach	The learning design for observation activity of plane figures' properties should be focused on the media which have been prepared by teacher.
2	Learning Result Evaluation	The evaluation used: the instrument of spiritual assessment, instrument of social attitude assessment, instrument of self assessment, instrument of peer assessment, instrument of knowledge aspect, and instrument of skill aspect.
3	Learning Media	The learning media combined the power point, teaching aid, and students worksheet.

Based on the Table 3, the teacher discussion was not only in terms of pedagogy and content, but also about the learning evaluation. It shows that teachers have changed their mind set, particularly in designing the mathematics learning and assessment in the classroom based on the 2013 curriculum.

### 3.2 Description of The Teachers’ Ability In Mathematics Learning Based On The 2013 Curriculum

The first open class activity was started by model teacher who has joined the 2013 curriculum training. The material discussed in the first open class was the Basic Competence 3.1 Comparing and ordering some integers and fractions as well as applying operation on integer and fraction by using various operation properties.

The substances of the observation result in the first Do activities is presented in the following Table 4 below.

Table 4. Description of the First Open Class

No	Aspect discussed	Observation Result
1	The implementation of scientific approach	The students’ activities in observing integer was not clear, because the it happened only through power point. The students’ activities in associating the integer have not yet emerged.
3	The use of learning sources/media	Teacher showed power point media too much so that the students were passive.
4	The students’ involvement in the learning	The students were less active because the learning media less support the involvement of the students.
5	Closing Activities	Until the end of the learning, the assessment has not been conducted optimally in measuring each indicator of the basic competence.

Based on the Table 4, we know that though the model teacher in the first open class was the one who has joined the 2013 curriculum implementation training, the learning was not yet optimally conducted. However, based on the reflection discussion, the team members who have not joined the training agreed that they got a valuable experience from the good and the lack of the learning performance. The interesting thing is that the model teachers are more confident in teaching

based on the 2013 curriculum because they said it was not difficult as they thought.

The second open class was conducted by the model teacher who has not joined the 2013 curriculum training to implement the lesson plan which has been discussed in the second Plan activity. The material discussed in the second open class was the Basic Competence 3.2: Explaining the definition of set, subset, complement of set, operation of set, and showing the example and non example of the set.

The second open class used lesson plan based on the experience and reflection discussion in the previous open class. The observation result of the second open class is presented in the Table 5 below.

Table 5. The Description of The Second Open Class

No	Aspect discussed	Observation result
1	Opening activities	In the beginning, students were not enthusiastic to join the mathematics learning. After the teacher gave teaching aid, students started to pay attention and tried the teaching aid provided.
2	The implementation of scientific approach	The students noted the observation result based on various sources less systematically.
3	The use of learning sources/media	The power point learning media was interesting for students because of the variation.
4	The students’ involvement in the learning	Some students were not involved in using the teaching aid because the number of teaching aid provided was limited and it was dominated by the more creative students.
5	Learning result evaluation	The authentic assessment conducted by teacher was less done, so many students’ activities were not assessed.
6	Closing Activities	In the end of learning, there is no task for the students.

Based on the observation in the second open class, though the model teacher in this session has not yet joined the training of 2013 curriculum, he could implement many aspects within the 2013 curriculum. It shows that the collaboration activity through the Plan-Do-See activities (Lesson Study) was very much significant for the dissemination of the 2013 curriculum.

The third open class was also conducted by the third model teacher who has not yet joined the 2013 curriculum training. The material was the Basic Competence 3.6 “Identifying the properties of plane

figures and using them to determine its perimeter and area”. The third open class was conducted based on the lesson plan constructed in the third Plan activity.

The description of the third open class is presented in the Table 6 below.

Table 6. The Description of the Third Open Class

No	Aspect discussed	Observation result
1	Opening activities	The challenge in a form of quiz given by teacher was responded positively by students.
2	The implementation of scientific approach	The teaching aid in order to identify the properties of plane figures was challenging students to try, to observe, and to ask question.
3	The use of learning sources/media	Some students did not use the teaching aid directly because it was still dominated by the clever students.
4	The students' involvement in the learning	Some students were not involved actively because it was still dominated by the clever students.
5	Learning result evaluation	The evaluation process in terms of using authentic assessment could be implemented well. The lack is that some students were not assessed because they were not given chance by teacher.
6	Closing Activities	The confirmation activities given in the end of learning was interesting for students to sum up what they have learned.

Based on the Table 1-6, we know that the improvement and perfection of Lesson Plan impacts on the improvement of learning practices in the classroom. Through this lesson study activities, the teachers who have not yet joined the 2013 curriculum training could make the students learn well and were able to implement the learning based on the 2013 curriculum. The model teacher who has joined the training also gained many experiences from the learning practices in the classroom. This is suitable with the statement of Adedoyin (2011) who

stated that one of the characteristics of good teacher is having pedagogical knowledge.

### 3.3 Description of the Lesson Plan Models and Media Based on The 2013 Curriculum

Based on the “Plan” and “See” discussion result, we have various models of lesson plan. Table 7 below presentsthe difference among lesson plan constructed from the three cycles of the Plan, Do, and See.

Table 7. Various Model of Lesson Plan and Media

No	Component of Lesson Plan	Lesson Plan 1	Lesson Plan 2	Lesson Plan 3
1	Opening	No Quiz available	No Quiz available	Started by Quiz
2	Learning Model	Cooperative	Cooperative-Jigsaw type	Problem Solving
3	Media	The main media for observation activity is power point.	The main media for observation activity is power point and any teaching aid available in the classroom.	The main media for observation activity is well prepared teaching aid combined with power point.
3	Learning Result Assessment	The instrument was not detail.	The instrument was not detail.	The instrument was detail.
4	Closing	Task was not designed, only used the available task in book.	Task was not designed, but reflection was available.	Task was designed and reflection available.

Based on the Table 7, we know that the teacher have changed in constructing lesson plan. The selection of the learning model shows that the teachers have tried to improve their learning.

### 3.4 The Hindrance of The 2013 Curriculum Implementation In Mathematics Learning

Based on the interview toward teachers, we know that the hindrance in the implementation of the 2013 curriculum are: (1) mathematics examples or books presenting mathematics concepts through “*Observing*”, “*Questioning*”, “*Associating*”, “*Experimenting*” and “*Networking/communicating*” activities are less available, (2) lack of guide or supervisor who can guide teachers at school (for instance, the school supervisor). Thus, teachers could not communicate their problems nor get advice to improve their practice, and (3) the Lesson Study model as a means of sharing experience among teachers has not yet been the policy of the education office of Semarang City. Hence, the teachers’ activities in the classroom could not be observed well.

The hindrance of the availability of mathematics examples or books presenting mathematics concepts through “*Observing*”, “*Questioning*”, “*Associating*”, “*Experimenting*” and “*Networking/communicating*” activities contradicts with the ideal condition of mathematics learning which should follow the international standard. For instance, the vision of the *National Council of Teachers of Mathematics* (NCTM) states that mathematics learning should focus on the problem solving, reasoning, and mathematics communication as parts of the curriculum (Kramarski, 2009: 137-138).

## 4 CONCLUSIONS

Based on the research result and analysis, we know that: (1) there is improvement of mathematics teachers’ ability in constructing the plan, implementation, and assessment of mathematics learning based on the 2013 curriculum, (2) various models of lesson plan and learning media based on the 2013 curriculum could be constructed, and (3) the hindrance of the 2013 curriculum implementation within mathematics learning in Muhammadiyah junior high school in Semarang City could be well described. Based on the result of this research, we strongly recommend that the acceleration of the 2013 curriculum implementation could use the lesson study model as the means of organized guidance.

<sup>2</sup>*School of Educational Studies, Universiti Sains Malaysia, Penang, Malaysia*

[chpsam@gmail.com](mailto:chpsam@gmail.com)

**Abstract:** This paper aims to discuss the changes in mathematics lesson planning among three groups of primary mathematics teachers while participating in a Lesson Study (LS) process. The Japanese model of LS process was introduced to these mathematics teachers from three different vernaculars Tamil primary schools in Malaysia. Each LS group consisted of three to four experienced and novice mathematics teachers. The whole process of Lesson Study which include identifying the goals, planning and refining of lessons, lesson observations and reflections, as well as revising the lesson plan drafts and re-teaching of the lessons were video and audio recorded for data analysis. However, for this paper only a comparative analysis of three lesson plans throughout three LS cycles of one participating school was made. Preliminary analysis of the data showed that there were some positive changes in terms of goal settings of the lesson, planning of the lesson structure which includes the set induction, concept development and closure of a 60 minutes mathematics lesson. In sum, this study highlights the potential benefits of LS process which significantly gained interests among the teachers, educators and researchers in planning of a mathematics lesson, as a way of improving mathematics teaching practices and recommended as an effective teacher professional development model to be continuously implemented among the Malaysian educators and researchers.

**Keywords:** Lesson Study process, primary mathematics teachers, lesson planning, lesson setting, lesson structure, effective teacher professional development model.

### 1 INTRODUCTION

In recent years, learning mathematics is a key essential in a daily education system particularly in Malaysia which aims to achieve the status of fully-developed nation by the year of 2020. Malaysia’s interest in preparing its nations for a productive life focus on rising mathematically literature society in order to engage in the wide range value-added economic activities and innovations in the country.

The expectations and demands on teachers have greatly increased especially in light of increased attention particularly towards the classroom teaching practices (Baker & Smith, 1999). The focus in teaching mathematics under the influence of socio-cultural perspectives has been gradually changing from knowledge to practices-based orientations in studying teacher learning and pedagogical knowledge growth (Ball & Bass, 2000). This practice-based orientations meanings teacher learning as exemplified in the self-motivated and tool-mediated interactions with students and teachers in teaching practices. Teachers in China and Japan too often initiated into collaborative working cultures which directed at improving teaching and learning through public lessons and lesson studies (Lewis and Tsuchida, 1998).

In accordance with these changes, this paper considers on a case studying changes in teachers’ planning stages and to ‘capture the essence’ of an effective teaching and learning practices in mathematics classroom after participating in a Japanese teachers’ development model called ‘Lesson Study’(LS) process.

### 2 REVIEW OF LITERATURE

The literature indicates *Lesson Study*; a form of collaborative school-based professional development initiative originated from Japan (Fernandez & Yoshida, 2004) and implemented extensively across the world (Stigler & Heibert, 1999) has improved teaching and learning of mathematics. Due to the positive outcome experienced from the implementation of *LS*, the attempt has been made in this study to implement *LS* as a component of professional development model in a Tamil Primary School in Malaysia.

The effectiveness of *LS* in changing the teaching practices and learning outcomes from the teachers’ perspective have been measured. For this purpose, in the following section background on Tamil primary schools in Malaysia; perspectives of effective teaching and learning mathematics and an overview of *Lesson Study* will be provided.

## 2.1 Background of Tamil Primary Schools in Malaysia

Malaysia is a multiracial country with majority of the population is Malays followed with Chinese and Indians. Numerous national primary schools have been established throughout the country to provide basic education (Teacher Education Division, 2005) to the people. However, the public was given opportunity to obtain basic education at primary level from vernacular schools (Curriculum Development Centre, 2001).

Vernacular schools have been established in the country to provide basic education since British colonization. The first Tamil primary school was established in Penang in 1816 and currently there are 523 Tamil schools in the country (Department of Statistic, 2012). At early stage majority of the schools are located at rubber estates and primarily attended by Malaysian Indians of Tamil origin. Due to the urbanization there is a declination among the young people leaving in rubber estates which resulted lower enrolment in the Tamil primary schools. Some of the schools also have been relocated to major urban areas where the majority of the populations are Indians (Department of Statistic, 2012).

Tamil primary schools play an important role in developing talented generations as well as National and Chinese type primary schools in Malaysia. All types of primary schools are sharing similar curriculum specifications in all the subjects except the Tamil and Chinese language in both Tamil and Chinese type of vernacular schools (Curriculum Development Centre, 2001). Based on the perspective of this study, teaching and learning mathematics carried out in all primary schools is based on the similar curriculum specifications. The medium of the language used in teaching mathematics in Tamil primary schools is in dual English and Tamil language while the other types of schools are in also in Malay, Chinese and English language (CDC; MOE, 2001). Even though the equal time period allocated for all types of schools for teaching mathematics, comparatively the performance of Tamil primary schools in mathematics is still lack behind from the other types of primary schools in Malaysia (Department of Statistics, 2012).

## 2.2 Perspectives of Effective Teaching and Learning Mathematics

Talking about teaching, we have to define first what we mean by *effective teaching*. Three main perspectives on effective teaching reviewed in this study. One perspective defines effective teaching

in terms of what teachers they themselves consider effective teaching to be all about (Young & Shaw, 1999). After conducting a meta-analysis of 31 studies, Feldman (1988) concluded that faculty's three top choices of instructional dimensions were a) knowledge of the subject, b) enthusiasm for teaching or for the subject, and c) sensitivity to, and concern with , class level and progress, in that order.

The second approach defines effective teaching from a student's perspective (Young & Shaw, 1999). Feldman (1988) found that students' top choice of effective teaching were, in order of importance: a) sensitivity to, and concern with, class level and progress, b) teacher's preparation; organization of the course, and c) teacher's stimulation of interest in the course and its subject matter.

The third approach is to regard effective teaching as those instructional techniques and practices both teachers and students agree to be effective. Feldman (1988) also found that both students and teachers concur in defining effective instruction in terms of course preparation and organization of the class. And yet, discrepancies remain between teachers and students. If judged under the lenses of the schools, then effective teaching would be defined in terms of knowledge and holding high standards.

Mathematics teaching is also involves practices that the teachers performs prior to the teaching or during the teaching (Stacey & Vincent, 2009). The practices comprises of deciding on the objectives of the lesson; instructional strategies to be used in line with the objectives; planning of the lesson, and methods to effectively assess students' work (Hill, Rowan & Ball, 2005). On the contrary, learning reflects on the students' participation in the classroom. Teaching began as early as the teacher start to think about what to teach in the next lesson (Stigler & Heibert, 1999).

In delivering effective teaching, the teachers need to identify the ways to implement learning so that the objective of the lessons could be achieved using appropriate instructional strategies (Morris & Hiebert, 2011). For this, teachers and students collectively agreed that teacher's preparation constitutes an important aspect of effective teaching practices (Feldman, 1988).

Thus, effective planning of the lessons in preparing the lesson resulted in improved learning of mathematics (Leikin, 2006). Instructional techniques and the learning styles used by the teachers were also another factor that determines the effectiveness of a teaching (Young & Shaw, 1999). Therefore for the purpose of this paper, the study aims to draws on lesson planning through

three LS cycles of one Tamil primary school out of three schools participated in this study.

### 3 THEORETICAL BACKGROUND

#### 3.1 Lesson Study Process

Lesson Study is a collaboration-based teacher professional development approach that originated in Japan (Fernandez & Yoshida, 2004). It provides a chance for teachers to reflect collaboratively on their planning and teaching of their daily lesson. Lesson Study is also positioned around teachers' interests, is learner motivated, provides opportunities for teachers to be researchers, provides ample of time and opportunities for the teachers to reflect on their teaching practices and student learning (Murata & Takahashi, 2002, p.10). Furthermore (Hiebert et al., 2002) stated that *LS* is a teaching improvement and knowledge building process that has its origins in Japanese primary education.

In *LS*, teachers tend to work in a small team to plan, teach, observe, analyses, and refine individual class lessons, called as research lesson. One main reason for the admiration of Lesson Study process, that it provides Japanese teachers with opportunities to make sense of educational ideas within their practices; change their perspectives on teaching and learning; learn to see their practice from a learner's viewpoint; and enjoy collaborative support among their colleagues (Takahashi et al., 2006, p.201).

Lesson study process is also said to be premised on the Confucian saying that, “*seeing something once is better than hearing about it one hundred times*” (Corcoran & Pepperell, 2011). Its crucial purpose is to gain new ideas about teaching and learning based on a better understanding of children's thinking so the observation of actual research lessons is at the core of the lesson study process. Yet, the Lesson study cycles encompasses much more than studying children's responses while observing lesson. It requires point dedicated to intensive *kyozaiikenkyu*- a process in which teachers collaboratively investigate all aspects of the content to be taught and instructional materials available – and to *jyugyokentuikai*- the post-lesson review session (Takahashi et al., 2006). The main feature of Lesson study process is collaborative planning and reflection that does not shy away from a critique of practice focused on the results of the group's work rather than on any individual. In these ways, it appears to offer teachers an opportunity to pool their collective teaching skills in situ as they adopt research goals appropriate to a particular school context for their lesson study

process. In Japan, where it is an integral to schools, Lesson Study is often credited with the success of Japanese students in international comparisons of mathematical achievement (Stigler & Hiebert, 1999). Internationally, there has been an increase in cross-cultural study of ways of teaching mathematics, and a growing interest in using lesson study as a basis for improving teaching in a variety of other contexts, most notably in Malaysia.

#### 3.2 Quality of the Lesson

Stigler & Hiebert (1999) stated about the importance of a mathematics lesson in three main components: reviewing previous content related to the new lesson (by teacher and students), student working mathematical task (by students) and sharing ideas (by students) in a summarizing whole- class discussion that identifies the lesson outcome (by teacher and students). The quality of mathematics teaching and learning is also depends on the teachers' notions of the objectives of the mathematical task given and monitored (Jaworski, 1992). Therefore, planning stages prior to classroom teaching is very important in determining the understanding of the students towards the lesson and achieving the planned learning outcomes.

### 4 THE STUDY

The researcher (first author) invited the school to participate in the larger study consist of seven different type of primary schools from three various states of Malaysia. Particularly, mathematics teachers were involved mainly intended to improve their teaching methods in classroom teaching practices. However, for the purpose of this study, one out of the three vernacular Tamil primary schools was chosen to investigate the changes in lesson planning through three *LS* cycles conducted continuously throughout the study. The *LS* team of school Y (with fictive names) a sub-urban school completed three cycles in the school year 2011-2014.

#### 4.1 Participants

Two primary mathematics teachers from school Y identified volunteered to participate in this study. Among the two participating teachers one teacher *Muru* was an experienced with >20 years and the other was teacher *Sara* with <5 years of mathematics classroom teaching experiences in primary schools. In this study, the researcher presumed the role of a participant-researcher and

as a researcher during the implementation of the lesson study process.

## 4.2 Data Collection Procedures

This paper described research findings by a qualitative illustrative resulting during three LS cycles Data were collected mainly through artefacts such as lesson plans and students' worksheets, video observations and audio-recordings of individual interviews with the teachers and post-lesson reflections in the larger study. For the purpose of this paper, three lesson plans collected from every LS cycles and classroom observations which were video-recorded were analysed qualitatively. The procedure of the study consist of: (i) lesson planning by the LS group, (ii) teaching the planned lesson by one of the teachers and observation by other members of the LS group, (iii) reflecting on the lesson collaboratively to plan an improved the revised lesson, (iv) teaching the revised lesson by one of the teachers in another classroom and observed by the team members again, and (v) collaboratively conducting a final reflection session. The findings ultimately focus on three lesson plans prepared by both teachers *Sara* and *Muru* as they were agreed to teach the lesson by turns. It has enabled better analysis of the changes in teaching practices. The first cycle focus on the topic of coordinate, second cycle on the two dimensional shapes both for Year 4 students and the third cycle on the length for Year 6 students.

## 5 RESULTS AND DISCUSSION

This paper attempt to describe the identified changes in three lesson plans in throughout three LS cycles and connected the mechanisms of the changes in the teaching practices.

### 5.1 Emerging Themes on Lesson Plan Analysis

The type of analysis presented in this paper was based on the sub-sections of the lesson structure and lesson setting as described above. However, in both the *lesson structures* and *settings* were merged together as the following categories: *learning objective, opening of the lesson, concept development which includes the structure of concept development process and lesson ending* The results were discussed below after an in-depth analysis of the three lesson plans obtained from school A.

### 5.1.1 Learning Objectives

Young (1979) highlighted an old proverb, which denotes the importance of defining objectives as, "If you don't know where you are going, any road will take you there." This saying clearly indicates that one has to decide first where to go. In this point, learning objectives in a lesson plan are an objective which shows the teacher the direction where to go. They are ends to be achieved at the end of any lesson as the result of instructional activities. Hence, in this study while analysing the lesson plans from the three LS cycles, the learning objectives were argued in two categories that as general and specific objectives. General objectives were defined as general learning goal which is not much related in-detail with the topic of the lesson or clearly defined as implicit ones. Nevertheless, specific objectives were referring as very specific and in-detail goal with mathematical concepts related to the topic of the lesson and which is measurable.

The following Table 5.1 below clearly displays the excerpts of the general and specific learning objectives obtained from the three research lessons throughout the three LS cycles of school A.

Table 5.1: Excerpts of Learning Objectives

1 <sup>st</sup> LS cycle	2 <sup>nd</sup> LS cycle	3 <sup>rd</sup> LS cycle
<b>Topic: Coordinate</b> <b>Year : 4</b>	<b>Topic: 2-D Shapes</b> <b>Year: 4</b>	<b>Topic: Length</b> <b>Year: 6</b>
<ol style="list-style-type: none"> <li><b>Identify</b> components of the Cartesian plane, including the horizontal axis and vertical axis.</li> <li>To <b>understand</b> coordinates, that have to move across first and then up or down.</li> <li>To <b>identify</b> coordination at the first quadrant.</li> <li><b>Name</b> the position of objects given in Cartesian plane.</li> </ol>	<ol style="list-style-type: none"> <li><b>Identify</b> the sides of 2-D Shapes.</li> <li><b>Measure</b> and <b>record</b> the perimeter of square, rectangle and triangle.</li> <li><b>Calculate</b> the perimeter of 2-D Shapes -square, rectangle and triangle.</li> </ol>	<ol style="list-style-type: none"> <li>Pupils will <b>compute</b> length from a situation <b>expressed</b> in fraction</li> </ol>

The topic taught in school A at the first LS cycle was among the newly integrated topic in mathematics curriculum of Year 4 by the Curriculum Development Centre, (MOE, 2013). The learning objectives plan in school A at this cycle were very detail and in explicit manner. The

four learning objectives planned in the lesson demonstrates the combination of relational and instrumental understanding as suggested by (Skemp 1976) in his article titled “Instrumental understanding and relational understanding”. The learning objectives were classified in terms of specific learning objectives. This well-planned learning objective in the lesson plan stimulates the sense of making mathematical concepts of the topic. But then, the orders of the objectives drawn in the plan were not heuristically follows from mathematical understanding to conceptual terms of learning objectives. For instances, as the first learning objective exhibits that identifying components of the Cartesian plan followed by understanding coordinates, again identifying coordination at the first quadrant and finally naming the position of objects given in the plane. The participant teachers upon their first lesson plan refining session outcome could have combined the key terms of learning objectives accordingly as understanding, identifying and followed by naming. The researcher felt that there are too many learning objectives to be focused at one time within one hour lesson. The time allocated for the lesson might be short to achieve the four learning objectives at once and it might interrupt students’ understanding process. Nevertheless, sequencing the position of the terms was not given much attention, the lesson plan none other demonstrates a detailed planning on the learning goal to be achieved by the students at the end of the lesson.

Ensuing to the second (2<sup>nd</sup>) LS cycle, the lesson planned in school A was on the topic of Shape and Space (2-D Shapes) of Year 4 clearly exemplify the three specific learning objectives as identify the sides of 2-D shapes, measure and record the perimeter of square, rectangle and triangle and finally calculate the perimeter of 2-D Shapes(square, rectangle and triangle).Upon, experiencing the participation in one complete Lesson Study cycle, the participants teachers shows some positive changes in their planning of the lesson particularly at the learning objectives section. The learning objectives in this lesson were well-ordered planned in a way as identifying, measuring, and recording. The objectives planned were based on chronological manner as understand the mathematical concepts, practice, evaluate and apply where it proceeds to instrumental understanding of the topic.

Here at the third LS cycle, a single sentence of learning objectives planned in School A reflects a one-hour lesson content to be taught. The teachers planned as, ‘at the end of lesson the pupils were able to **computer length** from a **situation expressed in fraction**’. The word ‘compute length’ did not exhibits the specific units of length since

there are many type of units and terms in length are available in the topic. The word ‘a situation expressed in fraction’ also did not clearly mentioned what was the situation expressed in fraction and it was very general and broad. There are many types of fraction as well in the content of the fraction topic. It did not reflect any specific units of length as similar to the types of fractions. What are the units of length mentioned here? What type of fraction expressed here as there are many?

### 5.1.2 Lesson Opening

To start a good lesson of the day introduction is an important element that attracts students’ attention and interest towards the progress of a lesson. Opening of the lesson constitutes an important aspect in lesson planning. Opening of the lesson or more specifically introduction of the lesson in this paper were reviewed on six different subcategories as: *reviewing the previous knowledge; mathematical content focus; usage of concrete objects and tools; posing problems, real-life situations; hands-on activities; and demonstrations*. In the following section the information about how opening of the lessons evolved throughout the 3 Lesson Study (LS) cycles in school A will be presented according to the aforementioned characteristics of an opening.

Well, no indication noticed in lesson plan of school A to reflect on the prior knowledge of the students during the LS cycle 1. This lesson was planned to teach by one of the teacher called Muru (pseudonym name) from the LS team. This experienced teacher initially plan the lesson with his LS participant team based on the outcome of the group discussion as suggested in the Lesson study process. Instead of reviewing the previous knowledge of the students, lesson plan in cycle 1 were planned to pose few types of open-ended questions to the students. Students were questioned regarding their general knowledge regarding the lesson topic that knowledge about their daily-life situations from their school to home. Ideally, the challenging questions prompt students’ general knowledge relates to the content of the lesson. Following excerpts were the details obtained in lesson plan of LS cycle 1 from the school A:

“Where is the Kaliamman Temple?”  
 “Can you explain the location of the temple?”

However, teacher Sara noticed to review out the students’ earlier knowledge during LS cycle 2 and cycle 3. In LS cycle 2, the intention reflected in a superficial manner whereby general questions were posed to the students. Following excerpts were the information identified in lesson plan of LS cycle 2 from the school A as:

*“Recall pupils’ previous knowledge of 2D shapes”  
“Show diagrams of 2D shapes and ask pupils to name the shapes”*

The topic of the lesson in this cycle was planned as: Shape and Space of 2D shapes. Generally, at the beginning of the lesson teachers plan to just recall their knowledge about the 2D shapes. Teacher use demonstration method to show the diagrams and ask the pupils to name the shapes. Apparently, the reviewing of the previous knowledge in this plan shows that the participant teachers intend to change the opening of the lesson after the in-depth discussion outcome in setting the goal for the *LS* cycle 2. This is obviously showing that after the *LS* cycle 1, the participant teachers become more focus and precise in designing their opening of the lesson.

On more detail, it can be seen in planning of the lesson of *LS* cycle 3 the teachers intention to derive the previous knowledge appears to be clear. The excerpt obtained from the lesson plan which was planned to teach by teacher Sara during *LS* cycle 3 of school A.

*“Recall pupils’ previous knowledge of concepts / terms/ formulas listed below:”*

- reading and measuring length
- conversion of units
- calculation of length
- multiplication of fraction

### **The Changes**

The two participant teachers started to work in more collaborative manner focusing on learning objective of the lesson. The changes in the planning stage show that participation in Lesson study process is worthwhile. It could be surmised that with the progress of *LS* cycles the teachers’ intention to identify of the students’ prior knowledge is further improved. On presenting the opening of the lesson school A exhibited that the beginning of the lesson was planned based on posing problems in related to the number sentences and mathematical word problems.

### **5.1.3 Concept Development**

The concept development analysed from the three lesson plan collected from the three *LS* cycles includes type of grouping, tasks given and materials and representations. *Concept Development* in the lessons are intended to assess and develop students’ understanding of fundamental concepts through activities that engage them in classifying and defining, representing concepts in multiple ways, testing and challenging common misconceptions and exploring structure. Research has shown that individual, routine practice on standard problems does little to help students deepen their

understanding of mathematical concepts. Teaching becomes more effective when existing interpretations (and misinterpretations) of concepts are shared and systematically explored within the classroom. The structure of concept development lessons simply includes whole class discussion, collaborative work on a substantial activity, students share their thinking with the whole class and students revisit the assessment task.

At the first *LS* cycle, the lesson plan exhibits the posing of the problems by the teacher using whole class introductions. The main activity in this lesson was solving problems with modifying situations and exploring their structure. Next, the lesson plan continued with individual solution methods.

The excerpts of the lesson plan given below:

- Teacher explains the correct way.
- Teacher gives example
- Teacher present
- Teacher explain and students were ask to name the location.

At the second *LS* cycle, the lesson plan was plan more to collaborative work activities such as classifying mathematical objects, interpreting multiple representations, evaluating conjectures and assertions and modifying situations and exploring their structure. Excerpts obtain from the lesson plan in *LS* cycle 2.

- Pupils are divided into group of three.
- Ask pupils to look around the class and choose a thing.
- Ask pupils to measure and think.

The lesson plan drafted at the third *LS* cycle, demonstrated that the lesson concept developments started with collaborative work on a substantial activities where students exploring the structure of problems. Here, it was plan such as the students were given the task of devising their own mathematical problems. They try to devise problems that are both challenging and that they know they can solve correctly. Students first solve their own problems and then challenge other students to solve them.

Excerpts of the lesson plan at the third *LS* cycle given below:

- Teacher gives 50cm ribbon/string to measure.
- Get another pupil to divide the same ribbon.
- Pose questions to the class.
- Presentations
- Hands-on activities
- Worksheet assessments

### *The Changes*

The concept development process while the progress of LS cycles changes simultaneously. The lesson planning stages changes into in-depth and conceptually organised planning while the teachers emerged themselves in LS process. The concept development process slowly adapting the structure of the concept lesson as completing task before the content introduction, whole class introduction, collaborative work on a substantial activities, students share their thinking with the whole class and completing the assessment tasks given.

#### **5.1.4 Lesson Ending**

The themes on the lesson ending discussed in this paper consist of the lesson ends with interactive activities, revising the concept development, repeating the set induction activities. Lesson plan in the first cycle exhibits a very general summary and announcement of the next lesson. Further, the closing of the lesson demonstrated answering teacher's questions towards understanding of the content.

At the second cycle, the lesson was planned to end with an worksheet assessments, emerging of real-life problems and complete summary of the lesson.

The excerpts of the lesson plan below:

- Introduction to real-life problem and summary
- Teacher gives two real-life problem involving perimeter.
- Students discuss and solve the problem.

While at the third LS cycle, the lesson was planned exhibits the similar as the second lesson plan contents. The only changes were the topic of the lesson.

### *The Changes*

The lesson ending clearly revealed some changes in the planning of the lesson plan throughout the three cycles. The teachers tend to realise the importance of the summing-up the lesson towards deep understandings on the contents of the lesson.

### **5.2 The Mechanism of Changes in Teaching Practices**

The changes in Sara and Muru's teaching practices between the three lessons were an important effect of the quality of the classroom lesson. In this case, John Mason (2002) stated that the importance of teacher consciousness and perceiving for learning through teaching. Mason (2010) suggested that collaboration between teachers strengthens learning from teaching. As he pointed out; that by

collaborating teachers can perform with higher spiritual processes to and with each other. This could make them grow in and into the community of teaching practices (Mason, 2010). The positive manner of changes among the participating teachers manifested themselves when they reflected on their own practices from a new perspective while participating in LS process. The changes in teaching practices occurred within a short stipulated time period. Researcher beliefs that the two teachers who participated in the lesson study process in school A gained a new awareness after initialling how their own teaching practices impacted their mathematics classroom discourse and this led them to re-examine their own beliefs about teaching and learning.

### **5.3 Conclusion and Implications**

These findings indicate that Lesson Study may encourage teachers learning to critically reflect on their own teaching practices through detailed lesson planning. Participant teachers who participated in Lesson Study process transformed their teaching strategies after sharing the idea of Lesson Study with their peers. Continued observation over a year indicated that the two participating teachers maintained these changes in planning and teaching further while continued observation will indicate whether these changes become embedded into their daily teaching practices. This study also supports other research findings that teaching practices changes require a social group to identify shared experiences through critical reflections on planning the lesson and create a new era to promote this professional development model. Other additional research studies are also needed to identify other aspects of Lesson Study process that develop teachers' instructional and pedagogical skills.

**Abstract:** This study is to investigate teachers assessment techniques used and to evaluate its effectiveness for students learning in classroom using open lesson study in schools. The teacher can play an important role in assessing the students' progress by various techniques appropriately with nature of subject and students' developmental level. The assessment technique used in most schools still emphasizes on learning achievement, especially the achievement obtaining from testing. The assessment by test do not measure students' real condition, and could not assess both of product and process which the students have had real practice. Students assessment while they are participating in classroom activity is the most necessary thing to be done. In classroom using the assessment for supporting one's learning, the teacher should adjust teaching continuously in order to see changes in students' learning. Effective teachers have learning objectives for their students and use assessments to see progress. This research focuses on the effectiveness of assessment techniques used against the intended objectives to be achieved by teachers in class room using open lesson study. Three subject-based open lessons from three different primary and junior schools observed by teachers who participate in lesson study. Teachers observe the open lesson and evaluate the lesson using lesson observation checklist extracted from standard matrix. The three observed lessons analyzed qualitatively and presented descriptively. The result showed that performance assessment of the group work based on observation and judgment is dominantly used by the model teacher in all three open lessons; and 48.8% observers in SD UPI lab school, 65.3% observers in SD Negeri Tanjungsari I school and 41.6% observers in SMP Negeri 26 agreed that the teacher use appropriate class room assessment techniques. In general the three lessons contain basic/necessary information and the lesson objectives were SMART. The lesson plan has appropriate assessment techniques coherent with the lesson objectives. Further teacher cooperative learning through lesson study in such schools should be practiced for improvement of class room assessment techniques.

**Key words:** lesson study, Indonesia University of Education, classroom assessment technique classroom based assessment

### 1 INTRODUCTION

Assessment is the systematic collection, review, and use of information about educational programs undertaken for the purpose of improving learning and development (Palomba & Banta, 1999). Assessment can be done at various times throughout a program and a comprehensive assessment plan will include formative and summative assessment. The point at which the assessment occurs in a program distinguishes these two categories of assessment (formative and summative). Formative assessment is often done at the beginning or during a program, thus providing the opportunity for immediate evidence for student

learning in a particular course or at a particular point in a program. Classroom assessment is one of the most common formative assessment techniques. The purpose of this technique is to improve quality of student learning and should not be evaluative or involve grading students. This can also lead to curricular modifications when specific courses have not met the student learning outcomes. Summative assessment is comprehensive in nature, provides accountability and is used to check the level of learning at the end of the program. For example, if upon completion of a program students will have the knowledge to pass an accreditation test, taking the test would be summative in nature since it is based on the

cumulative learning experience. Program goals and objectives often reflect the cumulative nature of the learning that takes place in a program. Thus the program would conduct summative assessment at the end of the program to ensure students have met the program goals and objectives.

The purpose of class room assessment is to improve the quality of student learning, not to provide evidence for evaluating or grading students. It provides faculty with feedback about their effectiveness as teachers, and it gives students a measure of their progress as learners. The aim of classroom assessments is to provide faculty with information on what, how much, and how well students are learning. Such assessments are created, administered, and analyzed by teachers themselves. Classroom assessment can also provide important program information when multiple sections of a course are taught because it enables programs to examine if the learning goals and objectives are met in all sections of the course. It can also improve instructional quality by engaging the faculty in the design and practice of the course goals and objectives and the course impact on the program.

The assessment for developing the students' learning, Rob-inson & Bartlett (1993) stated that it was in context of instructional management as the process in trying to understand the students' activity participation. It was more than testing since it should be continuously and regularly performed in order to see the students' understanding in the process, interaction, and application. It was not the last step of instructional activity. But, it was the starting point for enhancing the students' learning. It was supported by Miyauchi (2010) that the children's assessment while they were participating in classroom activity was the most necessary thing to be done. In order to accomplish curriculum objective, teacher should collect data of students' changes and progress of thought and comprehension. White (2007) suggested that assessment should be seen as a process for gathering evidence and making judgment about students needs strengths, abilities and achievements. So, when the assessment was spoken, the process should be emphasized rather than produced. In classroom using the assessment for supporting one's learning, the teacher should adjust teaching continuously in order to see the students' changes (Leahy et al., 2005). Black & William (1998) concluded the research studies regarding to the occurrences in class as follows:

Firstly, to set the problem as guidelines for students to use their skill as well as apply their approach  
Secondly, to provide opportunity for students to communicate what they had learned by drawing, acting, role playing, concept mapping, an

d Thirdly, to observe by listening to the students while they were explaining and reasoning  
Fourthly, to set question by using open-ended problem situation as the phrase inviting the students to explore their own approach and reason,  
Fifthly, to dis-cuss the words or techniques used by the students.

### 1.1 Classroom Assessment Techniques (CATs)

Classroom assessment techniques include a wide range of activities that may be grouped into the categories of summative or formative. Summative assessment techniques (e.g. testing and student ratings of instruction) are evaluative, occur at the end of learning, and, for the most part, are used to determine the extent to which learning has been retained. Formative assessment is reflective, student-centered, and used as an ongoing process to improve learning. Formative assessment allows for the correction, clarification and adjustment, by both teacher and student, to information prior to summative assessment (Adams, 2004). Formative classroom assessment techniques are linked to cognitive learning theory (Steadman, 1998), which focuses on how information is processed.

Classroom assessment focuses the primary attention of teacher and students on observing and improving learning, rather than on observing and improving teaching. To improve learning, it may often be more effective to help students change their study habits or develop their metacognitive skills (skills in thinking about their own thinking and learning) than to change the instructor's teaching behavior. In the end, if they are to become independent lifelong learners, students must take full responsibility for their learning. To achieve that end, both teachers and students will need to make adjustments to improve learning. Classroom assessment can provide information to guide them in making those adjustments (Angelo and Cross, 1993).

The use of CATs assumes that students must receive ungraded feedback, early and often, that students need to assess the quality of their own learning, and that students can assist in improving course instruction.

Angelo and Cross (1993) provide a list of the various CATs, which differ in complexity and the time they take to prepare, administer, and analyze. CATs also vary in use, based on instructional needs; however, a few of the most frequently mentioned CATs in the literature include: *the Minute Paper* – a one-minute writing assignment asking students to write about what they thought was the most important point made in class on a given day; the one-sentence summary; *the Memory Matrix* – an assignment in which students fill in cells of a diagram for which the instructor has

provided labels; and *the Muddiest Point* – a short writing assignment asking students to provide information on what they find least clear or most confusing about a particular lesson or topic.

On-going assessment of student learning is an essential aspect of effective teaching. Teachers can use a variety of assessment methods to diagnose students’ strengths and needs, plan and adjust instruction, and provide feedback to students and parents regarding progress and achievement. The primary purpose of classroom assessment is improving learning not to sort and select students or to justify a grade. Regardless of the particular methods employed, effective classroom assessment is guided by three fundamental principles. Classroom assessment should: promote learning, use multiple sources of information, and provide, fair, valid, and reliable information. Although there are various assessments, all of the assessments we have experienced fall into one of four basic categories of methods: Selected response and short, extended written, Performance and Personal communication. All four methods are legitimate options when their use correlates highly with the learning target and the intended use of the information.

Observation is the primary assessment method, and immediate descriptive feedback is essential to improving student learning in the multilevel classroom. Because each classroom forms its own culture, teachers play a powerful role as observers, and their professional judgement is valued and integral to quality classroom observation. Observation provides teachers in multilevel classrooms with an effective and efficient way to explore their students’ thinking. Assessment is an ongoing process aimed at understanding and improving student learning. It involves making our expectations explicit and public; setting appropriate criteria and high standards for learning quality; systematically gathering, analyzing, and interpreting evidence to determine how well performance matches those expectations and standards; and using the resulting information to document, explain, and improve performance. When it is embedded effectively within larger institutional systems, assessment can help us focus our collective attention, examine our assumptions, and create a shared academic culture dedicated to assuring and improving the quality of higher education (Angelo, 1995.)

### 1.2 Performance-Based Assessment

By performance based assessment, we are referring to assessment activities that directly assess student’s understanding and proficiency. These assessments allow students to construct a response, create a product, or perform a demonstration to show what they understand and can do. Since they call for students to apply knowledge and skills

rather than simply to recall and recognize, performance-based assessment are more likely to reveal student understanding. They are well suited to assessing application of content specific knowledge, integration of knowledge across subject area, and lifelong learning competencies such as effective decision making, communication and cooperation (Sheppard, 1989). Using performance assessment, teachers are able to directly observe the application of desired skills and knowledge. Performance assessments can be among the most authentic types of student assessment since they can replicate the kind of actual performances occurring in the world outside of school.

Investigations of teachers’ assessment practices revealed that teachers were not well prepared to meet the demand of classroom assessment due to inadequate training ( Hills, 1991; O’Sullivan & Chalnck, 1991). Recent years have seen increased research on classroom assessment as an essential aspect of effective teaching and learning (Bryant and Driscoll, 1998; McMillan, Myran and Workman, 2002; Stiggins, 2002). It is becoming more and more evident that classroom assessment is an integral component of the teaching and learning process (Gipps, 1990; Black and Wiliam, 1998). Ampiah, Hart, Nkhata and Nyirenda (2003) contend that a teacher needs to know what children are able to do or not if he/she is to plan effectively.

Therefore, in viewpoint of students’ learning assessment in class, major issues could be concluded that the evaluation for developing and supporting students’ learning should be emphasized. To improve class room assessment in science subjects, lesson study as a cooperative learning approach, is implemented in many countries. One of the countries implementing lesson study is Indonesia as an example. According to Sagor (2000), lesson study employed to improve it the quality of education. Therefore it is necessary to analyze/investigate class room assessment technique used in lesson study and its effectiveness for students’ learning, since the innovation was used by teachers, as context enhancing the learning in both teachers and students (Inprasitha, 2010).

**Objective of the study:** The objective of this study is to analyze/investigate teachers class room assessment techniques used and its effectiveness for students learning in classroom using open lesson study .

## 2 METHOD

To analyze the effectiveness of teacher’s classroom assessment techniques for Students Learning in Implementing Lesson Study, three open lessons (subject-based and school –based lesson study) from three different primary and junior schools

observed. The schools selected for such purpose are: SD Negeri Tanjungsari I, SD UPI lab school and SMP Negeri 26. Negeri Tanjungsari I primary school is located in Sumedang district but SMP Negeri 26 and SD UPI lab school are found in Bandung .All the school subject teachers participating to the open lesson were used to evaluate the effectiveness of classroom assessment techniques used by the model teacher .The three lessons observed were science and mathematics. Subject-based lesson was observed in UPI lab school and SD Negeri Tanjungsari I school and school-based lesson observed in SMP Negeri 26 School. Teachers observe the open lesson and evaluate the lesson using lesson observation checklist which is extracted from standard matrix (MOE,2014). The three observed lessons analyzed qualitatively and presented descriptively. The teachers evaluation of assessment techniques used then interpreted using the standard matrix. The response of lesson observer against given criteria

for lesson objective and classroom assessment techniques applied in three schools was analyzed and evaluated further and the results of the research work were summarized using tables.

### 3 RESULT

#### 3.1 Description of Study Participants

A total of 52 teachers in three different schools were included in this study for lesson observation. The mean year of service in teaching of all the study participants was 17 years with range from 3 to 36 years. Teachers that participate in lesson observation were subject teachers. Of the total 52 teachers, 42 teachers have bachelor degree, have masters degree and the remaining 4 teachers didn't show their academic qualification. Therefore dominantly the lesson observers have bachelor degree.

**Table 1:** School name, number of participants and their average year of service

School name	Total teachers	Average year of service	School location	Grade level
SD UPI Lab school	18	23	Bandung	primary
SD Negeri Tanjungsari I	19	16	Sumedang district	Primary
SMP Negeri 26	25	13	Bandung	junior
Total	52			

#### 3.2 General information of the lesson plan

The lesson plan of the three schools have the necessary general information like the rational, learning contents , teaching and learning activities ,

assessment, time for each stage of the lesson, teaching and learning materials and learner's support. But time for each stage of lesson in SMP Negeri 26 school is not shown clearly. For each criterion the response of lesson observer is shown in table 2 bellow.

**Table 2:** Teachers response to the lesson plan general information

Evaluation Criterion	SD UPI Lab school		SD Negeri Tanjungsari I		SMP Negeri 26	
	Yes F (%)	No F (%)	Yes F (%)	No F (%)	Yes F (%)	No F (%)
Rationales	14 (77.7%)	4 (12.3%)	17 (89.5%)	2 (10.5%)	14 (56%)	11 (44%)
Objectives	18 (100%)	0 (0%)	19 (100%)	0 (0%)	24 (100%)	0 (0%)
Learning contents	18 (100%)	0 (0%)	19 (100%)	0 (0%)	25 (100%)	0 (0%)
Teaching and Learning (T&L) Activities	18 (100%)	0 (0%)	19 (100%)	0 (0%)	24 (96%)	1 (4%)
Assessment/Evaluation	18 (100%)	0 (0%)	17 (89.5%)	2 (10.5%)	19 (76%)	6 (14%)
Time for each stage of the lesson	18 (100%)	0 (0%)	19 (100%)	0 (0%)	6 (14%)	19 (76%)
Teaching and Learning (T&L) Materials	18 (100%)	0 (0%)	19 (100%)	0 (0%)	20 (80%)	5 (20%)
Learner’s Support	18 (100%)	0 (0%)	19 (100%)	0 (0%)	22 (88%)	3 (12%)
<b>Total</b>	<b>140 (97.2%)</b>	<b>4 (2.8%)</b>	<b>146 (96%)</b>	<b>6 (4%)</b>	<b>154 (77%)</b>	<b>46 (23%)</b>

### 3.3 Lesson plan objectives:

As shown in table below the lesson plan is specific, measurable, attainable, relevant, and time-framed and contains the three domains (cognitive,

psychomotor and affective) of learning objectives. The lesson observer respond to characteristics of lesson objectives (how SMART) of the lesson. The result showed that in SD Negeri Tanjungsari I it is 96.5%, In SMP Negeri 26, 82% and in UPI Lab School, 72% as shown in table below.

**Table 3:** Teachers response to the lesson plan SMART characteristics

Evaluation Criterion	SD UPI Lab school		SD Negeri Tanjungsari I		SMP Negeri 26	
	Yes F (%)	No F (%)	Yes F (%)	No F (%)	Yes F (%)	No F (%)
<b>Objectives of the lesson has the following characteristics/ SMART/</b>						
Specific	16 (88.8%)	2 (1.2%)	19 (100%)	0 (0%)	23 (92%)	2 (8%)
Measureable	18 (100%)	0 (0%)	19 (100%)	0 (0%)	25 (100%)	0 (0%)
Attainable	18 (100%)	0 (0%)	15 (78.9%)	4 (21.1%)	19 (76%)	6 (14%)
Relevant	18 (100%)	0 (0%)	19 (100%)	0 (0%)	23 (92%)	2 (8%)
Time-framed	18 (100%)	0 (0%)	19 (100%)	0 (0%)	11 (44%)	14 (56%)
Consisting of three domains (cognitive, psychomotor and affective)	17 (94.4%)	1 (5.6%)	19 (100%)	0 (0%)	22 (88%)	3 (12%)
<b>Total</b>	<b>108 (72%)</b>	<b>3 (28%)</b>	<b>110 (96.5%)</b>	<b>4 (3.5%)</b>	<b>123 (82%)</b>	<b>27 (18%)</b>

### 3.4 Planed Assessment Techniques Characteristic

The characteristic of planned assessment techniques of the lesson based on the given criteria is evaluated and the result is shown below in table 4.

Table 4: Teachers response to the planed objectives of the lesson

Evaluation Criterion	SD UPI Lab school		SD Negeri Tanjungsari I		SMP Negeri 26	
	Yes F (%)	No F (%)	Yes F (%)	No F (%)	Yes F (%)	No F (%)
Appropriate technique (Q&A, Class Activities, observation used)	15 (83.3%)	3 (16.7%)	19 (100%)	0 (0%)	17 (68%)	8 (32%)
Coherent with the lesson objectives	17 (94.4%)	1 (5.6%)	17 (89.5%)	2 (10.5%)	21 (84%)	4 (16%)
Relevant to learning contents	18 (100%)	0 (0%)	19 (100%)	0 (0%)	24 (96%)	1 (4%)
Indicate every stage of learning activities	16 (88.8%)	2 (11.2%)	16 (84.2%)	3 (15.8%)	19 (76%)	6 (24%)
Adequate to assess students learning.	16 (88.8%)	2 (11.2%)	14 (73.6%)	5 (26.4%)	18 (72%)	7 (28%)
Consider diverse individual learning needs	17 (94.4%)	1 (5.6%)	13 (68.4%)	6 (31.6%)	10 (40%)	15 (60%)
<b>Total</b>	<b>99 (91.6%)</b>	<b>9 (8.4%)</b>	<b>98 (85.9%)</b>	<b>16 (14.1%)</b>	<b>109 (72.6%)</b>	<b>41 (27.4%)</b>

### 3.5 Appropriateness of assessment techniques used by the teacher

Observers have evaluated again the appropriateness of the assessment techniques used by the teacher.

Accordingly, 65.3% teachers at SD Negeri Tanjungsari I, 41.6% at SMP Negeri 26 and 48.8% at UPI lab school agreed that the assessment techniques used by the teacher was appropriate and the remaining observers disagree on the appropriateness as shown below in table 5.

Table 5: Observers response to the appropriateness of assessment techniques used by teacher

Evaluation Criterion	SD UPI Lab school		SD Negeri Tanjungsari I		SMP Negeri 26	
	Yes F (%)	No F (%)	Yes F (%)	No F (%)	Yes F (%)	No F (%)
Teacher does not use appropriate assessment techniques to judge the level of understanding of majority of students on core learning points	8 (44.4%)	10 (55.6%)	7 (36.8%)	12 (63.2%)	13 (52%)	12 (48%)
Teacher hardly uses assessment techniques to judge students' understanding	4 (22.2%)	14 (77.8%)	8 (42.1%)	11 (57.9%)	9 (36%)	16 (64%)
Teacher uses appropriate assessment techniques to judge the level of understanding of majority of students on core learning points	10 (55.6%)	8 (44.4%)	19 (100%)	0 (0%)	16 (64%)	9 (36%)
Teacher uses appropriate assessment techniques to judge the level of understanding of majority of students on core learning points at each step of the lessons.	12 (66.6%)	6 (33.4%)	16 (84.2%)	3 (15.8%)	7 (28%)	18 (72%)
Teacher uses appropriate assessment techniques conducted in the way each student can reflect individual unique learning to judge the level of understanding of majority of students on core learning	10 (55.6%)	8 (44.4%)	12 (63.2%)	7 (36.8%)	7 (28%)	18 (72%)
<b>Total</b>	<b>44 (48.8%)</b>	<b>46 (51.2%)</b>	<b>62 (65.3%)</b>	<b>33 (34.7%)</b>	<b>52 (41.6%)</b>	<b>73 (58.4%)</b>

### 3.6 Lesson objective achievement level evaluation

As a whole observers evaluate to what extent the lesson objectives was achieved/succeed. The result

showed that 59.6% observers at SD Negeri Tanjungsari schools, 58% at SMP Negeri 26 and 52.7% UPI lab school agreed that the lesson objectives was achieved as a whole but the remaining observers disagree on it.

Table 6: Observers general evaluation of the lesson objective achievement level by students

Evaluation Criterion	SD UPI Lab school		SD Negeri Tanjungsari I		SMP Negeri 26	
	Yes F (%)	No F (%)	Yes F (%)	No F (%)	Yes F (%)	No F (%)
lesson objectives achievement level ( as a whole)-After lesson conducted						
The lesson objectives are partially attained by no or few students	11 (61.1%)	7 (38.9%)	11 (57.8%)	8 (42.2%)	13 (52%)	12 (48%)
The lesson objectives are attained partially by majority of students.	11 (61.1%)	7 (38.9%)	14 (73.6%)	5 (26.4%)	20 (80%)	5 (20%)
The lesson objectives are attained by only some students	8 (44.4%)	10 (55.6%)	9 (47.4%)	10 (52.6%)	9 (36%)	16 (64%)
The lesson objectives are attained by majority of students	11 (61.1%)	7 (38.9%)	13 (68.4%)	6 (31.6%)	20 (80%)	5 (20%)
The lesson objectives are attained by all students	5 (38.5%)	13 (61.5%)	9 (47.4%)	10 (52.6%)	7 (28%)	18 (72%)
The lesson objectives are attained by all students and the lesson was inspiring ( make them to do or create something	11 (61.1%)	7 (38.9%)	12 (63.2%)	7 (36.8%)	17 (68%)	8 (32%)
Total	<b>57 (52.7%)</b>	<b>51 (47.3%)</b>	<b>68 (59.6%)</b>	<b>46 (40.4%)</b>	<b>87 (58%)</b>	<b>63 (42%)</b>

### 3.7 Over all evaluation of the lesson (summary)

As shown below the three lesson plan have general information. Objectives of the lesson plan are SMART\* and appropriate for student learning based on Minimum Learning Competencies (MLC). Lessons plan have appropriate assessment techniques that have a coherent link with the lesson objectives. Appropriateness of assessment

techniques used by the teacher was below 50% in SD UPI Lab School and SMP Negeri 26 that needs improvement but in SD Negeri Tanjungsari I it is about 65%. As a whole, the lesson objectives achievement /success level was evaluated. The success was 52.7% in SD UPI Lab school, 59.6% in SD Negeri Tanjungsari I and 26 58% in SMP Negeri.

Table 7: Overall evaluation of the lesson based on the criteria

Criterion	SD UPI Lab school		SD Negeri Tanjungsari I		SMP Negeri 26	
	Yes F (%)	No F (%)	Yes F (%)	No F (%)	Yes F (%)	No F (%)
Lesson plan includes necessary information	140 (97.2%)	4 (2.8%)	146 (96%)	6 (4%)	154 (77%)	46 (23%)
objectives of the lesson plan are SMART* and appropriate for student learning based on Minimum Learning Competencies (MLC).	108 (72%)	3 (28%)	110 (96.5%)	4 (3.5%)	123 (82%)	27 (18%)
Lesson plan has appropriate assessment techniques that have a coherent link with the lesson objectives.	99 (91.6%)	9 (8.4%)	98 (85.9%)	16 (14.1%)	109 (72.6%)	41 (27.4%)
Teacher use(implement) appropriate assessment techniques	44 (48.8%)	46 (51.2%)	62 (65.3%)	33 (34.7%)	52 (41.6%)	73 (58.4%)
As a whole, the lesson objectives are attained by students.	57 (52.7%)	51 (47.3%)	68 (59.6%)	46 (40.4%)	87 (58%)	63 (42%)

#### 4 CONCLUSION

In the observed instructions, students obviously gained opportunities to participate in dynamic classroom activities and discussions. The results of this study showed that the lesson plans in three schools include basic information such as lesson objectives, activities, assessment and teaching and learning materials; and the objectives prepared were SMART. Furthermore, lesson plan has appropriate assessment techniques that have a coherent link with the lesson objectives in all three schools. Matching assessment techniques with the lesson objectives will help to check if the intended objectives are achieved or not.

The result showed that performance assessment of the group work based on observation and judgment is dominantly used by the model teacher in all three open lessons. Observation is the primary assessment method, and immediate descriptive feedback is essential to improving student learning. Because each classroom forms its own culture, teachers play a powerful role as observers, and their professional judgement is valued and integral to quality classroom observation. Observation provides teachers in multilevel classrooms with an effective and efficient way to explore their students' thinking. Teachers learn about their students' strengths and areas in need of support and

development. Furthermore, classroom observation is valid and reliable when teachers are guided by targeted learning outcomes and clear criteria.

Since its introduction in early 2000s, lesson study has been viewed as a promising and powerful approach to professional development and school improvement in Indonesia. Lesson study and action research may be employed to improve it (Sagor, 2000). These movements reflect a fundamental shift of the teacher's role and profession. Since lesson study is implemented in these schools in Indonesia for many times, teachers are considered well developed professionally with regard to classroom assessment. As a result for these particular lessons, the investigation shows that classroom assessment techniques implemented by the teacher was below 50% in SD UPI Lab School and SMP Negeri 26 but in SD Negeri Tanjungsari I it is about 65%. Therefore further cooperative learning through lesson study is important in such schools to improve teachers' classroom assessment techniques.

The lesson objectives achievement by the student was above 50% in all three schools and it needs further improvement. To improve classroom assessment techniques, further cooperative learning through open lesson study should be practiced further. Because lesson study is a pillar in professional development of teachers, it should be widely implemented further.

## 5 ACKNOWLEDGEMENT

This work was supported by Japan international cooperation agency (JICA) and Indonesia university of education financially and technically. Primary and junior secondary School teachers that participated lesson study activity at SD Negeri

Tanjungsari I, SMP Negeri 26, and Indonesia University of education Lab school also assist the research work by responding the research question. Therefore, the researcher would like to thanks all these partners heartily.

<sup>2</sup>*Department of Mathematics, Indonesia University of Education, Bandung, Indonesia  
jsabandar@yahoo.com*

**Abstract:** The purpose of this study was to examine the impact of lesson study on the improvement of Mathematics instruction. The study was guided with the following research questions. 1) what are the impacts of lesson study on Math teachers' professional development? 2) How lesson study influences student learning in Mathematics? The target populations of the study were all Math teachers and 81 students of three grade levels of UPI primary lab- school. To conduct this study direct observation of three open lessons, rating scale questionnaire and videotapes were the methods used to collect data. The data collected through questionnaire analyzed by calculating the percentage. We tried to transcribe the video recorded during the implementation of one open lesson by the schoolteachers and many observers as part of the data analysis. Finally, we applied qualitative analysis to summarize the data collected through questionnaire, videotape and observation. Results argue that participation in lesson study gives Math teachers an opportunity to: improve their knowledge of subject matter, knowledge of pedagogy and knowledge of their students learning. According to the data analysis, each cycle of lesson study has its own contribution to the improvement of Mathematics instruction by affecting teachers' professional development and students learning. As a result, we suggest that Math teachers should apply Lesson Study continuously by considering its impact on their professional development and students learning in order to learn more on students, strategies and materials.

**Keywords:** Lesson study, Mathematics instruction, professional development, student learning

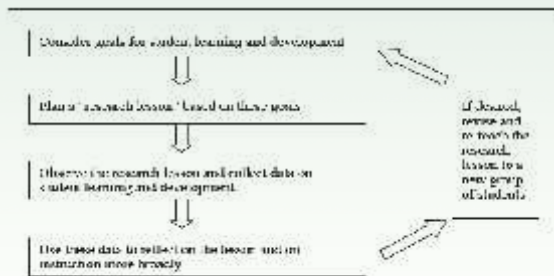

## 1 INTRODUCTION

This qualitative study is part of the ten months third country-training program (TCTP) from February 2014 to November 2014 on capacity development of Mathematics and Science teacher educators of Ethiopia held at Indonesia University of Education. Japan International Cooperation Agency (JICA) supported the training. During this training, Lesson Study was one of the main activities of which the first author of this article expected to have experience. For this reason, the author of this article tried to observe and participate in the implementation of lesson study in learning process in many schools around Bandung -Indonesia. The school under consideration in this study was the one in which around three Mathematics and one Science open lessons conducted and the researcher was involved throughout the three cycles of lesson study such as plan -do - see. The researcher managed to collect data and share experience with the teachers and experts on the way to implement lesson study in Mathematics classrooms of different grade levels. The result of this study will be more significant to the lecturers of Indonesia University of Education to look back on the way of implementing lesson study

in different schools of Indonesia. In addition to this, the study is more significant to the schoolteachers to look at the effectiveness of lesson study to improve their Mathematics instruction and assure their students learning. Last but not the least; the study will be helpful to the researcher as the participant of the Triangular cooperation Training Program for teacher educators among Indonesia, Japan and Ethiopia as the base to implement lesson study in Ethiopian schools.

Lesson study can be defined as a teacher-led instructional improvement process in which a group of teachers are expected to work collaboratively to: formulate goals for student learning, plan a lesson, teach and/or observe the lesson to collect evidence on student learning, reflect on the gathered evidence, revise the lesson for improvement and reteach the revised lesson when necessary (Lewis, 2002). This means during lesson study, teachers have a means for planning, implementing and conferring with their colleagues in school based or subject based approach. In general, from the above definition the Lesson study cycles are as follows.

Figure 1-The brief Summary of Lesson study cycle

Educational standards suggest that students should engage in complex problems that give rise to comprehensive Mathematical understanding (National Council of Teachers of Mathematics, 2000). As a result, Math teachers will have to shift their pedagogy of memorization, repetition, and recitation of correct answers to developing their students' reasoning and communication skills by actively engaging them in the process of teaching and learning as well as problem solving. (Smith, 2001). Professional development helps Math teachers to make pedagogical decisions and strategies for effective instruction in order to understand the Mathematics they teach and the effectiveness of the teaching materials they prepared to teach any particular topic of Mathematics. The most commonly used forms of professional development in different countries include short sessions at meetings, one-to-two day school-based workshops on specific topics, or two-to-three-week workshops in the summer. However, another form of professional development called Lesson Study originated in Japan is being implemented in different countries by different degrees of implementation. Indonesia is one of the countries implementing lesson study for more than ten years. Therefore, this study aimed to examine the impact of lesson study to improve Mathematics instruction in general and its impact on teachers' knowledge of subject matter, pedagogy and student learning in particular. Many educational reform literatures suggest that knowledge for teaching Mathematics is essential to learn how to teach the subject matter in order for students to understand it better (Smith et al. 2005; Hill et al. 2005). According to the National Research Council (2001) an academically rich environment begins with teachers who are knowledgeable in Mathematics, knowledgeable of students' ability and knowledgeable of instructional strategies. Knowledge of subject matter with an understanding of instruction results in a highly

effective teacher (Phillips 2003; Hill et al. 2005). A study conducted by Karim (2006) stated that the implementation of lesson study has the following impacts to improve the quality of Mathematics instruction, namely: 1) It improves the collaboration, collegiality and communication among teachers 2) the implementation of research lesson is opened and observed by internal and external observers to be criticized 3) it empowers Math teachers' association. In this study, we tried to examine whether or not participation of Math teachers in lesson study provides opportunities for them to improve their knowledge of subject matter contents, knowledge of their students' learning and knowledge of different strategies of teaching Mathematics. For that purpose, the research questions are as follows:

Research questions:

1. What are the impacts of lesson study on Math teachers' professional development?
2. How does lesson study influence student learning in Mathematics?

## 2 METHODOLOGY

The target populations of this study were all Math teachers and 81 students of UPI- primary Lab School of three grade levels such as grade three, five and six found inside the campus of Indonesia University of Education. To conduct this study the researcher used direct observation of three open lessons, questionnaire and video tape to collect the data. A questionnaire was prepared for Math teachers who participated in lesson study to examine its impact on their subject matter knowledge, pedagogical knowledge and students' learning within the three cycles of lesson study such as planning, implementation and reflection. The questionnaire was prepared in English language and translated into Indonesian language to make it understandable by all teachers. Three open lessons were observed and two of them were videotaped with the intention of examining how lesson study influences students' learning and teachers' professional development. The Math teachers of the school conducted three open lessons in different grades and different times in collaboration with many teachers from different schools, the TCTP participants from Ethiopia and some lecturers of Indonesia University of Education. The details of the open lessons are shown in the table below.

Table 1: The details of the conducted open lessons  
The Numbers of teachers tabulated in **Table 1**

Date	Grade	Number of Students	Number of teachers /observers	Topic of the lesson
28/03/2014	5	27	29	Prisms and pyramids
12/05/2014	3	30	28	Measuring Area of squares and Rectangles
25/08/2014	6	24	18	flow rate of Water

have participated during the implementation and debriefing sessions of each corresponding open lessons. However, during the planning session of each open lesson the number of teachers was not as much as the other sessions. The researcher’s observation and the comments given by the observers of each open lesson during the planning and reflection cycle are also part of the data for this research. The data collected through questionnaire from the schoolteachers analyzed by calculating the percentage as shown in **Table 2, Table 3 and Table 4**. The teachers were given free choice to strongly agree (SA), agree (A), undecided (UD), disagree (DA) and strongly disagree (SD) up on the given suggestions and their responses are tabulated. We tried to transcribe the video recorded during the implementation of one open lesson by the schoolteachers and many observers as part of the data analysis. Finally, we applied qualitative analysis to summarize the data collected through questionnaire, videotape and observation.

### 3 RESULT

To simplify the presentation of the data obtained through questionnaire, observation and video tape from the teachers and students who participated in lesson study, the researcher tried to examine the impacts of the three cycles of lesson study separately as follows.

### 3.1 Planning Cycle

To examine the impact of the planning cycle of lesson study up on the improvement of Mathematics instruction, the teachers were asked whether planning in a group improved their knowledge of the subject matter, knowledge of pedagogy, their confidence about their lesson and their knowledge of preparing effective teaching aids for any particular topic of Mathematics or not. The responses of the teachers are tabulated below

**Table 2: Mathematics teachers’ response on the impact of planning cycle of lesson study on their instruction (APPENDIX 1)**

**Table 2** shows that the planning cycle of lesson study helped the Math teachers of the school to: improve their knowledge of the subject matter, their pedagogical knowledge, plan their lessons independently, develop their confidence in teaching Mathematics and develop effective teaching materials that support productive exchange of ideas among students. This supports the researcher’s observation that during the planning cycle many ideas were coming from different participants that can improve the lesson in terms of the possible teaching strategies, possible teaching materials for every lessons and anticipations of students’ questions and answers.

### 3.2 Planning Cycle

Use 13-point type for the subtitle, aligned to the center, linespace exactly at 18-point with bold and italic font style. The initial letters should be capitalized.

#### 2.2.3 Doing/Implementing Cycle

The data collected through videotape and observation of the open lessons indicated that the implementation cycle of lesson study was helpful for the participant teachers to observe the effectiveness of their planning up on student learning critically. At this cycle, each participant

Teacher /observer had the opportunity to observe the overall activities of the students and evaluate

**Student 2:** Let me cut the larger one and overlap them.

**Student 3:** We do not have to cut it let us put the square on the top the rectangle and then compare.

**Student 1:** In this way, we cannot answer the question. (Such conversation like this continued in each group of the students)

**Teacher:** who can tell me which figure has the larger area? I want the other students to pay attention while the student explains the answer to this question.

**Student 4:** Let us put the square over the rectangle. As you can see, the rectangle and the square have extra parts when we overlap them. However, as to me the rectangle has more extra part than the square. Thus, the rectangle has the larger area than the square.

**Teacher:** I will give you another activity related to this. I hope you will enjoy it and answer the above question correctly.

During the above discussion, most of the students were confused. As a solution to the students' confusion, the teacher offered small unit squares for each group in which the area of each square was one square centimeter. The interaction among the students, the teacher and students was as follows.

**Teacher:** I have many unit squares for you. Each group representative can come and take these squares. The area of each square is one square centimeter. I want each group to cover both the rectangle and the square using the small squares and find their areas. Please work together by dividing your tasks among the group members.

**Student 4:** I have a question teacher. How the area of this square can be one square centimeter? It looks big. May I measure its dimensions using this ruler?

**Teacher:** No, please consider its area to be one square centimeter.

**Student 1:** How can we cover the rectangle and the square using these small squares?

**Student 3:** we can attach the small squares in rows and columns carefully. Let us do this being in two groups. One group should cover the rectangle and the other group covers the square.

**Teacher:** please start doing your activity you have 20 minutes to complete your task.

**Student 2:** I think student 3 brings a very good idea. Look the other groups are working in the same way. So let us continue and keep our time.

In the above way, each group tried to complete covering the given rectangle and the square using the unit squares in order to find the areas. During the group discussion, the teacher was observing his students activities and reminding them the time left to finish by moving around them. When the time was over, the teacher asked his students to stop and pay attention to whole class discussion in the following way.

**Teacher:** Well done students, this is the time to stop and pay attention to the class discussion. Now is the

time for you to present your finding from the given activity. Who can tell us the area of the given rectangle and the square? Which of them has the larger area? Raise your hand I will give you chance. Okay student 9.

**Student 9:** Thank you sir, we already knew the answer by counting the number of unit squares used to cover the rectangle and the square. Based on this, we found that the area of the rectangle is 50 square centimeter and the area of that of the square is 64 square centimeters. This shows the rectangle has the larger area than the square.

**Teacher:** you did well, thank you. Do we have another means students?

**Student 14:** Yes, We do not need to count all the unit squares to find the areas. Instead of that, we can simply count the number of unit squares found in one column and one row of the rectangle as well as the square then multiply them correspondingly. This is the shortest method.

**Teacher:** Can we apply student 14's idea to find the area of the given rectangle and the square students?

**Students together:** Yes, we can teacher.

**Teacher:** It is great job students. What can we conclude from student 14's idea?

**Student 20:** Thank you sir, we can conclude that the area of a rectangle = length x height and the area of the square = length x length=length<sup>2</sup>.

After the activity, the teacher asked the students to find the area of their table, white board and the floor of their classroom using the rectangle or the square areas as the base.

The students tried to find the area of the required table, white board and the floor.

The above script shows that the students were highly involved in the process of learning. This implies that the planning session of the open lesson had very good impact to involve all of the students. As a result, we can say that lesson study has significant impact on student learning.

### 3.3 Debriefing /Reflection cycle

To examine the impact of the reflection cycle of lesson study up on the improvement of Mathematics instruction, the teachers were asked whether the reflection cycle of lesson study helped them to assess their lessons effectively, analyze their lessons on how much they involve their students or not. The suggestions and the responses of the teachers to the given suggestions are tabulated below (APPENDIX 2)

The responses of the teachers for each suggestion as tabulated in **Table 3** shows that the reflection cycle of lesson study helped the Math teachers of the school to get important feedback about their students learning, assessment and involvement. This supports the researcher's observation that during the reflection cycle each observer were given the opportunity to explain what he/she learnt from the lesson, what was going well and what improvement could be considered depending on students learning and the effectiveness of the teaching materials prepared during the planning cycle. As a result, many constructive ideas were coming from each observer that can improve student learning and teachers' professional development. Here are some of the comments given by some observers during the reflection session of the third open lesson on the rate of water flow.

“According to my opinion, most of the students were doing the given activity by sharing tasks. For example, when one student started to fill the bottle with water the other student prepares the stopwatch while the other members record the time. I liked their cooperation. When we look their results, each group recorded different time to fill the given materials. However, they did not explain the reason for the difference. Thus it would be better if the students are asked to explain the reason for the different time.” (Observer 1)

“I liked the students' interaction in doing their activity together. As we can see from each group presentation, each group recorded the time taken to fill the given materials and the volumes are given. However, they never calculated the rate of water flow. Thus the lesson could be improved by making students to calculate the rate of water flow.” (Observer 2)

In addition to this, the researcher asked the participant teachers whether they have interest to apply lesson study in their classrooms or not. The given suggestion and their responses are tabulated below (APPENDIX 3)

The response of the teachers tabulated in **Table 4** shows that since lesson study has great impact to their professional development, they want to apply it continuously. At the end the questionnaire, one open-ended question presented for the teachers to write any additional impact of lesson study on the improvement of Mathematics instruction. One of the teachers stated the following additional idea.

“Lesson study has benefits for learning more structured knowledge than the traditional way of teaching and learning, so that learning is so much fun, and learning objectives are achievable.”

## 4 DISCUSSION

In summary, the data collected through questionnaire, videotape and observation revealed that lesson study helped Math teachers to improve their instruction by improving their content knowledge, pedagogical knowledge and their knowledge of student learning. With respect to their content knowledge, the case indicates understanding of the Mathematical problems with different perspectives based on the feedback obtained from student learning and the comments given by their colleagues during the planning and reflection cycles of lesson study. With respect to their pedagogical knowledge, the case indicates that during lesson study the Math teachers have the opportunity to select, apply and evaluate different teaching strategies and teaching materials. As a result, they have good opportunity to share experience on the effectiveness of the teaching strategies and teaching materials for any particular topic of Mathematics. With respect to their knowledge of student learning, the case indicates that during the planning cycle of lesson study the groups of teachers tried to anticipate about student responses for any problems raised during the implementation cycle. This helps the teachers to compare their anticipation with the student responses and learn more about student thinking in detail by predicting their students' responses and questions. In relation to this, Chaona and Inprasitha (2013) claimed that Lesson Study supports teachers in assessing students' learning by: listening how students describe their work, setting problem situation, asking students to communicate their learning through drawings, actions, diagrams, writing and discussing briefly. In general, this study supports the study conducted by Lewis et al (2009) which claimed that participating in lesson study affects the improvement of Mathematics instruction through three pathways namely: changes in teachers' knowledge and belief, changes in professional community and changes in teaching-learning resources. In addition to this, Meyer and Wilkerson (2011) found the following three windows of opportunities by which lesson study affects teachers' knowledge in teaching Mathematics, namely, lesson plan or the task to be implemented, discussion the teachers had during the planning and reflection cycles and the teachers' level of anticipating students' questions and responses.

## 5 CONCLUSION

Results of this study argued that participation in lesson study gives Math teachers an opportunity to: improve their knowledge of the subject matter, knowledge of pedagogy and knowledge of their students learning. According to the data, each cycle of lesson study has its own contribution to the improvement of Mathematics instruction by affecting teachers' professional development and students learning. As a result, we suggest that Math teachers should apply Lesson Study continuously by considering its impact on their professional development and students learning in order to learn more on students, strategies and materials. During the planning session the observers should be given different tasks and observe intentionally on the given task to learn more from the implementation of the lesson

## 6 ACKNOWLEDGEMENT

This work was supported by Japan International Cooperation Agency and Indonesia University of Education. We would like to thank the schoolteachers under consideration for their invaluable support in completing the questionnaire and giving constructive comments. Last but not the least, we would like to thank Dr. Turmudi for his constructive comments and support in translating the questionnaire.

**Abstract:** Lesson Analysis has been used as part of teacher training programs to improve teacher’s ability to sharpen teachers’ ability to analyze their own lesson. According to the characteristics of lesson analysis, it can be used as teacher reflection on daily basis as well (Hidayat: 2013). Teacher reflection is widely known as one of essential parts to encourage teacher’s awareness on point of view on on-going teaching. The research is aimed to investigate how lesson analysis as teacher’s reflection changes on teacher’s lesson plan and practices in daily lessons. Framework of lesson analysis used is emphasizing on quantitative and student-teacher verbal communication according to Hidayat & Hendayana (2013). A chemistry-high school teacher with 12 years of teaching experience applied as single sample research during eight lessons. Video tapped and transcript are employed on each lesson, while retrospective analysis used at end of every single meeting to gain revised planning and next lesson plan. Lesson analysis is given once after next lesson plan is made, while comparison of revised teacher’s lesson plan after treated with lesson analysis with previously is indicated as influence of lesson analysis as teacher’s self reflection.

**Keywords:** Lesson Analysis , Teacher’s Self-Reflection, Chemistry Lesson

### 1. INTRODUCTION

One of Indonesia government efforts increased the quality of education was by improving of teachers’ professionalism. As express in the UU No 14 year 2005 about the improvement of teachers’ and lecturers’ professionalism (Hendayana, 2013). Government did many teacher training programs such as lesson study. In lesson study activity, there was three steps i.e plan, do, and see. In see session, teachers make analysing and get reflection from learning activity. Teachers’ ability to analyze their lesson engage not only in lesson study activity but also in their daily lesson. Many various ways for teachers develop their ability to analyze their daily lesson, one of them by using lesson analysis framework. Lesson analysis is a way to see, hear, describe, discuss, and understand the interactions among teacher and students that comprise a lesson (Romagnano, Evans, & Gilmore, 2008).

Many expert develop lesson analysis framework i.e Fernandez, Kuno, Matsubara, and Hidayat & Hendayana. By using lesson analysis

framework, teacher make self reflection for improving the quality of learning. Matsubara (2013) stated that one of the good things of lesson analysis is that method allow us to realize how we teach by ourselves, not like being told by someone (like a supervisor). Hidayat & Hendayana’s framework was one of lesson analysis framework that focusing on individual lesson as the unit of analysis. Based on lesson analysis framework, teachers were able to address in considerable depth many aspects of teaching. Teachers used lesson analysis framework to make self reflection for their daily lesson. It will solve their learning problems that occur more detail. In daily lesson, teachers will improve and enhance their sensitivity to their lesson. Using lesson analysis performed on the stages of learning will get a more complete picture of the obstacles and progress that occurs in the classroom. And then the teacher will get the new knowledge to do learning process better, by preparation, domination of matter, attitudes, and problem solving.

## 2. RESEARCH METHOD

In 2014, a chemistry teacher with 12 year experience is observed in her daily classroom. Series of eight lessons were video-tape recorded, transcribed, and analyzed using teacher and student evaluating lesson analysis by Hendayana and Hidayat framework (2013). Lesson analysis system focus on student’s verbal responses in classroom discourse.

This study was conducted in one of Senior High School(SMA) in Bandung. The approach used in this study is a qualitative approach. The method used in this research is descriptive method of analysis.

## 3. FINDINGS AND DISCUSSIONS

Teacher’s self reflectionby analysing transcript gained fromseries of eight chemistry lessons. The topic of chemistry lesson as seen on table below.

Transcript Classification	Chemistry Lesson
1	Solubility and solubility constant product concept
2	Relation between solubility and solubility constant product concept
3	Precipitation Reaction Concept
4	The Common Ion Effect and The Effect of pH on Solubility Concept
5	Types of Colloid Concept
6	Properties of Colloid Concept
7	Application of Colloid in Daily Life
8	Application of Colloid in Daily Life

The transcript of series of eight chemistry lessons will be inputted into lesson analysis framework in Mic. Excel format then it will be classified into different categories. Lesson analysis is given once after next lesson plan is made, while comparison of revised teacher’s lesson plan after treated with lesson analysis with previously is indicated as influence of lesson analysis as teacher’s self reflection.

### ➤ Teacher’s self reflectionon on lesson 1

In the analysis of transcript, it is gained teacher’s self reflection about time allocation of experiment task, revised of student sheet, and revised of lesson apperception.

*G (KM) : “Untuk selanjutnya yaa, untuk pertemuan selanjutnya, kita mulai melihat dari hasil LA ini sebaiknya waktu praktikum yaa dibatasi“.*

*G (KM) : “Aaaa prosedur kerja walaupun di ppt ini karena mungkin ini, ini bukan, memang*

*ini perhitungan ya, jadi kalau perhitungan memang harus ada prosedurnya, tapi kalau misalnya yang bukan perhitungan anak-anak akan menemukan sendiri, kekurangannya lagi pada siswa kurangnya. Kemudian perlu adanya keselamatan dilaboratorium”.*

*G (KM) : “Jadi Untuk masukan RPP disitu harus ada jadi prosedur untuk memasukkan soal yang akan di uji sedikit demi sedikit itu karna siswa itu tidak ada takarannya jadi berlebih ,sesendok ada yang sesendok-sendok, ada yang sedikit-sedikit jadi tidak disamakan gitu, harusnya ada perintah dari guru bahwa cara memasukkan bahannya harus sedikit demi sedikit”.*

### ➤ Teacher’s self reflectionon on lesson 2

In the analysis of transcript 2, it is gained teacher’s self reflection about revised of lesson apperception and revised of student sheet.

*G(KM) : “”Mungkin siswa udah mulai, jadi udah mulai tau yaa, kemarenkan apersepsi pertama persamaan reaksinya kurang, jadi kita tambahkan persamaan reaksi.”.*

*G (KM) : Yaaa, tadi kan kita harus apa, apersepsi yaa di awal trus materi ini tetap saja harus banyak latihan siswanya, istilahnya setelah jadi soal-soal dari yang termudah yang tersulit, jadi kebiasaan kalau mudah nanti step by step yaa pemikiran siswa nya jadi kalau yang mudah sudah bisa tapi yang sulit pemecahannya juga bisa, soal juga harus diperhitungkan dalam KSP ini dan tetap yaa harus dihubungkan ke kehidupan sehari-hari supaya siswanya tidak jenuh akan belajar KSP”.*

### ➤ Teacher’s self reflectionon on lesson 3

In the analysis of transcript 3, it is gained teacher’s self reflection about revised experiment procedure, give laboratory savety warning, demonstration of experiment tool by teacher, and revised lesson apperception.

*G(KM) : “Hhaaakkk aaa lesson analysis kan disini masih ke guru ya yang mendominasi kita buatn mungkin oooo ditambahkan prosedur yang bahasanya bisa dimengerti oleh siswa ya pada LKS. Terus apersepsi kita tambahkan satuan-satuannya untuk mengingatkan bahwa dari mili ke liter atau dari apa ....untuk mempermudah siswa dan diingatkan masalah menggunakan alat bagaimana*

*pengukuran yang baik itu bagaimana dan yang terakhir adalah kita harus mencantumkan keselamatan kerja di LKS .... Mungkin ya seharusnya dileb juga ada ya. ini kan leb nya masih perbaikan perbaikan. itu saja mungkin.”.*

➤ *Teacher’s self reflection on lesson 4*

In the analysis of transcript 4, it is gained teacher’s self reflection about revise apperception, revise experiment procedures, and check supporting media.

G (KM): *“Ya..... disini kita harus ada penguatan konsep pada azaz Le Chatelier ya oooo pada penguatan apersepsinya dikeseimbangan ...keseimbangan ya ....terus ada oooo analogi ...nah analogi jungket.”*

G (KM): *“Hhaaaakkk aaaa supaya siswa paham ya di analogi kan karna memang ini abstrak ya buat siswa oooo pelajaran ini ....terus perbaikan tetep diprosedur LKS ....mungkin LKS nya disitu terlalu banyak oooo itu nya ya. terus yang terakhir adalah infokus dan LCD.”*

➤ *Teacher’s self reflection on lesson 5*

In the analysis of transcript 5, it is gained teacher’s self reflection about management of lesson time in each task.

Guru(KM) : *“Pembelajaran yang dilakukan tujuannya anak dapat membedakan jenis-jenis koloid, cuma pas fasa terdispersi dan medium pendispersi masih bingung anaknya. Jadi itu.. naah ini di menit-menit pertama sampai menit ke ini ya..ke dua puluh ya. Saya bawa ke pelarut dan terlarut masih itu juga sehingga kita harus banyak bagaimana solusi anak-anak memahami apa itu terdispersi dan medium pendispersi. Tapi di menit ke empat puluh lima disini sudah sesi kelompok mereka sudah mulai berkolaborasi dan itu memang disini sampai ke menit ke enam puluh mereka sudah mulai mengeksplor diri. Untuk liofil dan liofob udah jelas dengan pengamatan cat dan lem. Anak-anak terlihat ini dan saya bisa mengaplikasikan ke kehidupan sehari-hari. Cuma pas yang di medium dan fasa terdispersi anak-anak masih bingung. Tapi untuk pembelajaran yang saya bawa jadi..biasanya saya sama rekan-rekan disini untuk memberikan pembelajaran koloid itu hanya untuk menghafal aja ya tapi sekarang anak-anak bisa meneliti ooooh ini dari keadaan yang nyata anak-anak lebih bisa memahami. Itu aja.”*

Guru (KM) : *“Iyaa..peraga nya kan banyak waktunya nggak cukup jadi nggak fokus yah. Jadi nanti bisa dibikin lebih dipikirkan lagi ya. Baik itu dalam pengerjaan LKS nya, dalam segi penyampaian presentasi di depan mungkin bisa dipertimbangkan lagi.”*

➤ *Teacher’s self reflection on lesson 6*

In the analysis of transcript 6, it is gained teacher’s self reflection about giving affirmation in each task.

Guru (KM): *“Pembelajaran kali ini siswa sudah mulai berpikir sendiri dan saya bisa mengarahkan siswa menemukan sendiri. Saya hanya sebagai penguatan-penguatan konsepnya. Ya istilahnya mereka sudah benar, tapi belum sempurna maka ada penyempurnaan-penyempurnaannya. Terus disini anak-anak sudah mulai suka untuk materi sifat-sifat koloid, tapi disini masih ada yang saya tetapi cuma pada penekanan-penekanan atau penarikan kesimpulan aja dan penguatan konsep. Terus pada percobaan yang efek tyndall itu siswa memang masih kurang paham dalam menghamburkan cahaya itu padahal bahwa koloid itu dapat menghamburkan cahaya sedangkan campuran yang lain seperti kopi itu cahaya tidak tembus tetapi kalau di air gula dia itu akan diteruskan.. itu kan terkait pada ukuran partikel..disitu anak masih bingung.”*

Guru (KM) : *“Iyaaa jadi diefek tyndall aja bahwa itu dikaitkan dengan ukuran partikel aja. Tapi kalau yang lainnya mereka udah paham kan ada gerak brown, adsorpsi, elektroforesis, koagulasi, dan dialisis. Kalau gerak brown emang abstrak ya jadi tidak bisa diapa..digambarkan di amati tapi kenapa si koloid itu gerak brown karena adanya tumbukan partikel-partikel koloid itu berarti pada penekanan konsepnya juga. Tapi secara keseluruhan anak-anak bisa paham berhubungan dengan efek Tyndall, gerak brown, adsorpsi, elektroforesis, koagulasi, dan dialisis. Itu aja mungkin.”*

➤ *Teacher’s self reflection on lesson 7*

In the analysis of transcript 7, it is gained teacher’s self reflection about revised experiment procedure and revised lesson apperception.

Guru (KM): *“Akan mengubah apa sistem prosedur yah. Prosedur, jadi kita tidak diberikan prosedur, tapi siswa membuat sendiri yah.”.*

G(KM): “Apa aja yah nanti, supaya siswa menarik apah, menggali yang kemarin-kemarin sudah terjadi.”

➤ *Teacher’s self reflection on lesson 8*

In the analysis of transcript 8, it is gained teacher’s self reflection about improve student ability in class discussion and need to predict student’s response.

Guru (KM) : “Iya ada perbedaanya, namun saya juga melihat saya masih lemah untuk mengajak siswa diskusi setelah saya meminta siswa ke depan untuk mempresentasikan hasil yang telah mereka buat. Jadi kurangnya diskusi kelas ya, aa enakya”.

G(KM) : “Terus siswa tidak lagi banyak mengalami kesalahan dalam prosedur karena mereka yang memprediksi sendiri hanya saja dengan seperti itu mereka belajar kesalahan yang mereka lakukan ketika prediksinya tidak sesuai dengan yang mereka lakukan”.

Based on series of eight lessons, teacher make self-reflection by using lesson analysis framework in each lesson. Teacher self-reflection can impact from one lesson to another lesson to give improvement for learning process. This study was gained teachers self reflection about concept’ affirmation in apperception, time management, and experiment procedures.

#### 4 CONCLUSION

By using lesson analysis, teachers make reflection of learning process, understand the effectiveness and quality of learning and finding effective ways to help students for developing their competence. Teachers can solve their learning problems that occurred with more detail. Thus, that caused improvement and enhancement of learning knowledge. In addition, teachers also find appropriate learning materials for certain materials due to more complete picture of the obstacles and progress that occurs in the classroom. Then teacher will get a variety of new knowledge to implement their learning process better, through preparation, material domination, attitudes, and problem solving. This is in accordance with the opinion of Santagata and Angelici (2010) states that the framework lesson analysis designed to assist teachers in learning to reflect success in teaching. Lesson analysis gives teachers a variety of views to observation, reflection, and the study of learning in the classroom.

[Ibrohim\\_vds@yahoo.com](mailto:Ibrohim_vds@yahoo.com)

**Abstract:** *Abstract:* The purpose of the study was to develop and implement electronic portfolio based Lesson Study to improve lecturers' professionalism in Cell Biology teaching and learning. The present study involved 6 lecturers and 11 senior students involving in the 14 meetings Lesson Study process, implemented in two different classes. The activities were observed from the development and the implementation of the e-portfolio in form of integrated assignment in lesson plan. The data of the study were obtained from the e-portfolio implementation to the students as a process and evaluation, the assumption questionnaires, and the lecturers' structured interview towards the Lesson Study. The data were analysed by descriptive qualitative method and the students learning results attained from the quiz score. The results of the study related to the development of the e-portfolio through the implementation of the Lesson Study revealed several suggestions; (1) the colour and feature, (2) the uploading deadline should be fixed, (3) the format of the data should be in PDF or Ms. Word. The results of the development based on the evaluation were found that the e-portfolio components consist of (1) user page, (2) profile, (3) friends, (4) private portfolio, and (5) assignments uploading deadline. The results of the e-portfolio implementation to support lecturers' professionalism showed that there was an ability improvement in terms of (1) planning learning activities including the e-portfolio assignment planning, (2) implementing IT skill during learning activities, (3) evaluating the students' works, (4) creating a good communication between lecturers and students, (5) identifying the students' problems. The learning results which were observed from the quiz score improved 16.44% beginning from the first meeting to the seventh meeting.

**Keywords:** e-portfolio, lesson study, lecturers' professionalism, cell biology.

## 1 INTRODUCTION

The implementation of technology to assist the learning evaluation technique in higher education level is massively used to monitor the students' ability in learning as well as to enhance the lecturers' professionalism in integrating IT. The form of the evaluation that might be able to integrate IT and encourage the students' improvement and the lecturers' capability is e-portfolio (Barret, 2000). E-portfolio popularity has been begun from its development as an evaluation instrument for the recent ten years (Tartwijk, *et al.*, 2007). As Information and technology (IT) has been developed better, portfolio has been developed as well to become electronic portfolio (e-portfolio) to facilitate the evaluation process especially in education world. However, as a relatively new facility, e-portfolio cannot be directly used and might not directly affect to the improvement of the students' academic ability (Kwok, 2011). It is because there are many factors that contribute e-portfolio successfulness as an

evaluation instrument to enhance the students' and the lecturers' ability during teaching and learning process. Chau and Cheng (2010) reported that e-portfolio implementation is basically able to assist to develop the students' ability. It is in line with Abiding and Saleh's (2010) statement that e-portfolio was able to encourage the students to become independent students especially in planning, performance, and evaluation. As for the lecturers, the implementation of e-portfolio might ease to improve their ability to recognize the students' potential through their uploaded and exhibited assignments on e-portfolio. In addition, the implementation of IT, like e-portfolio, becomes an important point to be integrated in learning process to improve the lecturers' competence (Umar and Yusoff, 2014). Therefore, the development of evaluation instrument such as e-portfolio which is integrating IT is categorized as a competence that can improve the lecturers' professionalism.

The implementation of e-portfolio as an evaluation instrument needs to be developed so that

it can be applied properly in order to reach the goal of the learning. One way to optimize the implementation of e-portfolio is through lesson study involving lecturer team in the application. It is because the systematic lesson study stages, namely plan, do, and see, are believed to be able to improve the learning process quality. Thus, the lesson study performance is aimed at developing and implementing e-portfolio as well as to improve the lecturers' professionalism in teaching, especially for those who are directly involved as the lesson study team. As the implementation of lesson study in Indonesia, Marsigit (2007) stated that it was introduced in 2001 through IMSTEP-JICA Project program and has been applied ever since. A lesson study which is begun with team grouping makes the learning activity be able to improve the lecturers' professionalism directly in terms of performance, materials, and evaluation process (Holmes, 2013), as well as to develop the evaluation instrument on learning such as e-portfolio.

The developed and implemented e-portfolio through the lesson study activity is one of the efforts to solve the students' difficulty in comprehending the lecture materials, including Cell Biology subject. As a prerequisite subject in Biology department, Cell Biology subject is considered as a difficult subject to be comprehended by the students. The abstract materials make it hard to be understood. By using different way, Veselinovska, et al. (2011) state that Cell Biology difficulty level is quite high, thus, it needs a specific technique and method developed by lecturers to enhance the students' active participation and learning motivation. The development and the implementation of e-portfolio through the lesson study is an alternative problem solving to deal with the difficulty in learning Cell Biology. The involvement of the lesson study in the learning process is necessary because the e-portfolio was developed and implemented based on the characteristics of the subject itself.

Regarding to the references above mentioned, it is necessary to know how lesson study can be used to develop and implement e-portfolio so that it can improve the lecturers' professionalism in Cell Biology teaching and learning. Therefore, the purpose of the present study was to develop and implement e-portfolio to improve the lecturers' professionalism in Cell Biology teaching and learning.

## 2 PARTICIPANTS

The present study was involving several lecturers and university students taking Cell Biology subject by developing and implementing e-portfolio through the lesson study activity. There were 52 students involved in this study who were divided into two parallel classes, namely A and B, while the lesson study team involved 6 lecturers and 11 senior students as the team member. The lecturers who were involved consisted of 3 senior lecturers, who have been teaching for more than 10 years, and 3 junior lecturers, who have been teaching less than 10 years. All of the lecturers are IT illiterate in order to support the learning process even though they have tried it in a simple and standard way. As most of the students have already familiar with IT and utilize it to communicate not to support their learning.

## 3 RESEARCH PROCEDURE

The initial development of e-portfolio was conducted by arranging its component on e-portfolio web consisting of user page, profile, friends, and private portfolio. The result of the initial development was discussed in the lesson study activity especially in the first planning stage in team. Then, it was followed by do and see as the reflection to implement e-portfolio in learning.

The implementation of Cell Biology learning through Students Team Achievement Division (STAD) method was carried out through several activities, like brief explanation, group work, discussion, quiz, and giving reward to a group or a student who achieve better than others. The increasing of the students' quiz achievements was a successfulness indicator of the lecturers' professionalism improvement in improving the learning quality.

The lesson study team consisted of six lecturers from Biology department and eleven students of seventh semester taking thesis research. The team members consisted of lecturers from similar major and experienced lesson study program in 2010-2012. Three lecturers of the team once became model lecturer regarding their subjects. Plan-Do-See cycles were conducted for seven times for each class, so there were fourteen lesson study cycles conducted in two classes during the similar Cell Biology subject. The cycle of the lesson plan was adapted from Smith (2010).

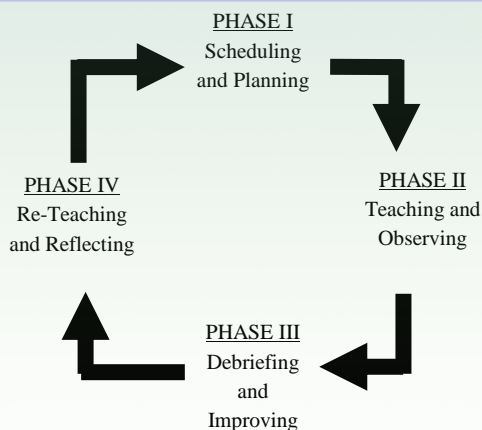

Fig 1. The cycle of lesson study (Smith, 2010)

Based on the arranged, agreed, and conducted schedule as well as referring to the above figure 1, the lesson study activities are presented on the following Table 1.

Table 1 The Lesson Study Schedule of the Two Sample Classes

Material	Plan (Phase I)	Do-See (Phase II)	Plan (Phase III)	Do-See (Phase IV)
Cell structure, advantages & disadvantages of learning Cell Biology, tools & technique of learning cell	18 <sup>th</sup> March 2013	22 <sup>nd</sup> March 2013 (Class A)	22 <sup>nd</sup> March 2013 (Class B)	24 <sup>th</sup> March 2013 (Class B)
Function of organic and inorganic chemical component.	29 <sup>th</sup> March 2013	1 <sup>st</sup> April 2013 (Class B)	1 <sup>st</sup> April 2013 (Class A)	3 <sup>rd</sup> April 2013 (Class A)

The nucleus and genetic material	6 <sup>th</sup> May 2013	9 <sup>th</sup> May 2013 (Class A)	9 <sup>th</sup> May 2013 (Class B)	11 <sup>th</sup> May 2013 (Class B)

## 4 DATA AND DATA ANALYSIS

The lecturers' professionalism data were obtained from the questionnaires delivered to the lesson study team members consisting of six lecturers and eleven senior students. The data were also obtained from the structured interviews to know the lecturers' opinion towards the development and the implementation of e-portfolio in learning. The questionnaires which were delivered consisted of the planning and the form of e-portfolio as well as the advantages of e-portfolio implementation. The questionnaires were delivered after the implementation of e-portfolio during the lesson study activities. While in order to examine the process of the lesson study, an observation sheet and field note were utilized.

The results of the questionnaires data analysis related to the development and the implementation of e-portfolio were categorized as be able to support the lecturers' professionalism if the results reached the minimum point 70%. The data obtained from the observation sheet and the field note were analysed by using data reduction and the conclusion was derived descriptive qualitatively.

## 5 FINDINGS

The development and the implementation of e-portfolio were conducted in Cell Biology learning through the lesson study activities. During the realization of the lesson study, 6 lecturers and 11 senior students were involved as the respondents. All of the respondents stated that the lesson study activities are able to improve the lecturers' professionalism in terms of planning, implementation, and learning evaluation.

Based on the analysis of the questionnaires, the video recording, the observation sheet, and the reflection activity during the lesson study, most of the team members experienced how to plan and carry out learning in a good structure. The reflection result showed that the lecturers' professionalism improved in the following aspects.

### 5.1. Planning Learning Activities including E-portfolio Assignment Planning

The planning of the assignment being uploaded by the students in form of e-portfolio was arranged based on the lesson plan in *plan* stage by the lesson study team. Table 2 presents the planning and assignment in form of the developed e-portfolio.

Table 2. The Percentage of the Assignment Planning in form of E-portfolio

Feedback based on the questionnaires	Percentage	Criteria
The planning of assignments being uploaded in form of e-portfolio consisting of Cell Biology materials	80.9	Very endorsing
The types of the assignment used as e-portfolio materials is interesting to be discussed	83.8	Very endorsing

The reflection result showed that the team members feel an improvement in terms of the lesson plan arrangement related to the assignment type as the e-portfolio component. The lecturers feel an improvement in terms of observing and revising the lesson plan with several assignments as the e-portfolio component.

### 5.2. Implementing IT Skill during Learning Activities

The developed and implemented e-portfolio improved the lecturers' ability in implementing IT in order to support the learning. It is reflected on the following Table 3.

Table 3. The Percentage of IT Utilization Skill in Learning

Feedback based on questionnaires	Percentage	Criteria
IT utilization in learning activity through e-portfolio is a technology integration need to be learnt.	95.6	Very endorsing
Uploading the complete assignments in form of e-portfolio is easy	91.2	Very endorsing
The lecturers and the students are able to learn IT besides the main materials	97.1	Very endorsing
The lecturers possess a skill in utilizing IT especially in arranging the e-portfolio	94.1	Very endorsing

A team member reported a condition in detail that it is necessary to improve the students' ability in learning a particular material, yet it is better if the lecturers are able to operate the IT facility first to support the learning activities. This statement was recorded on See on 10<sup>th</sup> April 2013 by Linda:

*'As a junior lecturer, I think we need to enhance our skill as a consequences in improving the lecturers' professionalism. One thing that I think it is necessary to improve is the integration of IT and the existence of e-portfolio is very relevant to fulfil our need. This is not only good for the students to improve themselves but also to motivate lecturers to always implement it in every learning activity.'*

*In this case, the lecturers will learn how to use IT and develop their own capability indirectly.'* (Taken from the reflection note on 15<sup>th</sup> April 2013).

The above statement indicated that the lecturer himself feel the advantage of the implementation of e-portfolio, especially in improving the IT skill. Linda informed the importance of e-portfolio for lecturers in assisting them to contribute skill, organize, deliver materials, give advice, discuss, and communicate regardless time and place.

### 5.3. Evaluating the Students' Works

The lesson study team members showed a positive behaviour by stating to the students that e-portfolio is an alternative way to evaluate the students. The lecturers stated that e-portfolio is not only used to examine the students' ability based on the uploaded assignments but also to help the students to study and recognize their own personal ability.

Table 3 The Percentage of E-portfolio Implementation to Support the Evaluation Process

Feedback based on questionnaires	Percentage	Criteria
The existence of e-portfolio ease the lecturers to score the students	86.8	Very endorsing
The existence of e-portfolio facilitates the lecturers as an evaluation instrument towards the students' ability.	92.6	Very endorsing

During the implementation of e-portfolio, the lecturers were more critical in observing the students' work. It is assumed from the field note of a member of the lesson study as follow:

*'I think I can see the students' work better after observing their works on e-portfolio. At the beginning I felt confused especially in terms of the important component structure and the important component placing of e-portfolio, yet that condition were fixed at once. Therefore, I think the implementation of e-portfolio is an effective way to evaluate the students' learning result.'*

(Taken from the reflection note on 3<sup>rd</sup> April 2013).

### 5.4. Creating a Good Communication between Lecturers and Students

One of e-portfolio facility is discussion forum which can be carried out between lecturer and student or among students. It is reflected on the statement:

*‘The communication process happen in e-portfolio facility makes the comprehension towards Cell Biology materials more detail. The students can upload their statements and some supporting data or relevant link related to the materials being discussed.’*

(Taken from the reflection note on 27<sup>th</sup> April 2013).

### 5.5. Identifying the Students’ Problems

The observation activity during the learning process showed that the observer was able to examine the difficulty experienced by the students both in utilizing e-portfolio and in comprehending the material. It is reflected on the following recording:

*‘The continuous observation enables me to observe the students’ problem meticulously. From the observation I can see that most of the students can hardly comprehend the materials, they tend to re-open the files on the e-portfolio. It seems that it helps them to re-learn their notes during the lecturing.’*

(Taken from the reflection note on 4<sup>th</sup> May 2013).

The e-portfolio facility basically eases the students to re-correct their works and compare the works to others’. This helps the students learning process indirectly; it was proven by the result of the questionnaire on Table 4.

Table 4. The Percentage of E-portfolio Implementation to Encourage the Students’ Learning Process

Feedback based on questionnaires	Persentase	Criteria
E-portfolio eases the students to compare their works one another	83.8	Very endorsing

### 5.6. Improving the Self Confidence

The developed and the implemented e-portfolio through the lesson study activities can improve the lecturers’ confident in teaching. It was felt by the model lecturer who play an important role during the lecturing process. Even though the other team members in Cell Biology subject did not perform as the model lecturers, they also confirmed that the implementation of e-portfolio supported by the

lesson planning helps the lecturers’ work. One of team members, Waskito, stated that:

*‘I can feel that the revised stages of the implementation of e-portfolio based on the previous suggestions optimized the e-portfolio for the students. The assignment deadline encourages the students to make a plan to finish their assignments every week. The e-portfolio is an appropriate instrument to give an instruction or guidance to the students so it creates a conducive learning atmosphere. Therefore, the lecturers might be more confident in teaching since they are supported by a proper planning and a proper instrument.’*

(Taken from the reflective note on 10<sup>th</sup> April 2013).

### 5.7. Improving the Students’ Learning Result

One of the lecturers’ improving professionalism indicators in learning by implementing e-portfolio was the students’ learning results. In the present study, the learning data based on the students’ quiz score on each meeting on each cycle during the lesson study were taken. The quiz average score of the students is presented on the following Figure 2.

Figure 2. The Histogram of the Quiz Average Score from the First Meeting to the Seventh Meeting

The above Figure 2 revealed that the quiz score average on each lesson study cycles increased even though the average score decreased on the third meeting. The increasing quiz average score from the first meeting to the seventh meeting was 16.44%.

### 5.8. The Developed E-portfolio Profile

The results of the development of e-portfolio during the lesson study activities are presented on the following Table 5.

Table 5. The Development of E-portfolio Features during the Lesson Study

Features	Description
User Page	The students register and get the lecturing materials as well as the information needed during the lecturing activity.
Profile	A place for the students portfolio and is completed by the students' identity and photograph.
Friends	Connect the users to other friends to do the assignments and share some information.
Private Portfolio	The uploaded assignments can be in form of file, photograph, or video.
Assignment Uploading Deadline	The deadline when the students have to upload their assignments. The deadline is a week after the lecturing activity started, after that the uploading session is closed.

## 6 DISCUSSION

The findings of the study showed that the lesson study was an important effort and process that supported the development and the implementation of e-portfolio in Cell Biology learning, especially in improving the lecturers' professionalism. The instrument was developed in the beginning of the study and improved during the implementation of the lesson study made the lecturers were able to discuss and observe its implementation. The lesson study team discussion process is a collaborative characteristic as an effort to improve the learning quality (White and Southwell, 2010). Furthermore, Garret, *et al.* (2001) stated that the development of the educators' comprehension is significantly enhanced through several activities and experiences to improve their professionalism, one of which is through the development and the implementation of e-portfolio.

The application of the lesson study for fourteen meetings in two Cell Biology classes showed an increasing ability of the lecturers in planning the learning activities, conducting the learning, and evaluating the learning by using e-portfolio. The lecturers' professionalism improvement was in line with the learning performance in class. Verhoef&Tall's (2011) study verify that the professionalism development was supported by the practical activities in class and discussion with the lesson study team.

The completing e-portfolio instrument was done together with the completing of learning materials

and the media, and the evaluation process was done after *do* stage or the continuous implementation. Therefore, the lesson study team members could learn how to adjust the learning materials and the supporting instruments as well as the evaluation process. It is in line with Wood's (2013) statement that the arrangement of the learning materials based on the learning situation might become a systematic experience for the lecturers, in terms of (1) understanding the materials object, (2) developing the materials object, and (3) implementing various techniques to arrange the next learning.

The development of the lecturers' competence to improve their professionalism is an important point in this study. All of the lesson study team member agreed that e-portfolio was an important part to develop their capability and self-potential as a lecturer. The advantage of the pair discussion, sharing, and giving feedback from the students' learning result session in form of e-portfolio made the lecturers more focus and confident in teaching. Rock & Wilson (2005) confirmed that the lesson study activity might increase professionalism which can be carried out independently by any universities. Besides, it saves more money compared to send the lecturers to improve their professionalism to other universities. In this case, there will be more fund saved that can be allocated for other activities.

This study also showed that the IT integration was an important thing needed to increase skill. Besides as an evaluation instrument, e-portfolio could also be used by the lecturers and the students to enhance their skills in utilizing IT, in which has been improving for the last 10 years in education world. Umar and Yusoff (2014) showed that the IT skill is positively correlate to the utilization frequency. Hence, the more the lecturer implement e-portfolio, the more they get the improvement in terms of IT utilization as the learning instrument.

The lecturers' professionalism due to the IT utilization through the lesson study activities could be seen from the planning side and the focus of the learning. Whenever the e-portfolio was implemented, the lecturers could observe the students' uploaded assignments in form of digital format, such as powerpoint, pdf, video, or photograph which could easily be used. Klement, *et al.* (2014) confirm that the IT support needs to be designed as easy to use as possible. This might make the lecturers know the strengths and weaknesses of the students in learning as well as the lecturers' awareness in observing the students' works.

The opinion stated by one of the lesson team members who actively participated in the

development and the implementation of e-portfolio showed an interest and willingness to utilize the same instrument in his/her learning. It is because the existence of e-portfolio helps to integrate IT so it can improve his/ her capability. It revealed that the lecturer was aware to the importance of IT support in the learning process, which also became an indicator that the lecturer had a willingness to improve his/her own capability through e-portfolio implementation. The experience of implementing e-portfolio as an evaluation strategy to support learning is known as an activity that can be implemented to improve the learning quality.

The IT has become a required instruments to be used to support the learning process in order to assist lecturers to deliver materials and evaluate, such as e-portfolio. The evaluation process, by using e-portfolio for instance, is an important point in learning because lecturers can be more focus on observing the students' ability through their uploaded works. As Taylor, *et al.*, (2005) stated that it is important to find a solution towards the learning problem nowadays. This is an important thing need to be considered since it eases the lecturers to evaluate the students' works during the Cell Biology learning.

The assignment planning process which needs to be uploaded to e-portfolio based on the Cell Biology curriculum involved the lesson study team. Practically, it might help the lecturers to enhance the lecturers' professionalism for it encouraged the team members to work in learning community in which (Taylor, *et al.*, 2005; Marsigit, 2007; and Rock and Wilson, 2005) state that it supports the learning activity in class in terms of the planning and the evaluation.

The learning result was the learning quality process improvement indicator which could be assumed from the students' improving average scores during the seven meetings. It revealed that the learning plan through various assignments which had been discussed beforehand in the plan stage and was uploaded in form of e-portfolio was able to develop the student thinking ability. The learning plan made through some discussion by the lesson study team members eased the process of the Cell Biology learning. The team collaboration in planning activity became the important aspect in the successfulness of the learning, as it revealed in Inprahista's (2014) study.

The plan and do support in the lesson study activities helped to improve the lecturers' professionalism in several aspects, namely (a) comprehend the Cell Biology materials subject more

detail due to the discussion among the lesson study team, (b) develop the capability in planning lesson, conduct and report the observation activity, (c) be focus on the students' difficulties related to the uploaded assignments in e-portfolio, and (d) observe the activities during the learning process to be adapted and implemented later.

## 7 CONCLUSIONS

The development and the implementation of e-portfolio through the lesson study activities were able to improve the lecturers' professionalism in Teacher Training Institute of PGRI MADIUN. The assignment planning process in form of e-portfolio which was based on Cell Biology curriculum helped to develop the lecturers' overall ability in planning a learning activity, carrying out and observing condition through observation, and reporting the result of the learning. In the end, the lecturers might feel the impact of the implementation of e-portfolio as an optimum teaching instrument to support the learning activity.

## 8 ACKNOWLEDGEMENTS

I would like to give my great appreciation to the head of IKIP PGRI Madiun, Indonesia Dr Parji, M.Pd., who had permitted and fasilitated to carry out this research at the university. The great appreciation is given too to ProfDra. HerawatiSusilo, M.Sc, PhD., Prof.Dr.A.D. Corebima,M.Pd and Dr.Ibrohim,M.Si who had guided in conducting the research.

**Abstract:** Teachers are encouraged to be life-long learners and to engage in professional learning through professional development programmes. There has been concern about the effectiveness of short term single professional development experiences, so called 'hit and run' activities. Successful professional learning needs to be long-term and reflective and Lesson Study is one such professional development strategy. Lesson Study provides ongoing, long-term learning and reflection for teachers using a teaching/learning cycle model of planning, teaching, evaluating, and reflecting by a group of teachers working collaboratively in one school or across a district. This paper describes how Lesson Study can be used to provide professional development to encourage teachers to adopt differentiated learning in their primary school mathematics lessons. It is envisaged that Lesson Study will assist teachers to meet their students' needs in learning mathematics by taking into account their diversity. A qualitative case study was employed in this research through an interpretive paradigm. Data was collected through semi-structured observations, document analysis, and video recording. The videos were analysed by using Multimodal Analysis Video (MMAV) software. This presentation outlines the professional development programme undertaken in Flores, Indonesia in 2014 and the preliminary findings.

**Keywords:** Lesson Study; differentiated mathematics instruction

### 1 INTRODUCTION

Mathematics is one of the core subjects in the Indonesian curriculum and is studied by every student. Many students, however, do not have an interest in learning mathematics. This may be caused by a number of reasons including the teachers' lack of qualifications, the teachers' lack of knowledge or their methods of teaching mathematics (Surya, 2010). One of the effective ways of improving student engagement may be for teachers to differentiate mathematics instruction so that it can meet the needs of all learners in regular classrooms and improve the ability of students (Tomlinson & Eidson, 2003).

Surya (2010) argued that the problem was not the students' capacity to learn but the quality of their teaching and instruction. He also recommended ongoing professional development to improve teachers' content and pedagogical knowledge and skills. The ongoing professional development for teachers is important and this can be done as part of the regular classroom routine (Jalal et al., 2009).

It is common for professional development in Indonesia to be delivered in a top-down style (Hadi,

2012). Teachers come to a workshop and learn new strategies or knowledge from instructor(s), then return to their schools. However, there are limits to how far this method of professional development can be taken. There is no consideration as to whether teachers apply the new knowledge and there is no evaluation about the effectiveness of the professional development on teachers' content and pedagogical knowledge and skills. Therefore, more effective forms of professional development are needed and the effects need to be measured and evaluated.

Hadi (2012) claims that it is difficult to introduce a different kind of professional development such as Lesson Study because teachers have established their own teaching style. This applies to almost every teacher, including mathematics teachers. On the other hand, with a great effort and willingness to change the quality of mathematics education in Indonesia, Lesson Study could be an effective way to improve teachers' knowledge, skills, understanding and values in differentiated mathematics instruction. Through Lesson Study, teachers can share their knowledge and

understanding and they can also provide constructive support to their colleagues.

So far, however, there has been little discussion about the use of Lesson Study to improve mathematics instruction in Indonesia. Therefore, this paper focuses on how Lesson Study can be used to provide professional development to encourage teachers to adopt differentiated learning in their primary school mathematics lessons. A brief overview of differentiated mathematics instruction and Lesson Study is provided, followed by a description of the research method he preliminary results of the study.

## 2 DIFFERENTIATED MATHEMATICS INSTRUCTION

As previously indicated, students in regular classrooms have diverse backgrounds and abilities. Differentiation in teaching can cater for that diversity in a heterogeneous classroom. Differentiated teaching is different from traditional teaching, and does not necessarily involve direct instruction. It uses similar content, but utilises diverse levels of cognitive thinking for different groups (Bender, 2009). Teachers adjust the activities to cater for particular students' readiness, interests, and learning styles and teachers subsequently can provide effective teaching which can both cater for their current students' interest and help students to realise their hidden interests (Tomlinson, 2003).

Teachers can start from the standard curriculum expectations and school facilities, but modifications can be made to the curriculum, the processes of teaching, the activities provided during the lesson time and the products of learning, with the main objective being to maximise student learning (Tomlinson, 1999). The way to assess students and the learning environment needs to also be modified to meet students' needs (Tomlinson, 2003). Differentiation in one topic may be different to that in another topic because the interest and ability of students varies depending on the learning area (D'Amico & Gallaway, 2008). This requires teachers to respond carefully to their students' needs. The students' progress and responses to lessons forms the basis for modifying future lesson plans. Therefore, a focus on how to design and implement differentiated instruction of work needs to be a central focus of any professional development such as Lesson Study. These forms of differentiation are summarised in Figure 1.

Figure 1. Differentiated Instruction Model (adapted from Tomlinson, 2003)

### 2.1 Content Differentiation

According to the students' various levels of ability, interest and readiness, teachers can modify the content by providing a range of materials from simple to more complex (Tomlinson, 1999). For example, in teaching multiplication, teachers can provide one, two or three digit multiplication based on students' readiness. Tomlinson (1999) also suggests that the content that is being taught needs to connect with students' daily life and present actual problems, not only doing repetitive exercises in the lesson.

### 2.2 Process Differentiation

The teaching and learning process is dynamic. With flexible grouping students are allowed to work alone or in a group (Strickland, 2007; Tomlinson, 1999, 2003; Tomlinson, Brimijoin, & Narvaez, 2008). They can work in pairs or with other students who have similar or different abilities and interests. Students who may not be confident to speak in a big group will get the opportunity to share their understanding in a small group or just with a single partner. Teachers can manage discussion for a whole class at the beginning or at the end of the lesson and then, students summarise the topic that they learnt on that day.

Students' learning profiles are influenced by their "learning style, intelligence preference, culture, and gender" (Tomlinson, 2003, p. 3). D'Amico and Gallaway (2008) describes three kinds of learning styles: (i) visual learners who prefer learning by seeing and tend to prefer to use, for example, videos, slides, pictures, charts, maps, and diagrams; (ii) auditory learners who are able to learn most effectively by listening, for example, to tapes, tutors, radio, and other people; and (iii) tactile or kinaesthetic learners who can improve their

understanding by doing experiments, touching, and moving. Based on these types of learning, teachers can deliver the material in different ways such as using videos or radio or doing experiments to accommodate these needs.

### 2.3 Product Differentiation

To address students' different levels of ability, tasks can be arranged in various levels of difficulty (Tomlinson, 2003). Appropriate level of task complexity can accommodate students' different degrees of knowledge (Tomlinson, 1999). This can also ensure students are being challenged (Strickland, 2007). Tasks are provided in order to meet students' readiness, interest, learning profiles, and affect (Tomlinson, 2003). Information about students' readiness can be gleaned from their previous reports, or if it is needed, teachers can conduct pre-tests. Also, students have freedom as to how to express their learning (Tomlinson, 1999). For example, students can explain their understanding orally, by writing or using visual representations such as charts. Flexibility in submitting the task is considered because students have different abilities and strategies for accomplishing tasks (Heacox, 2002; Tomlinson, 1999).

### 2.4 Assessment Differentiation

Different to the conventional teaching which usually assesses students at the end of a unit or topic or at the end of a certain time period (summative assessment), in a differentiated classroom students' progress is assessed periodically during the learning process (formative assessment) (Strickland, 2007; Tomlinson, 1999). Diagnostic assessment affords everyday information about students' readiness, interests, and learning profiles (Tomlinson, 1999). Students' products can also be assessed by both the students themselves and the teachers (D'Amico & Gallaway, 2008). Self-assessment can build students' self-confidence. Teachers can also make observations during the lesson time to assess their students' progress. The results of the formative assessment methods are then used to modify the following lesson.

### 2.5 Learning Environment Differentiation

The classroom environment also plays an important role in differentiation. This includes the circumstances of the classroom physically such as the arrangement of resources and mentally, such as

class roles (Tomlinson, 2003). A comfortable environment will motivate students in their learning.

Even though differentiating instruction needs much effort, this could develop students' capability that will affect to their self-confidence and this will boost their motivation to study more. It is not essential to differentiate all the aspects above in every lesson. Differentiation can be made maybe in two aspects e.g. content and process, or three aspects. Flexibility depends on teachers' readiness and the needs of the lesson and the learners. Every student will feel valuable as there is no word for 'fail' during the learning process.

## 3 LESSON STUDY

Lesson Study has become popular in a number of countries in recent years, for example in the United States where it has been used since the late of 1990s (Murata, 2011). Lesson Study in Indonesia was introduced in 2005 (Suratno & Iskandar, 2010). A case study of cooperative Lesson Study between Indonesian mathematics and science teachers and university faculty academic staff concluded that there were improvements in teachers' knowledge of content and organisation of the lessons and the students' response throughout the lessons (Saito, Harun, Kuboki, & Tachibana, 2006). Fernandez (2005) points out that Lesson Study can develop not only teachers' mathematical content knowledge, but also their research experience. Although it was determined that even though, teachers found difficulty in allocating the time, this professional learning developed participants' "teaching performance, variation of teaching methods/approaches, and collaboration" (Marsigit, 2007, p. 143).

Lesson Study is one of professional development types which is continuous and emphasises collaboration between teachers within a group (Lewis, 2002). The group of teachers meet regularly to create the lesson plan and review the teaching in order to further develop the lesson plan and teaching (Hunter & Back, 2011). Lesson Study begins by planning the lesson plan together, then one of the member teach while other members observe. After the lesson they meet to review the teaching process and then create the next lesson plan collaboratively. The process of Lesson Study is displayed in the Figure 2.

The professional development commences by organising the Lesson Study group and setting the goals for the groups. Taylor, et al. (2005) identified that their Lesson Study group's goal was "to give

students the opportunity to share their math thinking with their classmates” (p. 19). Then, the group starts the Lesson Study cycle by determining the lesson topic to be taught. After deciding which topic will be taught, the goals of the lesson can be generated from a general goal to the more specific goals (Murata, 2011). Example of general goal of the lesson is that students know prime numbers, and the specific goal may then be students are able to mention prime numbers between 20 and 30.

Figure 2. Lesson Study cycle for differentiated mathematics teaching

Then, from the goals, teachers collaborate together to create a lesson plan. Murata (2001) underlined that the key purpose is not to design a perfect lesson but to investigate students’ ways of learning when teachers use certain teaching strategies. Moreover, Murata (2001) said that this step is the opportunity for teachers to develop their own knowledge of the content. In Lesson Study, teachers apply ongoing assessment that is consistent with the learning process in differentiated mathematics instruction. This assessment then is being used to inform the next lesson plan (Bruce & Ladky, 2011; Tomlinson, 2001).

After the lesson planning is finished, one teacher from the group will teach a class while the other members of the group observe the lesson (Murata, 2011). The observer(s) fill in an observation checklist/form (see Appendix 1) and/or make anecdotal notes. This data is then being discussed with the rest of the Lesson Study group members (Murata, 2011). From this discussion, they decide whether they need to revise or re-teach the content (Murata, 2011).

Lesson Study is time consuming but this ongoing professional learning empowers teachers and improves their professional development progressively (Taylor, Anderson, Meyer, Wagner, & West, 2005). When the Lesson Study group members come from different schools, it is possible that they need to travel and need additional time for

meeting and discussion. This can be overcome, however, by gathering the Lesson Study group from teachers within a school. Murata (2011) suggests that an in-school Lesson Study group is effective because teachers can share information about the students and the particular community.

## 4 RESEARCH MODEL

### 4.1 Research Design

This study began with professional learning to introduce differentiated mathematics instruction and Lesson Study ideas to the teachers. This involved four teachers from SDI (Sekolah Dasar Instruksi Presiden) Madambake (Madambake President Instructional Primary School), Nangaroro district, Flores Island, Indonesia. After the Lesson Study session ended, it was followed by with the first Lesson Study group meeting. They are four teachers who are class teachers for Year Three, Four and Six, and the principal. In this meeting, the teachers decided who would teach and the rest of the members acted as observers. Then, they created the first lesson plan on the topic of angles with focus on differentiated mathematics instruction. After one teacher taught for the first lesson, they met to review the teaching process and this was followed by the creation of the second lesson plan for the second mathematics lesson. After the second lesson, they had the third Lesson Study group meeting for reviewing the second lesson.

### 4.2 Case Study: Differentiating Mathematics Instruction for Mathematics Lessons through Lesson Study Groups Meetings

A qualitative case study was employed in this study with a goal of collecting enough data about the Lesson Study group to provide professional development to encourage teachers to apply differentiated learning in their primary school mathematics lessons. Specifically, this case study focused on what the teachers talked about while planning and teaching mathematics using differentiated mathematics instruction. The case study approach is appropriate for studying a program or an activity such as this (Creswell, 2013).

### 4.3 Data Analysis

Data for this study included observation reports, written lesson plans and video recording of two mathematics lessons and three Lesson Study group meetings. The various types of data collected were analysed through three steps: (i) “categorization”, (ii) “description”, and (iii) “synthesis” (Wiersma and Jurs, 2005, p. 207).

The videos were analysed by using Multimodal Analysis Video (MMAV) software which contains facilities for importing videos files, entering analytical frameworks and creating time-stamped annotations and visualisations. Multimodal analysis is the study of how language, images and other resources combine to create meaning in texts, interactions and events (O’Halloran, E., & Tan, 2014). The video which was imported and analysed using MMAV software was transcribed using facilities in the software. The analysis of video focused on the teacher’s activities which were categorised based on the elements of differentiated instruction; namely content, process, product, assessment, and learning environment.

Figure 3. The Multimodal Analysis Video

- |                        |                      |
|------------------------|----------------------|
| 1. The film            | 4. Indicators or     |
| 2. The transcription   | description of each  |
| 3. Themes that will be | the theme            |
| analysed from the      | 5. The theme that is |
| video                  | chosen               |
|                        | 6. The film, sound,  |
|                        | dialog, and theme    |
|                        | strips               |

Figure 4. Visualization of video analysis results

A screenshot of MMAV is displayed in Figure 3. The various components of the graphical user interface (GUI) are (1) the player with volume, time and speed controls; (2) the transcription; (3) the themes that will be analysed from the video (this is created from the library GUI which is accessed through the library icon on the left); (4) indicators or descriptions of each theme (this assists the researcher when categorising the themes); (5) the

theme that is chosen for the annotation node; (6) the film, sound, dialog and themes strips. The videos were transcribed and the various forms of differentiated mathematics instruction which the teacher employed were coded using time-stamped annotation nodes transcribed the dialogs during the lesson.

The left panel in Figure 4 displays the relative percentage of time for each form of differentiated mathematics instruction. That is, the circles (i.e. the “states”) with the percentages represent the percentage of time for each form of differentiated instruction: i.e. content, process, product, assessment, and learning environment. The lines connecting the circles indicate the transition between each of these states.

## 5 RESEARCH FINDINGS AND DISCUSSION

The teachers who participated in Lesson Study worked together to prepare the lesson and anticipate the problems may arise. Also, they were able to also discuss the implementation of the 2013 curriculum 2013 that they started to apply in this academic year, 2014/2015.

### 5.1 Lesson Study group meeting 1

After the teachers learnt about differentiated mathematics instruction and Lesson Study in a professional development, they formed a Lesson Study group which was involved in this study. The four teachers met to discuss and prepare the first lesson plan with angle (right, acute, and obtuse angles) as a topic. They used the lesson plan format that is provided by school, but they modified and paid more attention to differentiation in the lesson. That is, the teachers tried to differentiate content, process, assessment and learning environment while they also became familiar with the new curriculum and textbook for 2013. However, they didn’t differentiate the product in the lesson. They still prepared the task with the same level of difficulties. However, as Tomlinson (1999) claims, it is difficult to differentiate everything in one lesson.

They chose topic based on the curriculum and then planned the lesson based on the teacher’s experience with some modifications on the content, process, assessment and learning environment. For the content differentiation, one teacher suggested using objects in the classroom to see the angles

created by each object. This is relevant to students' daily lives which are the objects close to them. To differentiate the process, the Lesson Study group decided to group students in the classroom. They tend to use heterogeneous grouping, given the various abilities of the students. In assessing students, the Lesson Study group decided to use a rubric for the ongoing assessment. However, the indicators in the rubric are concerned with student activeness during the lesson. These are listening, non-verbal communication, participation, and fluently of speaking.

### 5.2 Mathematics Lesson in SDI Madambake

The results of used differentiated mathematics instruction obtained from the preliminary video analysis of mathematics lesson about angles are shown in Table 1.

Table 1. The Used of Differentiated Mathematics Instruction in SDI Madambake

	Differentiated Mathematics Instruction shown	Example of evidence(s)	Time used during the lesson (in %)
1	Content of differentiation	Teacher associated the topic to students' environment by asking them to show the objects in the classroom that has angles.	1.70
2	Process of differentiation	Teacher gave open ended questions that encourage students to think creatively.	17.48
3	Product of differentiation	Teacher gave more time to the group that need.	0.26
4	Assessment of differentiation	From the lesson plan, it can be seen that teacher provide rubric for	-

		the lessons.	
5	Learning environment of differentiation	Teacher encouraged students to appreciate their friends who answered the question rightly by giving applause. Teacher appreciate student who did their job properly.	9.06
		Total	28.50

The teacher applied the principle of differentiation for 28.5% of the lesson time. Mostly, the teacher differentiated the process (17.48%), for example, the teacher tried to encourage students to think critically. Examples of this type were shown when the teacher required one student to point the angles of the board in the classroom before the teacher explained the meaning of angle, then the teacher asked: "Who can define...what the meaning of angle is?" The question was posed after the teacher asked students to point some objects in the classroom and showed the angle of the objects.

The learning environment differentiation (9.06%) was evidenced by the teachers' appreciation of appropriate responses to questions. She did not only say "good" to the student, but also sometimes asked the whole class to clap their hands in appreciation. In this way, the teacher encouraged students to respect their friends.

In the content of differentiation (1.70%), the teacher taught at the same level of difficulty to all students, but the teacher sought to establish the relations between the topic and the students' daily lives. She asked students to show objects in the classroom that has angles. Then, she asked some students to point the angles of the objects.

From the product of differentiation (0.26%), the teacher didn't offer various levels of task difficulties and gave only one kind of task. However, she gave opportunity to one group for completing the task.

Differentiation of assessment can be seen from the lesson plan. The group provide rubric to assess the students' activeness during the lesson. In this lesson, assessment of students' understanding about the topic was undertaken through group discussion. The teacher allocated marks based on the number of questions which the students answered correctly.

## 6 CONCLUSION

This paper proposes a model of Lesson Study features as a professional development to foster teachers' use of differentiation in mathematics lessons. The professional development session involving Lesson Study assists teachers to prepare their teaching. In this study, the data indicates that teachers used Lesson Study to assist them to differentiate content, process, product, assessment and learning environment. Even though, the differentiation was undertaken in less than one third of the total class time and across a limited number of indicators, it was evident that the teachers had valued the diversity of their students, which had a subsequent impact on their teaching. As Lewis, Perry and Hurd (2009) claim, teaching can be modified step by step.

# Materi Bangun Datar Dan Bangun Ruang Dengan Menggunakan Alat Peraga Untuk Meningkatkan Kreativitas Mahasiswa Semester I Tahun Akademik 2013/2014

Rahmania Sadek

*Fakultas Ilmu Pendidikan Program Studi PGSD  
Universitas Muhammadiyah Maluku Utara*

**Abstract:** Dari hasil Lesson Study dapat disimpulkan bahwa: (1) kondisi pembelajaran Pendidikan matematika I yang dijadikan lokasi penelitian secara umum sudah berjalan baik, sebagaimana dapat dilihat dari: pemahaman mahasiswa terhadap tujuan pembelajaran matematika terkait bangun datar dan bangun ruang, metode yang digunakan dosen model cukup bervariasi, meskipun materi pembelajaran matematika yang dikembangkan masih terlalu banyak, sumber yang digunakan masih menggunakan buku paket, peran mahasiswa dalam kegiatan pembelajaran cenderung masih kurang optimal, (2) pembelajaran bangun datar dan bangun ruang dengan alat peraga dilaksanakan melalui tahap perencanaan, pelaksanaan dan refleksi. (3) faktor-faktor yang mendukung pelaksanaan model pembelajaran dengan alat peraga adalah adanya alat-alat penunjang yang sudah di sediakan dosen, sehingga mempermudah pelaksanaan pembelajaran matematika, sedangkan faktor yang menghambat pelaksanaan alat peraga ini adalah budaya mengajar dengan menggunakan metode ceramah; (4). pembelajaran dengan menggunakan alat peraga ternyata lebih efektif. Begitu juga jika dibandingkan antara pembelajaran alat peraga dengan pembelajaran tidak menggunakan alat peraga, ternyata terlihat lebih antusias dalam kegiatan pembelajaran dengan menggunakan alat peraga.

**Keywords:** Bangun datar, bangun ruang, alat peraga

## 1 PENDAHULUAN

Matematika merupakan ilmu yang universal yang mempunyai peran sangat penting dalam berbagai disiplin ilmu dan memajukan daya pikir manusia (BSNP, 2006:139). Menurut Albert Einstein matematika adalah yang sebenarnya menawarkan kepada pengetahuan-pengetahuan alam suatu pengukuran pasti dimana tanpa matematika, kesemuanya itu tidaklah mungkin untuk diperoleh (Wahyudin, 2008a:8). Hal tersebut mengisyaratkan betapa pentingnya pendidikan matematika untuk dipelajari oleh semua orang khususnya mahasiswa.

Sedangkan pada kenyataannya banyak peserta didik yang belum mampu melakukannya, misalkan pada materi bangun datar dan bangun ruang yang merupakan salah satu materi yang harus dipelajari di perguruan tinggi khususnya PGSD.

Materi bangun datar dan bangun ruang sangat penting untuk dipelajari oleh perguruan tinggi untuk dipergunakan dalam kehidupan sehari-hari. Banyak sekali benda dalam alam nyata yang merupakan

bentuk bangun datar dan bangun ruang, sehingga pemahaman konsep yang benar tentang bangun datar dan bangun ruang ini sangat diperlukan oleh mahasiswa. Namun, pada kenyataannya, mahasiswa PGSD UMMU dari tahun ke tahun jumlah mahasiswa yang mencapai nilai KKM yang ditetapkan untuk pokok bahasan bangun datar dan bangun ruang sisi datar yaitu 65 masih di bawah 50%. Kemudian ketika dilakukan tes awal kepada mahasiswa semester I kelas A dan B ketika akan melakukan pembelajaran bangun datar dan bangun ruang, jumlah mahasiswa yang dapat mencapai nilai KKM di bawah 40%. Kenyataan ini sangat jauh dari yang diharapkan tentunya.

Menurut analisa penulis, hal tersebut diakibatkan materi bangun datar dan bangun ruang dalam kurikulum perguruan tinggi diletakkan secara terpisah antara bangun ruang dan bangun ruang sisi datar, yaitu bangun ruang sisi datar di semester I. Mahasiswa menganggap bahwa antara bangun datar dan bangun ruang sisi datar dan bangun ruang sisi lengkung tidak ada kaitannya. Hal ini terlihat ketika

mahasiswa diberikan materi bangun datar dan bangun ruang, pada umumnya mahasiswa merasa hal baru lagi termasuk rumus-rumus yang sama pada bangun datar dan bangun ruang. Ketika bertemu materi yang sama di matematika lanjutan tidak kebingungan ketika ditanya tentang materi tersebut. Hal ini menunjukkan kemampuan koneksi mahasiswa yang masih rendah sehingga konsep bangun datar dan bangun ruang kurang dipahami dengan baik.

Berdasarkan paparan di atas, dipandang perlu adanya pembaharuan strategi pembelajaran matematika pada situasi dan kondisi mahasiswa yang terjadi pada saat ini. Strategi pembelajaran pendidikan matematika I khususnya sub pokok bahasan bangun datar dan bangun ruang yang dapat dijadikan solusi adalah model pembelajaran matematika dengan menggunakan alat peraga untuk meningkatkan kompetensi mahasiswa.

Bagaimana penerapan bangun datar dan bangun ruang dengan menggunakan alat peraga untuk meningkatkan Kreativitas Mahasiswa Semester I Tahun Akademik 2013-2014.

## 2 KAJIAN PUSTAKA

### 2.1 Bangun Datar

#### 2.1.1 Pengertian Bangun Datar

Bangun datar merupakan sebutan untuk bangun-bangun dua dimensi.

#### 2.1.1 Macam-macam Bangun Datar

- Persegi
- Persegi Panjang
- Segitiga
- Jajar Genjang
- Trapesium
- Layang-layang
- Belah Ketupat
- Lingkaran

#### Persegi

#### Pengertian Dasar

Dalam kehidupan sehari-hari kita sering melihat bangun datar yang berbentuk persegi panjang, tetapi panjang sisinya sama. Bangun ini disebut persegi. Contoh bangun persegi adalah bingkai foto, teralis jendela, dan ubin.

Dengan demikian persegi adalah persegi panjang yang keempat sisinya sama panjang.

#### Sifat-sifat persegi

1. Semua sisinya sama panjang dan sisi-sisinya yang berhadapan sejajar.
2. Setiap sudutnya siku-siku.
3. Mempunyai dua buah diagonal yang sama panjang, berpotongan di tengah-tengah, dan membentuk sudut siku-siku.
4. Setiap Sudutnya dibagi dua sama besar oleh diagonal-diagonalnya.
5. Memiliki 4 sumbu simetri.

#### Rumus luas dan keliling persegi

- Luas Persegi

$$L = s^2$$

- Keliling Persegi

Keliling persegi panjang adalah jumlah panjang seluruh sisi-sisinya. Di tulis sebagai berikut,

$$K = 4s$$

#### Persegi Panjang

#### Pengertian Dasar

Persegi panjang adalah segi empat dengan sisi-sisi yang berhadapan sejajar dan sama panjang, serta keempat sudutnya siku-siku.

Sifat-sifat persegi panjang

1. Sisi-sisi yang berhadapan sama panjang dan sejajar. Setiap sudutnya siku-siku.
2. Setiap sudutnya siku-siku.
3. Mempunyai dua buah diagonal yang sama panjang dan saling berpotongan di titik pusat persegi panjang. Titik tersebut membagi diagonal menjadi dua bagian sama panjang.
4. Mempunyai 2 sumbu simetri yaitu sumbu vertikal dan horisontal.

Rumus luas dan keliling persegi panjang

- Luas Persegi panjang  
Luas persegi panjang sama dengan hasil kali panjang dan lebarnya. Dapat ditulis sebagai berikut:

$$L = p \times l$$

Keterangan: p = panjang  
l = lebar

- Keliling Persegi panjang  
Keliling persegi panjang sama dengan jumlah seluruh panjang p dan lebar l, maka dapat ditulis sebagai:

$$K = 2p + 2l \\ = 2(p + l)$$

Segitiga

Pengertian Dasar

Sebuah segitiga terbentuk apabila tiga titik yang tidak terletak pada satu garis lurus saling dihubungkan. Hal ini berarti:

Segitiga adalah bidang datar yang dibatasi oleh tiga garis lurus dan membentuk tiga sudut.

1. Jenis-jenis segitiga ditinjau dari panjang sisi-sisinya:
  - a. Segitiga sama kaki  
Segitiga sama kaki terbentuk dari dua segitiga siku-siku kongruen yang

diletakkan bersisian dan berhimpit pada sisi siku-siku yang sama panjang.

Dari uraian diatas dapat disimpulkan bahwa: "Segitiga sama kaki terbentuk dari dua segitiga siku-siku kongruen yang beripit pada sisi siku-siku yang sama panjang."

- b. Segitiga sama sisi  
Segitiga sama sisi adalah segitiga yang ketiga sisinya sama panjang.
- c. Segitiga sembarang  
Segitiga yang panjang sisi-sisinya tidak mencirikan segitiga sama kaki maupun sama sisi disebut segitiga sembarang. Dari pernyataan diatas dapat pula dinyatakan sebagai berikut:  
Segitiga sembarang adalah segitiga yang ketiga sisinya tidak sama panjang.

2. Jenis segitiga ditinjau dari sudu-sudutnya  
Pada topik sebelumnya kita telah mempelajari jenis segitiga ditinjau dari panjang sisi-sisinya. Sekarang kita akan meninjau jenis segitiga berdasarkan ukuran sudut-sudutnya.

Apabila segitiga ditinjau dari ukuran-ukuran sudut, maka nama segitiga itu mengikuti nama ukuran sudutnya, yaitu:

- a. Segitiga yang krtiga sudutnya lancip disebut segitiga lancip.
- b. Segitiga yang salah satu sudutnya siku-siku disebut segitiga siku-siku.
- c. Segitiga yang salah satu sudutnya tumpul disebut segitiga tumpul.

3. Jenis segitiga ditinjau dari panjang sisi-sisi dan besar sudutnya

- a. Segitiga sama kaki  
Segitiga sama kaki jika dikaitkan dengan besar sudut-sudut yang mungkin terbentuk adalah: segitiga siku-siku sama kaki, segitiga lancip sama kaki, segitiga tumpul sama kaki
- b. Segitiga sama sisi  
Segitiga sama sisi jika dikaitkan dengan besar sudut-sudutnya adalah besar tiap sudutnya 60°. Untuk segitiga sama sisi tidak ada penamaan khusus seperti segitiga sama kaki.

3. Segitiga sembarang  
Segitiga sembarang yang mungkin terbentuk jika dikaitkan dengan besar sudut-sudutnya adalah: segitiga siku-siku, segitiga lancip sembarang atau disebut

segitiga lancip, segitiga tumpul sembarang atau sering disebut segitiga tumpul.

**Sifat-sifat segitiga**

1. Segitiga siku-siku  
Segitiga siku-siku mempunyai dua siku-siku yang mengapit sudut siku-siku dan satu sisi miring(hypotenusa).
2. Segitiga sama kaki  
Didalam segitiga sama kaki terdapat:
  - a. Dua sisi yang sama panjang,sisi tersebut sering disebut kaki segitiga.
  - b. Dua sudut yang sama besar yaitu sudut yang berhadapan dengan sisi yang panjangnya sama.
  - c. Satu sumbu simetri.
3. Segitiga sama sisi  
Didalam segitiga sama sisi terdapat:
  - a. Tiga sisi yang sama panjang.
  - b. Tiga sudut yang sama besar.
  - c. Tiga sumbu simetri.

**Rumus luas dan keliling persegi panjang**

Luas segitiga =  $\frac{1}{2} \times a \times t$   
Keterangan: a = alas  
t = tinggi

Panjang sisi miring segitiga siku-siku dicari dengan rumus Phitagoras

$$(A^2 + B^2 = C^2)$$

Keliling segitiga =  $a + b + c$

**Jajar Genjang**

**Pengertian dasar**

Jajar gejang adalah segi empat dengan kekhususan yaitu sisi yang berhadapan sejajar dan sama sama panjang.  
Sifat-sifat yang dimiliki oleh jajargenjang adalah:

1. Sisi-sisi yang berhadapan sama panjang dan sejajar.
2. Sudut-sudut berhadapan sama besar.
3. Mempunyai dua buah diagonal yang berpotongan di satu titik dan saling membagi dua sama panjang.
4. Mempunyai simetri putar tingkat dua dan tidak memiliki simetri lipat

**Luas dan keliling jajar genjang**

Luas jajargenjang =  $a \times t$   
Keterangan: a = alas  
t = tinggi

**Keliling jajargenjang**

Menentukan keliling jajargenjang dapat dilakukan dengan cara menjumlahkan semua panjang sisinya. Sisi-sisi pada jajargenjang yang sejajar dan sama panjang. Misal apabila panjang 2 sisi yang tidak sejajar masing-masing adalah m dan n, maka keliling jajargenjang ditentukan oleh:

$$\text{Keliling} = m + n + m + n = 2(m + n),$$

dimana m dan n adalah sisi-sisi yang sejajar.

Persegi panjang adalah segi empat dengan sisi-sisi yang berhadapan sejajar dan sama panjang, serta keempat sudutnya siku-siku.

**Trapesium**

**Pengertian dasar**

Trapesium adalah segi empat yang memiliki sepasang sisi berhadapan sejajar.

Jenis – jenis trapesium antaralain :

- Trapesium sembarang  
Trapesium dikatakan trapesium sembarang jika trapesium tersebut tidak memiliki kekhususan
- Trapesium siku – siku  
Trapesium siku – siku adalah trapesium yang memiliki sudut siku – siku
- Trapesium sama kaki

Trapesium sama kaki adalah trapesium yang kaki - kakinya sama panjang

Sifat-sifat yang dimiliki oleh trapesium

- Sisi-sisi yang berhadapan sejajar.
- $\angle A + \angle D = 180^\circ$  .(sudut dalam sepihak)
- $\angle B + \angle C = 180^\circ$  .(sudut dalam sepihak)

Sifat-sifat khusus yang dimiliki oleh trapesium sama kaki

- Terdapat dua pasang sudut berdekatan yang sama besar
- Dalam trapesium sama kaki terdapat diagonal – diagonal yang sama panjang
- Luas dan keliling trapesium

- Luas =  $\frac{1}{2} (k_1 + k_2) t$

Keterangan: t = tinggi

- Keliling trapesium = alas + atap +

### Layang-layang

Pengertian dasar

Layang – layang adalah segi empat yang dibentuk oleh dua segitiga sama kaki yang alasnya sama panjang dan berhimpit.

Sifat-sifat yang dimiliki oleh layang - layang adalah:

- Pada layang – layang terdapat dua pasang sisi yang sama panjang
- Pada layang – layang terdapat sepasang sudut berhadapan yang sama besar
- Pada layang – layang terdapat satu sumbu simetri yang merupakan diagonal terpanjang

- Pada layang – layang salah satu diagonalnya membagi dua sama panjang diagonal lainnya secara tegak lurus

Luas dan keliling Layang – layang

- Luas =  $\frac{1}{2} d_1 d_2$
- Keliling layang – layang =  $2(x + y)$

### Belah ketupat

Pengertian Dasar

Belah ketupat adalah segi empat yang dibentuk dari segitiga sama kaki dan bayangannya, dengan alas sebagai sumbu cermin.

Sifat-sifat belah ketupat

- Semua sisinya sama panjang.
- Sudut-sudut yang berhadapan sama besar dan dibagi dua sama besar oleh diagonal-diagonalnya.
- Kedua diagonalnya saling membagi dua sama panjang dan saling tegak lurus
- Kedua diagonal belah ketupat merupakan sumbu simetrinya.

Rumus luas dan keliling belah ketupat

- Luas belah ketupat  
Luas =  $\frac{1}{2} (a \times b)$   
Atau Luas =  $\frac{h \times p \times d}{2}$   
Keterangan: a = diagonal 1  
b = diagonal 2

- Keliling Persegi panjang  
Keliling belah ketupat =  $4 \times p$

**Lingkaran**

**Pengertian dasar**

Lingkaran adalah himpunan titik-titik yang berjarak sama.

**Luas dan keliling lingkaran**

- Luas =  $\pi r^2$   
Keterangan: r= jari-jari
- Keliling lingkaran =  $\pi \times d$       $2 \times \pi \times r$

**2.2 Bangun Ruang**

1. Pengertian Bangun Ruang  
Bangun ruang merupakan sebutan untuk bangun-bangun tiga dimensi.
2. Macam-Macam Bangun Ruang  
Jenis bangun ruang antara lain:

- Kubus
- Balok
- Prisma tegak segitiga siku - siku
- Tabung
- Kerucut
- Limas
- Bola

**Kubus**

- a. Ciri - ciri Kubus :
  1. Jumlah bidang sisi ada 6 buah yang berbentuk bujur sangkar (ABCD, EFGH, ABFE, BCGF, CDHG, ADHE,)
  2. Mempunyai 8 titik sudut (A, B, C, D, E, F, G, H)

3. Mempunyai 12 rusuk yang sama panjang (AB, CD, EF, GH, AE, BF, CG, DH, AD, BC, EH, FG)
4. Semua sudutnya siku-siku
5. Mempunyai 4 diagonal ruang dan 12 diagonal bidang (4 diagonal ruang = garis AG, BH, CE, DF dan 12 diagonal bidang = garis AC, BD, EG, FH, AH, DE, BG, CF, AF, BE, CH, DG)

b. Rumus pada kubus

- Diagonal Bidang =  $u\sqrt{2}$
- Diagonal Ruang =  $u\sqrt{3}$
- Luas permukaan =  $6u^2$
- Volume =  $u^3$
- Jarak C terhadap BDG =  $\frac{1}{3}u\sqrt{3}$
- Jarak ACH terhadap BEG =  $\frac{1}{3}u\sqrt{3}$
- Jarak E terhadap BDG =  $\frac{2}{3}u\sqrt{3}$

**Balok**

a. Ciri-ciri Balok :

1. Alasnya berbentuk segi empat
2. Terdiri dari 12 rusuk
3. Mempunyai 6 bidang sisi
4. Memiliki 8 titik sudut
5. Seluruh sudutnya siku-siku
6. Mempunyai 4 diagonal ruang dan 12 diagonal bidang

b. Rumus pada balok

- Panjang semua rusuk balok :  $4(p + l + t)$
- Panjang diagonal sisi balok  $d_1, d_2, d_3$  :  
 $d_1 = \sqrt{p^2 + l^2}, d_2 = \sqrt{p^2 + t^2}, d_3 = \sqrt{l^2 + t^2}$

- Panjang diagonal ruang balok :  $d = \sqrt{p^2 + l^2 + t^2}$  cm
  - Luas sisi balok =  $2pl + 2pt + 2lt$
  - Luas bidang diagonal :  $L_d = l\sqrt{p^2 + t^2}$ ,  $L_d = p\sqrt{l^2 + t^2}$ ,  $L_d = t\sqrt{p^2 + l^2}$
  - Volume  $p \times l \times t$
- Rumus tabung
- Volume tabung = luas alas x tinggi
  - Luas alas = luas lingkaran alas tabung =  $\pi \times r^2$
  - Dengan  $\pi = \frac{2}{7} \approx 3,14$
  - Jadi Volume tabung =  $\pi \times r^2 \times t$
  - Luas Permukaan Tabung = 2 x luas alas + Luas selimut tabung =  $(2 \times \pi \times r^2) + (2 \times \pi \times r \times t)$  =  $2 \times \pi \times r(r + t)$

**Prisma Tegak segitiga siku-siku**

- a. Ciri-ciri :
1. Terdiri dari 6 titik sudut
  2. Mempunyai 9 buah rusuk
  3. Mempunyai 5 bidang sisi
- b. Rumus Prisma tegak segitiga siku – siku
- Luas sisi prisma : jumlah panjang rusuk alas x tinggi + luas 2 tutup
  - Volume prisma : luas alas x tinggi

**Kerucut**

- a. Ciri-ciri :
1. Mempunyai 2 bidang sisi (1 bidang sisi lingkaran dan 1 bidang sisi selimut)
  2. Mempunyai 2 rusuk dan 1 titik sudut
- b. Rumus kerucut
- Luas selimut =  $\pi r t$
  - Luas alas =  $\pi r^2$
  - Luas Permukaan kerucut = Luas alas + Luas Selimut =  $\pi r^2 + \pi r t$  =  $\pi r(r + t)$
  - Volume = Luas alas x tinggi =  $\pi r^2 t$

**Tabung / silinder**

- a. Ciri-ciri:
1. Mempunyai 2 rusuk
  2. Alas dan atapnya berupa lingkaran
  3. Mempunyai 3 bidang sisi ( 2 bidang sisi lingkaran atas dan bawah, 1 bidang selimut)

**Limas**

a. Limas Segitiga

- a. Ciri-ciri :
1. Alasnya berbentuk segitiga
  2. Mempunyai 4 bidang sisi (alas dan 3 sisi tegak)
  3. Mempunyai 6 rusuk

4. Mempunyai 4 titik sudut
- b. Rumus Limas segitiga
  - Luas alas = alas x tinggi
  - Volume = Luas alas x tinggi
  - Luas = Luas alas + (3 x luas tegak segitiga)

**Limas Segiempat**

- a. Ciri-ciri :
  1. Alasnya berbentuk segiempat (BCDE)
  2. Mempunyai 5 bidang sisi (BCDE, ABC, ACD, ABE, ADE)
  3. Mempunyai 5 titik sudut ( A, B, C, D, E)
  4. Mempunyai 8 rusuk (AB, AC, AD, AE, BC, CD, DE, BE)
- b. Rumus limas segiempat
  - Volume Limas = Luas alas x tinggi

**Bola**

- a. Ciri-ciri :
  1. Hanya mempunyai 1 bidang sisi
  2. Tidak mempunyai sudut dan tidak mempunyai rusuk
- b. Rumus bola
  - Volume =  $\frac{4}{3} \pi \times r^3$
  - Luas =  $4 \pi r^2$

**3 METODE**

**3.1 Subjek Lesson Study**

Subjek yang bertindak dalam Lesson Study ini adalah Mahasiswa-mahasiswi semester I (Satu) Tahun Akademik 2013-2014

**3.2 Rancangan Pelaksanaan Lesson Study**

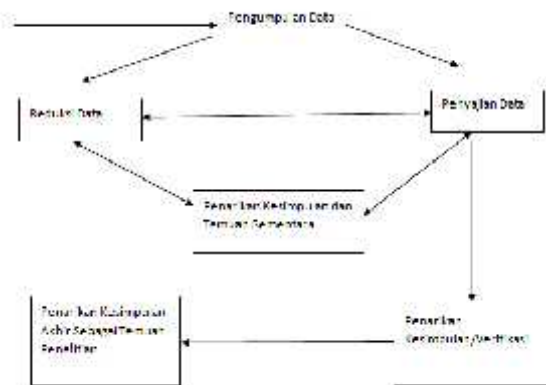

Jumlah siklus dalam Lesson Study ada empat kali di mana Perencanaan (Plan) di ruang Prodi PGSD dengan Observer 9 dan Satu Dosen Model, Pelaksanaan (Do) Lesson Study dengan Mata Kuliah Pendidikan Matematika I (Bangun datar dan bangun ruang) di ruang 28 PGSD Kampus B, Lantai III UMMU Ternate, dan Refleksi (See) Lesson Study di Ruang PGSD dengosen Model.

**3.3 Teknik dan Instrumen Pengumpulan Data**

Teknik dalam Lesson Study ini adalah Observasi dan Dokumentasi

**3.4 Teknik Analisa Data**

Dalam Lesson Studi ini memakai analisis Hubermas yaitu dengan urutan sebagai berikut pengumpulan data, display data, reduksi data dan mengambil kesimpulan/verifikasi (Poerwanti, 2000:32-33)

#### 4 HASIL DAN PEMBAHASAN

*Pertama*, kondisi pembelajaran pendidikan matematika I yang dijadikan lokasi penelitian secara umum sudah berjalan baik, sebagaimana dapat dilihat dari hasil penelitian yaitu: mahasiswa secara umum sudah memahami tujuan yang dikembangkan dalam rencana pembelajaran dalam empat siklus ini. Dalam pengembangan tujuan pembelajaran sudah sesuai dengan Silabus/Kurikulum. Meskipun begitu Dosen Model masih menunjukkan kekurangan optimal dalam menentukan tujuan, dikarenakan masih suka terpaku pada salah satu kemampuan keompok mahasiswa saja, yaitu kemampuan kognitif. Ditelaah dari metode yang digunakan dosen model dalam penyampaian materi pembelajaran matematika (bangun datar dan bangun ruang) cukup bervariasi dengan menggunakan alat peraga dalam pembelajaran Matematika sudah dilaksanakan. Metode yang sudah dilaksanakan diantaranya adalah metode ceramah, penugasan Kelompok, dan Tanya Jawab.

Sumber yang digunakan dosen model dalam pembelajaran pendidikan matematika I cenderung masih tertumpu pada sumber belajar yang tersedia di kampus. Buku paket yang ada di kampus dijadikan sebagai sumber utama, sedangkan penunjang yang digunakan adalah buku yang pada tahun-tahun sebelumnya digunakan. Sumber belajar masih terikat pada sumber yang tercantum di dalam kurikulum. Sedangkan kalau menggunakan sumber lainnya yang lebih bagus, kampus harus mengeluarkan biaya yang cukup besar, sehingga terkadang dosen mode matematika mempertimbangkan segi positif dan negatifnya dalam penggunaan sumber belajar/alat peraga tersebut.

Sarana yang digunakan dosen model dalam kegiatan pembelajaran matematika PGSD lokasi Lesson Study, terutama untuk menunjang pelaksanaan pembelajaran Matematika adalah tersedianya Infokus, dan Alat Peraga Bangun datar dan bangun

Peran mahasiswa dalam kegiatan pembelajaran pendidikan matematika I secara umum cenderung masih kurang optimal. Aktivitas siswa dalam kegiatan pembelajaran di kampus terutama dalam pembelajaran matematika masih suka agak gaduh. Dalam tugas-tugas kelompok pembelajaran seperti pekerjaan kelompok dan tugas pembelajaran lainnya mahasiswa sudah menyelesaikannya meskipun belum semuanya benar. Suasana kelas kalau ditinggal oleh dosen terkadang langsung ribut, karena mahasiswa banyak yang suka ikut keluar ruangan. Evaluasi yang dilakukan dosen dalam

pembelajaran matematika selama ini yaitu evaluasi pada setiap akhir pertemuan.

*Kedua*, pengembangan program pembelajaran Lesson Study pendidikan matematika Idengan menggunakan alat peraga dalam meningkatkan kemampuan mahasiswa secara umum dilakukan melalui tahap perencanaan (Plan), pelaksanaan (Do), dan Refleksi (See) sebagai berikut:

a. Perencanaan (Plan) pengembangan alat peraga bangun datar dan bangun ruang yaitu: (1) model pembelajaran dengan menggunakan alat peraga mengacu kepada komponen-komponen perencanaan pembelajaran yaitu: (a) pengenalan, (b) penyajian informasi, (c) pertanyaan dan respon jawaban, (d) penilaian respon di mana mengacu kepada komponen pencapaian pembelajaran sebagai berikut: (a) penyajian masalah-masalah dalam bentuk tugas kelompok soal pada tingkat tertentu dari penampilan/persentase mahasiswa; (b) mahasiswa mengerjakan soal-soal latihan yang ada di LKM dan mengevaluasi kemudian memberikan umpan balik/diskusi.

b. Pelaksanaan ( Do)

Pembelajaran pendidikan matematika I menggunakan alat peraga pada yaitu:

1) Tahap-tahap yang dilakukan dalam pelaksanaan pembelajaran, yaitu: (a) tahap pengenalan/pengantar meliputi : (1) penampilan judul yaitu halaman judul yang di tampilkan dengan power poin slait gambar tentang bangun datar dan bangun ruang; (2) menginformasikan tujuan pembelajaran atau kompetensi yang diharapkan, meliputi standar kompetensi, kompetensi dasar dan indikator; (3) menampilkan petunjuk penggunaan alat peraga; (4) menampilkan stimulasi pengetahuan yang dilakukan oleh mahasiswa dengan diskusi kelompok dengan menggunakan alat peraga bangun datar dan bangun ruang.

c. Refleksi (See)

Pembelajaran pendidikan matematika materi bangun datar dan bangun ruang dengan menggunakan alat peraga yaitu dilakukan pada awal proses pembelajaran, saat proses pembelajaran dan di akhir proses pembelajaran.

Dari hasil Refleksi dari observer bahwa proses pembelajaran menunjukkan bahwa dosen model masih agak kaku dan cenderung monoton dalam menyampaikan materi dalam Menggunakan alat peraga. Ditelaah dari aktivitas mahasiswa sudah menunjukkan antusiasnya. Hanya beberapa siswa yang masih agak canggung dalam menggambar alat peraga pembelajaran matematika dengan bangun

datar dan bangun ruang. Evaluasi terhadap keberhasilan belajar mahasiswa dilaksanakan dengan melalui (tes akhir/LKM). Dari hasil evaluasi diketahui bahwa ada peningkatan kemampuan mahasiswa antara sebelum dan sesudah melaksanakan pembelajaran dengan menggunakan alat peraga bangun datar dan bangun ruang.

## 4 KESIMPULAN DAN SARAN

### 4.1 Kesimpulan

Kondisi pembelajaran pendidikan matematika (Bangun datar dan Bangun ruang) yang dijadikan lokasi penelitian secara umum sudah berjalan baik, sebagaimana dapat dilihat dari:

- Pemahaman mahasiswa terhadap tujuan pendidikan matematik I, secara umum sudah memahami tujuan yang dikembangkan dalam rencana pembelajaran.
- Sumber yang digunakan dosen dalam pembelajaran matematika cenderung masih tertumpu pada sumber belajar yang tersedia di kampus.
- Sarana yang digunakan dosen dalam kegiatan pembelajaran matematika, terutama untuk menunjang pelaksanaan pembelajaran Matematika adalah tersedianya infokus dan alat penunjang lainnya.
- Evaluasi yang dilakukan dosen dalam pembelajaran matematika selama ini yaitu evaluasi pada setiap akhir pertemuan.

Pembelajaran pendidikan matematika I dengan menggunakan alat peraga ternyata lebih efektif jika dibandingkan dengan tidak menggunakan alat peraga pada bahasan bangun datar dan bangun ruang. Ternyata siswa terlihat lebih antusias dalam kegiatan pembelajarannya dengan menggunakan alat peraga.

### 4.2 Saran

## Global Standard: Its Purpose, Principles and Framework

Masataka Kizuka

*The Graduate school of Medical Sciences, Department of Applied Linguistics,  
Kyoto Prefectural University of Medicine.  
Inamori Memorial Building, 1-5, Hangi-cho, Shimogamo, Sakyo-ku, Kyoto, Japan.

**Abstract:** This paper focuses on insights from the Global Standard (GS) in the Education of Medical Doctors (EMD) which can be of great use in Initial Teacher Education (ITE). There is a firm rationale for introducing the GS into EMD: the present mobility of medical doctors across the globe. This aspect especially applies to ITE in countries such as those in the EU or in China and Japan. In this situation, quality assurance in ITE is indispensable. However, there is a pitfall in the GS: the use of the standard to assess the performance of school teachers by means of numerical targets or attainment targets, such as Can-Do lists or checklists. This framework critically fails to recognise that the professionalism of the performance by both teachers and medical doctors consists of competency as well as capability. The ultimate goal of a standard is an enhancement of the overall quality of teachers, and a huge difference between ITE and the teachers' licensing system exists in each country. Therefore, in order to be fit for a different context of ITE, the GS should be construed as a lenient framework or should just show a broad view of desirable, would-be teachers. That is, we should not try to concretise all the competencies required for teachers, an approach which is adopted in the GS in EMD because competency-based standards have difficulties in themselves and capability must be regarded as significant.

**Keywords:** Global Standard, Initial Teacher Education, Education of Medical Doctors, Competency, Capability

### 1 INTRODUCTION

This paper focuses on how Global Standard (GS) is conceptualised and how it can be best made use of in Initial Teacher Education (ITE), taking into consideration both the current situation and discussions in the Education of Medical Doctors (EMD), because there can well be a disparity in the underpinning concept of the GS between ITE and EMD.

### 2 BACKGROUND OF THE GS IN EMD

There is a firm rationale for introducing the GS into EMD: the present mobility of medical doctors across the globe. In this situation, quality assurance in education is indispensable from the point of view in order to ensure that all medical doctors have a common minimum competency and set of skills.

According to *The Oxford Advanced Learner's Dictionary*, “standard” is defined as: 1. a level of quality, especially one that people think is acceptable. 2. a level of quality that is normal or acceptable for a particular person or in a particular situation. In short, “standard” is mainly concerned with the “quality” of, in this case, medical doctors: therefore, the GS has been prevailing in EMD,

especially in the search for world-wide quality assurance.

However, it seems that the contemporary mobility of medical doctors is a rather passive motive about introducing the GS. Rather, it appears to be possible to make the most of this opportunity for enhancing the professionalism of medical doctors in EMD in general.

### 3 STANDARDS IN ITE

The condition in EMD especially applies to ITE in countries such as those in the EU or in China and Japan, the governments of which recruit quite many native speakers of English for schools. At this moment, there is no such movement as establishing a GS in ITE, although several countries have already made or have been trying to make nation-wide standards in ITE <sup>(1)</sup>.

Specifically with regard to the current movement in the field of standards for English Language Education (ELE), Can-Do lists or a checklist type of standards seem to prevail, such as the *European Portfolio for Student Teachers of Languages* (EPOSTL), and the “J-POSTL” (Japanese Portfolio for Student Teachers of Languages) and the “J-POTL” (Japanese Portfolio for Teachers of Languages), both

of which have been developed, on the basis of the EPOSTL, by The Japan Association of College English Teachers (JACET) Special Interest Group on English Education.

The followings are the typical extracts from the EPOSTL.

EPOSTL is a document for students undergoing initial teacher education. It will encourage you to reflect on your didactic knowledge and skills necessary to teach languages, helps you to assess your own didactic competences and enables you to monitor your progress and to record your experiences of teaching during the course of your teacher education.(p.3)

#### 4 THE ROLE OF THE LANGUAGE TEACHER

- I can promote the value and benefits of language learning to learners, parents and others.
- I can appreciate and make use of the value added to the classroom environment by learners with diverse cultural backgrounds.
- I can take into account the knowledge of other languages learners may already possess and help them to build on this knowledge when learning additional languages.
- I can draw on appropriate theories of language, learning, culture etc. and relevant research findings to guide my teaching.
- I can critically assess my teaching on the basis of experience, learner feedback and learning outcomes and adapt it accordingly.
- I can critically assess my teaching in relation to theoretical principles.
- I can accept feedback from my peers and mentors and build this into my teaching.
- I can observe my peers, recognise different methodological aspects of their teaching and offer them constructive feedback.
- I can locate relevant articles, journals and research findings relating to aspects of teaching and learning.
- 10. I can identify and investigate specific pedagogical/ didactic issues related to my learners or my teaching in the form of action research. (pp.17-18)

Obviously, above is a Can-Do list for trainee teachers.

Basically, both the "J-POSTL" and the "J-POTL" also consist of a set of Can-Do lists or checklists with huge numbers of detailed attainment targets or minute assessing points. This reveals that ITE and Teacher Education (TE) in ELE are to be regarded as skill-oriented/getting or skill-centred education, in order to assess the required competency for trainee teachers or in-service teachers.

Similar types of standards can also be found in different TE settings in Japan, such as the "Model

Core Curriculum for Teacher Education"<sup>(2)</sup> by The Japan Association of Universities of Education and the "Teacher Education Standards"<sup>(3)</sup> of the Hyogo University of Teacher Education in Japan, all of which are competency-based, Can-Do lists or a checklist type of standards.

It can be stated that specifically in ELT and in ITE in Japan competency-based, Can-Do lists or a checklist type of standards are the mainstream.

#### 5 PROBLEMS IN COMPETENCY-BASED STANDARDS

According to *The New Oxford American Dictionary*, "competency" is defined as "the ability to do something successfully or efficiently". In the ITE and TE context, this means that both knowledge and skills for implementing lessons must be acquired in order to complete the job successfully.

However, acquiring the competencies in the list does not always secure their "good practice", as professionals have mastered more than a limited professional range of competencies. Therefore, the vital points which should be considered here are: 1. It is quite unlikely that we can ever produce a complete list by the use of which to assess the outcomes of trainee teachers and school teachers, for professionals possess more than knowledge and skills which are visible from the outside (i.e., outcomes). 2. Even if the items on the Can-Do lists or the checklists are completely mastered by both trainees and teachers, this does not necessarily mean that they are "professionals" because they are not such simple people as to have just acquired every item in the list as a separate, stand-alone piece of knowledge or skill. The items in the lists must be interwoven with one another. One of the plausible questions here would be: how can "Reflectivity" be properly assessed by using Can-Do lists or checklists? It is not at all an easy task to disclose, by means of Can-Do lists or checklists, the degree of "Reflectivity" trainee teachers and school teachers have at the moment, for various complex features are included in "Reflectivity".

Moreover, a pitfall in competency-based standards is often described as a worrisome risk: the use of the standard to assess the performance of teachers by means of numerical targets or attainment targets—that is, how many attainment targets in the Can-Do lists or checklists have they achieved.

Therefore, competency-based, Can-Do lists or a checklist type of standards are not considered to be the ultimate goal for the GS in ITE.

#### 6 THE GS IN EMD

One characteristic aspect of the GS in EMD is that professional attributes including "professional

attitude” (i.e., behavioural aspects) are greatly emphasised. An interesting research on suitability/apptitude for professionals is implemented in EMD: disciplinary action among practicing physicians by medical boards has been strongly associated with unprofessional behavior in medical school (4). In other words, competency is viewed as only one part of assessing the ability of professionals in EMD. Therefore, the theoretical framework of the curriculum in EMD is constructed with “attitudes” of trainee doctors, which is shown in Figure 1 (5).

Figure 1. A model of a spiral curriculum in EMD

One concept which is closely connected with professional attributes and which plays a vital role for professionals is “capability”, which is defined in *The Oxford Advanced Learner’s Dictionary* as “the ability or qualities necessary to do something”, which can be called an “intangible quality” in my terms. Capability is indispensable attribute or aptitude if a person is to do a professional job. Lacking it, professionals cannot practice their trade properly. Therefore, the GS in such EMD as the *WFME Global Standards for Quality Improvement* by the World Federation for Medical Education (WFME) and the *European Core Curriculum: The Students’ Perspective* are not of the Can-Do list or check-list type, but just show a broad framework of reference to the required abilities, including professional attitudes for trainee doctors and doctors. In this sense, it can be stated that the framework of competency-based, Can-Do lists or a checklist type of standards in ITE critically lack the essential point that the professionalism of the performance by school teachers consists of not only “competency” but also “capability”.

The followings are some extracts from the *WFME Global Standards for Quality Improvement*.

#### PURPOSE

- Standards should be concerned with broad categories of the content, process, educational environment and outcome of medical education.
- Standards should function as a lever for change and reform. Standards should be formulated in such a way as to acknowledge regional and national differences in the educational programme, and allow for different profiles and developments of the individual medical schools, respecting reasonable autonomy of the medical schools.
- Use of a common set of international standards does not imply or require complete equivalence of programme content and products of medical schools.
- Standards should recognise the dynamic nature of programme development.
- Standards are formulated as a tool which medical schools can use as a basis and a model for their own institutional and programme development. Standards should not be used in order to rank medical schools.
- Standards are intended not only to set minimum requirements but also to encourage quality development beyond the levels specified. The set of standards, in addition to basic requirements, should include directions for quality development.
- Standards should be further developed through broad international discussion and consensus.
- The value of the standards must be tested in evaluation studies in each region. Such projects should be based on a combination of voluntary institutional self-evaluation and peer review.(p.6)

AREAS are defined as broad components in the structure, process and outcome of medical education and cover:

- Mission and Objectives
- Educational Programme
- Assessment of Students
- Students
- Academic Staff/Faculty
- Educational Resources
- Programme Evaluation
- Governance and Administration
- Continuous Renewal(p.8)

#### EDUCATIONAL OUTCOME

Basic standard:

The medical school **must** define the competencies that students should exhibit on graduation in relation to their subsequent training and future roles in the health system.

Quality development:

The linkage of competencies to be acquired by

graduation with that to be acquired in postgraduate training **should** be specified. Measures of, and information about, competencies of the graduates **should** be used as feedback to programme development.

Annotations

- Educational outcomes would be defined in terms of the competencies the students must acquire before graduation.
- Competencies within medicine and medical practice would include knowledge and understanding of the basic, clinical, behavioural and social sciences, including public health and population medicine, and medical ethics relevant to the practice of medicine; attitudes and clinical skills (with respect to establishment of diagnoses, practical procedures, communication skills, treatment and prevention of disease, health promotion, rehabilitation, clinical reasoning and problem solving); and the ability to undertake lifelong learning and professional development. (p.9)

It is obvious that the underpinning concept of the GS in EMD is different from that of the GS in ELT and in ITE in Japan. Interestingly, the *Teachers' Standards* in England and the *Professional Standards for the Accreditation of Teacher Preparation Institutions* in the United States are close in construction to the GS by WFME, both of which include a feature of professional attributes and are not merely Can-Do lists or a checklist type of standards.

## 7 CONCLUSION

It is worthwhile introducing the GS to ITE and TE because of the factors currently internationally affecting education in general: accountability, quality assurance, etc. Needless to say, the world-wide uniformity of teachers is not the goal of GS especially since a huge difference between ITE and the teachers' licensing system exists in each country. Therefore, it is reasonable and practical that the GS should focus on an enhancement of the overall quality of teachers, taking into consideration the present-day directions and trends in TE such as “reflective practice”.

In order to consider the GS, as we looked at it, competency-based standards consisting of Can-Do lists or checklists have a deficiency, which leads us to also highlight capability for professionals. Hence, it follows that GS should be construed as a lenient framework or should just show a broad view of desirable, would-be teachers, including both competency- and capability-features, an approach which is adopted in the GS in EMD.

## Lesson Study: An Implemented Innovation in the Thai Context

Narumol Inprasitha<sup>1</sup>, Maitree Inprasitha<sup>2</sup>

<sup>1</sup>Teacher Profession Center, Khon Kaen University, Khonkaen city, Thailand  
narum@hotmail.co.th

<sup>2</sup>Center for Research in Mathematics Education, Khon Kaen University, Khonkaen city, Thailand  
imaitr@kku.ac.th

**Abstract:** Lesson Study, a Japanese way of professional development of teachers, has been developed dated back for nearly 140 years. In Thailand, it has been implementing Lesson Study since 2000 and has a unique way of adapting this Japanese professional development. Our experience on Lesson study has been sharing in APEC member economies during the last 6 years and has been said "quite success" in improvement of teaching and learning mathematics. In this paper, key concepts for implementing the lesson study such as "adaptive innovation", "Unit of analysis for making lesson study cycle" "how to determine lesson study team" Or, why "cutting "revision step" from the weekly/ cycle will be discussed. Then, the growth of Lesson Study in Thailand which almost all of them were implemented by Center for Research in Mathematics Education, Faculty of Education, Khon Kaen University will be stated. At last, factors affecting success in applying the Lesson Study in developing the teaching professional development included : the support by original affiliation of school, school administrators' support, collaboration with outside experts, awareness of changes in students as well as teacher, confidence in Lesson Study as an opportunity of professional development, teachers' experience in collaborative working of teachers participating in Lesson Study Process, and knowledge management approach will be discussed.

**Keywords:** Lesson Study, Implemented Innovation, Thai context

### 1 INTRODUCTION

Lesson Study is an innovation as a major method in professional development in Japan. It occurred more than one hundred years ago. It was accepted throughout the time as a technique leading to the better and sustainable teaching (Lewis and Berry, 2006). In addition, it was a guideline of Teacher-led instructional improvement. The teacher was a motivator in teaching improvement by themselves without waiting from the expert outsider experts. For major objective, it was the Student-focused. Therefore, this guideline was very useful for the teacher's instruction whether in content, teaching technique, or student's learning (Lewis, 2002; Lewis and Berry, 2006; Shimizu, 2006; Isoda, 2006; Wang, 2006).

The Lesson Study Innovation was dissemination from Japan to schools in the United States of America as the first country in 1999. It was rapid growth until now. In 2007, there were 13 countries in Asia Pacific Cooperation adopted the teaching professional development in their own countries. For Thailand, the guideline of Lesson Study was administered in the development since 2002 initiated by Maitree Inprasitha (2003) by piloting the teacher training project of Faculty of Education, Khon Kaen University, until 2009, there were 24 schools used the Lesson Study and Open Approach in teaching professional development.

Since the Lesson Study Innovation was accepted in many countries in that it was valuable for teachers because it could make change in teachers and

students. As a result, it was considered to be very appropriate with Thailand because in recent situation the teacher needed to improve their own teaching in order to affect the students' learning reform. Consequently, the application of Lesson Study in teaching professional development of Thailand, would be useful for teacher reform.

### 2 DEFINITION OF LESSON STUDY

The word "Lesson Study" was defined by Center for Research in Mathematics Education, Khon Kaen University, in order to replace an English Term "Lesson Study," by replacing the word "jogyokenkyu," in Japanese Language. For the word "jogyokenkyu," consisted of 2 words "jogyo" meant the classroom, and "kenkyu," which referred to study or conducting research (Yoshida, 2004). According to the letter, therefore, lesson study referred to "the study" or "classroom research". But, the meaning based on real Japanese Culture, when teachers wanted to use lesson study innovation, they would participate in well-developed process including: discussion of Lessons which they already planned and observed teaching together, called "kenkyujogyo" reversing the word "jogyokenkyu." It could be translated that "study or research the lesson" Specifically, in Japanese meaning "lesson" had specific meaning as "The object of one's study." The lesson study or classroom study referred to the "study," according to step of implementation in attempting to accomplish the research objective

chosen to work together by every teacher (such as to comprehend how to do for enhancing the students in being able to learn freely).

### **3 HISTORICAL BACKGROUND OF LESSON STUDY IN THAILAND**

Maitree Inprasitha (2006) stated the background of lesson study in Thailand concluding that the historical background of lesson study in Thailand starting at Faculty of Education, Khon Kaen University, its development was aligned with development of Open Approach. Assistant Professor Dr. Maitree Inprasitha administered the process of lesson study in the project enhancing self-studying with research grant from Khon Kaen University in 2002. The objective of that project was to study the changes in worldview of 15 internship students in Mathematics Education, Faculty of Education, Khon Kaen University, participated in the project. The students taught by the internship group throughout the first semester of 2002 school year, were surveyed their opinion.

In the same year, Maitree Inprasitha (2006) implemented the research project titled “Learning Reform in Mathematics in Schools by focusing on Mathematical Process,” supported by the Office of National Research Commission. In the project, 2 schools participated in: Secondary School --- Kokesee-pittayasan School, and Primary School—Suansanook Municipal, Muang District, Khon Kaen Province.

Later on, in 2003, after the establishment of Center for Research in Mathematics Education: CRME, the development and advertisement in lesson study was responsible by the center. In that year, Faculty of Education, by collaboration between Center for Research in Mathematics Education, and PLAN Organization of Thailand, launched the project “Development of Learning Plan based on guideline of National Educational Reform Act 2001 in each major learning substance by Lesson Study,” aiming for development of in-service teachers in the Office of Khon Kaen Educational Service Area 5, Mathematics Education Learning Substance, and Social Studies, Religion, and Culture Learning Substance, 50 teachers each learning substance, so that they could be able to develop the lesson plan and use in their own class.

In 2006, Faculty of Education, Khon Kaen University, on behalf of the former Dean (Associate Professor Dr. Suladda Loipha ) allowed the Center for Teaching Professional Development and Educational Personnel to collaborate with PLAN Organization of Thailand, implemented the project for developing in-service teachers in the Office of Mahasarakam Educational Service Area 1, and 2, in Mathematics, Science, Thai Language, and Social Studies, Religion, and Culture Learning Substances, by using model of lesson study the same as in 2003.

In the same year, the Center for Research in Mathematics Education, participated in pilot project of pilot school for growing wisdom as a joint project of the Office of Primary School, and the Office of Administration and Development of Body of Knowledge for school reform of the whole system by focusing on teachers for 2 pilot schools including: Chumchonbanchonnabot School, Chonabot District, and Koo-kam-pittayasan School, Samsung District, Khon Kaen Province. The duration of project implementation was 3 years (2006-2008). For the first year, development of open knowledge management plan in Mathematics was emphasized. The teachers and researchers from Center for Mathematics Education, school coordinators, and Master Degree Students participating in research by using both schools as a basis for research collaborating in creating the lesson plan very Sunday. Then, the school coordinators, researchers from Center for Research in Mathematics Education, and Master Degree Students participating in research, 5 persons each school, observed classroom every period. The reflection was performed every Wednesday for Chumchonbanchonnabot School, and every Thursday for Koo-kam-pittayasan School.

The lesson study became to be better known in Thailand when the Center for Research in Mathematics Education, Khon Kaen University, was assigned from APEC to collaborate with Japan in organizing seminar titled “Collaborative Study on Innovation for Teaching and Learning Mathematics in Different Cultures among the APEC Member Economies, 3 times continuously 3 years. For the first one, implemented during 14-17<sup>th</sup> June 2006. For the third one, it was held during 25-29<sup>th</sup> August 2008 at Khon Kaen Province. There were different countries both of APEC members and Non APEC members, total of 18 countries including: China, Chile, Hong Kong, Indonesia, Japan, Korea, Malaysia, Philippines, Singapore, Thailand, the United States of America, Brunai-karus-salam, Australia, Africa, Kambodia, Lao, England, and Vietnam.

In 2009, the Center for Research in Mathematics Education, Faculty of Education, Khon Kaen University, was appointed by the Office of Higher Education Commission, collaborated with the Office of Primary Education Commission, extended the findings from application of lesson study based on network development with higher education institutes in the area including: Chiangmai University and Ubonrachatani University by performing in 12 provinces from North Region and Northeast Region in 19 schools.

In 2011, The Center for Research in Mathematics Education allocated budget to support implementation of teaching professional development, and extended from 4 schools to 22 schools in the North Eastern Region, and 2 schools in North Region.

Figure 1. Innovation usage for schools in 2011

In 2013, Faculty of Education, Khon Kaen University agreed to be consultant for teacher development based on guidelines called Browser in Service by using process in developing the Coaching and mentoring through the innovation of Lesson Study, and Open Approach for the Office of Primary Educational Service Area, and the Office of Secondary Educational Service area, for 5 Educational Service Areas in the North Eastern Region as well as North Region, for 25 schools.

The outcome of project implementation being able to develop the Mathematics Classroom supporting the students' Mathematical Higher-order Thinking, caused by cooperation among Khon Kaen University, the work offices being responsible for Educational Policy, and schools as basic sub-units in Educational Reform of Thailand. In addition, for systematic enhancement and development of Mathematics Teaching Profession at Khon Kaen University, the institutions would be set up for international collaboration in order to conduct Research and Development in Mathematics Teaching Profession for the near future, prepared by Khon Kaen University. Moreover, Khon Kaen University tried hard for the Faculty of Education to extend the innovation usage of Lesson Study, and Open Approach to cover 20 provinces, 37 Educational Service Areas, under the name of "The Project for Development of Students' Higher-order Thinking in the North Eastern Region," including total of 50 schools.

Figure 2. Innovation usage for schools in 2014

The implementation under the above project, the Center for Research in Mathematics Education, since the extension of innovation usage for a large number of schools, there were limitations in the staffs to support the school practice. Consequently, the Center for Research in Mathematics Education administered the Coaching Online System by assigning the co-researchers to work at 10 network centers in different provinces. Besides, Coaching Online System was implemented from Faculty of Education, Khon Kaen University into different networks with researchers as key persons in collaboration for writing the Lesson Plan, answering the occurred questions, problems, and obstacles. After collaboration in lesson plan writing, the researcher and co-researcher team followed to various schools in order to collaborate in observing the classroom as well as reflecting the knowledge management based on Lesson Study Process.

Figure 3. The system of Coaching Online

Figure 4. The climate of Coaching Online

The Center for Research in Mathematics Education, Khon Kaen University, is the center emphasizing on collaboration with various Universities, and Organizations from both of domestic and foreign countries in order to: 1) create research works for solving the problems as well as developing the Mathematics Teaching in schools from domestic and foreign countries in Khong River Basin, 2) to develop Mathematics Internship System in project of teacher production based on Basic education Program ( 5 year program ) as well as Graduate School level, 3) to disseminate research studies by presentation in the academic Conference, production of publication documents as well as mixed media and the training for in-service teachers.

In 2014, Faculty of Education by Center for Research in Mathematics Education receipts the big budget directly from the Governmental Budget Office to do a big project: Higher order thinking in Mathematics of students in the northeastern part of Thailand in 60 schools. This project initiated Lesson Study and Open Approach to develop higher order thinking in Mathematics of students in primary and secondary schools in the northeastern part of Thailand in 60 schools. To proceed the project, we plan to expand the project through the country in 2019.

#### 4 THE APPLICATION OF LESSON STUDY IN SCHOOL

For school appropriate with application of lesson study innovation, it consisted of every school in Thailand where the administrators were willing to obtain this innovation, and teachers wanted to use this innovation for developing their own knowledge management. However, in the case of small sized school, it would be useful when the innovation was used in school since every teacher could be able to participate in activity easier than large sized school. Besides, bringing lesson study to the school, in order that the innovation could work in school, the persons should be organization (such as University, the Office of Educational Service Area) rather than any researcher who would bring the innovation as one's personal belonging.

Before applying lesson study into school, the teachers should participated in basic workshop regarding to every activity and various details during performing activity of lesson study process as well as the innovation to be used in establishing knowledge management plan for basic understanding which might lead to good attitude towards participation in innovation (Narumol Inprasitha, 2009) for developing the lesson study group.

In setting the lesson study group in schools, at the beginning, only one group might be set up, from a learning substance, for learning at beginning. When the school was ready, the other learning substances would be extended. Each group should consist of at least 4 teachers in the same learning substance (Lewis, 2002). However, if the school wasn't ready for it, the group setting of lesson study might include different learning substances.

#### 5 LESSON STUDY PROCESS

When lesson study was stated, the related academics often stated the step or process when the teachers entering lesson study. For the phase, it was differently called by each academic. Some of them called it as “Process,” some of them called it “Cycle,” and the others called it “Steps.”

Lewis (2002) proposed the Lesson Study's Steps as follows:

Step 1: The establishment of lesson study by including the activities: finding the members, scheduling specific date, setting the meeting plan, and setting rule for group work.

Step 2: The study of classroom including 3 activities: making an agreement in guideline for conducting research, selecting the content, and selecting the unit to be performed.

Step 3: The planning for conducting research by studying the research plan, developing the lesson plan, and asking for counseling from the experts.

Step 4: The teaching and teaching observation, by collecting data as specifying.

Step 5: The discussion and analysis of research findings.

Step 6: The reflection and planning for next step.

Yoshida (2005) stated the Lesson Study Cycle that it was the major activities as different steps as follows:

The first step of lesson study process started by defining the research topic both in broad level and school level emphasizing the students' desirable characteristics required by the teachers.

The teachers set up the group for developing lesson plan, it might be group in class level, or subject. Then, they selected the objective of lesson study based on research topic in school level but considered the class level or subject level.

The teacher group for inviting the outside experts to participate in working with teachers in group in order to improve understanding in content, suggest the approach in students' learning, and support the group working.

The establishment of plan, each group selected topic from learning unit congruence with objective of lesson study, and selected the topic in that unit for research topic. The group members collaborated in implementing the lesson plan.

A group member used the plan for teaching while the other teachers in group (more than one person) and the other observers including the outside experts, observed the instruction. These observers collected data from students' thinking and learning. The observers might consisted of the other teachers outside group, or teachers from other schools.

After finishing lesson study, the group members discussed the classroom during schedule arranging for discussion. Information from discussion was used for improving the next class. Later on, the cycle of teaching, observing, discussing would be started again. The conclusions from discussions as the thing learned by teachers at the first duration of cycle would help the research to be implemented as desired guideline.

At the end of school year, the group of lesson study reflected the study and learning, and presented report of findings and effect from research. Specifically, in the issue of group objective and school research topic. There were 2 final aims of activity in the process: development of new approach in teaching and learning based on understanding in students' thinking.

However, the use of lesson study innovation, the source of innovation came from and developed in Japan for more than 100 years. In addition, it was a complex innovation since it included Socio-cultural contexts. Entering into a school in Thailand with different socio-cultural contexts from Japanese Schools very much. So, it was necessary to adjust so that it would be appropriate with school context in Thailand whether it was the cultural working of administrators or teachers, and students' learning behavior.

In this article, it presented the modified lesson study innovation with Thai context in which it was already used, and included the findings showing that the modified lesson study process could be able to help the teachers in reforming their own teaching (Narumol Inprasitha, 2009).

There were 5 steps of the above process:

Step 1: The teachers in lesson study group, collaborated in developing the knowledge management plan.

Step 2: The usage of knowledge management plan and classroom observation.

Step 3: The classroom reflection.

Step 4: The conclusions of teachers' learning.

Step 5: The modification of knowledge management plan.

In each step consisted of following implementations:

Step 1: The teachers in lesson study group collaborated in developing the knowledge management plan for using in one semester to be completed during the closing of school, which might be 2-3 days. It should be under suggestions of outside experts (the researcher from university or supervisor). For activity in goal setting which was in Step 1 of lesson study process used by Japanese Teachers, it could be modified by the teachers' emphasis on major school goals since it might be too complex activity. In creating the knowledge management plan, the teachers should be made appointment for implementation once a semester by doing in holiday or the end of semester since the teachers might not have time during the semester. The knowledge management plan should be constructed by teachers in lesson study group and outsider experts. The knowledge management plan should be the plan using innovation being congruence with school goals.

Step 2: The teachers in group selecting from their friends in group as the teachers using knowledge management plan whereas the other at least of one person observed classroom and recorded all incidences occurring in class. In classroom observation, the assigned teachers to use the plan, should use it according to guidelines which were agreed. For the observer teachers, they had to observed based on the researchers' guidelines. The most important thing was that: each time in using knowledge management plan, at least one teacher required to observe the class.

Step 3: The classroom reflection, the administrators and every school teacher collaborated in classroom reflect activity which was organized once a week after class in any day. For classroom reflect activity, it should be organized once a week after class in any day scheduled together. The reflecting moderator should be director. This activity required every teacher to participate in reflection. The director had to control reflection to continue following collaborated agreement.

Step 4: The teachers’ learning conclusions, performed once a semester after the end of each semester, by teachers.

Step 5: The modification of knowledge management plan, was the adjustment in knowledge management plan and teaching again. It was the activity performing at the end of school year. The teachers used the knowledge management plan they used to administer it last school year, to be discussed in the advantage and disadvantage, and modified it for teaching again in next school year.

For writing report including knowledge management plan, students’ information, and reflected that what they had learned. During the first session, it wasn’t needed to performed since it might be too much burden for them. But, when school implemented activity in process of lesson study for a period of time, the director should encourage the teachers to write a report since it would be very useful for them because they could reflect their own learning as well as evidence and performance of their work in which they could use as professional utilization in future.

The process of lesson study could be shown by the following chart:

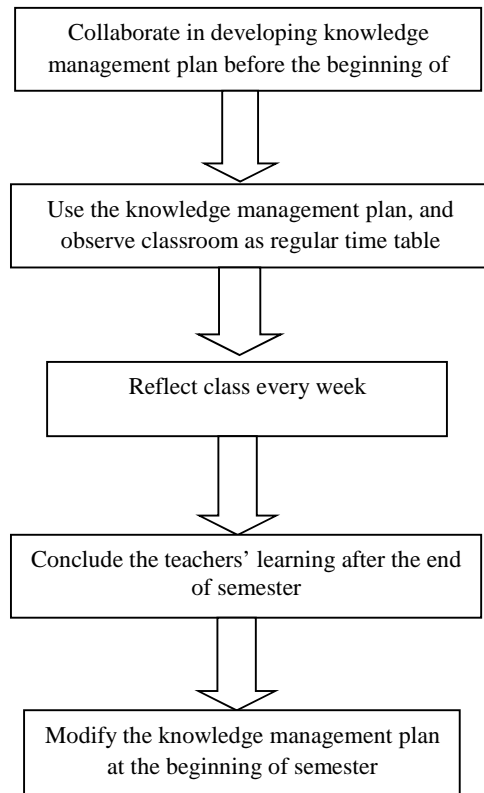

Figure 5. The Lesson Study Process Model

The details of activity in the lesson study process model of this research could be shown in the following table:

Table 1. Activity in the lesson study process model

The administrators and every school teacher	Set the long term goal in developing the students	Beginning of school year	once/school year	Notes
The teachers in lesson study group	Develop the knowledge management plan	During the end of semester, before the beginning of new semester	once/semester	At beginning, there should be outsider experts for providing suggestions.
The teachers in lesson study group	Use the knowledge management plan, and observe class.	Specified date in time table.	3 times a week	
The administrator and every school teacher.	Reflect the class	After class	Once a week	
The administrator and every school teacher.	Conclude the learning outcome.	The end of semester	Once a semester	
Teachers in the lesson study group	Modify the knowledge management plan	During the end of semester, before the beginning of semester	Once at the beginning of school year	Start to perform at the second year

## 6 FACTORS AFFECTING SUCCESS OF LESSON STUDY INNOVATION

According to the above, it could be viewed that the lesson study innovation was an innovation for professional development which was different from Thai traditional teaching professional development. It was often mostly used in short course training by outsider lecturers. For the lesson study innovation in long course training and implemented by teachers themselves, was the unfamiliar teaching professional development. As a result, teachers had to change their working culture, attitude, many kinds of belief. Therefore, many factors were required in bringing the lesson study innovation in school in order to be success.

Narumul Inprasitha (2009) stated that the success of lesson study innovation referred to the innovation that could be functioned in school until leading to changes in teachers and students. When the organization used this innovation, the following factors should be considered:

(1) The support from control unit of school.

A factor that would support this innovation to be successful, was the work unit in higher level of school, including the Office of Educational Service Area, the Office of Primary Education Commission, as well as the Ministry of Education, should provide support in different aspects: the support for approach that this innovation was valuable, supporting by sending the experts in knowledge management to provide suggestions and support for working morale.

(2) The school administrator’s support

The lesson study innovation couldn’t be able to access the school unless the administrator’s support which could be performed by helping for setting up the lesson study group, scheduling time for teachers to collaborate in developing the lesson study and reflecting, scheduling time table for teachers so that they would have their time in observing the other teacher’s teaching, supporting for the media and tools of knowledge management, and encouraging their morale in participating different activities.

(3) The collaboration with outsider experts

The outsider experts referred to the scholars from the Office of Educational Service Area, instructor or researcher from university supporting for knowledge management which was very important in session the teacher starting to lesson study process. If there was no this factor, the teachers would not able to change themselves.

(4) The awareness of changes in students and teachers themselves

After the teachers used lesson study innovation for a period of time, they were aware that this innovation could help them to change, and there was the effect of teachers’ changes on students’ changes. So, they recognized the worth of innovation. They were confident in the innovation and continued participating in lesson study.

(5) The confidence that the lesson study was an opportunity of professional Development

The teachers who wanted their own professional development for promotion, and viewed this innovation as a guideline for helping them in obtaining guideline for conducting their dossier for promotion in which it would encourage them to be willing to participate in activity of lesson study process.

(6) The experience of working together of teachers participating in lesson study Process

The teachers’ experience on participating in activity of lesson study innovation, whether it was the creation of knowledge management, application of planning and classroom observation, as well as

reflection. In working together, it would help teachers obtaining experience and viewing the value of experience occurring from lesson study innovation. As a result, teachers participated in lesson stud process, and supported this innovation to be existed in school successfully.

(7) The guidelines of knowledge management

The guideline of knowledge management was an important helping the teachers to have same destination in creating the knowledge management plan, classroom observation, and classroom reflection. Furthermore, the teachers were facilitated in obtaining viewpoints of discussion during session in developing the knowledge management plan as well as classroom reflection. Consequently, the teachers recognized that knowledge management plan caused the students’ changes in which it could lead to the teachers’ viewed that the lesson study innovation was valuable and finally existed in school successfully.

## 7 CONCLUSIONS

The lesson study innovation was a technique in teaching professional development being recognized that it could cause the teachers’ various changes especially in teaching. However, this innovation was complex since it included Socio-cultural contexts because it was from Japan as its owner for more than one hundred years until it was normal cultural working. Since schools in Thailand had very much different contexts socio-cultural contexts from Japanese contexts, would use this innovation. Therefore, it needed to be based on collaboration of every one in organization for modifying one’s cultural organization, thinking, belief, attitude in order to support this innovation for being existed in organization successfully.

**Abstract:** Lesson Study, a Japanese way of professional development of teachers, has been developed dated back for nearly 140 years. In Thailand, it has been implementing Lesson Study since 2000 and has a unique way of adapting this Japanese professional development. Our experience on Lesson study has been sharing in APEC member economies during the last 6 years and has been said "quite success" in improvement of teaching and learning mathematics. In this paper, key concepts for implementing the lesson study such as "adaptive innovation", "Unit of analysis for making lesson study cycle" "how to determine lesson study team" Or, why "cutting "revision step" from the weekly/ cycle will be discussed. Then, the growth of Lesson Study in Thailand which almost all of them were implemented by Center for Research in Mathematics Education, Faculty of Education, Khon Kaen University will be stated. At last, factors affecting success in applying the Lesson Study in developing the teaching professional development included : the support by original affiliation of school, school administrators' support, collaboration with outside experts, awareness of changes in students as well as teacher, confidence in Lesson Study as an opportunity of professional development, teachers' experience in collaborative working of teachers participating in Lesson Study Process, and knowledge management approach will be discussed.

**Keywords:** Lesson Study, Implemented Innovation, Thai context

### 1 INTRODUCTION

Lesson Study is an innovation as a major method in professional development in Japan. It occurred more than one hundred years ago. It was accepted throughout the time as a technique leading to the better and sustainable teaching (Lewis and Berry, 2006). In addition, it was a guideline of Teacher-led instructional improvement. The teacher was a motivator in teaching improvement by themselves without waiting from the expert outsider experts. For major objective, it was the Student-focused. Therefore, this guideline was very useful for the teacher's instruction whether in content, teaching technique, or student's learning (Lewis, 2002; Lewis and Berry, 2006; Shimizu, 2006; Isoda, 2006; Wang, 2006).

The Lesson Study Innovation was dissemination from Japan to schools in the United States of America as the first country in 1999. It was rapid growth until now. In 2007, there were 13 countries in Asia Pacific Cooperation adopted the teaching professional development in their own countries. For Thailand, the guideline of Lesson Study was administered in the development since 2002 initiated by Maitree Inprasitha (2003) by piloting the teacher training project of Faculty of Education, Khon Kaen University, until 2009, there were 24 schools used the Lesson Study and Open Approach in teaching professional development .

Since the Lesson Study Innovation was accepted in many countries in that it was valuable for teachers because it could make change in teachers and

students. As a result, it was considered to be very appropriate with Thailand because in recent situation the teacher needed to improve their own teaching in order to affect the students' learning reform. Consequently, the application of Lesson Study in teaching professional development of Thailand, would be useful for teacher reform.

### 2 DEFINITION OF LESSON STUDY

The word "Lesson Study" was defined by Center for Research in Mathematics Education, Khon Kaen University, in order to replace an English Term "Lesson Study," by replacing the word "jogyokenkyu," in Japanese Language. For the word "jogyokenkyu," consisted of 2 words "jogyo" meant the classroom, and "kenkyu," which referred to study or conducting research (Yoshida, 2004). According to the letter, therefore, lesson study referred to "the study" or "classroom research". But, the meaning based on real Japanese Culture, when teachers wanted to use lesson study innovation, they would participate in well-developed process including: discussion of Lessons which they already planned and observed teaching together, called "kenkyujogyo" reversing the word "jogyokenkyu." It could be translated that "study or research the lesson" Specifically, in Japanese meaning "lesson" had specific meaning as "The object of one's study." The lesson study or classroom study referred to the "study," according to step of implementation in attempting to accomplish the research objective

chosen to work together by every teacher (such as to comprehend how to do for enhancing the students in being able to learn freely).

### **3 HISTORICAL BACKGROUND OF LESSON STUDY IN THAILAND**

Maitree Inprasitha (2006) stated the background of lesson study in Thailand concluding that the historical background of lesson study in Thailand starting at Faculty of Education, Khon Kaen University, its development was aligned with development of Open Approach. Assistant Professor Dr. Maitree Inprasitha administered the process of lesson study in the project enhancing self-studying with research grant from Khon Kaen University in 2002. The objective of that project was to study the changes in worldview of 15 internship students in Mathematics Education, Faculty of Education, Khon Kaen University, participated in the project. The students taught by the internship group throughout the first semester of 2002 school year, were surveyed their opinion.

In the same year, Maitree Inprasitha (2006) implemented the research project titled “Learning Reform in Mathematics in Schools by focusing on Mathematical Process,” supported by the Office of National Research Commission. In the project, 2 schools participated in: Secondary School --- Kokesee-pittayasan School, and Primary School—Suansanook Municipal, Muang District, Khon Kaen Province.

Later on, in 2003, after the establishment of Center for Research in Mathematics Education: CRME, the development and advertisement in lesson study was responsible by the center. In that year, Faculty of Education, by collaboration between Center for Research in Mathematics Education, and PLAN Organization of Thailand, launched the project “Development of Learning Plan based on guideline of National Educational Reform Act 2001 in each major learning substance by Lesson Study,” aiming for development of in-service teachers in the Office of Khon Kaen Educational Service Area 5, Mathematics Education Learning Substance, and Social Studies, Religion, and Culture Learning Substance, 50 teachers each learning substance, so that they could be able to develop the lesson plan and use in their own class.

In 2006, Faculty of Education, Khon Kaen University, on behalf of the former Dean (Associate Professor Dr. Suladda Loipha ) allowed the Center for Teaching Professional Development and Educational Personnel to collaborate with PLAN Organization of Thailand, implemented the project for developing in-service teachers in the Office of Mahasarakam Educational Service Area 1, and 2, in Mathematics, Science, Thai Language, and Social Studies, Religion, and Culture Learning Substances, by using model of lesson study the same as in 2003.

In the same year, the Center for Research in Mathematics Education, participated in pilot project of pilot school for growing wisdom as a joint project of the Office of Primary School, and the Office of Administration and Development of Body of Knowledge for school reform of the whole system by focusing on teachers for 2 pilot schools including: Chumchonbanchonnabot School, Chonabot District, and Koo-kam-piattayasan School, Samsung District, Khon Kaen Province. The duration of project implementation was 3 years (2006-2008). For the first year, development of open knowledge management plan in Mathematics was emphasized. The teachers and researchers from Center for Mathematics Education, school coordinators, and Master Degree Students participating in research by using both schools as a basis for research collaborating in creating the lesson plan very Sunday. Then, the school coordinators, researchers from Center for Research in Mathematics Education, and Master Degree Students participating in research, 5 persons each school, observed classroom every period. The reflection was performed every Wednesday for Chumchonbanchonnabot School, and every Thursday for Koo-kam-pittayasan School.

The lesson study became to be better known in Thailand when the Center for Research in Mathematics Education, Khon Kaen University, was assigned from APEC to collaborate with Japan in organizing seminar titled “Collaborative Study on Innovation for Teaching and Learning Mathematics in Different Cultures among the APEC Member Economies, 3 times continuously 3 years. For the first one, implemented during 14-17<sup>th</sup> June 2006. For the third one, it was held during 25-29<sup>th</sup> August 2008 at Khon Kaen Province. There were different countries both of APEC members and Non APEC members, total of 18 countries including: China, Chile, Hong Kong, Indonesia, Japan, Korea, Malaysia, Philippines, Singapore, Thailand, the United States of America, Brunai-karus-salam, Australia, Africa, Kambodia, Lao, England, and Vietnam.

In 2009, the Center for Research in Mathematics Education, Faculty of Education, Khon Kaen University, was appointed by the Office of Higher Education Commission, collaborated with the Office of Primary Education Commission, extended the findings from application of lesson study based on network development with higher education institutes in the area including: Chiangmai University and Ubonrachatani University by performing in 12 provinces from North Region and Northeast Region in 19 schools.

In 2011, The Center for Research in Mathematics Education allocated budget to support implementation of teaching professional development, and extended from 4 schools to 22 schools in the North Eastern Region, and 2 schools in North Region.

Figure 1. Innovation usage for schools in 2011

In 2013, Faculty of Education, Khon Kaen University agreed to be consultant for teacher development based on guidelines called Browser in Service by using process in developing the Coaching and mentoring through the innovation of Lesson Study, and Open Approach for the Office of Primary Educational Service Area, and the Office of Secondary Educational Service area, for 5 Educational Service Areas in the North Eastern Region as well as North Region, for 25 schools.

The outcome of project implementation being able to develop the Mathematics Classroom supporting the students' Mathematical Higher-order Thinking, caused by cooperation among Khon Kaen University, the work offices being responsible for Educational Policy, and schools as basic sub-units in Educational Reform of Thailand. In addition, for systematic enhancement and development of Mathematics Teaching Profession at Khon Kaen University, the institutions would be set up for international collaboration in order to conduct Research and Development in Mathematics Teaching Profession for the near future, prepared by Khon Kaen University. Moreover, Khon Kaen University tried hard for the Faculty of Education to extend the innovation usage of Lesson Study, and Open Approach to cover 20 provinces, 37 Educational Service Areas, under the name of "The Project for Development of Students' Higher-order Thinking in the North Eastern Region," including total of 50 schools.

Figure 2. Innovation usage for schools in 2014

The implementation under the above project, the Center for Research in Mathematics Education, since the extension of innovation usage for a large number of schools, there were limitations in the staffs to support the school practice. Consequently, the Center for Research in Mathematics Education administered the Coaching Online System by assigning the co-researchers to work at 10 network centers in different provinces. Besides, Coaching Online System was implemented from Faculty of Education, Khon Kaen University into different networks with researchers as key persons in collaboration for writing the Lesson Plan, answering the occurred questions, problems, and obstacles. After collaboration in lesson plan writing, the researcher and co-researcher team followed to various schools in order to collaborate in observing the classroom as well as reflecting the knowledge management based on Lesson Study Process.

Figure 3. The system of Coaching Online

Figure 4. The climate of Coaching Online

The Center for Research in Mathematics Education, Khon Kaen University, is the center emphasizing on collaboration with various Universities, and Organizations from both of domestic and foreign countries in order to: 1) create research works for solving the problems as well as developing the Mathematics Teaching in schools from domestic and foreign countries in Khong River Basin, 2) to develop Mathematics Internship System in project of teacher production based on Basic education Program ( 5 year program ) as well as Graduate School level, 3) to disseminate research studies by presentation in the academic Conference, production of publication documents as well as mixed media and the training for in-service teachers.

In 2014, Faculty of Education by Center for Research in Mathematics Education receives the big budget directly from the Governmental Budget Office to do a big project: Higher order thinking in Mathematics of students in the northeastern part of Thailand in 60 schools. This project initiated Lesson Study and Open Approach to develop higher order thinking in Mathematics of students in primary and secondary schools in the northeastern part of Thailand in 60 schools. To proceed the project, we plan to expand the project through the country in 2019.

#### 4 THE APPLICATION OF LESSON STUDY IN SCHOOL

For school appropriate with application of lesson study innovation, it consisted of every school in Thailand where the administrators were willing to obtain this innovation, and teachers wanted to use this innovation for developing their own knowledge management. However, in the case of small sized school, it would be useful when the innovation was used in school since every teacher could be able to participate in activity easier than large sized school. Besides, bringing lesson study to the school, in order that the innovation could work in school, the persons should be organization (such as University, the Office of Educational Service Area) rather than any researcher who would bring the innovation as one's personal belonging.

Before applying lesson study into school, the teachers should participated in basic workshop regarding to every activity and various details during performing activity of lesson study process as well as the innovation to be used in establishing knowledge management plan for basic understanding which might lead to good attitude towards participation in innovation (Narumol Inprasitha, 2009) for developing the lesson study group.

In setting the lesson study group in schools, at the beginning, only one group might be set up, from a learning substance, for learning at beginning. When the school was ready, the other learning substances would be extended. Each group should consist of at least 4 teachers in the same learning substance (Lewis, 2002). However, if the school wasn't ready for it, the group setting of lesson study might include different learning substances.

#### 5 LESSON STUDY PROCESS

When lesson study was stated, the related academics often stated the step or process when the teachers entering lesson study. For the phase, it was differently called by each academic. Some of them called it as "Process," some of them called it "Cycle," and the others called it "Steps."

Lewis (2002) proposed the Lesson Study's Steps as follows:

Step 1: The establishment of lesson study by including the activities: finding the members, scheduling specific date, setting the meeting plan, and setting rule for group work.

Step 2: The study of classroom including 3 activities: making an agreement in guideline for conducting research, selecting the content, and selecting the unit to be performed.

Step 3: The planning for conducting research by studying the research plan, developing the lesson plan, and asking for counseling from the experts.

Step 4: The teaching and teaching observation, by collecting data as specifying.

Step 5: The discussion and analysis of research findings.

Step 6: The reflection and planning for next step.

Yoshida (2005) stated the Lesson Study Cycle that it was the major activities as different steps as follows:

The first step of lesson study process started by defining the research topic both in broad level and school level emphasizing the students' desirable characteristics required by the teachers.

The teachers set up the group for developing lesson plan, it might be group in class level, or subject. Then, they selected the objective of lesson study based on research topic in school level but considered the class level or subject level.

The teacher group for inviting the outside experts to participate in working with teachers in group in order to improve understanding in content, suggest the approach in students' learning, and support the group working.

The establishment of plan, each group selected topic from learning unit congruence with objective of lesson study, and selected the topic in that unit for research topic. The group members collaborated in implementing the lesson plan.

A group member used the plan for teaching while the other teachers in group (more than one person) and the other observers including the outside experts, observed the instruction. These observers collected data from students' thinking and learning. The observers might consisted of the other teachers outside group, or teachers from other schools.

After finishing lesson study, the group members discussed the classroom during schedule arranging for discussion. Information from discussion was used for improving the next class. Later on, the cycle of teaching, observing, discussing would be started again. The conclusions from discussions as the thing learned by teachers at the first duration of cycle would help the research to be implemented as desired guideline.

At the end of school year, the group of lesson study reflected the study and learning, and presented report of findings and effect from research. Specifically, in the issue of group objective and school research topic. There were 2 final aims of activity in the process: development of new approach in teaching and learning based on understanding in students' thinking.

However, the use of lesson study innovation, the source of innovation came from and developed in Japan for more than 100 years. In addition, it was a complex innovation since it included Socio-cultural contexts. Entering into a school in Thailand with different socio-cultural contexts from Japanese Schools very much. So, it was necessary to adjust so that it would be appropriate with school context in Thailand whether it was the cultural working of administrators or teachers, and students' learning behavior.

In this article, it presented the modified lesson study innovation with Thai context in which it was already used, and included the findings showing that the modified lesson study process could be able to help the teachers in reforming their own teaching (Narumol Inprasitha, 2009).

There were 5 steps of the above process:

Step 1: The teachers in lesson study group, collaborated in developing the knowledge management plan.

Step 2: The usage of knowledge management plan and classroom observation.

Step 3: The classroom reflection.

Step 4: The conclusions of teachers' learning.

Step 5: The modification of knowledge management plan.

In each step consisted of following implementations:

Step 1: The teachers in lesson study group collaborated in developing the knowledge management plan for using in one semester to be completed during the closing of school, which might be 2-3 days. It should be under suggestions of outside experts (the researcher from university or supervisor). For activity in goal setting which was in Step 1 of lesson study process used by Japanese Teachers, it could be modified by the teachers' emphasis on major school goals since it might be too complex activity. In creating the knowledge management plan, the teachers should be made appointment for implementation once a semester by doing in holiday or the end of semester since the teachers might not have time during the semester. The knowledge management plan should be constructed by teachers in lesson study group and outsider experts. The knowledge management plan should be the plan using innovation being congruence with school goals.

Step 2: The teachers in group selecting from their friends in group as the teachers using knowledge management plan whereas the other at least of one person observed classroom and recorded all incidences occurring in class. In classroom observation, the assigned teachers to use the plan, should use it according to guidelines which were agreed. For the observer teachers, they had to observed based on the researchers' guidelines. The most important thing was that: each time in using knowledge management plan, at least one teacher required to observe the class.

Step 3: The classroom reflection, the administrators and every school teacher collaborated in classroom reflect activity which was organized once a week after class in any day. For classroom reflect activity, it should be organized once a week after class in any day scheduled together. The reflecting moderator should be director. This activity required every teacher to participate in reflection. The director had to control reflection to continue following collaborated agreement.

Step 4: The teachers' learning conclusions, performed once a semester after the end of each semester, by teachers.

Step 5: The modification of knowledge management plan, was the adjustment in knowledge management plan and teaching again. It was the activity performing at the end of school year. The teachers used the knowledge management plan they used to administer it last school year, to be discussed in the advantage and disadvantage, and modified it for teaching again in next school year.

For writing report including knowledge management plan, students' information, and reflected that what they had learned. During the first session, it wasn't needed to performed since it might be too much burden for them. But, when school implemented activity in process of lesson study for a period of time, the director should encourage the teachers to write a report since it would be very useful for them because they could reflect their own learning as well as evidence and performance of their work in which they could use as professional utilization in future.

The process of lesson study could be shown by the following chart:

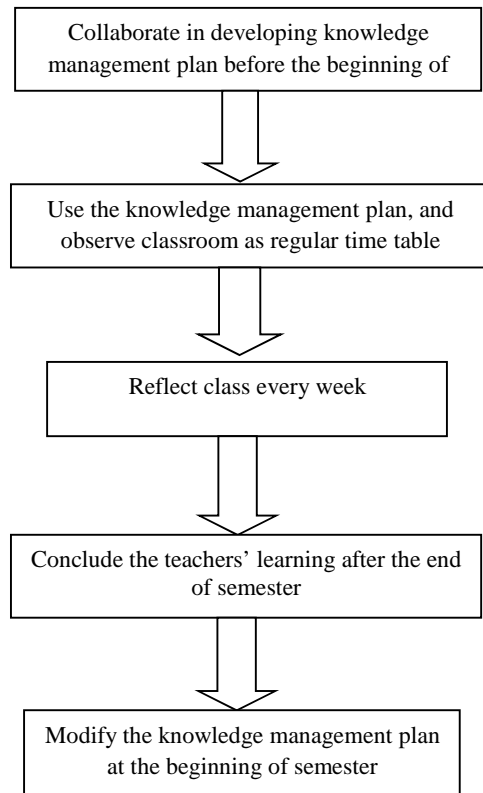

Figure 5. The Lesson Study Process Model

The details of activity in the lesson study process model of this research could be shown in the following table:

Table 1. Activity in the lesson study process model

The administrators and every school teacher	Set the long term goal in developing the students	Beginning of school year	once/school year	Notes
The teachers in lesson study group	Develop the knowledge management plan	During the end of semester, before the beginning of new semester	once/semester	At beginning there should be outsider experts for providing suggestions.
The teachers in lesson study group	Use the knowledge management plan, and observe class	Specified date in time table	3 times a week	
The administrator and every school teacher	Reflect the class	After class	Once a week	
The administrator and every school teacher	Conclude the learning outcome	The end of semester	Once a semester	
Teachers in the lesson study group	Modify the knowledge management plan	During the end of semester, before the beginning of semester	Once at the beginning of school year	Start to perform in the second year

## 6 FACTORS AFFECTING SUCCESS OF LESSON STUDY INNOVATION

According to the above, it could be viewed that the lesson study innovation was an innovation for professional development which was different from Thai traditional teaching professional development. It was often mostly used in short course training by outsider lecturers. For the lesson study innovation in long course training and implemented by teachers themselves, was the unfamiliar teaching professional development. As a result, teachers had to change their working culture, attitude, many kinds of belief. Therefore, many factors were required in bringing the lesson study innovation in school in order to be success.

Narumul Inprasitha (2009) stated that the success of lesson study innovation referred to the innovation that could be functioned in school until leading to changes in teachers and students. When the organization used this innovation, the following factors should be considered:

(1) The support from control unit of school.

A factor that would support this innovation to be successful, was the work unit in higher level of school, including the Office of Educational Service Area, the Office of Primary Education Commission, as well as the Ministry of Education, should provide support in different aspects: the support for approach that this innovation was valuable, supporting by sending the experts in knowledge management to provide suggestions and support for working morale.

(2) The school administrator's support

The lesson study innovation couldn't be able to access the school unless the administrator's support which could be performed by helping for setting up the lesson study group, scheduling time for teachers to collaborate in developing the lesson study and reflecting, scheduling time table for teachers so that they would have their time in observing the other teacher's teaching, supporting for the media and tools of knowledge management, and encouraging their morale in participating different activities.

(3) The collaboration with outsider experts

The outsider experts referred to the scholars from the Office of Educational Service Area, instructor or researcher from university supporting for knowledge management which was very important in session the teacher starting to lesson study process. If there was no this factor, the teachers would not able to change themselves.

(4) The awareness of changes in students and teachers themselves

After the teachers used lesson study innovation for a period of time, they were aware that this innovation could help them to change, and there was the effect of teachers' changes on students' changes. So, they recognized the worth of innovation. They were confident in the innovation and continued participating in lesson study.

(5) The confidence that the lesson study was an opportunity of professional Development

The teachers who wanted their own professional development for promotion, and viewed this innovation as a guideline for helping them in obtaining guideline for conducting their dossier for promotion in which it would encourage them to be willing to participate in activity of lesson study process.

(6) The experience of working together of teachers participating in lesson study Process

The teachers' experience on participating in activity of lesson study innovation, whether it was the creation of knowledge management, application of planning and classroom observation, as well as reflection. In working together, it would help teachers obtaining experience and viewing the value of experience occurring from lesson study innovation. As a result, teachers participated in

lesson stud process, and supported this innovation to be existed in school successfully.

(7) The guidelines of knowledge management

The guideline of knowledge management was an important helping the teachers to have same destination in creating the knowledge management plan, classroom observation, and classroom reflection. Furthermore, the teachers were facilitated in obtaining viewpoints of discussion during session in developing the knowledge management plan as well as classroom reflection. Consequently, the teachers recognized that knowledge management plan caused the students' changes in which it could lead to the teachers' viewed that the lesson study innovation was valuable and finally existed in school successfully.

## 7 CONCLUSIONS

The lesson study innovation was a technique in teaching professional development being recognized that it could cause the teachers' various changes especially in teaching. However, this innovation was complex since it included Socio-cultural contexts because it was from Japan as its owner for more than one hundred years until it was normal cultural working. Since schools in Thailand had very much different contexts socio-cultural contexts from Japanese contexts, would use this innovation. Therefore, it needed to be based on collaboration of every one in organization for modifying one's cultural organization, thinking, belief, attitude in order to support this innovation for being existed in organization successfully.

**Abstract:** The purpose of this service activities are: 1) To provide assistance for elementary classroom teachers in preparing and developing teaching tools; 2) In order to reflect the experience of learning for elementary classroom teachers through Lesson study. Preparation of training activities for the development of the learning elementary classroom teachers integrate theoretical and practical approach. Theoretical concepts in terms of didactic and methodical in applied learning based on scientific assessments, while the application is done practically in the field. This activity is carried out by using the application of science and technology training methods, based lesson study in order to improve the professionalism of teachers. The interesting thing is encountered when devotion to the activities of the Plan, the majority of teachers had difficulty in defining indicators of learning. They have a perception that for elementary school students learning indicators to formulate enough cognitive level C3 (application). In addition, they argue C1 is cognitive, affective domain C2 and C3 psychomotor. When DO and SEE, we both learned that the division of the group for 1st grade and fourth grade consisting of 6 people / groups were not effective in the implementation of learning. Better for class I SD, maximum 2 persons / groups and for the fourth grade, a maximum of 4 people / group. In designing the study, should be considered a tool / media that is given to each child as a foundation in the mastery of learning materials.

**Keywords:** Lesson study, learning devices, elementary school

### 1 INTRODUCTION

Science and Technology (Science and Technology), both as the substance of the teaching materials and the organization of learning devices, continues to grow. This dynamic requires teachers always improve and adjust its competence in order to be able to develop and present the actual subject matter using a variety of approaches, methods, and the latest learning technology. Only in this way the teacher is able to organize a successful learning lead learners to enter the world of life according to the needs and challenges of his time. Instead, the unwillingness and inability of insight and competence of teachers adjusting to the demands of his profession development environment it will be one of the factors inhibiting the achievement of the objectives of education and learning (Kemdikbud, 2012).

Until now, both in fact and perception, there are many who doubt the competence of teachers in both the subject areas taught and other areas that support

primarily didactic and methodical learning field. This is quite reasonable doubt because it is supported by the results of competency tests that show there are many teachers who have not reached the standard of competence specified. Competency test also shows that there are many teachers who do not master the use of information and communication technology (ICT). Another quite surprising conclusion from the study of which is that the classroom is dominated by a one-way lecture from a teacher and a very rare question and answer. It reflects how many teachers are not trying to improve and update the professionalism (Kemdikbud, 2012).

That fact is also found in a number of primary schools located in the District of East City, as one of the target areas LPM University of Gorontalo. Apparent inability of the teacher looks at the learning device used by teachers in learning activities at school sometimes obtained with a way to copy paste from other schools. Based on observations in the field, can be identified several

problems, among others: 1) The low ability of teachers to formulate indicators of achievement of competencies and learning objectives; 2) The relationship between Standar Kompetensi, Basic Competence and indicators as well as the learning objectives are not synchronized; 3) Not exactly the selection of teaching materials; 4) The form and the scoring system is not appropriate. Most teachers only rate the product but does not implement learning assessment; 5) The utilization of learning resources, especially media that is still low.

The purpose of this service activities are: 1) To provide assistance for elementary classroom teachers in preparing and developing teaching tools; 2) In order to reflect the experience of learning for elementary classroom teachers through Lesson Study

## 2 MATERIALS AND METHODS

To overcome the problems faced by a group of teachers in the district elementary class East Town, then after the Executive Team science and technology program for the community (IbM) conduct a feasibility study, immediately implement alternative problem solving, which is coordinated with the Department of Education and Culture related to training on the preparation and development tools learning for elementary grade teacher at East City District.

The steps of solving the problem is as follows : 1). Survey the existence of Elementary School Teacher; 2) Coordination with Related Agencies (Department of Education, Schools); 3) Determination of Location and Recruiting Teachers who have not been certified preferred; 4). Grouping participants into two major groups, namely: Teachers Class Teacher Class High and Low; 5) Implementation Assistance Preparation Lesson study-based learning tools. To ensure all the stages went well, always balanced with monitoring and evaluation.

Alternatives are taken with consideration of the efficiency and effectiveness of the achievement of the success of this activity. Preparation of training activities for the development of the learning elementary classroom teachers integrate theoretical and practical approach. Theoretical concepts in terms of didactic and methodical in applied learning based on scientific assessments, while the application is done practically in the field. This activity is carried out by using the application of science and technology training methods, based

lesson study in order to improve the professionalism of teachers.

Between the strategic target audiences in these service activities is the Head of Education Office East District of the City and all its officials, Chairman of Force Working Group teachers (KKG) East City District, and the Heads of Primary School located in the district of East Town and the Primary Schools. They have a strategic role to bring together classroom teachers as participants in the mentoring-based lesson study.

Furthermore, who becomes the target audience of this activity is the primary grade teacher who was in the East City District, Gorontalo. Selection of target audience groups based on the consideration that the group grade teacher has a very important role in the school as a learning agent that can be expected to pass on information about the preparation and development of learning tools on other elementary classroom teachers in elementary schools around.

### 2.1 Method of Activity

Community service activities in the group of elementary classroom teachers through mentoring the preparation and development of the learning is done using a method based mentoring lesson study in the East City District, Gorontalo using about 3 months of preparation to the successful implementation of the evaluation phase. The stages of implementation as follows :

1. Conduct a survey to identify the presence of classroom teachers in primary schools in the East City District.
2. To coordinate with branches of the Department of Education and Culture East, to set the location of the implementation of mentoring for elementary classroom teachers in preparing and developing a learning device.
3. Form a group of classroom teachers into High-grade teacher groups are groups of classroom teachers who teach in grades 4, 5, 6 and Low-grade teacher, the group of classroom teachers who teach in class I, II and III.
4. Implementation Assistance. In this activity the group given the knowledge and skills of teachers in the preparation and development of learning tools such as: syllabi, lesson plans, teaching materials, worksheets, and assessment Learning Media Assessment.
5. Evaluate and monitor the effectiveness and efficiency of development assistance activities and the preparation of the learning undertaken

by a group of elementary school classroom teachers in the East City District.

The evaluation was conducted in three phases:

- 1) Initial Activity: to establish a plan of activities to be carried out;
  - 2) during the implementation process: to determine the enforceability of the program and feedback for continued program improvement;
  - 3) The final activity: an evaluation to measure the success of the entire program of activities.
- Evaluation is done by using the assessment instrument of learning, and through participation assessment for mentoring activities take place.

Target outcomes resulting from the Group IbM elementary classroom teacher in the East City District is a learning device in the form of: syllabi, lesson plans, teaching materials, media and valuation assessment.

### 3 RESULTS AND DISCUSSION

Based on data from the Department of Education's Office of Gorontalo in Year 2012, an elementary school in the East City District school amount 17, the amount civil servant teachers 175 teachers and 51 non-civil servant teachers. Furthermore, from the number of teachers who already have a teaching certificate representing 84 civil servant teachers and two non-civil servant teachers.

#### ➤ Realization of resolution

After coordinating with the Department of Education and Chairman of the District of East Town Master Force Working Group (KKG), the executive had engaged in assisting the preparation and development of learning tools for elementary classroom teachers in the East City District, Gorontalo, amounting to 32 people. Classroom teachers representing elementary classroom teachers who teach in the lower grades (grade I, II, and III) and elementary classroom teachers who teach in high-grade (Grade IV, V, and VI). on 19 to 21 November 2012. Activities PLAN that learning occurs in the preparation of SDN 72 East Town on 19 November 2012, while the activity or OPEN CLASS DO and SEE (Reflection) performed at SDN 61 East City on November 21, 2012. For Open Class activities conducted in Class I, II and Thematic learning approach to learning Mathematics Class IV.

#### ➤ Results assisting the preparation and development of learning devices

Mentoring activities for elementary classroom teachers in the East City District, Gorontalo in preparing and developing the learning devices, followed by 32 elementary classroom teachers divided into 4 groups: 2 groups of classroom

teachers representing elementary classroom teachers who teach in the lower grades (grade I, II, and III) and two groups of elementary classroom teachers who teach in high-grade (grade IV, V, and VI).

This mentoring activity-based lesson study. PLAN activity is the preparation of the learning has been done in SDN 72 East Town on 19 November 2012 for together, then the teacher is given the task to develop the learning of each school according to the conditions. Activities or OPEN CLASS DO and SEE (Reflection) performed at SDN 61 East City on November 21, 2012. For activities carried out in the Open Class Class I, II and Thematic learning approach to learning Mathematics Class IV.

The interesting thing encountered when Plan activities, the majority of teachers had difficulty in defining indicators of learning. They have a perception that for elementary school students learning enough to formulate indicators C3 (application). In addition, they argue C1 is cognitive, affective domain C2 and C3 psychomotor. Misperception has been given an explanation when drafting the plan learning activities.

When the DO or the implementation of learning activities in the form of an open class, the teacher acts as a one person model teacher, while the other teachers to act as an observer or observers in learning. The observer in charge of observing the students in learning activities, for example, when students begin to concentrate on learning. Based on observations during the open class in the first grade elementary school, students begin learning concentration turns when teachers invite children - children singing song "Wake up", The number of students who began to concentrate learn to sing ranges characterized by 73%, then the concentration of studied children children decreased again.

Then the students begin to concentrate more when teachers share media hours getting to know the time, every child receives one (1) hour media. Each child tries to shift the existing clock, time toward 7 o'clock and 9 o'clock as instructed teachers. When these activities there are some children who are just quiet and there are also children who have been doing other things because the teacher is given the task has finished working on. From the results of this learning activity, we learned that although the model of applied learning teacher is cooperative learning, and students sit in groups (6 persons / group) but did not appear to group activities. That there is an individual in a group activity. So that children who have completed the task set by the teacher, seemed silent or even do something else.

Furthermore, when the open class in a Class IV B, Mathematics, with material Integer, sort the

numbers from the smallest to the largest of the five numbers hundreds of thousands. The teacher divides the worksheets that contain numbers - numbers written on paper and put in an envelope. Fourth grade students numbered 42 people divided into seven groups, each group consisted of 6 people. When active learning students seem to learn, but there are also students who sit at the edge does not seem to learn. Then the students sitting position in which the student group of men placed on equal footing, it seems the tendency to fight and not to learn.

Furthermore, when the SEE or reflection, the teachers were asked to reflect back on the lessons he has done. The teachers have the courage to express models of learning experience that is done, have the courage to express limitations and dare to open ourselves to make improvements in the future. It is very important for a teacher in an effort to improve the quality of learning. As teachers learning agent should always be willing to continuously learn. From the development assistance activities of this study, we can learn from the open class and reflection activities that have been carried out which of the open class in the first grade elementary school, we can learn the importance of designing the foundation should be given to students and groups of students in the division.

In the opinion of KITADA, Yoshiko (2014) in collaborative learning, the teacher should provide the foundation for every student. The foundation can be a tool / media / about a higher level. For any student who has completed can continue to improve their ability to learn. Furthermore, when viewed from the division of the group, it turns out to children in 1st grade, the number of members of a group of 6 people / groups is too large. Children have difficulties in communicating. Should break out groups for children - children grade 1 is 2 persons / groups.

Furthermore, in the opinion of Masaaki SATO (2014), should be sharing in the learning group had only a maximum of 4 people. The reason why the distribution of the collaborative learning group that only a maximum of 4 people, with the seating position of men and women in a diagonal position and not parallel. This is because girls are usually faster growing and more 'care' than boys. When girls and boys are on the same level, there is a tendency to do other things (play). Furthermore, if the group consists of 6 members, then the child is sitting on the edge position, it would be difficult to communicate with friends in the group.

#### 4 CONCLUSION

From the community service activities such as mentoring preparation and development tools based learning lesson study can be summarized as follows:

- Elementary grade teacher at East City District enlightened and information in the preparation and development of learning devices.
- Elementary classroom teachers get the experience with the reflective learning through Lesson study.
- On the learning class 1 and class IV, the small groups consisting of 6 people / groups, it was not effective.

#### 5 SUGGESTION

From the community service activities are suggested things - the following:

- Activity is expected to remain lesson study carried out to improve relations collegiality among educators in an effort to improve the quality of learning.
- A paradigm shift in the center the learning from teacher to student center, the teacher needs to be assisted in the preparation and development of the learning devices.
- Reflection for us as the college that produces teachers, in order to give the students experience in developing the learning.
- The division of a group of students of class I and class IV should not be too large, For 1st grade students, should be members of the 1 group of a maximum of 2 people, while for the fourth grade students should be 4 people (2 sons, 2 daughters).

#### 6 ACKNOWLEDGEMENTS

Thanks go to the head of the East City District Education Office, State Elementary School Headmaster No. 4 City East, elementary school teachers in City East for facilitating and is willing share their experiences. Especially for the teachers who have been willing to open a class for the learning. Thanks also to the Institute of Community Services, State University of Gorontalo who have financed these activities through PNBP funds in 2012.

## Locating Opportunities For Learning To Teach In Lesson Study

Rachel Goh

*National Institute of Education, Nanyang Technological University, Singapore  
goh\_swee\_peng@moe.edu.sg*

**Abstract:** A review of the literature speaks of teacher learning located in lesson study as inherently messy, and complex. What, and how beginning teachers learn amid the challenges in the context of lesson study is hardly explored. Exploring the ways in which teachers participate in the lesson study team can contribute to the understanding, and knowledge building of the conception of learning to teach in community. This paper describes a study that has explored the experiences of beginning teachers as they participated in the lesson study cycle with their relatively more experienced colleagues. The study investigated the opportunities for developing their understanding of knowledge, practices, and student learning through the analysis of teacher talk in the lesson study discussions. The significance of the study lies in its contribution to the theoretical construct of teacher learning in situ. The empirical design of the study took the form of a qualitative case study involving two lesson study teams in two Singapore primary schools. The qualitative case study which employed participant observations, and interviews addressed how teachers talked about subject matter, teaching, and student learning, and what teacher talk revealed about the challenges, and opportunities for learning to teach in lesson study. The research methodology will first be presented followed by the findings of the study, and their wider implications for teacher induction, and mentoring.

**Keywords:** lesson study, learning to teach, English language education

### 1 INTRODUCTION

In recent years, the systemic provision of white-space for professional development within the teachers' school time-table has led to the formation of professional learning communities (PLCs) in Singapore schools. The shift in the current thinking about teacher professional development away from the transmission mode of one-shot training workshops could account for “a surge of interest from school leaders in exploring Lesson Study as a school-based form of professional learning and curriculum development for teachers” (Fang, Lee, & Haron, 2009, p. 1)

### 2 LITERATURE REVIEW

Most of the reviewed studies on teacher learning in lesson study have largely focused on exploring the conditions that support teacher collaboration, and learning (e.g. Chong & Kong, 2012; West-Olatunji, Behar-Horenstein, & Rant, 2008). A number of these reviewed studies adopted the situated learning theoretical perspective in understanding teacher learning in lesson study (e.g. Liberman, 2009; Parks, 2008; Pella, 2011). A few studies have however found how tightly teacher productive, and unproductive thinking are coupled, alluding to the “messy” field of learning in community (e.g. Adamson & Walker, 2011; Parks, 2008).

Teacher conversations in the lesson study teams have mostly been treated descriptively rather than analytically as a mediation tool to sieve out the “subtle nuances in interactions” (Erickson, 1992, p. 204), except for the study by Dudley (2013) which analysed the functions of interaction discourse to understand the mediation of language-in-use. So far, no studies have considered teacher discourse from the angle of positionality as the active agency of individual teachers in co-constructing knowledge was underplayed in foregrounding the exploration of the role of the community of practice, and “onto the intricate structuring of a community's learning resources (Lave & Wenger, 1991, p. 94). Some studies have reported findings on intertextuality as to how are what others have said being referred to, such as in “folding back” to collect ideas, and reconstruct subject matter knowledge (SMK) (Cavey & Berenson, 2005), and “inter-contextuality” as synthesizing prior, and shared knowledge from multiple classroom contexts (Pella, 2011). These findings inform the understanding of mediation of talk for teacher learning.

The implications for future research in teacher learning in lesson study are clear. Firstly, the exploration of the opportunities for learning to teach in lesson study cannot be divorced from the understanding of the participation structures with which teachers interact. Secondly, a fine-grained analysis of teacher conversations is productive in understanding the mediation of talk in teacher learning.

### 3 METHODOLOGY

Bearing the perspective of the significance of talk to teacher learning, a qualitative research which directed a preference for the case study research design, and participant observations, and in-depth interviews for the research methods was undertaken.

#### 3.1 Scope of the study

A single-case design involving two school sites was utilised. The two schools selected were Ningxia Primary School (pseudonyms), a “popular” primary school, and New Vision Primary School, a “neighbourhood” (pseudonyms) primary school. The New Vision team was a diverse group across gender, and race which was reflective of the multi-racial society in Singapore while the Ningxia team consisted of all female Chinese teachers. Both teams comprised 11 teachers with 3 beginning teachers (BTs) led by the Level Master, and a knowledgeable other who was either the School Staff Developer (SSD) or the Subject Head (SH). BTs were defined as teachers who have less than 2 years of teaching experience. The team worked with 7 year olds pupils focusing on English language teaching at the Primary 1 level.

In New Vision, the Research Teachers (RTs) were selected by the drawing of lots to ensure fairness, and equity since all members would have an equal chance of being picked as the RT. In the end, the RTs who were selected were two experienced teachers with at least eight years of teaching experience. In Ningxia, the three BTs were selected as RTs based on the team’s understanding that teaching the research lessons (RL) would help them in their learning to teach.

#### 3.2 Data analysis

To analyse the participation structures of the teachers in terms of the patterns of topic initiation, and floor taking turns, each transcript from the participant observation of the team meetings was segmented into meaningful units of analysis or idea units. Topic initiators were identified, and grouped to understand how the role assignment influenced knowledge initiation. As far as possible, each topic issue was labelled in vivo using the participants’ words, and coded a priori based on whether they referred to subject matter knowledge (SUB), teaching pedagogy (TEA), or student learning (STU), to direct at the first research question. The topic initiators were grouped as: (1) BTs; (2) RTs; (3) facilitators comprising the Level Master (LM), School Staff Developer (SSD), Subject Head (SH), and Senior Teacher (ST), and the researcher (R); and (4) other experienced teachers to

compare the differences in the patterns of knowledge initiation.

To analyse teacher talk, an ethnographic perspective on discourse analysis was taken through the exploration of “part-whole, whole-part relationships and the use of contrastive relevance” (Gee & Green, 1998, p. 127) within, and across cycles, and across sites using a constant comparison analysis (Glaser, 1965). It differed from the traditional linguistic discourse analysis in being less focused on the language itself, and more focussed on its interaction functions for the joint activity of knowledge construction (Mercer, 2007, p. 141), and grounded in the sociocultural perspective of learning.

### 4 FINDINGS

The findings from the analysis of the participation structures would be presented to provide perspectives from quantified data to address the first research question: How do teachers talk about subject matter, teaching, and student learning. This would be followed by a discussion of the findings from the analysis of interaction discourse to address the second research question: What does teacher talk reveal about the challenges, and opportunities for beginning teachers in learning to teach in such practice-based contexts.

To provide readers a sense of the trajectory of the topic shifts in the lesson study discussion, the topic issues in New Vision Cycle 1, and their topic initiators are shown in Table 1. Planning discussion 1 started off with a focus on student learning difficulty, and ended with a decision to collect evidence of children who “can’t actually write” using the “character study” task. Planning discussion 2 started with a sharing of the findings from the students’ responses on that pre-lesson task. During Planning discussion 3 in which the RT 2 walked the team through the unit plan that had been worked on, the majority of the topic issues raised (8 topics: 80%) were related to teaching for the upcoming research lesson. During the post-lesson meeting, the focus on student learning was taken up again by the Level Master situating the discussion on the observations of students’ learning.

Table 1. Topic Issues, and Topic Initiators in New Vision Lesson Study Cycle 1

Session	Segment	Topic issue	Code	Initiator
Planning discussion 1	1	“What topic/skill do students have difficulty learning?”	STU	LM
	2	“new reading programme”	SUB	ST
	3	“What is the overarching thing we want to do?”	TEA	SSD
	4	Working with “the end in mind”	TEA	LM
	5	“value in giving them the character study task”	STU	Researcher
Planning discussion 2	1	“explore, and analyse the pretest”	STU	LM
	2	Identifying lesson focus	SUB	RT 2
	3	Deciding on stellar book, and resources	TEA	Researcher
	4	“who is willing to be the research teacher?”	TEA	RT 2
Planning discussion 3	1	Sharing on the teaching of recounts	TEA	BT 2
	2	Presenting the flow of lesson unit	TEA	RT 2
	3	“make use of other lessons”	STU	ST
	4	Checking on focus: adjectives on feelings words?	SUB	Others
	5	Not reinventing the wheel	TEA	RT 1
	6	Locating lesson observation in the lesson unit	TEA	LM
	7	“consider the live resource room”	TEA	SSD
	8	“move on” with lesson planning	TEA	RT 2
	9	“show the pictures” of live resource room	TEA	SSD
	10	“come back to where we discuss”: scaffolding	TEA	LM
Post-lesson discussion	1	“research teacher usually start off first”	STU	LM
	2	RT's reflections	STU	RT 1
	3	Other teachers' reflections	STU	Others
	4	“relook at the worksheets”	TEA	ST
	5	“flexibility to change the lesson, and questioning”	TEA	LM

#### 4.1 Distribution of topic issues

The distribution of topic issues along the planning, and reflecting activities over the two lesson study cycles in New Vision is shown in Table 2 below. It appeared that the mediating activity of lesson planning engendered more topic issues on the teaching pedagogy (41 topics: 55.4%) than on student learning (11 topics: 14.9%), and subject matter (4 topics: 5.4%). Leveraging the “new reading programme” within the national mandated English curriculum for the lesson study inquiry could have shaped the teachers’ taken-for-granted assumptions that the subject content has been dealt with, leading to fewer topic shifts on subject matter initially in Cycle 1 (3 topics: 4.1%) but more topics in Cycle 2 (8 topics: 10.8%) when teachers began to raise questions on their understanding of adjectives

used to describe a character in the story. Focusing the post-lesson discussions on observed student learning during the research lessons engendered more topic issues related to student thinking, and actions (9 topics: 12.2%) than on what had worked well, and what did not work as well (7 topics: 9.5%).

#### 4.2 Knowledge initiation patterns

To understand the mediation of the topic initiators, and their knowledge initiation, the idea of topic floor holding time was used. The time each topic issue initiated took centre stage, and was sustained in the discussion before the next topic shift was noted. The distribution of the topic floor holding time in the New Vision team is shown in Table 3.

Table 2. Distribution of Topic Issues in New Vision Team

Activities	Subject matter		Teaching		Student learning		Total	
Planning	4	5.4%	41	55.4%	11	14.9%	56	75.7%
Reflecting	2	2.7%	7	9.5%	9	12.2%	18	24.3%
Total	6	8.1%	48	64.9%	20	27.0%	74	100%

Table 3. Topic Floor Holding Time (in minutes) in New Vision Team

Initiated by	Subject matter		Teaching		Student learning		Total	
	Minutes	Percentage	Minutes	Percentage	Minutes	Percentage	Minutes	Percentage
BTs	0	0%	12	2.5%	3	0.6%	15	3.1%
RTs	15	3.1%	85	17.5%	7	1.4%	107	22.0%
Facilitators	37	7.6%	161	33.1%	99	20.3%	297	61.0%
Others	15	3.1%	28	5.7%	25	5.1%	68	14.0%
Total	67	13.8%	286	58.7%	134	27.5%	487	100%

Over two lesson study cycles, the teachers spent more than half the time talking about topics related to teaching pedagogy (286 minutes: 58.7%), the bulk of which were initiated by the facilitators (161 minutes: 33.1%), followed by RTs (85 minutes: 17.5%). It appeared that the role assignment as RTs shaped the two teachers’ knowledge initiation patterns, accounting for a total of 22% of talk (107 minutes) centred on topics initiated by them. During the planning discussion 4 where RT2 was not around, and the post-lesson discussion 3 when both RTs were not around, the experienced teachers in the team stepped up to contribute more, accounting for a major part of the 14% of talk (68 minutes) in which they were the knowledge initiators. Of the topic shifts initiated by BTs, they were most concerned with teaching which accounted for 12 minutes of sustained conversation (2.5%).

### 4.3 Changes in participation patterns

To understand how participation patterns changed over the course of the lesson study cycles, the number of times the teachers took turns to speak during the discussions were aggregated. Special attention was paid to the floor turn taking patterns of BTs to compare the changes in their participation across cycles, and across the two sites to understand the playing out of “legitimate peripheral participation” in this context. Table 4 below shows the distribution of floor turn taking amongst the teachers in New Vision.

Generally, the New Vision teachers took more turns across all groups to contribute to conversations

related to teaching pedagogy in Cycle 2 as compared to Cycle 1 (221 more speech turns: 53.3% more). Though the overall number of times BTs spoke decreased (3 less speech turns: 5.6% less), they participated more in conversations related to teaching pedagogy (10 more speech turns: 37.0% more). The number of floor turn taking by the other experienced teachers rose across all topic categories, reflecting their increasingly more central participation in the New Vision lesson study team.

### 4.4 Role mediation

The percentage distribution of floor turn taking in the New Vision team, and Ningxia team is shown in Table 5 to compare the differences in their speech turns shaped by role mediation. In general, the distribution of speech turns across subject matter, teaching, and student learning was similar, with both teams utilizing more than two-thirds of the speech turns talking about teaching related topic issues.

By virtue of their role assignment as RTs, the BTs in Ningxia had more opportunities to talk, which accounted for 15.6% of the floor taking turns in their team as compared to the BTs in New Vision (7.0%). Bearing the perspective of the teacher learning as learning to talk about work practice, rather than learning from listening to others talk (Lave & Wenger, 1991, p. 109), it appeared that the role mediation as RTs engendered more opportunities for learning across all categories of knowledge domain for the BTs in Ningxia.

Table 0. Floor Taking Turns in New Vision Team

Teachers	Subject matter		Teaching		Student learning		Total	
	Cycle 1	Cycle 2	Cycle 1	Cycle 2	Cycle 1	Cycle 2	Cycle 1	Cycle 2
BTs	6	3	27	37	21	11	54	51
RTs	19	3	142	204	43	17	204	224
Facilitators	62	43	234	305	94	58	390	406
Others	2	26	14	90	20	25	36	141
Total	89	75	417	636	178	111	684	822

Table 5. Floor Taking Turns (in percentage) in New Vision (NV) and Ningxia (NX) Teams

Teachers	Subject matter		Teaching		Student learning		Total	
	NV	NX	NV	NX	NV	NX	NV	NX
BTs	0.6%	1.8%	4.2%	9.4%	2.1%	4.3%	7.0%	15.6%
RTs	1.5%	-	23.0%	-	4.0%	-	28.4%	-
Facilitators	7.0%	4.9%	35.8%	43.6%	10.1%	12.9%	52.9%	61.5%
Others	1.9%	2.5%	6.9%	15.3%	3.0%	5.2%	11.8%	23.0%
Total	10.9%	9.2%	69.9%	68.3%	19.2%	22.4%	100.0%	100.0%

The speech turns by the BTs in Ningxia were however not evenly distributed among the three BTs, with BT 2 playing a more central role, particularly when BT 3 was absent for the lesson planning for the third research lesson. The increased opportunities for talk as RTs were engendered in the planning meetings where they rehearsed what they had planned for the research lesson, and in addressing their concerns, for example, with certain suggestions from the experienced teachers along the way. In the post-lesson discussions, the BTs as the RTs had the prerogative to share their reflections before the rest of the team.

However, these community-mediated actions also allowed the 2 New Vision RTs who were more experienced teachers to dominate 28.4% of the speech turns in the team, shaping the distribution of speech turns of 4 facilitators (52.9%), and the 3 other experienced teachers (11.8%). In comparison, more speech turns were distributed among the 4 facilitators, (61.5%), and 5 other experienced teachers (23.0%) in the Ningxia team, who contributed more in almost all knowledge domains to support the novice teachers in planning the research lessons. Except for topic issues related to subject matter, the New Vision facilitators contributed more speech turns to their team (7.0%) than the Ningxia facilitators (4.9%).

## 5 DISCUSSION

### 5.1 How teachers talked about student learning difficulty

The examination of the teacher conversations in New Vision Planning Discussion 1 revealed a face of teacher practice dealing with the different manifestations of students' learning difficulty. The conversation transcript is shown in Table 6 below. An analysis of the meaning making repertoires teachers drew upon revealed the different ways of knowing student learning difficulty.

From the transcript, it appeared that as the teachers built on one another's contributions, the

discussion became increasingly more about how weak the pupils were. On a closer analysis, the face of teacher practice it offered was a collective image of how the pupils' reading problems occurred at various levels ranging from the most basic level of the decoding of words [39/04] to word-level comprehension [41/07], to sentence-level comprehension [36/01-36/02], and to text-level comprehension as they "cannot link what they are reading to what they are understanding" [39/04-39/05]. When it came to pupils' problems with writing, teacher talk revealed how the pupils' problems operated on two levels: (1) at the micro-level with "simple sentence construction" [41/08] with regard to their challenges with "spelling" [35/02], "vocabulary, grammar" [28/04], and (2) on a more meta-level to "apply what they have learnt from reading to writing" [28/02-28/03]. The teachers drew upon their past observations of students' difficulty with reading "simple instructions" [29/03-29/04], reading of a 50-word list [30/3], and other assessments done so far [41/01]. When talking about student learning difficulty, the BT's did not make such reference to their ways of knowing how pupils "still have problems with application" [28/06], "have difficulty constructing meaning" [35/04], and "can't comprehend what the sentence or question is" [36/01-36/02]. Opportunities for learning to talk about ways of knowing for knowledge building could come about from listening to such talk.

The teacher conversations has revealed a face of teacher practice by concretizing student learning difficulties. The rendering of these true situations in the classroom opened up a pathway to enable the topic of discussion to shift towards exploring the school's newround-robin discussion. By agreeing with Randy [31/01], Sally hedged on her idea unit about children's problems with linking reading to writing [28/01] to gain leverage to talk about the ELdepartment's programme that she was initially scheduled to share on after the discussion on the lesson study focus. She referred to Randy

againsaying, “Like what Randy says, to first of all, show the teachers.” [31/05], although Randy did not

Table 6. Transcript from New Vision 28 Mar TTT: Deciding on Research Focus

28/01 28/02 28/03 28/04 28/05 28/06 28/07	Randy (BT3)	I think the children are not ready to link reading and writing. If they are able to link reading and writing and apply what they have learnt from reading into their writing, they won't have problems with writing when it comes to vocabulary, grammar and sentence structure. Sometimes when we teach like grammar and sentence structure in context, but they still have problems with application. So, ya /	Hypothesizing
29/01 29/02 29/03 29/04 29/05	Annie	Basically, I think the pupils still have problems reading. So I think because of that, then all the other subjects are affected. You need to know how to read before you can do the questions. But simple instructions they have problems with reading, they have problems in doing the questions.	Ways of knowing
30/01 30/02 30/03	Cathy	I think my class (.) half of them couldn't read. Half of them couldn't write. Those who are better, they really can write in paragraphs. Those who can't, can't even clear through the 50 words.	Ways of knowing
31/01 31/02 31/03 31/04 31/05 31/06 31/07 31/08 31/09 31/10 31/11	Sally (ST)	For me, I agree with Randy. That's why this year I embarked on sharing with the P2 teachers how our reading curriculum can help support our writing. For example, for reading, we teach sequencing of events, character study, settings and over 2 terms and in term 3, it supports the narrative writing. Like what Randy says, to first of all, show the teachers. I'm the ST for English, that's why I come from that point of view. The grammar items that we teach, for example, we covered in the Primary English, time sequence words. So, time sequence words can not only be used in procedural writing but also in recounts. The children must be shown very, very clearly that when you learn this in grammar, you can actually use it in procedural writing. So that explicit teaching must be made.	Intertextuality  Intertextuality Positionality
35/01 35/02 35/03 35/04	Diana (BT1)	50% of the pupils still needs help with reading. Some of them have solid reading skills but the writing is not there yet. Spelling and things like that. When I go through the reading with them per se, they have difficulty constructing meaning. That is my concern right now.	
36/01 36/02	Shawn (BT2)	Same as the rest. The children can read but they can't comprehend what the sentence or questions is.	Positionality
37/01 37/02	Clive (LM)	You mean they don't understand what they are reading per se. They can decode the words but they don't understand.	
38/01	Shawn	Ya. They don't understand the intention of the sentence.	
39/01 39/02 39/03 39/04 39/05 39/06	Isaiah (RT1)	My class, yes, some of them can read very well. The minority, those few, the whole group right can parrot, but they cannot (read). They can parrot you very nicely. But they got no reading skills. They cannot decode and that's where it holds back the whole lot of class. Those in between cannot link what they are reading to what they are understanding (.) so there is a bit of problem.	Categorisation of pupils
40/01 40/02 40/03	Susan	Ok, for my side will be mainly, I am taking the P1 lower ability students. The main concerns would be identifying the words, understanding the words, and committing to memory.	Positionality
41/01 41/02 41/03 41/04 41/05 41/06 41/07 41/08 41/09	Clive	For my class, based on the assessment so far, I have observed that they can decode the words but they don't understand the exactly meaning. Even if they do understand, they don't see it in the context of the writing. How to use it in sentence formation. This is so far because we are going to step into writing. I'm wondering how we are going to bridge this particular gap for them, to first understand the meaning of words they are reading and how to apply the words in simple sentence construction based on the topic we are going to do for Term 2. So in general, one round and it seems that most of us are on English. So is it ok that we focus on English? And now there is 2	Way of knowing

Interaction no./line no.	Speaker	Interactions	Discourse analysis
41/10 41/11		parts right, one of reading and there is writing. How do we actually progress from here?	

not mention this. In this way, Sally positioned herself as the expert but tempered her positioning by first alluding to Randy’s insight on linking reading with writing, and positioning Randy as a voice to support the new EL Department reading programme.

Starting the lesson study with a “*genuine problem*” [New Vision Sep 26: Interview with Clive] as a shared way of engaging in doing things together (Wenger, 1998, p. 125) rendered the ensuing collegial conversation about pupils’ learning difficulties natural, and taken-for-granted by the insiders of the team. To outsiders, it might have appeared as another episode of teachers’ ranting given the pressure to cover the syllabus, and achieve good results. The rendering of this conversation alluded to the lens afforded by pragmatism as an interpretative repertoire through which the teachers made sense of what to foreground in lesson study inquiry.

## 5.2 How teachers talked about teaching

The ways in which the teachers talked about teaching in the context of lesson study were informed by different things. For Sally, it was in “not making the same mistake twice”. In getting the teachers’ buy-in to leverage the reading programme for the lesson study inquiry, she shared how “*talking to the P2 teachers, I realized that some of them just jumped straight to here (individual work), there is a little of this (explicit teaching) for about 10 minutes, this is taken out totally (group work) ... But in doing lesson study, if you are agreeable to this (.) it will definitely improve the pedagogy of the lesson.*” [New Vision Mar 28: Planning discussion 1]

This idea of “trying to improve something that is there already” [New Vision Sep 26: Interview with Isaiah] encapsulated the teachers’ understanding of lesson study inquiry in practice. The mediation of intertextuality as a dominant discourse that teachers drew upon created new images of practice through synthesizing, and making connections, for resource building. The transcript of the third planning meeting is shown in Table 7 to illustrate the meaning-making repertoires that teachers drew upon to inform the design of the research lesson.

From the analysis of the transcript, it revealed how the research lesson was not viewed as “a once-off lesson” [146/01], but as “a package” [144/01] comprising several lessons. To take student learning beyond the research lesson, the teachers considered making use of other lessons such as circle time [09/01-09/02], making use of other resources such as the positive word lists [12/05], and making use of the existing resources in the national mandated curriculum such as the STELLAR guidelines [177/01-177/02]. The teachers engaged in “folding back” (Cavey & Berenson, 2005) to recall their prior experiences, in using some of these resources in their classroom [33/01], and considered how the subject matter knowledge lent itself to the social, and emotional development of the students [33/02].

The name of individuals in the school such as “Christine” was being referred to lend weight to the use of certain resources such as the rainbow names as positive adjectives [31/01-31/02]. Even when the name of the originator eluded, the concept of “colour coding” was referred to in order to build on the ideas that were mentioned in the previous planning discussions.

In the end, the most significant developments in the New Vision case study occurred in two aspects of practice. The first was in the development of a series of vocabulary building pre-lesson tasks to support the character study research lessons. This involved the tool-mediation of the use of the concept map to brainstorm the characteristics of clowns in research lesson one, and the anchor chart to build a list of emotion traits, and personality traits in research lesson two. The second was the development of formative assessment strategies drawing upon the team’s earlier study on TLC FA (Teacher Learning Community: Formative Assessment) to make the learning intentions of the second research lesson, and its success criteria explicit to students.

When the phrase “Don’t reinvent the wheel” is typically used, it reminds one to avoid making any unnecessary preparations or do any work that is deemed redundant, the premise of which is to save time. When asked on her thoughts on the use of the phrase “don’t reinvent the wheel” in the context of this conversation transcript, Diana, the BT, said, “I thought it’s not bad. The fact that they (the pupils) are already exposed to that (FTGP booklet). I think

that was a very interesting idea.” She explained how with the use of rainbow names “linking it back to what they are exposed to really helped in my classroom”. [New Vision, May 20: Interview with Diana].

It appeared that the teachers’ premise of “don’t reinvent the wheel” was not so much just to save

time. The teachers’ understanding was much beyond what seemed to be originally intended with the idiomatic metaphor of “don’t reinvent the wheel”. By examining how it has been deployed, it alluded to the central premise of teacher agency in

Table 7. Transcript from New Vision 11 Apr TTT: Lesson Planning of Research Lesson 1

Interaction no./line no.	Speaker	Interactions	Discourse analysis
9/01 9/02 9/03 9/04 9/05 9/06 9/07 9/08 9/09 9/10 ...	Sally (ST)	Just to explore some ideas: make use of other lessons, for example, circle time in the morning. So after teaching some vocabulary words on adjectives right to describe people, you may want to put some of these words on the board. And then in the morning, you may want to give the children a small slip of paper and tell them to name one person like caring or helpful. Write down the person’s name and then give reasons in a very short sentence, why the person you choose in your class is like this, ok. So every day if you do it, you do it, ok, for that two weeks or three weeks, if you do it consistently every day, the children get to revise the vocabulary, they also get to come out with reasons why. So that actually supports our English lesson.	Make use of other lessons
12/01 12/02 12/03 12/04 12/05 12/06 12/07 ...	San San (RT2)	Thank you very much. And in PAL (Programme for Active Learning) lessons, the objectives that are presented to them at the beginning of the lesson, it really spells out the SEL (social emotional learning) clearly. And if you open your FTGP (Form Teacher Guidance Period) book, there is I think a few pages on positive words. You can use that too. I like that idea. Thank you very much. We can put this together in a package in order to build up you know so that when it comes to here, it is nothing alien to them.	Make use of other resources
13/01 13/02 ...	Randy (BT3)	Based on what Sally just shared, because during my FTGP, Christine actually shared with us on the colourful rainbow.	Intertextuality
15/01 15/02 15/03 ...	Susan	So for classes that actually did that, you may want to tap on the rainbow. For Shawn’s class and a few of us, you may want to tap on that. Some of the positive ways are checking on themselves or by their parents.	Intertextuality
28/01 28/02 28/03 28/04 ...	Isaiah (RT1)	(Referring to the FTGP book) We can use the part with the feeling word bank. Like Sally said, using a note for that. You can use that together to encourage or thank you note. You want to have a blank one. It’s also can. Next, next week. So that’s why I said use the FTGP book. It is very very useful.	Make use of other resources
29/01 30/01 31/01 ...	Sally Isaiah Sally	We don’t have to reinvent the wheel. Don’t need to reinvent the wheel. We use whatever resources we have.	Metaphor
33/01 33/02 33/03	Isaiah	Last year, I also did this. I also put it on the wall. So at least right, their friends also feel good. Like I said, we are doing the SEL part also. And especially when it creates an environment of (.)	Prior experience
62/01 62/02 ...	Ixora (KO)	Based on what you wrote. I just thought of somebody during TTT actually shared on this using colour coding.	Intertextuality
144/01 144/02	Sally	When Isaiah and I were doing it, we were thinking of it as a package as in suggested.	Making use of several lessons
145/01	Clive (LM)	The lesson would not be SBA 1 all the way. We will extend ...	
146/01 ...	Isaiah	It is more like a package than a once-off lesson.	Making use of several lessons

Interaction no./line no.	Speaker	Interactions	Discourse analysis
177/01 177/02 177/03 177/04 177/05	Isaiah	I printed the whole guidelines (STELLAR guidelines: Strategies for English Language Learning and Reading)for you. The one we tap on is from SBA 2 and you can see probably the questions that we were talking about. "Have you ever watched a car racing show on television? How do you feel?" All that. The feelings are all there.	Make use of existing resources

building on the available resources to maximize student learning. In Wenger's (1998) words, even though the lesson study team was shaped by institutional conditions outside the control of the teachers, it is their response to their conditions that will "produce a practice with an inventiveness that is all theirs" (p. 79)as their joint enterprise.

## 6 CONCLUSION

This study of teacher learning situated in teachers' work attempted to bring to bear the inner logic of teachers' pedagogic discourse underlying the transformation of knowledge into the pedagogic communication (Bernstein, 1996) in the planning, and enactment of research lessons. A fine-grained analysis of teacher discourse was deployed to describe in more nuanced ways the interpretive meaning making repertoires teachers drew upon to make sense of problems situated in teacher practice.

The implications for lesson study in engendering learning to teach through opportunities in engaging in teacher talk related to subject matter, teaching, and student learning is considerable. This is particularly when the beginning teacher plays the more central role as the research teacher. As long as there are novice teachers, and teachers who are new to the school or to the grade level participating in the lesson study team, the opportunities for learning to teach through the lesson study practice would be naturally occurring. It is therefore significant to widen the scope of the mentoring of novices to include the conception of learning to teach as mediated by teacher talk in lesson study. The case for locating opportunities for learning to teach in lesson study is much aligned to the decentered apprenticeship view of (Lave & Wenger, 1991) which paid attention to the locus of mentoring not on an individual mentor but "onto the intricate structuring of a community's learning resources (p. 94). This study builds on this theoretical construct of teacher learning by expanding the locus of mentoring to include the active agency of teachers in the community.

## Konsep ‘PADI’ dalam Penulisan Karangan Naratif

Rohani Ismail<sup>1</sup>, Faridah Taib<sup>2</sup>, Rose Ghani<sup>3</sup>, Mastura Ahmad<sup>4</sup>, Suhaila Abdul Rauf<sup>5</sup>

<sup>1</sup>*Sekolah Menengah Broadrick, Pusat Bahasa Melayu Singapura*  
rohani\_ismail@moe.edu.sg

**Abstrak:** Guru-guru mendapati bahawa para pelajar gemar menjawab soalan karangan berbentuk naratif. Namun, hasil penulisan mereka didapati kurang menarik dan kurang baik dari segi bahasa. Lantaran, bagi mengatasi situasi sebegini, guru-guru bahasa Melayu telah memperkenalkan konsep ‘P.A.D.I’ – akronim untuk **P**erasaan, **A**ksi, **D**ialog dan **I**lham. Pengenalan kepada Konsep P.A.D.I ini juga telah dijadikan sebagai Kajian Pengajaran (*Lesson Study*) pada tahun 2011. Kumpulan sasaran adalah pelajar Menengah 2 Ekspres. Berdasarkan Kajian Pengajaran ini, para pelajar berjaya memahami konsep ‘P.A.D.I’ dan mengaplikasikan konsep ‘PADI’ tersebut dalam penulisan karangan naratif. Pendekatan Kajian Pengajaran atau *Lesson Studies* telah digunakan bagi meneliti keberkesanan pengajaran dan pembelajaran. Dapatan kajian menunjukkan kesan yang menggalakkan bagi pembelajaran pelajar. Karangan naratif yang dihasilkan pelajar didapati lebih menarik dari segi idea dan muta bahasa yang digunakan oleh pelajar bertambah baik dan bermutu. Justeru itu, guru-guru bersetuju bahawa Kajian Pengajaran ini dapat membantu mengurangkan dan seterusnya mengatasi masalah para pelajar.

**Kata Kunci:** Kajian Pengajaran, Penulisan Naratif, Perasaan, Aksi, Dialog, Ilham

### 1 PENGENALAN

Guru-guru mendapati bahawa secara keseluruhan pelajar-pelajar amat cenderung untuk memilih karangan berbentuk naratif kerana menganggap karangan jenis ini lebih mudah jika dibandingkan dengan bentuk karangan ekspositori ataupun deskriptif. Namun begitu, hasil karangan pelajar didapati agak lemah kerana kurang menarik dari segi jalan cerita dan bahasanya. Setelah dikaji, hasil karangan pelajar didapati menggunakan gaya penulisan menceritakan semula, tanpa penggunaan dialog, frasa-frasa berbunga dan pelajar sering menggunakan urutan plot yang kurang menarik.

Bagi menangani situasi sebegini, guru-guru bahasa Melayu telah mengambil inisiatif untuk menjalankan Kajian Pengajaran yang lebih fokus dalam membantu pelajar dari segi penulisan. Guru-guru telah memperkenalkan konsep ‘PADI’ – akronim untuk **P**erasaan, **A**ksi, **D**ialog dan **I**lham. Pengenalan kepada Konsep PADI ini juga telah dijadikan sebagai Kajian Pengajaran (*Lesson Study*) pada tahun 2011.

Dengan memperkenalkan konsep ‘PADI’, guru berharap dapat membantu pelajar menulis karangan dengan lebih baik dan menarik dari segi idea dan bahasa. Pemberatan markah untuk Kertas 1 terutama sekali Bahagian B (Karangan) adalah besar dan penting. Bahagian ini pasti menjejaskan keputusan peperiksaan pelajar-pelajar secara keseluruhan. Oleh sebab itu guru memilih tajuk tersebut dengan harapan dapat membantu pelajar mempertingkatkan keupayaan mereka menulis dan seterusnya meraih keputusan keseluruhan peperiksaan yang lebih baik dalam subjek Bahasa Melayu.

### 2 PERNYATAAN MASALAH

Kebanyakan pelajar didapati gemar memilih untuk menjawab soalan karangan naratif, tetapi hasil karangan yang mereka tulis kurang baik dan tidak menarik. Komponen menulis karangan merupakan komponen yang penting dalam peperiksaan dan pemarkahan. Markah yang diperoleh boleh membantu pelajar meraih markah yang cemerlang dalam subjek tersebut. Oleh itu, kumpulan kajian pengajaran ini telah memilih untuk menumpukan perhatian kepada aktiviti bahagian mengarang sebagai bahan kajian.

Guru memilih untuk memperkenalkan konsep ‘PADI’ sebagai aktiviti utama supaya pelajar mendapat pendedahan kepada cara pembelajaran menulis karangan naratif yang lebih baik dan berstruktur. Dengan mengenalkan konsep PADI ini diharapkan dapat membantu pelajar menggunakan konsep yang telah dipelajari secara sedar ketika mengarang dan menulis karangan jenis naratif.

Sebelum pendekatan kajian pengajaran dijalankan oleh kumpulan guru, keputusan peperiksaan pelajar pada tahun 2010 telah dianalisis. Penelitian tersebut menunjukkan bahawa pelajar tidak mempunyai masalah untuk lulus dalam subjek bahasa Melayu. Namun begitu, dari segi peraturan pelajar yang mendapat keputusan cemerlang bagi subjek bahasa Melayu tidak menggalakkan. Guru juga meneliti hasil karangan pelajar dan mendapati karangan pelajar hanya berbentuk menceritakan semula, tanpa penggunaan dialog atau frasa-frasa berbunga yang berkesan serta mengandungi pembinaan unsur plot yang kurang menarik. Oleh itu, guru mengambil inisiatif untuk mengatasi masalah ini dengan menjalankan kajian pengajaran.

Oleh yang demikian, guru telah mengambil inisiatif untuk membantu meningkatkan pencapaian pelajar dengan melibatkan diri dalam kajian kajian pengajaran. Setelah meneliti dan mengikuti beberapa perkongsian di Seminar Bahasa Melayu anjuran Pusat Bahasa Melayu Singapura dan berbincang dengan Guru Pakar, kumpulan kajian pengajaran melaksanakan pendekatan kajian pengajaran menggunakan konsep PADI untuk membantu pelajar meningkatkan pencapaian mereka dari segi penulisan.

### 3 MATLAMAT KAJIAN

Tujuan kajian ini dilakukan adalah untuk:

1. meneliti keberkesanan penggunaan konsep PADI dalam penulisan naratif pelajar
2. meneliti keberkesanan penggunaan konsep PADI dalam meningkatkan mutu bahasa dan jalan cerita dalam penulisan pelajar.

### 4 KAJIAN LITERATUR

Terdapat banyak kajian yang telah dijalankan mengenai penggunaan pendekatan Kajian Pengajaran dan keberkesannya. Darling-Hammond & McLaughlin (1995) menyatakan kajian penyelidikan digunakan untuk berkongsi pandangan terhadap perkembangan profesional guru yang efektif dan berkesan.

Rahayu (2005), pula berpendapat bahawa Kajian Pengajaran dilakukan di dalam kelas dengan tujuan untuk memahami pelajar dengan lebih baik dan dilakukan secara bersama-sama dengan guru lain. Ini juga merupakan tujuan mengapa kajian pengajaran dilaksanakan di sekolah. Dengan menjalankan kajian pengajaran, guru boleh bekerjasama dan meraih manfaat yang boleh diraih bersama dalam memperbaiki pengajaran dan pembelajaran bahasa Melayu di bilik darjah.

Konsep karangan naratif juga telah mendapat perhatian ramai pengkaji. Mahzan Arshad (2003), mengatakan bahawa teks naratif menampilkan pelbagai cerita dan disusun dalam satu pola yang mengandungi bahagian pengenalan, perkembangan dan akhiran. Kumpulan guru dalam kajian pengajaran ini turut menumpukan pada unsur-unsur penting dalam penulisan agar pelajar mahir dalam menyediakan struktur menulis yang lebih teratur dan bersistem.

Yahya Othman (2005) pula menyatakan penguasaan kemahiran menulis bukan hanya bergantung kepada bakat semata-mata malah dipengaruhi juga oleh pengajaran menulis yang bersistem dan berkesan. Oleh yang demikian, kumpulan guru berpendapat bahawa dengan pengenalan dan penggunaan konsep PADI ini akan

memberikan pelajar kemahiran dan cara untuk memperbaiki hasil penulisan mereka.

Sehubungan dengan hal ini, Nik Safiah Karim (2004), berpendapat proses menulis karangan merupakan kemahiran yang paling sukar untuk dikuasai, jika dibandingkan dengan kemahiran bahasa yang lain dan ramai orang tidak mahir menulis.

## 5 KAEDAH KAJIAN

Setelah meneliti masalah kajian yang menjadi keprihatinan guru dalam pengajaran dan pembelajaran, kumpulan guru telah bersetuju untuk melaksanakan kajian yang menggunakan pendekatan kajian pengajaran. Guru menggunakan Kajian Pengajaran bersifat eksperimental kepada kumpulan pelajar yang terlibat dalam kajian ini. Kajian pengajaran yang dijalankan mengikut prosedur yang telah ditentukan lebih awal. Di peringkat awalnya, guru mengenal pasti dan berbincang mengenai perkara yang menjadi fokus kajian yang akan dijalankan.

Kumpulan guru berbincang dan mendapatkan pandangan guru pakar mengenai perancangan dan pelaksanaan kajian yang bakal dijalankan. Setelah itu, guru memberi fokus kepada perbincangan mengenai bahan dan kemahiran bahasa yang ingin ditekankan dalam kajian. Pembinaan bahan pengajaran mengambil kira pandangan kumpulan guru bagi memastikan pelajaran yang dirancang telah diteliti dan dirancang sebaik yang mungkin. Dalam proses ini, segala maklum balas diambil kira bagi memastikan pelajar meraih manfaat yang maksimum apabila pengajaran kajian dilaksanakan.

Proses pembelajaran ini memuatkan Rancangan Pengajaran Kajian Kitaran 1 dan Kitaran 2. Setiap rancangan pengajaran telah dibincangkan oleh kumpulan kajian pengajaran bagi memastikan pembaikan dilakukan demi menyediakan pengalaman pembelajaran yang menarik, bermakna dan berkesan dalam meningkatkan pengalaman pembelajaran pelajar. (Sila rujuk Lampiran 1 dan 2 bagi perincian mengenai maklum balas kumpulan guru bagi memperbaiki proses pembelajaran bagi Kitaran 1 dan Kitaran 2 kajian pengajaran yang dilaksanakan.)

Strategi pengajaran yang digunakan semasa Kajian Pengajaran ini dijalankan adalah pembelajaran secara kooperatif. Dalam pengajaran yang dilaksanakan, pelajar melengkapkan tugas secara kumpulan seperti aktiviti mengenal pasti elemen-elemen dalam konsep P.A.D.I dan menulis bahagian-bahagian tertentu karangan (pendahuluan dan klimaks). Ketua kumpulan yang dilantik dalam kalangan pelajar akan melakukan pembentangan dari hasil tugas yang diberikan oleh guru.

Kajian Pengajaran yang dijalankan melalui dua proses kitaran kajian. Kitaran kajian pertama dijalankan pada 24 April 2011. Cikgu Rose Ghani merupakan guru pelaksana bagi Pengajaran Kajian ini. Kitaran Kajian yang kedua dilaksanakan pada 3 Ogos oleh Cikgu Faridah Taib.

## 5.1 Subjek Kajian

Subjek kajian terdiri daripada 16 orang pelajar Menengah 2 Ekspres tahun 2011. Kaedah Kajian Pengajaran yang dijalankan berbentuk eksperimental dan diadakan sebanyak dua kali pusingan iaitu pada 28 April 2011 dan 3 Ogos 2011.

Guru Pakar dari Pusat Bahasa Melayu Singapura, Kementerian Pendidikan, turut serta berperanan sebagai Orang yang Berwibawa atau *Knowledgeable Others* semasa kajian ini dijalankan. Beliau turut memantau penyelidikan pengajaran dan memberikan nilai tambah kepada proses kajian yang dijalankan.

## 5.2 Prosedur Kajian

### Kajian Pengajaran I

Kajian Pengajaran dijalankan dengan menggunakan kaedah pengajaran dalam kelas. Proses untuk membina Kajian Pengajaran meliputi merangka langkah pengajaran, pengumpulan data-data ujian prakajian, poskajian dan soal-selidik.

Kajian Pengajaran memberikan fokus kepada aspek pemerhatian pada sikap dan cara belajar para pelajar semasa pengajaran dan pembelajaran berlangsung. Kajian Pengajaran ini berpusat pada para pelajar sementara para guru dalam kumpulan kajian bertindak sebagai pemerhati semasa guru utama menjalankan pengajaran.

Kajian pertama diadakan pada 28 April 2011. Guru telah menggunakan strategi pembelajaran kooperatif dalam pengajaran. Alat bantu video digunakan untuk merakam kegiatan pelajar dalam sesi pengajaran yang dijalankan.

Pengajaran bermula dengan guru menerangkan objektif pengajaran. Guru menayangkan klip video dari laman *youtube* yang mengandungi sebuah lagu berjudul 'Mentera Semerah Padi' yang dinyanyikan oleh M. Nasir untuk mengaitkan perkataan padi dengan konsep 'P.A.D.I.' yang diperkenalkan oleh guru. Guru menerangkan pemilihan lagu tersebut dan meminta pelajar memberikan beberapa peribahasa Melayu yang menggunakan perkataan padi.

Langkah kedua pengajaran memerlukan guru menerangkan konsep akronim 'P.A.D.I.' iaitu yang terdiri daripada elemen dan akronim berikut. Setiap

elemen diberikan warna tertentu untuk membezakan penggunaannya.

P =	Perasaan (Biru)
A =	Aksi (Hijau)
D =	Dialog (Merah)
I =	Idea (Hitam)

Seterusnya, guru menerangkan dengan lebih terperinci setiap elemen dan memberikan contoh-contoh relevan yang dipetik daripada cerpen 'Ayah'. Contoh petikan bagi setiap elemen adalah seperti yang berikut:

- Perasaan - Perasaan ialah sesuatu yang dirasa dalam hati. Contohnya ialah perasaan marah, sedih, gembira dan sebagainya.

Contoh:

*Betapa terguris tangkai jantung hatiku pada saat dan ketika itu. Titisan air mataku tergantung di dagu, kemudian jatuh satu persatu.*

- Aksi - Aksi ialah tingkah laku, sikap atau gerak-geri.

Contoh:

*Aku terkenang saat kata-kata kesat tersebut dilafazkan dengan lantang.*

*Aku menapak berat ke arah muka pintu. Daun pintu kubuka, kakiku melangkah keluar dari rumah yang selama ini aku ibaratkan seperti syurga.*

- Dialog – Dialog ialah kata-kata yang dituturkan oleh watak

Contoh:

*"Keluar engkau dari rumah ini, anak yang tak tahu untung. Pergi berambus!"*

- Idea – Idea ialah buah fikiran, gagasan dan jalan cerita. Idea cerita mengandungi permulaan, konflik, klimaks, dan penyelesaian.

Contoh:

*"Keluar engkau dari rumah ini, anak yang tak tahu untung. Pergi berambus!" suara ayah menerjah masuk kededua belah kuping telingaku.*

Langkah seterusnya, guru memberi arahan kepada pelajar untuk mengenal pasti dan menandakan elemen-elemen konsep 'P.A.D.I.' yang terdapat dalam perenggan yang telah ditentukan dalam cerpen 'Ayah'. Kemudian, ketua kumpulan membentangkan dapatan mereka.

Setelah pelajar mengenali konsep 'P.A.D.I.', mereka ditugaskan untuk menulis bahagian pendahuluan sebuah karangan yang bertemakan 'Pengorbanan'. Pelajar boleh merujuk dan menggunakan senarai frasa berbunga yang diberi terlebih dahulu. Ketua kumpulan akan membentangkan hasil karangan bahagian pendahuluan tersebut.

Semasa guru utama menjalankan pengajaran dan pembelajaran, guru-guru pemerhati akan menilai respons para pelajar. Setelah itu, perbincangan dijalankan oleh guru-guru yang terlibat dalam Kajian Pengajaran ini.

Berdasarkan pusingan Kajian Pengajaran yang pertama, guru-guru telah mendapatkan maklum balas dan saranan daripada Orang yang Berwibawa. Terdapat bahagian-bahagian pengajaran yang harus diperbaiki pada pusingan Kajian Pengajaran selanjutnya.

Kajian Pengajaran pusingan kedua telah dijalankan pada 3 Ogos 2011, setelah dilakukan beberapa perubahan pada Kajian Pengajaran I. Perubahan-perubahan yang dilakukan untuk Kajian Pengajaran II adalah seperti yang berikut:

- i) menukar penggunaan video klip lagu yang lebih bersesuaian di bahagian set induksi. Guru telah menggunakan lagu puisi ‘Ini Nasi Yang Kusuap’ yang dinyanyikan oleh Kumpulan Nuradee. Di samping lagu yang diperdengarkan, klip video tersebut juga menunjukkan proses menanam padi;
- ii) semasa pengajaran, guru mengaitkan lebih lanjut konsep padi sebenar dengan Konsep ‘P.A.D.I’ dalam karangan. Hasil padi sebenar ialah campuran antara titik peluh, ‘darah’ petani dan alam semula jadi. Oleh sebab itu, untuk menghasilkan karangan yang baik mesti mempunyai kandungan elemen-elemen konsep ‘P.A.D.I’;
- iii) memberi setiap kumpulan hanya satu elemen sahaja untuk dikenal pasti dan ditandai dengan warna tertentu; dan
- iv) kumpulan diberi tema baharu, iaitu ‘Kejujuran’ dan dikehendaki menulis bahagian klimaks karangan tersebut.

## 6 DAPATAN KAJIAN

Dapatan kajian yang dijalankan menunjukkan kesan yang positif bukan sahaja kepada pelajar tetapi juga kepada kumpulan guru yang menjalankan kitaran kajian pengajaran. Seperti yang telah ditegaskan oleh kajian-kajian pengajaran yang lain, jelas sekali bahawa dengan bekerjasama dan penglibatan yang aktif dalam kumpulan kajian pengajaran ini, guru mendalami apa yang sebenarnya berlaku semasa pengajaran dan pembelajaran dijalankan. Dalam perkataan lain, guru meneliti respons dan tindak balas pelajar semasa guru menjalankan pengajaran. Hal ini membantu guru untuk meneliti apakah langkah-langkah pengajaran yang berkesan dan bahagian mana pula yang perlu diperbaiki. Guru juga meneliti kesesuaian bahan pengajaran dan pedagogi yang digunakan. Guru sentiasa meneliti

keberkesanan pendekatan dalam membantu proses pembelajaran pelajar.

### 6.1 Impak Kepada Guru

Kajian Pengajaran yang dilaksanakan memberikan impak yang positif dan membina bagi guru. Selain merangsang minat dan keghairahan guru dalam melaksanakan kajian pengajaran yang dirancang, guru juga mendapati bahawa para pelajar bersikap positif terhadap proses pengajaran dan pembelajaran yang dilaksanakan. Guru mendapati bahawa mereka berpeluang untuk memerhatikan dengan secara teliti dan terperinci bagaimana proses pembelajaran pelajar semasa pengajaran kajian dijalankan. Berikut adalah refleksi para guru mengenai Pengajaran Kajian yang telah dilaksanakan.

#### Guru yang Menjalankan Pengajaran

*Saya amat teruja kerana dipilih untuk menjalankan kelas bagi Kajian Pengajaran ini. Topik Kajian Pengajaran yang kami pilih memang baik dan sesuai untuk pelajar. Saya berpuas hati kerana objektif pengajaran dapat dicapai. Pelajar-pelajar diperkenalkan dengan konsep PADI ini dan mereka mengaplikasikan konsep PADI secara sedar semasa menulis karangan naratif, agar dapat menghasilkan karangan yang lebih baik dan menarik.*

- Cikgu Rose Ghani

*Sebagai guru bagi Kajian Pengajaran Kitaran 2, saya berpendapat bahawa pelajar-pelajar begitu baik dari segi kelakonan. Mereka dapat memberi respons dengan baik semasa guru memberikan soalan rangsangan dan semasa menjalankan aktiviti yang diarahkan guru. Pelajar-pelajar lebih memahami konsep PADI tersebut.*

- Cikgu Faridah

#### Guru Pemantau 1

*Dengan memperkenalkan konsep PADI ini, pelajar-pelajar mendapat pendedahan yang baik dari segi strategi untuk menulis karangan yang lebih bermutu dan baik.*

- Cikgu Rohani

#### Guru Pemantau 2

*Secara keseluruhan, Kajian Pengajaran yang dijalankan sungguh baik terutama sekali langkah induksi. Walaupun klip video yang digunakan agak padat dari segi isi, namun klip video tersebut iaitu puisi lagu Ini Nasi Yang Kusuap oleh kumpulan Nuradee telah menimbulkan kesedaran kepada*

pelajar dan mereka dapat menghargai jasa petani serta rezeki yang mereka perolehi.

- Cikgu Mastura

Guru Pemantau 3

Sebagai guru baru dalam kumpulan Kajian Pengajaran, saya berbesar hati kerana dapat melibatkan diri dalam Kajian Pengajaran ini. Saya dapati pelajar-pelajar amat responsif dan dapat melakukan tugas yang diberi dengan baik, walaupun terdapat sebahagian pelajar yang agak kecoh ketika melakukan tugas yang diberi. Konsep PADI yang diperkenalkan amat mudah untuk mereka ikuti dan saya harap mereka dapat terus menggunakan konsep ini ketika mengarang karangan naratif.

- Cikgu Suhailah

**6.2 Impak kepada Murid**

Daripada pemerhatian dan pertanyaan yang diajukan kepada pelajar didapati bahawa pelajar dapat memahami konsep PADI yang baru diperkenalkan. Pelajar juga dapat mengaplikasikan konsep PADI dalam karangan naratif. Pelajar didapati juga lebih berkeyakinan dan secara sedar menggunakan konsep PADI apabila mengarang karangan naratif.

Guru juga mendapati bahawa pelajar dapat menghasilkan karangan naratif yang lebih baik dan menarik dari segi bahasa dan idea. Pelajar mendapati bahawa konsep yang diperkenalkan mudah difahami. Mereka lebih yakin atau konfiden untuk menggunakan pendekatan yang dipelajari dalam karangan mereka. Daripada refleksi pelajar, rata-rata mereka menyukai konsep yang dipelajari kerana mudah difahami dan mereka bebas menggunakan pelbagai warna sesuai dengan keperluan pembelajaran mereka.

Analisis keputusan pelajar

Kumpulan kajian pengajaran telah meneliti pencapaian pelajar sebelum dan selepas penggunaan dan pendekatan yang menggunakan konsep PADI dalam pengajaran dan pembelajaran. Jelas sekali bahawa setelah penggunaan konsep PADI diperkenalkan, terdapat peningkatan dalam peratusan pelajar yang cemerlang dalam kelakonan mereka dalam peperiksaan pertengahan dan akhir tahun. Data ini juga menunjukkan bahawa, semakin mahir pelajar kepada penggunaan konsep PADI, peratusan pelajar yang mendapat keputusan cemerlang dalam peperiksaan meningkat dari tahun 2011 hingga ke tahun 2012.

Keputusan adalah berdasarkan pencapaian kumpulan sasaran Menengah 2 Ekspres (2011).

Jadual 1: Tahun 2010 (Sebelum konsep PADI diperkenalkan):

Peperiksaan	% Lulus	% Cemerlang
SA 1	100	0
SA 2	100	12.5

Sebelum pendekatan dan penggunaan konsep PADI diperkenalkan kepada para pelajar iaitu pada tahun 2010, tidak ada pelajar yang meraih keputusan cemerlang walaupun kesemuanya lulus dalam peperiksaan pertengahan dan akhir tahun. Namun, setelah konsep PADI diperkenalkan kepada para pelajar tahun 2011, peratusan pelajar yang meraih keputusan cemerlang mula meningkat.

Jadual 2: Tahun 2011 (konsep PADI diperkenalkan)

Peperiksaan	% Lulus	% Cemerlang
SA 1	93.8	43.8
SA 2	100	18.8

Jadual 3: Tahun 2012 (pelajar sudah tahu menggunakan konsep PADI)

Peperiksaan	% Lulus	% Cemerlang
SA 1	100	70.6
SA 2	100	41.2

Peratusan cemerlang tertinggi dapat dilihat pada tahun 2012 berdasarkan keputusan peperiksaan SA1. Soalan peperiksaan pada Kertas 1 Bahagian B hanya memberi tumpuan kepada karangan jenis naratif untuk menguji kebolehan pelajar mengarang dengan menggunakan konsep PADI yang telah diajar. Daripada keputusan yang dicapai, dapat dirumuskan bahawa dengan memperkenalkan konsep PADI, dapat membantu pelajar mengarang karangan jenis naratif dengan lebih baik dan menarik dari segi bahasa dan idea.

## 7 KESIMPULAN KAJIAN

Melalui kaedah Kajian Pengajaran (*Lesson Study*) yang dijalankan, serta memperkenalkan konsep PADI kepada para pelajar dan mengaplikasikan konsep tersebut, dapat dirumuskan bahawa terdapat peningkatan dari segi kualiti dan kreativiti dalam hasil penulisan karangan para pelajar. Pelajar secara sedar dapat menggunakan konsep tersebut dengan baik. Penggunaan elemen-elemen konsep PADI dapat membantu pelajar menulis karangan yang berkualiti dari segi bahasa dan idea. Konsep 'P.A.D.I.' ini akan seterusnya diperkenalkan kepada para pelajar menengah satu hingga tiga. Kumpulan guru pengkaji berharap dengan penggunaan konsep PADI, para pelajar akan terus dapat menghasilkan karya yang bermutu dan mencapai prestasi yang cemerlang dalam subjek Bahasa Melayu.

### SARANAN DAN DAPATAN PEMANTAUAN

Kumpulan kajian pengajaran melakukan pemerhatian dan pemantauan setiap pelaksanaan pengajaran kajian yang dijalankan. Pemerhatian yang teliti dilakukan termasuklah dari segi perancangan, kebolehtadbiran rancangan pengajaran, strategi pengajaran yang

[Type text]

diambil, bahan-bahan pengajaran yang digunakan serta respons pelajar terhadap pengajaran dan bahan pengajaran yang digunakan dalam proses pembelajaran. Guru-guru pemerhati memberikan input mengenai pengajaran yang dijalankan.

Antara saranan yang dikemukakan ialah mengenai kesesuaian bahan klip video yang digunakan bagi bahagian induksi dalam pengajaran dan pembelajaran. Bagi kitaran pertama, klip video bagi sesi induksi didapati kurang sesuai. Informasi ini membantu guru untuk mendapatkan klip video yang lebih sesuai bagi kitaran pengajaran yang kedua. Daripada kitaran pengajaran yang pertama juga, guru mendapati bahawa beberapa aspek penerangan tentang konsep PADI perlu diperjelas. Guru juga mendapati bahawa dari segi arahan dan aktiviti kumpulan juga boleh diperbaiki bagi memberikan kesan pembelajaran yang lebih bermakna dan berkesan.

Berikut adalah saranan dan dapatan yang diberikan bagi setiap pengajaran kajian yang dilaksanakan. Saranan dan Dapatan Kitaran Pertama merupakan hasil pemantauan yang pertama. Saranan dan dapatan ini akan digunakan untuk memperbaiki rancangan pengajaran yang kedua. Saranan dan dapatan kitaran kedua akan digunakan untuk memperbaiki pengajaran yang seterusnya.

<b>Saranan Dan Dapatan Kitaran Pertama</b>	<b>Saranan Dan Dapatan Kitaran Kedua</b>
<p><b><u>Maklum balas dari Guru Pakar:</u></b> <b><u>Induksi:</u></b></p> <p>Penggunaan klip video <i>Youtube</i> lagu ‘Semerah Padi’ agak terlalu panjang dan tiada begitu jelas terdapat kaitan dengan pengajaran konsep PADI.</p> <p>Namun, penggunaan slaid gambar-gambar yang menunjukkan proses penanaman padi amat baik dan relevan kerana mempunyai kaitan dengan tajuk pengajaran konsep PADI.</p> <p><b><u>Langkah-langkah Pengajaran</u></b></p> <p>Secara keseluruhan, langkah-langkah pengajaran yang dilakukan guru mendapat respons atau maklum balas yang baik dari Guru Pakar Cikgu Mohd Rafi (<i>Knowledgeable Others</i>) yang telah diundang untuk memantau</p>	<p><b><u>Induksi:</u></b></p> <p>Setelah mendapat maklumbalas dari Guru Pakar Cikgu Mohd Rafi, guru telah menukar bahan bantuan untuk induksi Guru telah menggunakan petikan klip video puisi lagu Ini Nasi Yang Kusuap, nyanyian kumpulan Nuradee. Guru Pakar amat berpuas hati dengan penggunaan klip video yang amat relevan dengan konsep P.A.D.I yang hendak diajar guru. Klip video ini menunjukkan cara petani menjalani proses penanaman padi dan segala penderitaan mereka dapat dirasai oleh pelajar melalui lirik lagu tersebut. Pelajar dapat meluahkan semula dan memberi pendapat mereka tentang perasaan mereka ketika menonton klip video tersebut.</p> <p><b><u>Langkah-langkah Pengajaran</u></b></p> <p>Kekurangan dalam langkah-langkah pengajaran pada kitaran 1</p>

### 1 INTRODUCTION

In Japan, lesson studies are so popular, which are core activities of School-Based Practical Researches (SBPRs). SBPRs in Japan are defined as a series of research-oriented activities conducted by teachers at the same school. They enrich practical knowledge and reconstruct their belief system through not only lesson studies but also other activities of SBPRs such as making portfolios on their teaching, holding practical conferences for teachers from other schools and so on. That means Japanese school teachers try to establish professional learning communities (PLCs) by means of not only lesson studies but also other activities in relation with them through SBPRs.

However, it is commonly agreed upon that the formation of PLCs is not easy. For example, Dooner et al. (2008) point out that the formation of PLCs take a lengthy period and require some measures to ease tension among members. As for SBPRs in Japan, Kihara (2010) suggests the necessity of special ideas when choosing research themes, settling annual activity plans, and establishing task forces for the planning and operation of SBPRs, and also

mentions the importance of the insight and skills of teacher leaders, who are responsible for the practical decision making involved in these activities. Previous studies mostly focused on the formation of PLCs and ignored the issue of their continual development. However, Hipp et al. (2008) note that although it is common understanding among researchers that the proliferation of leadership and school culture as a foundation to build upon are essential to maintain a long process of school improvement, the issues of the sustainability of PLCs and fully understanding them remain. Sato (2012) also mentions one problematic situation: there are practically no schools that undertake a designated research project under the designated experimental school system and continue their reform after the expiration of the prescribed period, because of the complexity of the factors of development in SBPRs. As these researchers referred to, teachers even in Japanese schools have difficulties in making SBPRs sustainable.

To clarify the factors for sustainable development of the SBPRs in Japanese schools, firstly, in 2011, the authors made interviews with

leading teachers to get information on their efforts to revitalize SBPRs extending for more than one year at three elementary schools and one junior high school, using theories on PLCs. The data indicated that there were 4 factors for sustainable development of the SBPRs at those schools. They are "A. Actualization of Distributed Leadership", "B. Formation of Group Identity", "C. Construction of Networking among Schools and Some Organizations outside the Schools" and "D. Acquisition of Required Resources and its Effective Use". Additionally, the authors revealed that each factor had 2 to 5 subcategories. The authors made the model of the factors for the development of SBPRs in consideration with the relationship among the above 4 factors (Figure1).

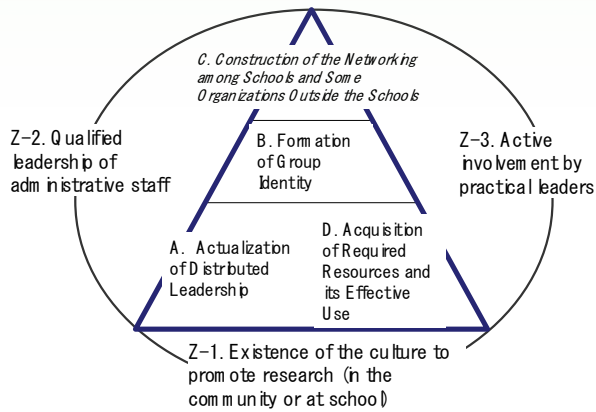

Figure1. Model of the factors for the development of school-based practical researches

## 2 RESEARCH QUESTION

To confirm the reliability of those factors on sustainable development of the SBPRs, the authors made interviews with leading teachers about SBPR efforts extending for a few years at another schools.

## 3 METHODOLOGY

### 3.1 Subjects

The subjects of this study were three elementary schools (the elementary schools H, T, and HJ) which received subsidies from a foundation for practical research during the years 2009 and 2010. These schools were engaged in SBPRs during the two years period in collaboration with university researchers who supervised the SBPRs.

All three of the schools applied for the practical research subsidy and proceeded with their SBPRs to spread and develop the ideas for ICT utilization inside and outside of schools. For example, Teachers at school H had been making their inquiries on the usage of tablet PC and IWB. In the process of their practical researches, teachers at school H also made

lesson studies and held the practical research conferences for teachers from other schools.

Because of the time lapse since the end of the two-year subsidy period, it was possible to compare the efforts between, during, and after the subsidy period and analyse the results. For these reasons, these schools were considered valid as research subjects to obtain knowledge on SBPR development.

### 3.2 Method of Data Collection

Firstly, the authors obtained an overview of practices of the three subject schools during the subsidy period, as well as their background situations regarding the acquisition of funding, by reviewing the research plans prepared at the time of application submission, in addition to the reports during and after the subsidy period. From July until October 2012, based on the information, the authors interviewed teachers who served as research-propelling leaders during the subsidy period. The interviews took the form of semi-structured interviews.

Questions asked to teacher leaders were categorized two parts. The first was about practice during the subsidy period which included the overview of practices (including teachers' learning) and things that the interviewee paid special attention to as a teacher leader for SBPR in promoting practices etc.

The second was about the practices after the subsidy period which included the situation while the teacher leader for SBPR was still at the school and after the teacher leader for SBPR left the school.

Each interview with teacher leaders for SBPR took around 58–95 minutes.

### 3.3 Analysis Procedure

First, the authors transcribed recordings of the interviews. Next, the transcribing data was sorted according to the questions. Then, they sorted the narratives about the SBPRs from the subsidy period according to 4 factors of our previous research. Throughout the process, one of the authors executed the extraction and (re)sorting of the narratives before the rest of the authors checked the result to confirm appropriateness, etc.

Table 1. Activities by three schools for SBPR development and structure of factors in SBPR development

Category	Sub-category	H	T	HJ
A. Actualization of Distributed Leadership	A-1. Collaboration and Cooperation among more than one teacher leader	○	○	○
	A-2. Role allotment to members by practical leaders		○	
	A-3. Scouting and nurturing of next generation of practical leaders			○
B. Formation of Group Identity	B-1. Establishment of a framework and procedure easily accepted by members	○	○	○
	B-2. Circulation of information and know-how on practice	○	○	○
	B-3. Introduction of activities in which all members participated	○		○

Z. Fundamental Factors	Z-1. Existence of the culture to promote research (in the community or at school)	○	○	○
	Z-2. Qualified leadership of administrative staff	○	○	○
	Z-3. Active involvement by practical leaders	○		○

## 4 RESEARCH FINDINGS

### 4.1 Situations of SBPR Development

Kihara (2008) established several perspectives for actions aimed at SBPR development, such as (1) restructuring the research theme, (2) reconstructing the research organization, (3) continuing the practices, and (4) disseminating information outside the school, thus providing bases for assessment. The review of the efforts at the three schools according to these perspectives revealed that in all cases, SBPR development took place in a situation meeting at least

one of these bases.

### 4.2 Factors for SBPR Development: Subordinate-level Categories

The factors that enabled SBPR development at the three schools, including their subordinate-level categories, were sorted as shown in Table 1. All of the aforementioned 4 factors for PLC development were observed in one way or another. As a result, the authors reconfirmed that above factors were also quite important for the sustainable development of the SBPRs at those schools.

#### 4.3 Another Factors for SBPR Development

In addition, the authors clarified the existence of the fifth factor for SBPR development named "E. Looking for Evidence to Use for Teacher Empowerment". For this new category, the following two subordinate categories were observed:

The first one is "E-1. Use evidence for reflection inside a school". Incidents belonging to this sub-category were observed in the efforts by Elementary school H and HJ. For example, teachers at school H collected the data of achievement test. The data indicated the efforts at school H were effective for students' learning. Therefore, teachers at school H were empowered and motivated for the sustainable development of the SBPRs.

The second subordinate category is "E-2. Use evidence for appeal to the educators outside a school". Examples of this were also observed in the efforts by elementary school H and HJ. Teachers at school H made efficient use of some kinds of data to appeal the school innovation to teachers outside the school, LEA staff and so on. In the practical conferences held at school H, the teachers gave presentations on the outstanding results of their practice by using the several kinds of data such as the achievement test and the questionnaire for students etc. These appeal made it possible for teachers at school H to develop the network for their SBPRs with the educators outside the school.

### 5 CONCLUSIONS AND DISCUSSION

In this study, the authors conducted a comparative examination of school-based practical researches at 3 schools with the aims of confirming the reliability of the factors on sustainable development of the SBPRs.

As a conclusion, the authors suggested the new model of the factors for the sustainable development of SBPRs in consideration with the relationship among the 5 factors mentioned above (Figure2).

Although the SBPR cases analysed in this research spanned several years, it is hardly a long enough period for full SBPR development. Considering that some schools in Japan maintain efforts to develop their practical studies for several decades, continued follow-ups of the SBPR cases the authors examined in this research are expected. Additionally, taking into account the fact that the subsidizing foundation specified the SBPR themes it is easy to conjecture that the development of the SBPRs at the schools was affected by some compelling forces. Accordingly, it is also our intent for the future to look into schools that are developing practical research outside the influence of such external agencies.

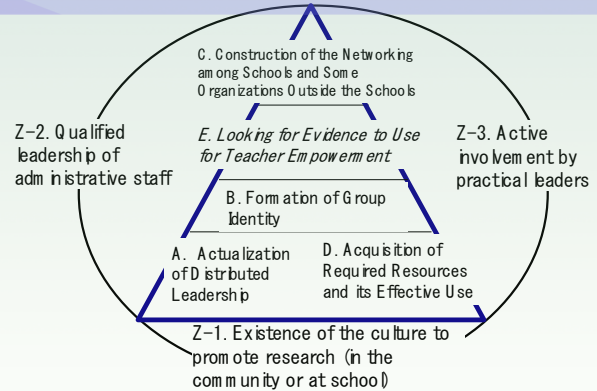

Figure2. New Model of the factors for the development of school-based practical researches

### 6 ACKNOWLEDGEMENTS

The authors wish to express their gratitude to the teachers who were interviewed on the SBPR development at their schools. A part of this study was supported by Grand for Aid for Scientific Research (B) No. 24300284.

**Abstract:** This paper discusses the expression of model teacher that initially teaching mathematics in an open lesson setting. The LS were conducted as a collaboration between Mathematics Teachers Association (MGMP) of West Bandung of Bandung City and UPI. Changing process of teacher attitude and behavior in mathematics teaching need to be known by many people, due to generally most of the teachers when they are teaching mathematics do not want to be seen by other people. This situation causes that their mistake in teaching would be constantly happen, and usually the teachers do not want to learn from their mistakes and experiences. By performing as model teacher in an open lesson setting, it means that he/she is ready to be criticised by colleagues for improvement. Though in the development of professional teacher through LS, someone was not allowed to directly criticize a model teacher, someone can only give suggestion via the students' way of thinking, or students' strategy of learning, instead of directly critique the teacher's way teaching. In this situation, at least the model teachers have given the space in their heart to be criticised for correction by all audiences and all colleagues in the reflection session. There were 6 mathematics teachers who involved 240 students, how were their feeling and their expression to the initial model teacher in the setting of LS. The result indicated that model teachers positively impressed to this activity. They felt that all suggestions have given them a positive impact for improvement of their practice in the classroom.

**Keywords:** Model teacher, Lesson study, Experience of Mathematics Teacher

### 1. INTRODUCTION

The model teacher as an ideal teacher expected by a standard teacher. Model teacher was not easy job, due he/she would be observed by a lot of lesson study participants. Observers would observe intensively, though the focus of observation usually on the students learning process rather than the instruction parts. Therefore how was the student's reaction to the teacher's question, how did students follow to the teachers instruction. As consequence, the model teacher has to be able to choose the most appropriate instruction for the students so that they can interpret as well as able to translate into real action in the classroom.

The teacher instruction should be guided by a certain theory of learning or pedagogical knowledge. Step by step the teaching approach conducted by the teacher might follow the theory underpinning the lesson, and joining the syntax of the methods of learning.

According to Turmudi (2012) mathematics teaching as we observed in Indonesian classroom still emphasize on the teaching approach that dominated by the teachers, students were more pasive as reciever given by

teacher that usually only one way communication. Experts, such as Silver (in Turmudi, 2012) states in mathematics teaching usually students 'watching' what the teacher do and solved the problem in the black board in the classroom. Even Ernest (2004) adds student do mechanically as authomatons.

The transmission learning patterns as 'transfer knowledge' was sill dominated by the teachers, as teachers introduced the general rules, or formulas, than presented the exercises for the students (Thompson & Senk, 2003). These practices should be proposed to be modified in which the learners construct their own knowledge by involving the social aspect. It means that their colleagues in the classroom should control his own progress in conceptual and procedural understanding of mathematics.

This teaching paradigm might suggest that the teaching should conducted interactively. Two way communications between students and teacher, and multi-direction interaction among students should be the form of instruction in the classroom, therefore the academic climate of the class should be intercative and collaborative. Hence, the *cooperative learning* model facilitated learners to discuss, the students worked in pairs, worked

in small groups, and work in discussion should be part of Indonesian classroom.

Mathematics is not the lesson that should be learned closely in the isolated place so that the learners were away from the society. Mathematics has to be learned by individual where as her or his knowledge should be controlled and known by others. This is what we called as *social constructivism* theory in mathematics teaching and learning.

This paper aimed to uncover teacher experiences as a model teacher for the first time in Bandung City, Indonesia.

## 2. THEORETICAL FRAMEWORK

In conducting teaching innovation, the teacher can use new strategies to challenge students, to activate them, that take students to play role in constructing knowledge (Cobb, *et al.*, 1992). In other words, student played role as an active subject who build the knowledge of mathematics.

Teaching strategies of mathematics and teaching techniques that can be developed by the teachers in lesson study is still limited in number, therefore it needs to develop more strategies so that the teacher can learn from it, enable them to refer for teaching in an open lesson (Turmudi, 2008; Turmudi, 2009). These strategies should enable teacher to teach students in the constructivist paradigm. This is relevant to the work of Cobb, Driver, Asoko, Leach, Mortimer, and Scott (in Loucks-Horsley, 1998) “We recognize that learning is a process in which learner construct their own knowledge”.

Lesson study has many characteristics of effective professional development programs identified in previous research, such as: it is site-based, practice-oriented, focused on student learning, collaboration-based, and research-oriented (Bell and Gilbert 2004; Borko 2004; Cochran-Smith and Lytle 1999, 2001; Darling-Hammond 1994; Wang and O’Dell 2002; Little 2001; Hawley and Valli 1999; Wilson and Berne 1999). Lesson study places teachers at the center of the professional development activity with their interests and a desire to better understand student learning based on their own teaching experiences. The idea of lesson study is simple: teachers organically come together with a shared question regarding their students’ learning, plan a lesson to make student learning visible, and examine and discuss what they observe. Through multiple iterations of the process, teachers have many opportunities to

discuss student learning and how their teaching affects it.

Turmudi et al. (2010)

Lesson study typically follows the steps PLAN, DO, and SEE, with a research lesson (live lesson observation) as the centerpiece of the study process (Fernandez and Yoshida 2004; Lewis 2002; Lewis and Tsuchida 1998; Murata and Takahashi 2002; Wang-Iverson and Yoshida 2005). After identifying a lesson goal, teachers plan a lesson and implement it in the classroom. The goals can be general at first (e.g., how students understand the concept of sphere volume, Turmudi & Julia 2014), and are increasingly refined and focused throughout the lesson study process to become specific research questions by the end (e.g., strategies students use to balance for learning a linear equation, Turmudi & Dwi Haryanto, 2011).

According to Fernandez (2005), lesson study provides opportunities for teachers to develop their pedagogical content knowledge. Different types of knowledge (e.g., knowledge of content, curricula, and student learning, history of content development) come together and interact with one another during the lesson study cycle. An ideal context is created in which teachers can integrate these types of knowledge and make content accessible to their students in the classroom. Often in traditional professional development, these different types of knowledge are learned separately (e.g., attending a lecture on math content, reading a book on classroom management).

In this situation sometimes the teacher has very advance in pure mathematical knowledge, but very poor in pedagogical knowledge. In the contrary, the teacher has abundant of strategies in teaching mathematics, but he or she poor in the content of mathematics. It could not be like that, the teacher has to be mastered in both either content knowledge as well as pedagogical knowledge. In the other words, the teacher should has pedagogical content knowledge.

## 2.1 Adapting lesson study for Indonesian Setting

In Indonesia, lesson study was introduced through the JICA activities since 2000s which has a collaboration project among Indonesian and Japan sites. In Indonesian site (UPI, UNY, and UM) and Japanese site worked collaboratively. Japanese provided experts to support the teacher as well as lecturers in providing and improving pedagogical content knowledge (PCK) of mathematics. Through the multiple activities such as working group conference, task-team meeting, seminar, national and international seminar, writing the mathematics and science textbooks, among three universities the Indonesia site (UPI, UNY, and UM) the notion of lesson study was learned guided by Japanese experts. This was followed by conducting the piloting project as triangle collaborative between Japanese government, Indonesian University of Education, and government of Sumedang Regency (Hendayana, 2006), then followed up by conducted the P-HKI program (Hendayana, 2010).

In the US case, some US lesson study cases presented by The Columbia University Teachers College Lesson Study Group. This group identified central characteristics of participation that limited teachers' learning. When working with Japanese colleagues, U.S. teachers were challenged to find a strong research focus and to stay with the research process needed for lesson study (Fernandez, cited by Hart, Alston, & Murata, 2011).

The U.S. teachers struggled to develop a meaningful research hypothesis, to develop means to explore the hypothesis, to use evidence to make claims, and to generalize the findings. In another study for which U.S. and Japanese teachers were interviewed about their lesson study experiences, the same group of researchers found that U.S. teachers were more likely to describe content goals (e.g., learning how to develop lesson of sphere volume) in disconnect to other goals (e.g., student disposition) and focused heavily on what teachers do in lessons and not on student discovery and autonomy (Fernandez and Cannon 2005). Fernandez also investigated how teachers took advantage of learning opportunities that were created by lesson study (Fernandez 2005), and in the study, the lack of strong mathematics content knowledge and reasoning skills kept the U.S. teachers from taking full advantage of opportunities to learn.

However, the author describes positive outcomes of how the teachers in the study collaboratively anticipated and discussed their students' thinking, revised and taught a lesson multiple times, and reflected on particular aspects of student thinking of mathematics that supported their learning as teachers.

One of the strengths of lesson study is that it places teachers' interests in the center of their learning process. In order for teachers to take full advantage of the opportunities of lesson study, they must be research-oriented and have inquisitive dispositions. However, if the teachers do not have these dispositions (as some research indicates), the dispositions can gradually be developed through participating in the lesson study process. Opportunities provided through lesson study support teachers as they develop knowledge and research skills and engage in future lesson study cycles in more effective and meaningful ways. While it may take longer for beginning lesson study participants to learn to hone in on the critical research process, in most cases, these teachers will become familiar and more adept with these expectations by their second or third lesson study experience. In the meantime, the sense of community and new professionalism will sustain their motivation to participate. Thus, these challenges found in the case studies mentioned earlier may be necessary learning steps for teachers who are for the first time considering teaching as a research process.

Learning from the experiences of the teachers from US and Japan, the teachers of mathematics from Indonesia have eagerness to learn how to conduct lesson study, they were eager to be observed in their teaching of mathematics, so the continuous quality improvement would be the target in teaching mathematics so that the quality of students' understanding would improved.

## 2.2 Teachers experiences as Model Teacher in Open Lesson

Clearly that the lesson study influence one career development as mathematics teacher in Junior secondary school. The duty of mathematics teachers in the lesson study was described in detail, was learned by the teachers. In the pre-implementation, the teachers have to identify the objective of learning, to create the student learning trajectory, or alternative way of solution of the problems, as well as path of learning. The teachers were trained to design the lesson plan, to analyse a minute by minute

students activity, to know student level understanding, and think about how question should we ask for the learner to think critically.

The model teachers got the benefit as they joining the lesson study. They bravely open the lesson, though they do not quite sure whether they teaching was appropriate or not. They thought that if someone else ready to be a model teacher, it means that he or she also is ready to be criticised, would be judged by his or her colleagues and observers. However, in the reality was not. According to RTN (Teacher of SMPN 12), at the beginning I was affraid, worried, and less confident, worried with a making mistake, but after seeing a lot of lesson study we can learn a lot. So I become more confident to be a model teacher of mathematics. My open lesson (RTN, teacher of SMPN 12) was attended by expert from Japan, I have tried to have well prepared lesson plan. Even a profesor from UPI comment “If my mathematics teacher were you, I was sure that my pavorite lesson were mathematics not chemistry as now”.

Similarly, SFN (a teacher from south part of Bandung, students of master degree program) commented “I was doubt, because when I was teaching I did not want to be watched, I was not ready to be criticised, so far I did not like to be criticised. If there was a supervision from the head master or the supervisor, then I felt anxiety. In fact, in the reality, after finishing the lesson almost all the comments were positive. It means that it becomes more confident of myself in conducting teaching when someone else seeing my lesson in the classroom.

A teacher from SMPN Cimahi (SG) as a model teacher also commented:

“...after becoming model teacher in an open lesson conducted in the context of innovation course , I was so fraud and I always be ready to be a model teacher in mathematics classroom. I was not the one who did not want to be observed in my teaching.

The last experience last a couple of month, when the assessor of school came, the assessor asked to come for seeing may lesson. One day earlier, my collegeaus and I was confirmed to be observed our class, no one wished to be observed but me. Generally the teachers did not want their teaching to be observed. In my mind, I have to prepare my self to be observed. In my lesson, when open lesson, I was observed by 20 observers, in this case I would only be visited by 2 persons.

In the previous plan, I would give the test for the students, but because of *assessor* coming, then I have to make plan for the following activities. With the LS experiences, all the preparation can be made. In fact only one visitor (assessor) came to my class. He came to my class whole the time. I now that the assessor was mathematics teacher. The assessor gave very high appreciation to my class presentation. This occation adds experiences for me to be more convenient as a model teacher or as a teacher to be observed in the classroom”.

When a question was addressed to LIA (teacher of SMPN 15 in Bandung) whether Lesson Study useful for her carier “LS useful to make self development, because by joining the lesson study, I can make an innovative lesson plan, not only traditional teaching so my following lesson would be more advance and innovative”. Further more, Lia stated “Prior to learn LS, I have applied such lesson daily, ... but I need more deeply in the teaching model, in the questioning techniques I need to learn more, in learning mathematics content I also need to developed more, in the teaching methods I also need study more”

As model teacher, Lia (sebagai guru model) was aware that she always keep to update knowledge so that the continous quality improvement was still going on. Moreover, Lia expressed “I my mind, with the open lesson, I should change my way of teaching, but the process of change is not as easy as in a night, it takes time, need more persistent, I need to learn more exploration of the content of mathematics as well as methods of teaching mathematics, in other words, I should master in pedagogical content knowledge.

Other experiences was exposed by EhM (one of SMP mathematics teacher) “...one of the most impresive, ... before being a model teacher, I thought that when I became model teacher, I would be affraid, but after joining the lesson study for several times I relised that all my colleagues would fine. ‘Yes, when I became model teacher there were two things, one I should thanks, the other I should thanks to all my colleagues that has observed me, so my first experience I felt stressful, less preparation, and ...nervous, whereas in fact we have done our own teaching for more than ten years, why we should be nervous?

By learning from the open lesson, the more time the more confident in teaching mathematics, the more time I was more

convenient in teaching mathematics. The reflection session, the more time the observer give more polite comments. I can see that the comments from the observer in the reflection session to be more convenient and challenges.

The experiences of teacher model in an open lesson for the first time varied, but most teachers have a positive impression to the open lesson.

### 3. METHOD AND DATA ANALYSIS

This paper uncovers how was the teachers' experiences in the first open lesson. The brief and simple research focuses on the question whether the lesson study give benefit to develop their carrier as mathematics teachers, whether they have no wishes to be observed for the improvement purposes, do they have proud feeling to be observed, are they persons that happy for being published their work through the scientific publication. A question also addressed to model teacher regarding the most constraint to be model teacher of the open lesson and the last question was raised regarding whether they make a discussion at their own school after opening the lesson as model teacher.

Those survey questions were asked to the subjects (six persons) of the study in the written form: three of them are contacted using the essay questions, two of them were sent and asked by mobile phone, and one of them was using email. Results of the survey questionnaire showed that in general the teachers have experiences and knowledge development positively in constructing pedagogical content knowledge.

Result of the survey questionnaires were analysed qualitatively, to have the pattern response pattern that can be interpreted as responden answers, conclusions, and their oppinion as model teacher in an open lesson ocaton. Description of their opinion, and impression were used as a base for their colleagues who want to be model teacher in an open lesson sequences.

### 4. DISCUSSION

After presenting their lesson on the open lesson, the teachers have a number of impression, mostly they have positive comments. It was common when the model teacher has opinion that “If to be a model teacher, when finishing the lesson, then the teacher would be criticised by

observers”. However in the reality not, even a model teacher think the observers usually give a positive impression toward model teachers.

A model teacher (SH) from south part of Bandung mentioned “ I have doubt, teaching is one of profession that I was affraid to be observed, I was worried that my teaching was wrong, I was not ready to be critised. It was worried. When a class suoervision comming to my class, I also be anxious”. Another model teacher, Rtn (one of teacher in the northern part of Bandung City) stated “...I felt have no confidence, I also be affraid when teaching in an open lesson, but this feeling gradually recovery due I often witnessed the model teacher in an open lesson”. EnDH (teacher of SMPN in the center part of Bandung) expressed their experiences as a model teacher “...the first time as model teacher, which was stressful, and make me nervous”. Moreover she stated that in fact there was positive sides: a polite comment from the colleagues in the reflection session, make me more confidence to conduct an open lesson as model teacher, “...whoever to be a mathematics model teacher, in an open lesson, he or she not necessary to feel inconvenient, and feel would be judged by observers”.

After passing a critical time, to be a model teacher at the first time, finally the positive things was coming. “Their self confidence were increased after becoming model teacher of mathematics”. Moreover, the model teacher has positive and constructive comments from the colleagues. After becoming model teacher for the first time, I always ready to be the second time of the model teacher. But I still need more time to learn constructing the lesson plan design”. I still need guidance to make a good lesson plan.

The most and hardest part to be a model teacher were “when preparing our mental and psychological part to be observed by colleagues, it was never been observed before” (SG), for me (RTN) “the hardest part is that my lesson plan, has not perfect yet”. Because the lesson plan has not perfect yet, I feel stressful and nervous when open lesson come”. “I feel not well, feel that I will make wrong, I was not ready to be critised.”

Do they have additional new horizon when they finished open lesson as a model teacher for the first time and do they always discussed the lesson or the issues in the innovation after finishing an open lesson? They giev comments as follows:

SH : I always tried to spend my time for making discussion with my colleagues at

my school about mathematical content as well as mathematics instruction. Sometimes there was very strong debate when we have different opinion in mathematics. It was common for me and I also use the discussion forum for mathematics teacher (MGMP)

SG : I often do my discussion with my colleagues at school, though it was not in the formal situation as in open lesson. I frequently discussed mathematics and mathematics teaching with friends, the issues on the student attitude towards mathematics as well as toward education in general. Discussion in the lesson study setting, give me special experiences for me in deliver the speech as well as deliver the ideas of mathematics for the floor or forum of mathematics group discussion.

RTN : Discussion just one or two, because the full scedule make me so busy, therefore we have difficulty to meet together. There was no MGMP day, as previously we have MGMP day on Wednesday, but not now. Sometimes I throw the ideas “Was there any new ideas regarding our teaching mathematics, please share to us, my question addressed to the teacher of mathematics at school.

EH: At SMP we have a routine discussion of MGMP group people. We allowed the chair of group at school, because the chair person has more and wider horizon of mathematics and mathematics instruction. We really do hope that the human resourses such as lecturers still want to give us more refreshment in mathematical issues, covered by lesson study.

EM : In the activity of the open lesson of the lesson study, we have an efforts to discuss learning plan (lesson plan) that would be presented in the implementation, that would be observed together, and would be revised collaboratively. In my mind, someone cannot play his/her ego. For example “I usually teach using this approach, so in my open lesson I would use this certain approach. In the open lesson we cannot behave such kind of ego”

On the contrary, we should discuss and design the lesson plan collaboratively, so that if we comment to the lesson mean “our lesson, not my lesson”, the false of the syteaxt means “our fault, not my fault”

everything was belong to us, not me. Not only the model teachers, but also us (belong to us me and members of the group). We work collaboratively in discussion of lesson study. Therefore we would improve our practical profession as teacher of mathematics.

From the participants as model teachers we can conclude that at the beginning they have a stressful feeling to face an open lesson, eventhough at the end they tried to dessiminate their result by using discussion as media for scalling up to improve the quality of the lesson. As stated by participant “I spent the time to discuss (SH)”, “I often make a discussion” (SG)”, “Is there any new ideas for discussion please share to us (RTN)”, “We frequently do the discussion among members of MGMP routinely” (EH).

## 5. CONCLUSION AND RECOMMENDATION

Model teacher give an inspiration that naturally a teacher when he/she was teaching can be observed and watched by every body. Because the one who observed the lesson was not allowed to interfere to the students as well as the teacher. Observers could not disturb the teaching process in the classroom. Even, for example just taking the fotograph or video, the cameramen could not block the student sight to the blackboard.

Though the model teacher felt not convenient to be observed, after the action as model teacher, and after the reflection session, the model teachers become more comfortable. At the beginning they feel stressful, being nervous, but post reflection session they feel convenient, their horizon to be opened. Now the model teacher are ready to be a model teacher for the second time, ready to be observed by anybody else. The teacher also be ready their experience to be shared and published, they just have difficulties in writing their research experiences to be an article of the journal. With regard to the most heavy barriers in conducting an open lesson, the teacher mentioned “I have feeling that my preparation has not perfect yet, so I have an effort to make better”.

[azriana\\_abdul\\_manan@moe.edu.sg](mailto:azriana_abdul_manan@moe.edu.sg)

Abstrak:

Drama dalam pendidikan telah bermula apabila anak-anak Queen Victoria dan Albert mementaskan *Athalia* dan beberapa cerita lain. Bermula dari sinilah dikatakan drama telah mula digunakan untuk membantu pengajian bahasa di sekolah-sekolah. Peranan drama dalam pendidikan begitu signifikan berlaku pada pertengahan abad kelapan belas (Zainal Abd. Latiff 1989: 4). Drama – sebuah aktiviti yang melibatkan penggunaan teknik yang luas seperti pergerakan, aksi vokal dan tumpuan mental yang lazimnya kurang menyerlah di dalam kelas tradisional. Pelajar lebih terangsang dan berminat sekiranya aktiviti berdrama dijalankan di dalam kelas. Melalui daya kreativiti guru, pengubahsuaian strategi dan teknik mengajar dapat dilakukan untuk menerapkan aktiviti berdrama dalam pengajaran kita agar ia lebih menarik, bermakna dan membawa kesan yang maksimum, tidak kira apabila berdepan dengan pelajar-pelajar yang kurang motivasi ataupun kurang minat dalam Bahasa Melayu. Kajian ini adalah percubaan untuk menerapkan penggunaan drama dalam mengukuhkan pengajaran bahasa, menyemai sikap suka membaca dan sekaligus menanam nilai-nilai murni melalui karya-karya yang dibaca. Prinsip TEACHING FOR REAL dijadikan sebagai panduan dan sandaran dalam persiapan melakarkan pengajaran menggunakan aktiviti berdrama untuk mencapai objektif pengajaran. Melalui penggunaan drama, pelbagai objektif pengajaran dapat dicapai di dalam kelas Menengah 1, 2 dan 4 yang telah dipilih untuk menjalankan kajian ini. Di antaranya adalah cara berkomunikasi yang lebih berkesan dan meyakinkan, mengasah bakat dan kreativiti, pengaplikasian bahasa dan konsep ataupun pengajaran kefahaman bagi mempersiapkan pelajar untuk peperiksaan.

### 1 PENGENALAN

“Why Don’t Students Like School?” Keputusan akademik yang kurang memuaskan atau rendah. Pelajaran yang membosankan dan membebankan fikiran. Kurang keterlibatan di dalam aktiviti kelas kerana malu dan tidak yakin. Itu adalah di antara masalah mengapa para pelajar tidak berminat untuk bersekolah. Tujuan mereka ke sekolah bukanlah dengan tujuan utama untuk belajar dan membentuk minda mereka, sebaliknya lebih untuk berinteraksi secara santai dengan kawan-kawan. Berdasarkan kajian di dalam buku “Why Don’t Students Like School?”, otak tidak cenderung untuk berfikir dengan sendirinya. Malah, otak mengelak untuk berfikir melainkan di dalam situasi-situasi kognitif yang menggalakkan pemikiran. Pengajaran berdasarkan aktiviti drama dikaji dalam meningkatkan motivasi pelajar dalam pembelajaran Bahasa Melayu. Di dalam kajian ini, pelajar yang mendapat keputusan yang sederhana di dalam Peperiksaan Akhir Tahun 2012, diharapkan dapat meningkatkan prestasi akademik, berkeyakinan dalam pertuturan untuk menyampaikan idea secara berkesan dan keluar dari kepompong rasa rendah diri yang menghambat pembabitan mereka dalam aktiviti di dalam kelas/luar kelas. Aktiviti-aktiviti drama dan teknik dipilih kerana ia adalah wahana

yang sesuai untuk menyatukan emosi pelajar dengan kognitif mereka. Dalam pengalaman mereka melakukan aktiviti-aktiviti drama, mereka mengambil risiko dalam penggunaan bahasa dan merasakan hubungan di antara pemikiran dan kelakuan. Mempelajari Bahasa Melayu melibatkan penimbangan di antara penerimaan pengajaran guru dan mempraktikkan kemahiran-kemahiran bahasa seperti membaca, memahami, bertutur dan menyampaikan buah pemikiran. Penggunaan drama akan dapat memenuhi keperluan ini secara berkesan kerana melalui drama, sesebuah kelas akan belajar menggunakan dan mempraktikkan bahasa serta mengintegrasikan bacaan, penulisan, pertuturan dan pendengaran. Aktiviti berdrama juga akan dapat menimbulkan dan mengekalkan rasa minat pelajar untuk terus melibatkan diri di dalam aktiviti yang dijalankan kerana suasana pembelajaran yang menarik dan penuh dengan elemen hiburan. Dengan itu, perasaan dan perhatian pelajar digait, memperkayakan pengalaman pelajar dalam pembelajaran bahasa ibunda mereka yang semakin menerima tekanan daripada Bahasa Inggeris yang dianggap lebih penting dari segi ekonomi dan penggunaannya yang semakin meluas.

## 2 TINJAUAN BAHAN RUJUKAN

Minda manusia tidak secara alaminya cenderung untuk berfikir kerana berfikir memerlukan usaha, berlaku secara perlahan dan tidak menjanjikan kejayaan. Oleh itu manusia tidak bergantung kepada pemikiran secara sedar tetapi sebaliknya banyak bergantung kepada memori. Walaubagaimanapun, apabila proses berfikir dapat dilakukan dengan jayanya, manusia berasa puas hati. Oleh itu manusia mencari peluang untuk berfikir tetapi, manusia hanya memilih masalah yang memberi cabaran dan pada masa yang sama, dapat diselesaikan dengan jayanya. Untuk memastikan pemikiran yang berjaya, pemikir harus ada maklumat yang secukupnya daripada persekitaran, ruang dalam memori berfikir serta fakta dan prosedur yang diperlukan di dalam memori jangka masa panjang. Teknik menggunakan aktiviti drama diaplikasikan di dalam kelas untuk menggalakkan proses pemikiran di dalam para pelajar. Menurut Sir John Pollock (1958), drama adalah satu pertunjukan yang berlaku penyatuan antara lakonan dan pengucapan atau persembahan gerak laku, serta melakonkan atau meniru watak-watak. Drama harus mengandungi persoalan, tindakan, perkembangan dan klimaks serta kesimpulan. Drama adalah wadah yang baik untuk meneroka aspek teori dan praktikal Bahasa Melayu. Aktiviti berdrama dapat dibentuk untuk membina pengajaran di dalam kelas bagi membina kemahiran berkomunikasi atau selainnya di dalam situasi yang autentik dan dinamis. Dengan menggunakan aktiviti berdrama sebenarnya, pelajar diberikan peluang untuk mempraktikkan Bahasa Melayu dan mengaplikasikan teknik dalam keadaan yang bebas tekanan serta membuat hubungan di antara apa yang baru dipelajari dengan pengalaman pelajar.

## 3 TUJUAN KAJIAN

Aktiviti-aktiviti drama yang bervariasi, menarik, eksperiensial dan visual bentuknya seperti mimos, improvisasi, main peranan, teater bercerita, dikon, simulasi, boneka, teater membaca dapat diolah untuk memenuhi keperluan rangsangan, isu pelajaran, pengukuhan atau pengayaan, pemulihan dan penilaian di dalam sesuatu pengajaran. Di dalam kajian ini, beberapa aktiviti drama seperti bermain boneka(puppet), wayang kulit, lakonan pelajar dan lakonan guru telah diolah untuk mencapai objektif pengajaran akademik bagi persiapan peperiksaan yang diinginkan seperti karangan naratif, pemahaman, peribahasa, dan kata kerja. Pada masa yang sama, objektif pembentukan pelajar yang berkeyakinan dan kreatif dan pandai

bekerjasama dengan anggota yang lain ingin dicapai juga. Justeru, tujuan kajian kami adalah seperti berikut:

1. Mengkaji keberkesanan menggunakan aktiviti berdrama dalam meningkatkan motivasi pelajar mempelajari Bahasa Melayu.
2. Mengkaji peningkatan prestasi pelajar dalam peperiksaan bahasa melayu dengan menggunakan dapatan ujian-ujian kelas serta markah peperiksaan dalam tahun 2012 dan tahun 2013.
3. Meningkatkan keyakinan diri pelajar bagi tujuan meningkatkan keupayaan berkomunikasi.
4. Meningkatkan keupayaan pelajar untuk berfikir secara kreatif dan kritis melalui penulisan.

## 4 PERMASALAHAN KAJIAN

Pelajar menengah 1 dan 2 daripada aliran Ekspres didapati lebih cenderung kepada Bahasa Inggeris kerana Bahasa Inggeris adalah bahasa komunikasi di rumah dan juga pergaulan sosial bagi 90% daripada mereka. Oleh itu, penting bagi meningkatkan minat pelajar di dalam pembelajaran Bahasa Melayu iaitu Bahasa Ibunda yang kian terabai di tengah-tengah kepesatan mencapai kemajuan akademik di sekolah oleh pelajar-pelajar aliran Ekspres.

Bagi pelajar menengah 2 Normal Akademik, mereka lemah dalam kemahiran menjawab peperiksaan kerana, mereka mudah terlupa dan tidak dapat mengaplikasikan kemahiran-kemahiran yang diperlukan bagi menjawab soalan-soalan peperiksaan. Mereka juga bersifat aktif dan tidak cenderung kepada pembelajaran tradisional di mana guru mengajar dan mereka duduk mendengar. Mereka aktif dan berani menyampaikan pendapat.

Lain halnya dengan pelajar 1 Normal Teknikal, mereka lebih cenderung kepada kinestetik dan agak kurang yakin berkomunikasi secara formal dalam bilik darjah. Mereka mudah bosan dengan kaedah pengajaran tradisional yang kadang kala boleh mengakibatkan mereka hilang tumpuan dan minat mempelajari bahasa Melayu. Keupayaan mereka bertutur dalam bahasa Melayu agak baik, namun ada yang memilih untuk berdiam diri sahaja di dalam kelas bahasa Melayu.

Pelajar menengah 4 Ekspres pula, memerlukan banyak latihan dan pengajaran mengimbas kembali untuk mempersiapkan diri mereka bagi peperiksaan yang akan datang.

## 5 KAJIAN LEPAS

Beberapa kajian saintifik telah menunjukkan bahawa drama aktiviti yang kreatif dan berbentuk

instruksional serta pendidikan mempunyai kesan yang positif kepada proses pendidikan secara amnya dan memperkukuhkan pertuturan serta komunikasi. Satu ciri penting dari aspek sosial kemahiran berkomunikasi secara lisan adalah kebolehan memberi ucapan dengan keyakinan dan rasa selesa. Aktiviti berdrama adalah cara yang paling sesuai untuk membentuk keyakinan diri di dalam diri pelajar. Menurut Pietro(1987), pelajar yang lazimnya tidak banyak berbicara lebih cenderung untuk mengambil bahagian di dalam aktiviti yang sedang dijalankan kerana mereka tidak rasa diri mereka digugat oleh guru. Sam (1990) bersetuju dengan menyatakan yang aktiviti berdrama dapat memberi peluang kepada pelajar untuk melibatkan diri secara aktif kerana ia melibatkan pelajar bukan sahaja secara mental tetapi personaliti dan ketrampilan mereka juga. Desiatova(2009) pula menyatakan bahawa manfaat menggunakan teknik serta aktiviti drama amat terserlah kerana menggalakkan pelajar untuk bertutur dan berkomunikasi walaupun mereka mereka mempunyai keupayaan berbahasa yang terhad. Pelajar dapat menggunakan cara komunikasi bukan lisan seperti seperti dari segi mimik muka dan pergerakan badan. Penglibatan pelajar dalam aktiviti berdrama memberikan pelajar peluang untuk melihat perhubungan di antara konteks dan penggunaan bahasa kerana mereka harus memenifestasikan bahasa ke dalam bentuk aksi. Pelajar harus menginterpretasikan makna bagi bahasa itu berdasarkan konteks. Dengan ini pelajar akan dapat menghubungkan bahasa yang telah dipelajari dengan pengalaman mereka tentang dunia (Maley and Duff, 1978)

## 6 KAEDAH KAJIAN

Beberapa eksperimen telah dijalankan untuk meninjau keberkesanan aktiviti dan teknik berdrama di dalam meningkatkan pencapaian serta motivasi pelajar. Kelompok pelajar yang berbeza-beza telah menjalani aktiviti-aktiviti yang bervariasi untuk melihat keberkesanan aktiviti dan teknik berdrama di dalam mencapai objektif yang berbeza. Kaedah berbentuk kuantitatif dan kualitatif diambil bagi menjalankan kajian ini untuk mendapatkan maklumat yang tepat dan benar.

### Subjek Kajian

Ciri-ciri responden bagi tujuan sampling .

- 1 kumpulan kelas menengah daripada 2 Normal Akademik – 32 pelajar yang mendapat gred A1 – B4 pada tahun 2012)

- 1 kelas menengah daripada 2 Ekspres yang terdiri daripada 9 orang pelajar yang mengambil Bahasa Melayu Lanjutan (penguasaan Bahasa Melayu yang agak baik tetapi tidak meminati Bahasa Melayu; lebih cenderung kepada Bahasa Inggeris)
- 1 kelas menengah daripada 4 Ekspres yang terdiri daripada 17 orang pelajar. Prestasi mereka pelbagai terdiri daripada yang lemah (mendapat C6 hinggalah ke A2)
- 1 kelas menengah daripada 1 Ekspres yang berbeza profil pelajarnya (mendapat C untuk PSLE hinggalah ke A\*). 21 orang pelajar – 3 orang pelajar mendapat gred C, 2 orang mendapat A\* dan 16 orang mendapat A.
- 1 kelas menengah daripada 1 Normal Teknikal yang terdiri daripada 22 orang pelajar yang mengambil Bahasa Melayu Asas. Mereka lebih gemar dan selesa berkomunikasi secara santai/tidak formal. Adakalanya perbualan mereka boleh bertukar kepada salah faham dan pergaduhan.

### Instrumen Kajian

Kaedah yang berbeza-beza digunakan terhadap kelompok pelajar yang beza-beza. Kaedah yang telah digunakan ialah:

1. Pemerhatian / Teori Grounded  
Pencerapan reaksi pelajar oleh guru pengkaji bagi tujuan mengukur minat dan penglibatan pelajar di dalam aktiviti yang telah digubal.
2. Temu bual  
Menemubual pelajar selepas persembahan mereka untuk mendapatkan maklumbalas pelajar tentang aktiviti yang telah dijalankan.
3. Analisis Data  
Perbandingan markah peperiksaan yang dijalankan pada tahun 2013 dilakukan untuk ketiga-tiga kumpulan dengan menggunakan aktiviti-aktiviti berdrama bagi mengkaji peningkatan dalam pengaplikasian kemahiran-kemahiran yang diperlukan untuk para pelajar kuasai bagi tujuan peperiksaan. Format-peperiksaan tidak diubah bertujuan untuk menguji kebolehan pelajar mengaplikasi kemahiran.
4. Rujukan  
Rujukan internet melalui komputer juga dijalankan untuk mendapatkan maklumat tambahan bagi menggubal pengajaran yang

sesuai untuk memenuhi objektif pengajaran yang ingin dicapai.

### Prosedur Kajian

#### Eksperimen 1:

Subjek bagi eksperimen ini adalah 9 orang pelajar daripada menengah 2 Ekspres. Walaupun mereka mengambil Bahasa Melayu Lanjutan, mereka masih belum dapat menggarap kemahiran menjawab soalan kefahaman. Pemahaman terhadap sesuatu teks juga masih boleh diperbaiki kerana mereka membaca sesuatu teks secara keseluruhan sahaja dan tidak berupaya untuk membuat rujukan inferens terhadap teks itu. Mereka juga lebih selesa bertutur di dalam bahasa Inggeris. Ujian diagnostik dijalankan dan 7 orang gagal di dalam ujian itu. Dua orang lulus tetapi hanya seorang sahaja yang lulus dengan cemerlang. Oleh itu, bagi mendapatkan pemahaman pelajar terhadap teks, guru pengkaji telah menggubal sebuah pengajaran di mana pelajar-pelajar dikehendaki untuk menghidupkan teks itu secara berkumpulan dengan melakonkannya.

Pelajar-pelajar dikehendaki untuk memikirkan dan mengekspresikan mimik wajah, gerak-geri dan juga latar susunan props. Guru tidak akan membantu sekadar memberikan pembayang dengan membacakan ayat-ayat di dalam teks untuk pelajar fikirkan dengan lebih mendalam cara untuk mengekspresikannya dengan lebih baik. Percubaan pertama pelajar tidak begitu berjaya kerana terdapat banyak aspek teks itu yang tidak diungkapkan secara eksplisit ataupun implisit. Setelah mendengar teguran guru, percubaan pelajar yang kedua berjaya dari segi ketepatan dengan teks serta inferens yang bernas berdasarkan konteks. Pelajar dapat menjawab soalan-soalan berdasarkan teks yang berasaskan Blooms Taksonomi dengan baik termasuk soalan yang memerlukan daya pemikiran yang lebih kritis. Jawapan mereka dapat diperkukuhkan dengan bukti walaupun tanpa bimbingan guru. Pemahaman pelajar telah ditingkatkan dengan aktiviti melakonkan teks itu. Guru pengkaji mengingatkan pelajar untuk mengimajinasikan apa yang mereka baca di dalam minda sehinggalah kepada butiran yang terkecil untuk membantu meningkatkan pemahaman.

Ujian 1 adalah ujian yang menggunakan teks yang mempunyai tema serupa dan jenis soalan-soalan yang serupa dengan ujian diagnostik. Ujian kedua dijalankan menggunakan teks yang mempunyai tema yang berbeza tetapi soalan yang serupa. Ujian ketiga pula dijalankan pada jangka waktu yang agak jauh daripada aktiviti drama yang telah dijalankan di penggal 1 bagi melihat sama ada

pelajar dapat mengekalkan apa yang telah mereka pelajari.

#### Eksperimen 2:

Subjek bagi eksperimen kedua ini pula adalah 17 orang pelajar daripada menengah 4 Ekspres yang terdiri daripada mereka yang mempunyai kebolehan yang pelbagai. Para pelajar didapati masih tidak dapat menguasai penulisan karangan naratif dengan baik. Karangan mereka hambar dan tidak diaplikasikan dengan teknik-teknik karangan naratif yang dapat mempertingkatkan mutu karangan naratif pelajar menjadi lebih baik. Aktiviti berdrama yang telah guru pengkaji pilih untuk menggalakkan pelajar mengaplikasikan teknik-teknik karangan naratif adalah lakonan guru.

Bagi kajian ini, para pelajar menengah 4 Ekspres telah menghadiri Seminar Bimbingan Persiapan Peringkat 'O' yang telah dianjurkan oleh sekolah-sekolah Kelompok Barat 2. Guru pengkaji yang juga guru bertanggungjawab membentangkan tentang karangan naratif telah beraksi dengan menghidupkan karangan dengan lakonan secara individu melalui teknik-teknik penulisan yang sesuai. Para pelajar telah mengambil bahagian dalam aktiviti amali yang juga diadakan di dalam sesi itu iaitu mereka mengaplikasikan teknik-teknik yang sesuai untuk menghidupkan sesuatu konflik. Beberapa kumpulan juga telah terpilih untuk melakonkannya.

Setelah sesi seminar itu, pengajaran usulan telah dijalankan di mana para pelajar diingatkan semula tentang teknik-teknik yang harus mereka fahami dan aplikasikan dalam karangan mereka. Beberapa orang telah dipilih untuk membaca penulisan mereka yang kini sarat dengan teknik-teknik penulisan yang sesuai menggunakan intonansi suara yang sesuai dan gerak-geri badan yang sesuai.

Dalam pengajaran yang seterusnya, pelajar dikehendaki menulis sebuah karangan naratif menggunakan teknik-teknik penulisan yang sesuai. Sebab aktiviti bercerita ini dipilih adalah untuk membuktikan kepada para pelajar bahawa teknik penulisan adalah penting untuk diaplikasikan ke dalam karangan naratif kerana bisa menghidupkan karangan itu. Pelajar juga lebih memahami cara dan bila untuk menggunakan teknik-teknik karangan naratif yang sesuai kerana mereka akan membaca tulisan mereka sendiri untuk mendapatkan kesan yang mereka kehendaki. Dalam pengajaran seterusnya, guru membawa pelajar untuk mendapatkan inspirasi bagi mengolah plot karangan naratif yang menarik.

**Eksperimen 3:**

Eksperimen yang ketiga ini melibatkan kumpulan pelajar menengah daripada aliran 1 Ekspres yang mempunyai penguasaan Bahasa Melayu yang berbeza-beza. Mereka lebih selesa berkomunikasi di dalam Bahasa Inggeris berbanding dengan Bahasa Melayu. Aktiviti berdrama ini adalah amat sesuai bagi menggalakkan pelajar-pelajar ini berjinak-jinak menggunakan bahasa melayu di dalam pertuturan dan meningkatkan motivasi mereka untuk mempelajari bahasa melayu.

Bagi kajian ini, guru menggunakan aktiviti-aktiviti yang berbeza bagi mencapai objektif pengajaran yang berbeza. Aktiviti berlakon menghidupkan boneka (puppet) digunakan untuk mengajar peribahasa. Daripada pemerhatian guru pengkaji, pelajar-pelajar begitu ghairah untuk menggunakan boneka-boneka itu. Mereka diberi dua peribahasa dan harus menggunakannya di dalam dialog di antara watak-watak boneka yang telah mereka pilih. Mereka begitu tekun membuat perbincangan merancang dialog mereka dan menyelitkan peribahasa yang harus mereka aplikasikan. Mereka juga berlatih menggunakan boneka. Sewaktu persembahan berkumpul, guru pengkaji mendapati bahawa para pelajar bersungguh-sungguh melakonkan boneka mereka. Suara mereka diubah mengikut boneka yang telah mereka pilih. Contoh, suara yang tinggi dan lembut untuk boneka arnab dan suara yang garau untuk boneka musang. Walaupun kadangkala perbincangan dijalankan dalam Bahasa Inggeris tetapi mereka berusaha untuk menggunakan Bahasa Melayu apabila diingatkan guru pengkaji.

**Eksperimen 4:**

Subjek bagi eksperimen ini adalah 32 orang pelajar daripada menengah 2 Normal Akademik. Walaupun mereka sudah dua tahun mempelajari bahasa Melayu di peringkat sekolah menengah, mereka masih belum dapat menggarap kemahiran menjawab soalan peperiksaan khasnya bahagian penulisan. Kemahiran yang diajarkan sering mereka lupa, lebih-lebih lagi setelah peperiksaan Semestral. Ujian penulisan menunjukkan mereka kurang dan ada juga yang tidak mengaplikasi segala teknik penulisan yang diajarkan. Guru pengkaji telah menggubal sebuah pengajaran di mana pelajar-pelajar dikehendaki untuk menulis dialog yang diubah kepada skrip lakonan dan menghidupkan suasana bersesuaian dengan tema secara berkumpulan dengan melakonkannya.

Dengan tema Kebersihan Persekitaran (Akibat Kecuaian Kita) pelajar-pelajar dikehendaki untuk memikirkan jalan cerita yang bertepatan dengan tema dan tajuk persembahan. Mereka harus

memastikan ada perkara-perkara penting yang guru tetapkan di dalam persembahan mereka itu. Dua perkara penting itu adalah perkataan-perkataan yang berimbuhan 'meN....kan' dan peribahasa yang bersesuaian dengan topik. Pelajar digalakkan memberikan perhatian kepada mengekspresikan mimik wajah, gerak-geri dan juga latar susunan props. Guru sekadar memantau gerak kerja pelajar dan memberikan tip-tip jika pelajar perlukan. Percubaan pertama pelajar berlakon pernah di jalankan dengan bantuan skrip drama radio. Tetapi kali ini mereka menulis skrip mereka sendiri, mengarah lakonan mereka sendiri dan juga menyediakan prob yang mereka perlukan. Pelajaran tersebut telah dapat dijalankan dengan berjaya dan berkesan di mana pelajar yang menonton persembahan kumpulan dapat mengenalpasti perkataan-perkataan berimbuhan 'meN...kan' dan peribahasa yang digunakan berdasarkan tema dan tajuk, dengan melengkapkan lembaran kerja yang diberikan. Aktiviti ini diperkukuhkan lagi dengan latihan susulan iaitu menulis laporan( sebagai seorang pemberita) bagi salah satu isu yang dilakonan pelajar-pelajar. Tugas menulis ini dapat mereka selesaikan di rumah dengan baik walaupun tanpa bimbingan guru. Kebolehan pelajar menulis telah ditingkatkan dengan aktiviti lakonan dalam kelas itu.

Sesi berdrama ini telah mendapat perhatian semua pelajar termasuk mereka yang sebelum ini agak pasif di dalam kelas. Mereka mengambil masa dua hari untuk menulis skrip serta berlatih drama hasil tulisan mereka sendiri.

**Eksperimen 5:**

Eksperimen yang terakhir ini melibatkan kumpulan pelajar menengah daripada aliran 1 Normal Teknikal melalui aktiviti komunikatif bertemakan Budaya Melayu yang dijalankan selama dua minggu. Projek kumpulan ini bertemakan Warisan Seni Pentas: Wayang Kulit. Pelajar diberi maklumat mengenai jenis-jenis wayang kulit, asal usulnya dan juga watak-watak wayang kulit. Mereka dikehendaki melukis dan mewarnakan serta memotong patung wayang kulit pilihan mereka. Menyusuli aktiviti itu, pelajar diminta menjadi dalang hanyak membawakan satu watak. Aktiviti berdrama ini adalah amat sesuai bagi menggalakkan pelajar-pelajar ini berjinak-jinak menggunakan bahasa melayu yang sempurna di dalam pertuturan dan meningkatkan motivasi mereka untuk menggunakan bahasa melayu secara formal.

Bagi kajian ini, guru menggunakan aktiviti-aktiviti yang berbeza bagi mencapai objektif pengajaran yang berbeza. Aktiviti berlakon menghidupkan patung wayang kulit digunakan

untuk mengajar pelajar bertutur dengan sopan dan gramatis. Daripada pemerhatian guru pengkaji, pelajar-pelajar begitu ghairah untuk menggunakan patung-patung tersebut. Mereka diberi peluang berlakon secara spontan kerana kebolehan menulis pelajar golongan ini agak terhad. Mereka begitu tekun membuat patung-patung dan merancang dialog mereka dan menyelitkan isu-isu masakini yang harus mereka aplikasikan, contohnya tentang kebersihan dan kesihatan. Mereka minta untuk berlatih menggunakan patung-patung wayang kulit. Sewaktu persembahan berkumpul, guru pengkaji mendapati bahawa para pelajar bersungguh – sungguh berlakon. Suara mereka diubah mengikut watak yang telah mereka pilih. Jelas pelajar kita walau dari aliran apapun sangat kreatif.

## 7 DAPATAN KAJIAN DAN PERBINCANGAN

Eksperimen 1:

Jadual 1: Berikut adalah dapatan daripada ujian-ujian yang telah dijalankan.

Rata-rata terdapat peningkatan dari segi prestasi pelajar di dalam ujian-ujian yang seterusnya.

SUMBER DATA	Jumlah Jawapan (Ujian 1) 11/30 mata	Jumlah Jawapan (Ujian 2) 11/30 mata	Jumlah Jawapan (Ujian 3) 11/30 mata	Jumlah Jawapan (Ujian 4) 11/30 mata
1. NUR SUCILLAS	15	17	16	17
2. QALBIAH ESTRIYSA	7	15	15	20
3. CHURISTALAIN	24	27	27	26
4. NUR NABILAH	8	17	18	18
5. NUR FIZAH	12	14	15	18
6. NUR FARHA	14	21	16	14
7. SITI NUR SYARAH	9	13	13	14
8. LULIA WAH	12	12	14	17
9. NURAZAH BANTAL	12	15	16	17

Walaupun terdapat penurunan dari segi kualiti kelulusan di dalam ujian keempat, tetapi ia tetap lebih baik daripada ujian pertama pelajar secara amnya. Penurunan dari segi kualiti markah itu mungkindisebabkan jarak masa yang agak jauh daripada pengajaran yang telah dijalankan dalam penggal sebelumnya. Walaubagaimanapun, pelajar masih dapat terus untuk mengaplikasikan penghidupan imaginasi mereka walaupun memerlukan aktiviti mengimbas kembali. Daripada pemerhatian guru pengkaji, pelajar-pelajar didapati mencuba sedaya-upaya untuk bekerjasama di antara satu sama lain bagi menghasilkan sebuah sketsa yang tepat mengikuti jalan cerita seperti yang terparap di dalam teks itu di dalam pengajaran menggunakan drama. Pelajar juga didapati lebih memahami sesebuah teks selepas pengajaran itu dijalankan.

Eksperimen 2:

Dalam latihan sesi amali di dalam seminar, pelajar dapat menghidupkan sebuah konflik dengan menggunakan teknik. Cara pelajar menceritakan perenggan karangan mereka juga baik kerana mereka cuba untuk menjadikan cerita mereka menjadi lebih menarik. Rasa malu dapat diketepikan kerana guru pencerita yang bercerita dengan mimik muka, gerak-geri badan serta intonansi suara yang sesuai menjadikan suasana tidak mengugut pelajar malah mendorong mereka untuk sama memberikan yang terbaik. Guru pengkaji juga telah mendapatkan pendapat pelajar dan guru-guru yang hadir di dalam seminar itu untuk memberikan komen tentang aktiviti bercerita yang dijalankan. Para pelajar menyatakan bahawa bahagian pembentangan karangan naratif adalah yang paling menarik dan mereka tidak berasa mengantuk sepanjang pembentangan. Mereka juga menjadi ghairah untuk mencuba teknik-teknik yang baru dikongsikan di dalam karangan mereka. Guru-guru yang hadir juga memberikan maklumbalas yang serupa menyatakan bahawa mereka terhibur dengan pembentangan yang berbentuk bercerita itu.

Di dalam aktiviti pengajaran susulan, pelajar dilatih untuk menggunakan teknik-teknik yang sesuai bagi menyampaikan beberapa konflik. Pelajar sudah semakin terbiasa menggunakan teknik-teknik karangan naratif. Pelajar-pelajar juga kini sudah semakin bersedia untuk menulis sebuah karangan naratif yang lengkap. Pelajar berusaha untuk memikirkan sebuah jalan cerita yang bukan sahaja menarik tetapi pada masa yang sama memenuhi keperluan soalan. Rata-rata ke semua pelajar telah mencuba untuk mengolah plot cerita mereka dengan menyelitkan teknik-teknik penulisan karangan naratif yang sesuai. 15 orang pelajar telah berjaya meraih markah melebihi 26 mata daripada 40 mata markah penuh.

Eksperimen 3:

Bagi eksperimen ini, guru pengkaji mendapati bahawa para pelajar berusaha bersungguh-sungguh untuk mencapai objektif pengajaran dengan merancang dialog mereka. Walau bagaimanapun, ada dua kumpulan yang menginterpretasikan makna peribahasa dengan tidak tepat. Guru pengkaji terpaksa memberi maklumbalas dan membetulkan interpretasi pelajar yang tidak tepat itu dan memberikan saranan yang lebih baik bagi mengaplikasikan peribahasa itu di dalam bentuk dialog. Daripada pemerhatian guru, pelajar didapati begitu khusyuk membuat perancangan dan melakonkan watak-watak boneka mereka. Namun di dalam keghairahan mereka, aspek interpretasi peribahasa dengan lebih tepat diabaikan.

Eksperimen 4:

Guru pengkaji dan guru-guru yang diundang menghadiri sesi persembahan ini mendapati bahawa para pelajar berusaha bersungguh-sungguh untuk mencapai objektif pengajaran dengan merancang skrip dan lakonan mereka. Persembahan mereka itu telah diadili dan kumpulan yang menang telah diberikan hadiah. Guru yang menjadi pengadil memberikan maklumbalas yang sangat positif dan menggalakkan kerana pelajar kelihatan begitu yakin dan seronok berlakon. Walaupun ada kumpulan yang kekurangan jumlah pelakon hari itu, mereka tetap dapat mengahasiq persembahan yang baik dengan membuat pengubahsuaian secara automatik. Maklumbalas pelajar juga menyatakan mereka sangat seronok berlakon dan telah memahami topik tatabahasa yang diberikan dengan lebih baik. Mereka juga dapat mengenalpasti peribahasa-peribahasa yang sesuai dengan situasi.

**Eksperimen 5**

Jadual 2: Sikap dan Minat Pelajar Normal Teknikal terhadap Pengajaran dan Pembelajaran Bahasa Melayu yang mengaplikasikan teknik drama

Daripada eksperimen ini, guru pengkaji mendapati bahawa pelajar Normal Teknikal lebih cenderung dan aktif dalam kerja-kerja tangan.

No.	Terdapat	Sikap		TMS/Sikap	
		Berkaitan	Peratus	Kekurangan	Peratus
1.	Kamu akan membuat persembahan drama menggunakan konsep persembahan bahasa Melayu	23	99	0	0.0
2.	Saya telah menikmati dan memahami maklumbalas yang diberikan oleh guru	18	81.8	4	18.2
3.	Alasan yang saya berikan untuk membuat persembahan bahasa Melayu	18	81.8	4	18.2
4.	Saya akan membuat persembahan bahasa Melayu apabila saya telah selesai belajar	18	81.8	4	18.2

Mereka sangat tekun berusaha untuk mencapai objektif pengajaran dengan menyiapkan patung-patung yang berwarna-warni dan merancang lakonan mereka. Walaupun ada kalanya perkataan yang mereka ujarakan agak kurang memuaskan, mereka sedia mendengar teguran dan cuba memperbaiki lakonan mereka dengan meminta untuk membuat persembahan kali kedua. Guru menggalakkan pelajar berusaha lagi untuk memberi mereka peluang kedua dan lebih bersemangat untuk belajar bahasa Melayu.

Dapatan daripada pemerhatian turut serta oleh pengkaji juga mendapati murid-murid menunjukkan riak muka yang ceria dan gembira semasa sesi pengajaran dan pembelajaran berjalan. Keadaan ini sedikit sebanyak mencerminkan perasaan dalamannya yang cukup seronok dan gembira mengikuti kelas tersebut.

**Keseluruhan**

Secara keseluruhannya seperti yang disarankan daripada pembacaan mengenai penggunaan teknik-teknik dan aktiviti-aktiviti berdrama ini, seni

persembahan yang mencakupi aktiviti bercerita, lakonan pendek dan bermain boneka membolehkan peserta menguji pencapaian intelek, emosi dan nilai hidup mereka. Selain itu, pelajar juga dapat meluahkan pernyataan perasaan seperti marah, kasih, suka dan duka selain dapat memperlihatkan kreativiti. Ciri-ciri sedemikian dapat dieksploitasikan melalui aktiviti yang dijalankan semasa proses pengajaran dan pembelajaran teknik berdrama untuk mencapai objektif pengajaran akademik yang berbeza-beza sesuai untuk persiapan peperiksaan dan mengaplikasikan kemahiran-kemahiran yang diperlukan di dalam peperiksaan. Murid-murid juga diberi peluang untuk mengembangkan potensi diri melalui medium seni persembahan. Mereka juga kini lebih berkeyakinan untuk membuat persembahan di depan khalayak.

Kemahiran berfikir secara kreatif dan kritis memerlukan pemikiran bercapah yang bergantung kepada pengetahuan dan pengalaman peribadi pelajar. Kemahiran yang dimaksudkan merangkumi kemahiran menilai, membuat kesimpulan, menghayati dan mengesan pengajaran. Melalui teknik mengalami, menghayati yang dilakukan oleh pelajar dalam aktiviti berdrama, ternyata menyerlahkan kemampuan berfikir secara kritis dan kreatif. Hal ini sekaligus membuktikan bahawa peningkatan penguasaan kemahiran berbahasa dalam kalangan pelajar boleh dipertingkatkan melalui amalan pengajaran dan pembelajaran yang mengaplikasikan teknik berdrama.

**8 KESIMPULAN**

Pelajar memerlukan pengajaran dan pembelajaran yang dapat mencungkil bakat mereka, yang melibatkan bukan sahaja minda mereka, tetapi juga perasaan dan emosi mereka untuk mengekalkan objektif pengajaran yang ingin dicapai. Selain daripada membina diri mereka dari segi akademik dan pemikiran mereka untuk menjadi lebih kreatif dan kritis, kemahiran-kemahiran yang diperlukan dalam abad ini, pelajar juga memperkasakan diri mereka dengan keyakinan diri dan keberanian mengambil risiko dalam mencapai sesuatu objektif. Oleh itu, jelaslah daripada perbincangan di atas, sesuatu pengajaran yang direka dengan baik dan teliti menggunakan teknik berdrama akan dapat mencapai hasil yang diinginkan dalam diri pelajar. Guru itu sendiri harus berani mengambil risiko dan mengetepikan rasa malu yang mencengkam diri kerana guru sebagai pemudahcara juga harus memaparkan pengaplikasian teknik berdrama di dalam pengajaran mereka untuk menimbulkan sesuatu suasana pengajaran yang dirasakan selamat dan menggalakkan pelajar untuk mencuba sesuatu yang baru tetapi menarik dan menghiburkan.

**Abstract:** Lesson study gives opportunities to learning community as well as collaborative and long learning process to enhance teachers' knowledge and sharing experiences. The learning community gives big impact in lesson study approach by collaboration, discussion and reflection to enhance the development of teaching and learning process. The collaboration happens in four steps which are preparing lesson plan, teaching action, reflection and modification of teaching based on the reflection. The power of the Lesson Study in developing teaching quality should be exposed to teachers training. Therefore, this article aim to discuss how to build teaching community during teaching practical in school. Five teachers training were involve in this study. They were supervised by four lecturers who implemented lesson study approaches during practical training in school. The discussion focus on the building of the lesson plan community and the evaluation community throughout the Lesson Study approach during practical teaching. The involving of the communities in practical teaching give impact on effective teaching experiences especially pedagogical content knowledge and all elements of teaching and learning processes. For this purpose, the quality of education could be increase even though they are still new in teaching profession.

**Keywords:** Teaching Community, Lesson Study, Teachers Training, Teaching Profession, Lesson Plan.

### **1. INTRODUCTION**

Generally, the quality of education is largely determined by the quality of the students produced in the education system. The quality of students is determined by the quality of teaching in a holistic manner. To determine the quality of teachers, several strategies have been implemented by the Ministry of Education through a variety of initiatives under the Teacher Education Division and Curriculum Development Division that directly involved in the teaching professionalism. Among the initiatives was the creation of a Professional Learning Community (PLC).

Teachers need to constantly improve their knowledge, to make changes and try to improve their teaching approaches because the dynamical nature of education. The world is changing so rapidly, these changes affect knowledge in education, student thinking, technology, and ultimately to create diverse student groups. In short, sustainability in teacher education needs to grab the attention of all parties and should be planned in the education system. Thus, professional learning

communities established in the education system to help teachers to improve the quality of teaching and learning while helping students in the education system at the school. The PLC is one of the approaches to enhance the professional development of teachers in the teaching process. Classroom is a learning platform for students to be protected and used wisely to nurture and development of the various elements of education. Classroom also is the place of teaching and learning to achieve the educational goals of producing students who are integrated in terms of physical, emotional, spiritual and intellectual. The success of this goal will be visible when the quality of teaching and learning processes can be created and activated by the teachers either in or outside of classroom. This can be accomplished through the Lesson Study approach, which focuses specifically on the process of teaching and learning in the classroom. In this case, the quality of teachers should be stimulated so that their teaching motivation retain during their service. Therefore, the evaluation must be collaboratively done so the teaching processes become more widening and shared.

In Malaysia, the lesson study was introduced in 2011 with a total of 289 schools are involved directly (Ministry of Education, 2012). It is a sharing platform in promoting collaboration and discussions through social interaction. This partnership is expected to develop teachers' knowledge related to student learning that stimulates the development of teaching practices. In addition, the implementation of lesson study provides the space and opportunity to create a learning community of teachers for a collaborative partnership to improve student's learning and skills development. In fact, the goals set in the lesson study allow teachers to determine the best steps to improve their teaching practices. The strategies in lesson study can be used to produce new ideas in teaching and learning that based on initiative being set to understand student thinking (Yoshida, 2002). In addition, professional learning communities provide opportunities for teachers (a) to identify the appropriate issues that enhance the learning of students and teachers, (b) to share experiences in the classroom with a group of students, (c) to identify issues of equality and equity, (d) to allow teachers to learn, implement teaching and improve student's performance in the classroom (West - Olatunji, Behar - Orenstein, & Rant, 2008).

In this case, the PLC through implementing Lesson Study approach has been pioneered in the education system in Japan. This approach is expected to change the individual method of teaching the into a form of partnership, discussion and collaboration with a learning community. In the implementation of lesson study, the challenge is to create a culture of learning communities to achieve collaborative discussion, cooperation and partnership. With the open collaboration in implementing the lesson study, teaching assessment will be more holistic and detailed. Hence, this study aims to discuss how we can build community involvement in the implementation of lesson study and how the assessment was done by the learning community during the practice teaching.

## 2. PRACTICAL TEACHING

The practical teaching undertaken in the context of classroom instruction for 16 weeks in normal school. Student teachers were required to teach between 10-12 hours a week along one semester. Also, the practical teachers must write a daily teaching and learning plan according to the format prescribed by the faculty with the addition, where necessary according to the situation and specifications subject and school. During the teaching practical, student

teachers were supervised at least three times by supervisors and mentors. In addition to teaching, student teachers were necessary to involve a program organized by the school, such as extra-curricular activities, sports, society, school uniforms and other school activities.

The focus during the practical teaching was the assessment. Formal assessment conducted by lecturers and mentor in school. Mentors are appointed by the school administration based on major and minor specialization taken by student teachers. The assessment was done holistically, not only during the teaching and learning in the classroom, but also the involvement of student teachers in other school activities. However, in this research, lesson study focused on the classroom assessment and how to build the community of evaluation during practical teaching.

## 3. LESSON STUDY

Lesson study is a term introduced by means of learning in the classroom instruction process. In other words, it is related to studies involving observation of the learning process in teaching. Generally, there are four steps introduced in the implementation of lesson study: identify problems and goals, building lesson plan, classroom instruction and reflection. In this case, the teachers can learn with the learning community for planning and evaluating the process and steps involved in the classroom instruction.

In Japanese, lesson study is known as "Jugyokenkyu" which is meant "the study of teaching". The term was introduced by Makoto Yoshida, who is an expert and has vast experience in the field (Wiburg & Brown, 2007). Lesson study is an approach in conducting a research on teaching in the classroom. This approach is used to explore the development of student learning at a deeper and meaningful stage that emphasizes the learning process. Lesson study is a continuation of collaborative teaching methods and has its own characteristics (Mohamed Naim Daipi, 2009). In Japan, student teachers have been exposed and are directly involved in lesson study during their learning preparation to become teachers (Wiburg & Brown, 2007). From the aspect of teaching, when lesson study is carried out in the classroom, it can enhance the teachers' learning experience in the various aspects of teaching and to improve their teaching ability. However it does not marginalize the importance of student learning during the teaching process. This is because the assessment and

reflection of each lesson is not only focused on the teacher, but also the development of student learning. In addition, the lesson study approach can be used to explore teachers' ideas to enhance critical and creative thinking, to help each other find solutions to a problem and to expand the understanding, skills and abilities of teachers and students.

### 3. COMMUNITY LEARNING THROUGH LESSON STUDY

The implementation of lesson study involves several teachers in a teaching session. The teachers work collaboratively for each lesson that starts from defining the objectives of the teaching up to the reflection. The first step in the lesson study is the teachers discuss and specify learning objectives appropriate to the target students. The objectives of the content should not be too much for the students to understand and to be taught effectively. Utilizing a student-centred teaching approach is recommended so students can actively participate and fully involve

The second step, teachers collaboratively build a complete lesson plan for teaching. This partnership is expected to generate more brilliant ideas, which resulted in an interesting lesson plan. In this step, a teacher will use the lesson plan as guidance to teach in the classroom. Other teachers will monitor and evaluate the instruction. This group of teachers will understand better the content of teaching because the lesson plan was prepared by them. Thus, observations of student responses will be improved. After completion of the lesson, all teachers will reflect on the instruction and discuss to see the strengths and weaknesses of the process so that changes can be made to improve the teaching plan. Furthermore, the following classroom instruction can be taught with reference to the improved and developed teaching plan.

The applications of lesson study in teacher training is an innovation to improve the quality of instruction during the teaching training especially when assessing the teaching capability. Figure 1 shows the steps in the implementation of lesson study in the practical teaching.

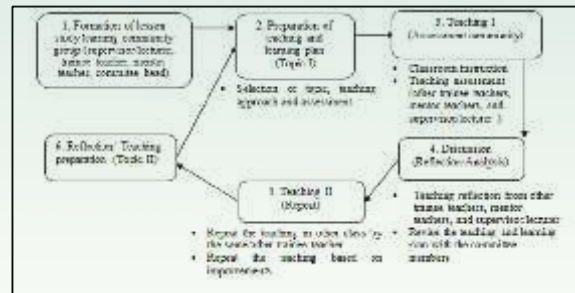

Figure 1. The Implementation of Lesson Study Model in Practical Teaching.

Based on Figure 1, the implementation process of lesson study is consists of six steps. Learning community is formed through a collaborative engagement between the lecturers and mentors. Fernandez and Yoshida (2004) involved in collaboration with experienced teachers, education professors and mentor teachers from the university in the field of education, as well as other educators. In fact, lesson study is a medium of teacher development that can help new teachers and senior teachers to create meaningful experience from the teaching communities (Fernandez, 2005). Learning communities have become a culture in the Japan education system and the most popular when the community group is formed in the school itself.

### 4. METHOD

The study involved five particle teachers who were teaching in schools under the supervision of four lecturers. These practical teachers utilized lesson study approach in their classroom. Data were collected through practical teacher reflective journals, observations and interviews. Practical teachers had undergone the teaching training at the selected schools for 16 weeks. Each of them trainee was required to establish a community group to attend the open class to share and assess the instruction.

### 5. RESULT AND DISCUSSION

Professional learning communities are able to make a difference to the students and teachers in the teaching and learning process. Taylor et al. (2005) suggest that teacher learning either individually or collectively is tested in a professional learning community. In fact, it is an indicator of academic development. The features of learning in a community include (a) learning various techniques and teaching strategies, (b) active learning provides

space for social learning, (c) the interaction of teachers and students, (d) the continuation collaboration of the teacher and students outside of class increases with the support of collaborative learning culture within the school, and (e) the norms of the school organization is compiled in learning partnerships rather than isolation.

The implementation of lesson study involves a group of teachers who collaborate to create a lesson plan based on the goals that have been agreed upon. Then, the group makes some teaching observations at one of the teachers who use the created lesson plans. After the first lesson, teachers can make changes to the teaching that has been designed by improving and establishing a new teaching plan. After that, the second teaching session conducted based on the new lesson plan. Observations were made on the second lesson delivered by a different teacher from the first lesson, and then discussion will be carried out again by making some reflection on the second lesson. The discussion will identify the strengths and the changes that need to be done if the next instruction is executed (Fernandez & Yoshida, 2004).

This study focused on the formation of learning communities in the implementation of lesson study and the overall assessment of practical training. This part will discuss on the establishment of a community group during practical training. At the initial stage, the challenges in the implementation of lesson study was the formation of learning communities. The integration of lesson study approach during the teaching training began with collaborative discussions to develop lesson a study community. Based on the analysis of the observations, lesson study communities were formed from two groups, lesson study learning community and research community. Figure 2 shows a model of community formation in the integration of lesson study during the teacher training.

Figure 2. Community involvement in lesson study.

Based on Figure 2, the major steps in the implementation of lesson study are the preparation of teaching and learning plan, teaching open classes

and reflection of teaching. Learning communities can be divided into two groups: 1) learning community group and 2) assessment community group. The learning community involved in all major steps of the lesson study model. Meanwhile the research community is the community involved in the observation and discussion of teaching reflection.

### 5.1 Learning communities of lesson study group (LCLS)

Students in Education program have been placed in schools for practical teaching in a final year. The students have been determined by the university management to take into account the needs of the placement at the selected schools. Placement of students in schools was done either in a program (same specialisation) or different programme to provide opportunities for collaborative discussion among themselves. However, there were other students from sport sciences, Islamic education, special education and teaching English as a second language (TESL) that being placed in the same school as required by the school management.

The trainee teachers attended the same activities as other teachers while in school. They were given a timetable to take over the classes of two senior teachers according their major and minor specialisation. The senior teacher with the major specialisation was appointed as a mentor to the trainee teacher. In this situation, the learning community was created which comprised of trainee teacher, mentor teacher, supervisor and other trainee teachers from major and minor field . The group consists of members, who have similarities in terms of specialization. Therefore. This group to provide the input in developing lesson plan.

### 5.2 Assessment Community Group (AC)

The second group of learning community is assessment community (AC). This froup consists of those who were willing to engage in the observation during the teaching process. The lesson study approach provided an opportunity for the involvement of the various parties who have a relationship with the education to be presented in the open class. In the context of teaching training, the assessment community consists of other lecturers who supervise students in the same school, the teacher of the minor specialisation, head of committee, administrators, and other trainee teachers

in the same school. To facilitate the formation of lesson study community, approval to conduct lesson study approach in teaching training was discussed in the first session of the meeting.

## 6. CONCLUSIONS

Lesson Study approach provides ample space for teachers to collaborate and discuss the development of science in education. Through this approach, teachers will be more concerned with the process of teaching students to deepen student thinking rather than just thinking of the teacher's task to finish the syllabus alone. This atmosphere can create a culture of education and research, and friendly bilateral relations between the teachers and student, and also between students and other students. Therefore, this relationship can be established with more closely. This is because teachers not only need to know the development of the teaching process, but they need to learn about the outside of the school results in the classroom observations. Caring teachers of students assisted by community groups who are equally involved in the teaching process, although the implementation of Lesson Study is intermittent. In fact, the lesson study approach can contribute to the professional development of teachers in education, especially at the level of training. Through this approach, teachers will be more practical learning through collaboration pengalamanny of the various parties to improve pedagogy and education. Just as important is the willingness of teachers to embrace change and improve science to equally realize the changes in education.

## Writing Mathematics Journal to Improve The Ability of Thinking Skill and to Communicate The Reasoning

Muharramah Octanova, S.Si

Mathematics Department, Sekolah Tiara Bangsa – ACS  
 Jl. Bantar Jati, kelurahan Setu, Jakarta Timur – Indonesia  
 octanova.edward@gmail.com

**Abstract:** Journal writing is an effective instrument to develop mathematical thinking and communication skills in mathematics. Journal writing in mathematics gives opportunities for students to assess and analyze what they have learned. It is a record of the experience received from particular math concept or problem solving activity. Students have to think about what they know in order to communicate it in writing. Therefore, students may obtain essential value about the mathematical problem solving process.

**Keywords:** Mathematics Journal, Thinking Skill, Reasoning Skill

### 1. BACKGROUND

I have been teaching Mathematics for over 10 years which I spend most in Primary level. The last 4 years I have been assigned to teach lower primary level. I really enjoy teaching lower primary level. As time goes on, I become more aware that this lower primary level is very important. This level is a phase when children start learning to organize and internalize information to construct and develop the understanding. In consequence, as teachers we are involved directly with the growth of children’s mind, we have to give them right concepts of knowledge.

Through the years of service as a Mathematics teacher, I always believe Mathematics is a subject that develops thinking skill. In lower level it is familiar for Mathematics teacher to apply the CPA (concrete→pictorial→abstract) approach that was introduced by Jerome Bruner. It is the connected steps from concrete objects to abstract symbols that is recommended for concept development. It is a very good approach to accustom young learners to work and think organically. Hence, it will help young learners later on when they start learning algebra in upper primary level.

For the nature character of mathematics as the area to develop thinking skill to solve problems in real life, therefore learning with understanding needs to take place. Learning based on understanding is more enduring, more psychologically satisfying and more useful in practice than learning based mainly on the rehearsal of recipes and routines low (Haylock and Cockburn, 2008). In mathematics, every concept needs to be understood properly. The beginning concept of arithmetics is about numbers. They have to be able to correlate an amount of objects with its

symbol (number) and compare which symbol is greater than the others. After they have understanding about numbers, they will learn the meaning of operation symbols and have to be able to operate them properly.

We use our thinking skill to solve problems in real life. The ability to solve problems requires some basic developed skills that work with synergy. These skills include knowledge, analysing, practising, observing, evaluating, reasoning, and communicating. Therefore, in mathematics learning process, applying the skills into learning activities is required.

It is important for us to encourage them to record important notes of some concepts as a journal. They may record an Idea of a concept, some examples or practices, unusual problem solving that they find difficult but interesting, conclusions etc. Realizing that the most important part in Mathematics is the process when young learners learn to understand an Idea by analysing, practicing, evaluating and concluding, Mathematics Journal plays a role as an effective instrument to accommodate the development of the skills. They may have more time to think of some notes that they do not really understand and highlight them. They record some ideas to solve higher order level of problems, analyse the different ways of solutions, and choose which one is suitable for them. They will learn to evaluate their work that will strengthen their understanding of the strategies which is good for the growth of their mind. This activity of writing Mathematics Journal is an effective instrument to develop reasoning skill that henceforward must be accommodated with the ability to communicate ideas with solid reason. Mathematics Journal can be also an instruments for teachers to know how well students understand the lesson that has been delivered.

## 2. HYPOTHESIS

To summarize the issues generally, there are some arguments to be proven further in a lesson study.

- a. Writing Maths Journal enables learners to develop their thinking skill and to communicate it with solid reasons.
- b. It requires an effective strategy of writing Mathematics Journal to give two-way advantages for both students and teachers. Therefore the journal can become an instruments for teachers to find out how well the students understand the delivered concepts, hence they can decide an action to follow up the problems in the next lesson and meet the objectives of the lessons.

## 3. REVIEW OF LITERATURE

Mathematics subject is recognized as the area of logic development involves planning, analysing, interpreting, predicting, reasoning, evaluating, and reflecting. Those components are the skills we use in real life either pertaining to solve easy matters of professional duties. Judy Anderson stated (NCB, 2009, p. 5) in her paper of ACSA (Association of California School Administrators) Conference 2009, a fundamental aim of mathematics curriculum is to educate students to be active, thinking citizens, interpreting the world mathematically, and using mathematics to help from their predictions and decisions about personal and financial priorities.

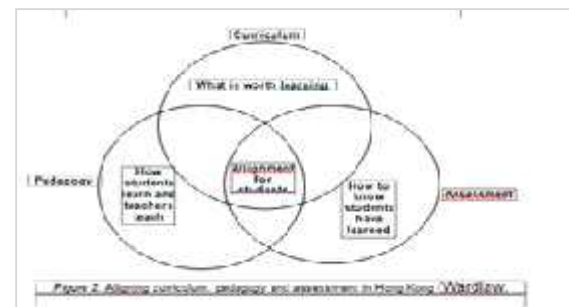

To solve mathematics problems, we are given some facts to help us plan certain strategy, make some predictions, analyse it, interpret the conclusions with solid reasons according to the related concepts in Mathematics. Sometimes we have to go through and evaluate the work to make sure all the process and the result meet the lessons' expectation. Same thing happen when we plan a family trip. After we decide the destination, then we identify all we need for the trip; transportation, accommodation, refreshment etc, we calculate the estimate cost together with unexpected sudden cost. Afterwards we break up the cost into how many months or how many days we can collect the budget. If we want to have some more places to visit, it means more budget to spend and we have to recalculate all the cost to find out how much money we may collect per time. Thus in real life we often handle things that require an ability to arrage a strategy with thinking skill.

It is also stated in Judy Anderson's paper of ACSA Conferense 2009, “ However developing successful problem solver is a complex task requiring a range of skills and dispositions”

(Stacey, 2005). Emphasize on understanding applies not only to children learning but also to teachers teaching (Haylock and Cockburn, 2008). In mathematics education, students need to have thorough knowledge and reasoning ability to produce valid work and mathematically acceptable. They certainly require good communication skill and the ability to work in a group. Therefore an effective teaching method with compatible instruments support will empower the students to equip themselves with the required skills.

Below is Judy Anderson's summary of the approach of problem solving in mathematics curriculums and the support provided for teachers in Singapore, Hongkong, England and The Netherland. She emphasized that the selected countries had been chosen to exemplify some of the approaches taken to highlight issues involved in implementation (ACSA 2009). The latest brief description of the problem solving approach of Indonesia mathematics curriculum is also included.

In Singapore, teachers are given challenges to design and use similar task in their lesson. Two initiatives *Thinking School Learning Nation* (TSLN) and *Teach Less Learn More* (TLLM) have aimed to reduce the curriculum content and engage the students in more thinking and problem-solving tasks (Kaur & Yeap, 2009).

The Hongkong Curriculum Framework has three interconnected components: Key Learning Areas, Generic Skills and Values and Attitude. Mathematics is one of the Key Learning Areas and the Generic Skills include: collaboration,

communication, creativity, critical thinking, information technology, numeracy, problem solving, self-management and study skills.

Mathematics curriculum in England contains a framework of personal learning and thinking skill and have a focus on assessment for learning. Problems solving is described as “lying at the heart of mathematics” and is represented as a cycle of a process including representing, analysing, interpreting, evaluation, communicating and reflecting.

Figure 3.4 Representation of process involved in problem solving (OCDF, 2008a) (p.11)

Pedagogical approach known as Realistic Mathematics Education (RME) is a framework applied in the Netherland. The framework is based on the notion that mathematics is a human activity and that students need to experience ‘re-inventing’ the mathematics for themselves or ‘mathemizing’ the problems during lessons.

Mathematics curriculum development in Indonesia has been aligned with the global development of mathematics education. The curriculum combines the RME (Realistic Mathematics Education), contextual learning and open-ended approaches. RME approach emphasize on equipping the learners with mathematics skills to solve problems in daily life. According to Freudenthal, the inventor of RME approach, mathematics is rich with human values that the realistic learning is applied along the process. It is more than a transferred applicable subject in certain amount of periods of lesson in class, the process applies human activities in life. Active learning takes place that learners are given realistic designed problems that stimulate thinking skill to develop mathematical tools thoroughly and solve the problems effectively.

Open-Ended approach first developed in Japan in 1970s as a research to evaluate and measure the ability to solve higher-order thinking Mathematics problems. The results of certain series of experiment shows that this approach is potential to improve the quality of Mathematics learning. The approach allows the learners to explore their methods to generate more than one applicable solutions to the problems. Therefore the problems are formulated in such ways that lead to

different valid answers both the processes and the results.

Contextual Learning is an approach of learning that allows learners to apply their academic ability in different conditions or subjects, as a group or individual. The strategy helps learners to correlate their role and responsibility as family member, citizen, worker, and student. The characteristic of the approach are problem-based, self-regulated, applicable in different context of situations that involve community or group of people, and responsive to the different needs of learners. It requires an ability of provable reasoning and communication to explain the proof hence it the community will recognize its validity.

Considering the mathematics curriculums and problem solving approaches initiatives of Singapore, Hongkong, England, The Netherland and Indonesia reveals some differences and similarities. In spite of the differences of technical procedures required in each approach, all acknowledge their curriculum to include more problem solving opportunities in mathematics lessons, examples in text books and also to include a method as an opportunity to sharpen the ability to communicate the reasoning of their thinking.

### 3.1 Writing

Mathematics and language are essentially related. Language place a substantial part in developing students fundamental concepts of mathematics. It is to reflect and record their understanding in writing, therefore we may get the clearest idea of how well the students have learnt in certain part of mathematics concepts. According to Mayer (in Mangisila and Wisniowska, 1996, p. 96), writing is a meaningful process in which students may actively develop connections between concepts that they have understood with concepts they are learning. Edel Reilly clarify in his mixed method study of writing in mathematics, that to gain clearer understanding of what actually students understand about mathematics they are studying, one needs to assess students’ thinking within mathematics classroom. Writing is a tool through which teachers can examine what students comprehend of the mathematical concepts they are taught (Kennedy, 1999; Robinson, 1998 in Reilly, Writing to Learn Mathematics, 2007, p.16).

### 3.2 Mathematics Journal

Journal writing in Mathematics is an effective instrument to develop mathematical thinking and communication skills in mathematics. Journal writing in mathematics gives opportunities for students to assess and analyze what they have

learned. It is a record of the experience received from the certain math concept or problem solving activity. Student have to think about what they did in order to communicate it in writing. By this means, students may obtain essential value about the mathematical problem solving process. Therefore doing math is not a task to follow the steps or rules without understanding. When a math journal entry is required as to follow up the specific learning goal, one actually has to think about what was done and what was required to solve the specific math activity or problem. Teachers may find that math journal can is effective to gain clearer picture of the students understanding and reflect themselves of how effective the activities and explanation impact the students' understanding of particular concept. Then they may be able to make a decision what action to follow up for further required review. Further reflection, this means can be also an effective way for teachers to reflect themselves to save more time by figuring out how they will bring mathematics problems to the class at the beginning of a topic. They will think of a good mathematics problem solving that covers several learning objectives. This can be a good strategy to gives opportunity to the students to correlate their knowledge of previous topics to be applied in the solution. This such activity covers many skills such as the strong understanding of fundamental concepts required, thinking skill, reasoning skill, communication skill, and reflection skill.

#### 4. METHODS

This proposal focus on 4 main areas to be developed in a lesson study in primary levels.

- Applying journal writing in mathematics in different grades of primary, especially lower primary.
- Proving that the journal writing in mathematics strengthen knowledge as well as the ability of reasoning and communication skill.
- Proving that the journal writing in Mathematics is helpful for teachers to reflect how successful the lesson understood by the students (informal assessment).
- How it help teachers to save more time to cover several learning objectives at a time.

To process the 4 areas, several observation in grade 1-3 had been conducted in a month. However, further well-prepared program of lesson study with some experts to guide the activity and evaluation is highly required to produce a fixed method that can be applied in all levels of mathematics education.

#### 5. FINDINGS, LESSON STUDY IMPLICATIONS, CONCLUSION

Here are some samples of Mathematics Journal

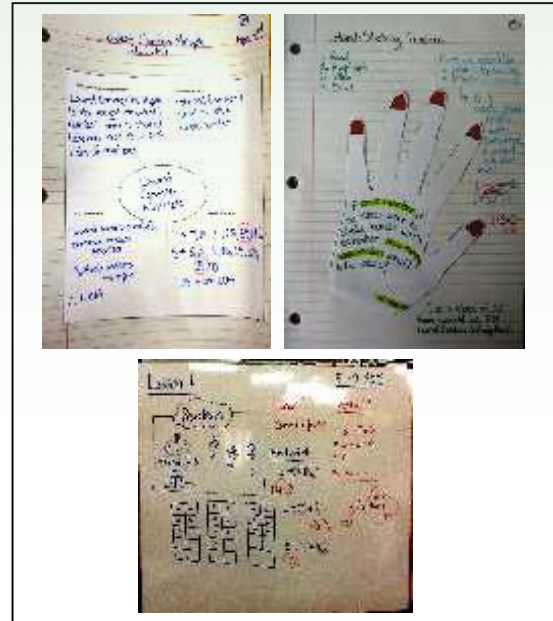

Figure 4. Samples of Mathematics

This is the summary of the usefulness of Mathematics Journal:

- For teachers to open a topic by giving them a problem to solve.
- For children to write their ideas to solve the problems.
- For children to refresh their prior knowledge and make connection to certain problems.
- As an instrument for children to produce a systematic work with reasoning in particular steps.
- For children to conclude a concept in the end of a topic.
- For children to review their understanding.
- For teachers as an informal assessment.
- For teachers to cover several learning objectives.

As to prove the effectiveness of Mathematics Journal to meet its goals, we made a lesson study group that consist of teachers from grade 1-3. We arranged a few classess to be observed within a month. Thus this was an extra program apart from the fixed anual program in our department and school. With this condition, we find a few difficulties especially to find fixed time to evaluate and discuss our finding of some observation we have done in certain classes.

We successfully conduct lesson study 4 times in different lower primary classes. Once in primary 3

and primary 1, and twice in primary 2. Here are the result we find in our observation:

- a. Only a few children find it useful. Those are the higher achiever children.
- b. It is not effective for middle and low achiever children. The problem for middle achiever children is the inability to show an organized work. Whereas the problem for lower achiever is the inability to understand the concept.

The two condition above are inferred after getting feedback from questionnaire that is given in the end of academic year (35 children of grade 2) and evaluating the condition of some samples of Mathematics Journal.

After we compare the sample Mathematics Journal (expected outcomes) and the one that had been applied at school. We conclude some mistakes in applying Mathematics Journal are:

- a. Lack of variety of Journal's activity.
- b. The designed activity is not encouraging students to share their ideas.
- c. Too much writing.

Figure 5. Samples of Children's

After conducting some discussion, we agree that the some causes of the mistakes are:

- a. There is a tendency to follow the book flow, therefore children write notes in their

Mathematics Journal quite often and it makes them feel too many learning objectives to gain. Before delivering a topic, it is better for teachers to design an activity for the Mathematics Journal that covers the main learning objective and connects the new concepts with their prior knowledge, therefore once a class discussion is implemented then at the same time the thinking skill and the communication development process take place.

- b. There is no activity that is able to measure their ability to communicate their ideas during the lesson.

## Teachers’ Reflection in Lesson Study Process: A Preliminary Analysis

Saw Fen TAN<sup>1</sup> and Chap Sam LIM<sup>2</sup>

<sup>1</sup>*School of Educational Studies, Universiti Sains Malaysia, Pulau Pinang, Malaysia*  
[sawfen@gmail.com](mailto:sawfen@gmail.com)

<sup>2</sup>*School of Educational Studies, Universiti Sains Malaysia, Pulau Pinang, Malaysia*  
[chpsam@gmail.com](mailto:chpsam@gmail.com)

**Abstract:** This study aims to explore the Malaysian teachers’ reflection as they engage in lesson study. Two lesson study groups of mathematics teachers in two primary schools involved in this study. However, in this paper, we only discuss the reflection of a lesson study group. This lesson study group comprised of six teachers and a headmaster. Three cycles of lesson study process were carried out and studied. Each lesson study process included four steps: (1) identify and formulate goals; (2) plan lesson plan collaboratively; (3) teach/ observe lesson; and (4) discuss/ refine lesson plan. Researchers participated in all the process of the lesson study processes to coach the participants as well as observe them. Qualitative data collected were videos of observed lessons, videos of reflection sessions, observation sheets and field notes. In order to explore the participants’ reflection in lesson study process, the videos of reflection sessions were imported into NVivo and transcribed. The participants’ utterances were coded according to categories. Preliminary analysis of data disclosed that teachers involved more actively in the reflection sessions when they reflected on their own research lesson. Their involvement in the reflection sessions increased from first reflection session to the third reflection session, on the other hand, the articulation of researchers decreased from first to the third reflection session. There were three major themes of reflection: (i) teacher and teaching; (ii) students and learning; and (iii) other. The number of subcategories under the theme of teacher and teaching was the highest if compared with that of students and learning, and other. As progress from first cycle to third cycle of LS, the content of reflection shifted from teacher and teaching to pupils and learning. The participants reflected more on pupils and learning. The preliminary result showed that LS process has slowly changed the teachers’ focus to more on pupils’ learning rather than teachers’ teaching.

**Keywords:** lesson study, reflection, in-service teacher

### 1 INTRODUCTION

Teaching is a complex activity. Everyday teachers are facing with various kinds of students and classroom situations. Thus, teachers need to equip themselves not only the subject content knowledge and teaching skill, but also flexibility and resilience in meeting up these changes and challenges. Reflection is one of the teachers’ professional developments (Calderhead & Gates, 1993; O’Sullivan, 2002; Suratno & Iskandar, 2010) which is gaining popularity. Through reflection, teachers recognize the complex nature of the classroom (Zeichner & Liston, 1996). Besides, reflection assists teachers to evaluate themselves and help them in realising their own weaknesses as well as strengths (Boon, 2002). Teacher will be able to see their needs and directions of searching for ideas from other sources after realising their strengths and weaknesses. As a result, reflective teacher will involve in professional development more actively (O’Sullivan, 2002). In sum, the process of reflection

improves the teachers in terms of their skills and knowledge (Boon, 2002). Hence, there is a need to promote reflective practice among the teachers.

Review of literature shows that not many studies were done on Malaysian teachers’ reflective practice. The studies done focused on both pre-service teachers (e.g. Nor Hasniza Ibrahim, 2006; Boon & Wee, 2005) as well as in-service teachers (e.g. Siti Mistima Maat & Effandi Zakaria, 2010; Suraya Sulyman, 2005; Tee, 2007). Although not many studies were done on teachers’ reflection, but the findings of all these studies revealed reported that reflection of pre-service teachers as well as in-service teachers were at low level. The scope of their reflection was narrow. This might revealed that majority of teachers in Malaysia do not reflect effectively and critically. Thus, there is a need to cultivate reflection practice and skills among the teachers.

Chiew (2009) reported that the process of lesson study promotes teachers’ reflective thinking and ultimately improve teachers’ teaching practice (Fernandez & Yoshida, 2004). Therefore, this study

was carried out to explore the teachers’ reflection when they engage in the lesson study process. And, in this paper, we report the content of teachers’ reflection in the lesson study.

### 1.1 Lesson Study

Lesson study, “*kenkyuujugyou*”, was originated from Japan. It is a conducted by teachers in Japan to improve their level of teaching competencies.

Lesson study drew the attention of the world and spread speedily to other countries after the publication of *The Teaching Gap: Best Ideas from the World’s Teachers for Improving Education in the Classroom* by Stigler and Hiebert in 1999. According to Stigler and Hiebert (1999) there are four main characteristics of lesson study: (i) lesson study is based on long-term continuous improvement model; (ii) lesson study maintains a constant focus on student learning; (iii) lesson study focuses on direct improvement of teaching in context; and (iv) lesson study is collaborative.

The process of lesson study, as shown in Figure 1, is comprised of four main components: (1) study, (2) plan, (3) do research lesson, and (4) reflect. At the beginning, group of teachers study the students’ current performance or achievement, and compare that with the ideal performance. Then, they formulate the goal for the lesson study group. Then, the plan a lesson plan based on the formulated goal. A teacher in the group teaches the research lesson to a class. During the research lesson, other teachers in the group and knowledgeable others observe the students’ learning in the lesson. They record the students’ learning. Then, teachers in the lesson study group and knowledgeable others gather to reflect together. They share data they have collected in the research lesson. Based on the reflection and discussion, the lesson study group revises the lesson plan. They can stop the lesson study cycle after they finish revising the lesson plan. Or, they can re-teach the revised lesson plan to another class of students.

(Source: Lewis, 2009)

Figure 1. The lesson study cycle.

### 1.2 Reflection

The theory of reflection was first advocated by John Dewey (1993). His definition of reflection was “active, persistent, and careful consideration of any belief or supposed form of knowledge in the light of the grounds that support it and the further conclusion to which it tends” (p. 9). The concept of Dewey was further added by Schön (1983) with the notion of reflection-in-action and reflection-on-action. Reflection-in-action occurs when the action is taken place, teacher interpret, analyze and provide solutions to the problem. Whereas reflection-on-action is carried out after the incident happens. Teacher finds meaning and make sense of what he/she has done. Killion and Todnem (1991) added reflection-for-action on top of the two reflections. According to them, this reflection revisits the past and the present experience, then think about the future action.

### 1.3 Theoretical Framework

The theory that underpins this study is Situated Learning theory. This theory was proposed by Lave and Wenger (1991). According to this theory, learning occurs through the learner’s legitimate peripheral participation in the community of practice. Learner is not acquiring a discrete body of abstract knowledge which they will imitate and apply in the next context. Instead, they are gaining the skill or understanding through engaging in the activity of the community of practice.

Community of practice is a “group of people who share a concern, a set of problems, or a passion about a topic, and who deepen their knowledge and expertise in this area by interacting on an ongoing basis” (Wenger, McDermott, & Snyder, 2002, p. 4). Legitimate peripheral participation occurs when the newcomers or novices join a community of practice where their membership is recognized by the old-comers or experts in the community. They access to the resources and the network in the community as they engage the community of practice.

In this study, the community of practice is conceptualized as the lesson study group which consists of teachers and knowledgeable others. As they engage in the lesson study process, they interact and collaborate with experts (knowledgeable others or other teachers) and novices (other teachers) in the community of practice (lesson study group). After participating in three cycles of lesson study, teachers are expected to move in a centripetal direction, from novice to expert. They gradually develop their reflective thinking.

## 2 METHODOLOGY

### 2.1 Participants

The studies involved two lesson study groups. However, this paper only focuses on the data collected from one mathematics study group in a primary Chinese school. Table 1 shows the demographic data of the participating teachers and headmaster.

As shown in the Table 1, this lesson study group comprised of a headmaster (HM) and six teachers. Teacher TH only involved in the first cycle because he was a temporary teacher in the school, he has left the school to further study when the lesson study group carried out the second and third cycle of lesson study

Table 1. Demographic of the Participants.

Participants	Gender	Age	Year of teaching experience	Qualification
TH	Male	20	0	STPM
TE	Female	31	6	Bachelor Degree of Education
TI	Female	30	8	Diploma of Education
TN	Female	41	16	Teaching Certificate
TS	Female	28	6	Diploma of Education
TW	Female	30	6	Diploma of Education
HM	Male	54	33	Teaching Certificate

### 2.2 Procedure of Data Collection

At the outset of the study, the second author provided all the participants an introductory workshop. The workshop aimed to introduce the origin and process of lesson study to the participants. Besides, the participants also exposed to the process of reflection during the workshop. The second author played a video clip of a lesson taught by an Excellent Teacher. The lesson was a Grade 5 mathematics lesson with the topic of fraction. Immediately after watching the video clip, participants were required to write their reflection on a piece of paper. Then, the second author discussed their reflection together with them.

Then, teachers and headmaster set up lesson study group and started the lesson study process as displayed in Figure 1. Firstly, they identified and formulated goal of the lesson study. Secondly, they planned a lesson collaboratively. Third step, a teacher from the lesson study group taught the research lesson based on the planned lesson plan to a class of pupils. During the research lesson, other group

members and knowledgeable others (lecturers from university) observed the lesson. They were provided observation sheets. Fourth step, immediate after the research lesson, the second author interviewed six pupils who have following the research lesson. These pupils were selected by their teacher based on the academic performance, where two each from high, medium and low performing groups. This interview aimed to explore the pupils’ perceptions upon the research lesson. Their perceptions were brought into the teachers’ reflection session in order to enrich the teachers’ reflection. Lastly, fifth step, participating teachers, headmaster and knowledgeable others gathered and reflected on the research lesson. And, they refined the lesson plan.

This lesson study group carried out three cycles of lesson study. All observed research lessons and reflection sessions were video recorded with permission and transcribed for the purpose of analysis.

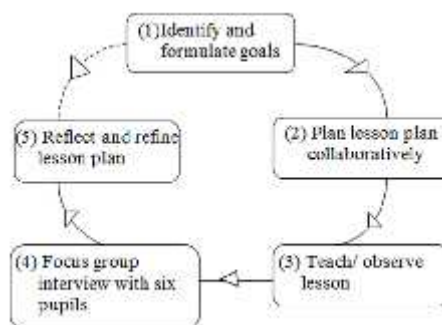

Figure 1. The lesson study cycle.

The data collected included the videos of research lessons, the videos of reflection sessions, observation sheets and field notes.

### 2.3 Data Analysis

In order to explore the participating teachers’ and headmaster’s reflection as they engaged in the lesson study process, the videos taken during the “reflect and refine lesson plan” sessions (Step 4) were imported into NVivo 10 and transcribed in verbatim.

Then, all the participants’ utterances were coded to their names. An utterance was defined as “a unit of analysis of speech that corresponds to any uninterrupted stretch of speaking by one or more people” (Rowe, 2004, p. 79). The frequency and percentage of coverage of utterance of each participant were computed using NVivo 10. The frequency and percentage of coverage of utterance were used to explore the participants’ involvement in the reflection sessions.

In addition, the reflection sessions were coded into the several main themes in order to explore the aspects of participants’ reflection.

### 3 RESULT

This section is divided into two parts. The first part reports the participating teachers', headmaster's and researchers' involvement in the three lesson study cycles. Meanwhile, the second part discusses the content of participating teachers' and headmaster's reflection.

#### 3.1 The Involvement of Participants in the Three Reflection Sessions

As shown in Table 2, teachers who were teaching the research lessons tended to involve more actively in the reflection session if compared with other teachers. This was shown by teacher TH and TE. Teacher TH taught the first research lesson and the frequency of his utterance was the highest (75 utterances) if compared with other teachers during the first reflection session. Likewise, teacher TE taught the third research lesson and the frequency of her utterance was the highest (43 utterances) if compared with other teachers in the third reflection session. Teacher TI taught the second research lesson, although the frequency of her utterance was not the highest, but it was the second highest (65 utterances) among other teachers.

Furthermore, teachers' elaboration and explanation was more when they reflected on the research lesson they taught if compared with when they reflected on research lesson taught by other teachers. As displayed in Table 3. the coverage of utterance of teacher TI was higher during the second reflection session (20.34%) compared with the third reflection sessions (3.17%). And, the coverage of teacher TE's utterance during the third reflection session was 21.08%, which was higher if compared with 0.28% and 1.22% during the first and second reflection sessions. This might be due to teachers have more feelings of ownership when they were reflecting on the lesson they taught.

Generally, the involvement of the participating teachers was not active during the first reflection session. For instance teacher TS, the frequency and coverage of her utterance were 5 utterances and 0.60% only. This incident might be caused by they were not used to reflect and discuss in group. But, when they continued to participate in the group, their involvement grew higher. For instance, the headmaster, his coverage of utterance rose to 25.10% during the third reflection session. The participating teachers and headmaster give more comments and suggestions on the research lesson during the second and third reflection sessions.

Table 2. The Frequency of Participants' Utterance in the Three Reflection Sessions.

Participants	Frequency of Utterance		
	LS 1	LS 2	LS 3
TH	*75		
TE	2	7	*43
TI		*65	4

RT			5
RA		7	
RK		3	
Total	338	276	126

**Key:**

absence

\* Teacher who is teaching the lesson

In contrast, during the first reflection session, the frequency and coverage of researchers' utterances were high. For RO, the frequency and coverage of utterance were 91 utterances and 37.02%. Likewise, there were 85 utterances or 25.15% of the reflection came from RL. In other words, 62.17% or more than half of the reflection were contributed by the two researchers in the first reflection session. The researchers articulated a lot during the first reflection session because they asked questions to probe the teachers to reflect on the research lesson. In addition, they gave lots of comments and suggestions to refine the lesson plan. The frequency and coverage of researchers' utterance decreased in the second and third reflection sessions. For instance, the frequencies of RO's utterances reduced from 91, 32, until 14 utterances, as shown in Table 2. And the coverage of her utterances dropped from 37.02%, 12.00%, to 11.28%, as displayed in Table 3. The decrease of researchers' articulation from the first to the last lesson study cycles might implied that the researchers slowly withdrawn their scaffold as the teachers participate more actively in the reflection sessions.

Table 3. The Frequency of Participants’ Utterance in the Three Reflection Sessions.

### 3.2 The Content of Participants’ Reflection

As shown in the Table 4, the content of teachers’ reflection was divided into three major themes: “teacher and teaching”, “students and learning”, and other. There were 11 subcategories under the major theme of “teacher and teaching”; five subcategories under the major theme of “students and learning”; and two subcategories under the theme of “other”.

Teachers and headmaster emphasized more on the “teacher and teaching” when they were reflecting on the research lessons. The number of subcategories under the major theme of “teacher and teaching” was higher than that of “students and learning” and “other”. Besides, the number of utterances categorized under the theme of “teacher and teaching” (63 utterances) was also greater than the number of utterance grouped under the themes of “students and learning” (29 utterances) and “other” (13 utterances).

The content of the participants’ reflection changed from cycle 1 to cycle 3. The scopes of teachers’ reflection became broader. During the first lesson study cycle, the participating teachers and headmaster discussed about seven issues only. Meanwhile, in the second lesson study cycles, the number of issues discussed by them dropped a bit to five issues. In the last lesson study cycle, the number of issues reflected by them increased to 11 issues. This might showed that the lesson study process made the teachers to reflect at the wider angle.

Table 4. The Content of Participants’ Reflection in the Three Reflection Sessions.

Content of Reflection	Lesson Study Cycles			Total
	LS1	LS2	LS3	
<b>teacher and teaching</b>				
(i) achievement of learning objectives	5	-	1	6
(ii) content of lesson	-	-	10	10
(iii) provide more examples	-	-	1	1
(iv) instruction given	-	2	3	5
(v) language mistakes	2	-	-	2
(vi) lesson plan	-	2	-	2
(vii) questioning techniques	3	-	3	6
(viii) several approaches	5	-	-	5
(ix) talking styles	2	-	-	2
(x) teaching materials	3	1	3	7
(xi) time management	4	7	6	17
<b>students and learning</b>				
(i) students' personality	-	-	11	11
(ii) hands-on activity	-	-	3	3
(iii) involvement or engagement of students	-	-	4	4
(iv) moral values	-	-	3	3
(v) students' actions	-	-	8	8
<b>Other</b>				
(i) cooperation among the teachers	-	-	2	2
(ii) not related to lesson	-	11	-	11

In addition, the focus of teachers’ reflection also changed from the first cycle to the third cycle. In the first two cycles, the participants never reflected on the “students and learning”. But, in the third lesson study cycle, there were five issues related to students and learning appeared in the reflection session.

Overall, the aspects related to “content of lesson”, “time management” and “students’ personalities” were the most comments issues reflected by the teachers during the reflection sessions.

## 4 CONCLUSIONS

This paper discussed the reflection of a lesson study group when they engaged in the lesson study process. Preliminary analysis of data collected showed that teachers' involvement increased from first to the third reflection sessions. On the other hand, the articulation of researchers in the reflection sessions dropped from first to the last reflection sessions. Teachers tended to articulate more when they were reflecting on the research lesson they taught if compared with that of other teachers. Teacher and teaching was the popular theme in the reflection sessions. The participating teachers and headmaster did not talk about students and learning in the first two reflection sessions. They started to reflect on aspects related to students and learning only in the third reflection session. This might show that the reflection sessions in the lesson study process changed the teachers to focus on students and learning when they were reflecting.

## 5 ACKNOWLEDGEMENTS

This project was made possible with funding from the Research University Grant of Universiti Sains Malaysia, Penang, Malaysia. The authors would like to thank the principal, the mathematics teachers and their pupils of the participating school.

## The relationship between ‘Lesson Study’ and Novice Teachers Professionalism: A case study of a mentoring program in secondary education in Indonesia

Siti Nurul Hidayah

*School of Education, Faculty of Social Science, University of Wollongong, New South Wales, Australia  
snh184@uowmail.edu.au & gazeboclub@yahoo.com*

**Abstract:** In Indonesia, little attention has been paid to the benefits of mentoring for novice teachers’ professional development. Mentoring seems to be conceptualized and identified differently from western contexts. The Indonesian government has launched mentoring programs in the form of professional development programs, such as Lesson Study and Piloting Activity. The lesson study program has been identified as a part of clinical supervision models of mentoring. The studies on the ‘mentoring’ programs in Indonesia show that the programs provide positive impacts on teachers’ instruction, but are perceived by in-service teachers as time-consuming program. Other studies provide evidence that the lesson study programs have provided valuable effects on the teachers’ professionalism and has many benefits for better teaching refection with some shortcomings, such as: cultural barriers and teachers’ low awareness of the schemes. Nevertheless, such programs are likely to provide the same types of support for both in-service teachers and novice teachers as they participate in the same mentoring programs. Consequently, novice teachers may struggle in their first teaching phase. Mentoring programs for novice teachers in Indonesia are not sufficiently empirically studied. The aim of this study is to explore specific aspects that are effective when using ‘Lesson Study’ in the mentoring program to develop novice teachers’ professional development in “Sekolah Permata Hati” (a secondary school) in Indonesia. This is necessary since a mentoring program can be proposed to enhance the existing training programs offered in the novice teachers’ professional development programs. The preliminary report finding shows that a ‘lesson study’ program that has been embedded within a mentoring program seems to have positive impacts on novice teachers’ professionalism with some limitations. Most teachers stated that a successful ‘lesson study’ will be difficult to be achieved without mentoring support due to the problems of preparation and planning, reflective practices and program sustainability. Therefore, it is necessary to strengthen new teachers’ professionalism using mentoring strategies in their early phase of teaching.

**Keywords:** lesson study, mentoring program, mentor, and mentee.

## 1 INTRODUCTION

### 1.1 Background of the study

Studies launched in many countries on the issue of impact of teacher training and that of teacher knowledge and preparation indicated that mentoring creates a distinction in teaching effectiveness (Wong and Wong, 2008; Koballa, et al., 2008; Kutcy and Schulz, 2006). A well-organized mentoring program may stimulate beginning teachers’ enthusiasm to develop their teaching competences. This program seems to be more than senior-junior teachers’ affiliation; it is a sharing knowledge in a collaborative teamwork. Both parties attain improved teaching skills and expertise in a dynamic mentoring process. As argued by Wang, et al. (2008), teacher learning and the on-going development is regarded as a life-long enterprise. The mentors can exchange and refresh their knowledge by working together with their junior colleagues; while new teachers will be

more prepared to face the real teaching situation that may make them frustrated and feel isolated in new environment. To prepare new teachers’ readiness in teaching, it is suggested that teacher education must be designed to support the development of teachers’ adaptive expertise in efficiency and innovation (Johnson, 2009; Jonson, 2008; Wang, et al., 2008).

Many researches have interrelated quality education with quality teachers and teaching (Dinham, 2008; Koballa, et al, 2008; Achinstein, et al, 2004). For teachers to take a part of advancing student improvement and outcomes, it is critical for them to increase themselves pedagogically through proper training and continuing professional development. An untrained teacher is likely to teach in the way he or she was taught at the training college when a powerful teacher education process such as mentoring was not available or recognized as important opportunity to transform teaching across generations (Darling-Hammond, 2003). It is obvious that under-qualified teachers could damage or limit quality teaching and learning.

Typical teacher education programs tend to spend too much time on acquainting trainee teachers with strategies for teaching basics (Strain, 2003) that are often out of touch with the ‘real’ teaching in the schools (Kutcy and Schulz, 2006) and sometimes conflict with the local culture of learning (Peacock, 2009; Hu, 2002 cited in Dogoncay-Aktuna, 2005). Teacher education has a tendency to present more teaching and learning theories and ignores the practical experience on dealing to actual teaching atmosphere, such as how to overcome students’ misbehavior in the classroom, to adapt teaching syllabus to local cultural context and to work with other teachers collaboratively to improve students’ achievement. This situation may cause new teachers to work in isolation (Wang, 2008) and feel frustration (Hobbs and Kubanyiova, 2008). Such frustrations could lead to teachers’ attrition (Wang, et al., 2008). Therefore, it is argued that mentoring could play a big role in decreasing further damage to teaching.

The Indonesian government has been focused on the upgrading of teachers’ quality and abilities through mentoring. The prominence of mentoring has been accepted in Indonesian laws: The law mandate No. 14/ 2009 about *widyaswara* refers to senior teachers’ responsibility to mentor their juniors; and Law No. 74 / 2008 refers to mentoring from senior to junior lecturers in universities (Departement Pendidikan Nasional Direktorat Jenderal Pendidikan Tinggi, 2010). Mentoring is an essential task for all qualified government teachers. However, these programs particularly provide support to particular government teachers, less concern on private teachers. At present, there has been little discussion about specific mentoring programs for novice teachers in Indonesia.

In Indonesia there are many different types of professional development programs in place for teachers. Based on Law No. 14/ 2005, the government provides a teacher certification program (MONE, 2008) as a strategy for teacher quality improvement (Jalal et al., 2009). Indonesian government promote this program to motivate the teachers improving their teaching qualities that may impact on greater students achievement. Nevertheless, this certification program has many issues including the widespread use of forged certificates in teachers’ portfolios (Sugiharto, 2009); poor validity and reliability of teachers’ competence assessment (Maulia, 2008); faulty certification processes due to bribery issues and a lack transparency of assessment (Sulistiyo, 2009, cited in Jakarta Post, 2009). In addition, studies indicate that although the certification program helps teachers to gain promotions, it does not improve student achievement (Fahmi et al., 2011). The teacher certification program that is aimed to develop teachers’ professionalism would appear to be a

failure. The program supports higher salaries, but with less impacts on teachers’ competencies. These teacher certification issues have thus turned into a significant problem in Indonesia.

For these reasons, novice teachers require opportunities to participate in professional communities, which can provide effective and meaningful mentoring and support, to assist their assimilation in their early career phase. Additionally, timely mentoring advice may lead to teacher qualification upgrading.

## 1.2 Research Problem

A number of studies in undertaken in western countries indicate that mentoring programs assist novice teachers to enhance their professional teaching growth (Peeler & Jane, 2005; Richardson et al., 2007; Youngs, 2007). However, in Indonesia, few studies illustrate the benefits of mentoring for novice teachers. In Indonesia, mentoring appears to be conceptualized and identified differently from western contexts. In the Indonesian context, mentoring programs are considered to be in-service training programs and professional development programs.

The Indonesian government has launched mentoring programs in the form of professional development programs, such as Lesson Study and Piloting Activity. These programs are generally undertaken through joint lesson planning, observation and reflection in university-schools partnership (Suratno, 2012; Suratno & Iskandar, 2010). The lesson study program has been identified as a part of clinical supervision models (Acheson & Gall 2011). Although the ‘mentoring’ programs are widely implemented in the schools, the programs appear to overlook the importance value of mentoring for novice teachers.

## 1.3 Purpose Statement

Mentoring programs for novice teachers in the schools in Indonesia are not sufficiently empirically studied. It is an important area since it impacts on novice teachers’ professional development. The present study will gather information regarding a specific case of a mentoring program in a secondary school in Indonesia. The aim of this study is to explore specific aspects that are effective when using ‘Lesson Study’ in the mentoring program to develop novice teachers’ professional development in “Sekolah Permata Hati” (a secondary school) in Indonesia. This is necessary since a mentoring program can be proposed to enhance the existing training programs offered in the novice teachers’ professional development programs.

Additionally, the study investigates this mentoring program to gather extensive data from the participants identifying the strengths and weaknesses of the model to develop novice teachers' professionalism. The findings of the study will be beneficial in providing recommendations in developing better school-based mentoring in Indonesia in the future.

## 1.4 Research Questions

Main Question:

What aspects are effective when using 'Lesson Study' in the mentoring program?

Sub Questions:

- What are the strengths and weaknesses of this model to develop novice teachers' professionalism?

## 1.5 Significance of Study

The findings of this school-based mentoring program will be used as a foundation to plan more effective mentoring programs in secondary education and other educational sectors. In the wider context, the results of the research will provide advice to relevant authorities, such as the Indonesian government, educational stakeholders, school leaders and teachers to design more effective policies and practices of mentoring that will improve teachers' professionalism. Also, successful mentoring activities may contribute to the development of novice teacher mentoring literature in Indonesia and other similar contexts.

## 2 LITERATURE REVIEW

As mentoring novice teachers is the main theme of the literature, the discussion will be presented in the following interconnecting sections: concept of mentoring for novice teachers and mentoring concept for novice teachers in Indonesia.

### 2.1 Concept of Mentoring for novice teachers

Mentoring is defined as “a process whereby someone with more experience and expertise provides support, counselling and advice to a less experienced colleague” (New South Wales Department of Education and Training (NSW DET, 2001, p. 2). Another perspective identifies mentoring as “a process whereby an experienced and knowledgeable colleague facilitates the socialization and

professional development of another” (Bhindi, 2003, p. 4). Mentoring offers support, counselling, advice and facilitation from senior colleague to their junior one in their early phase of teaching to develop their professionalism.

Traditional models of mentoring include the master-novice apprentice model where a master teacher is assigned to a novice for her or his initial year in the profession (Blair, 2008). Here, the master teacher functions as a mediator to mediate the teaching skill of his /her novice teacher. Vygotsky (1978) identified this as semiotic mediation. Following Vygotsky (1978, 1981), the process of mentoring can widen what he called the Zone of Proximate Development (ZPD). He believed that the development of higher mental function appears twice, or on two planes. First it appears on the social plane and then on the psychological plane. This means that “the interaction between the master and the student in the mentoring process will help the later in developing his/her skill as an individual” (Vygotsky, 1981 p. 161). The interaction between senior teachers and their new teachers in a dynamic mentoring conversation creates a productive mental set of learning that leads to enhanced teaching aptitudes.

Cohen argued that mentoring is “a behavioural activity which refers to a one-to-one relationship that evolves through reasonably distinct phases between the mentor and the adult learners” (1995, p.61). The relationship between mentor teachers and their mentees is more personal as they work as a close partner. Citing from ANTA, Bond (1999, p.6) argued that mentoring is “a deliberate pairing of a more skilled or experienced person with a lesser skilled or experience one, with the agreed upon goal of having the lesser skilled persons grow and develop specific competencies”. This definition is not restricted because words such as “teaching”, “coaching”, “advising”, “training,” “directing” and “protecting” are substitutes for the word “mentoring”. Furthermore, Bond (1999) claimed that in a mentoring process, mentors engage in productive activities with the mentees in equal amount of interest. On the basis of these definitions, it can be concluded that mentoring is a process of knowledge and skills transference from the experienced to less experienced one to their professionalism.

### 2.2 Mentoring for Novice Teachers: Indonesian Experience

In Indonesia, little attention has been paid to the benefits of mentoring for novice teachers. Research databases do not yield many scholarly studies on the topic of mentoring in Indonesia. Mentoring seems to be conceptualized and identified differently in

Indonesia. In the following section, it will discuss some forms of mentoring that has been applied in the school setting in Indonesia.

### 2.2.1 In-service Training and Teacher Education Framework

Some scholars have found certain impact of mentoring for teachers in Indonesia. To start with, a study of the *Permantapan Kerja Guru* (PKG) -a Teacher Training Program (TTP)-approach to in-service teacher development in Indonesia for science teachers showed that the project was a motivated undertaking (Treagust, 2003). This program established a widespread network of teacher-trainers in Indonesia to strengthen teachers' professionalism. As the first national teacher training, this program can be categorized as a leading professional development program in Indonesia.

In addition, there was a relevant study of teacher training in Indonesian secondary schools by Thair and Treagust (1999). They claimed that in upgrading teacher qualification across the Indonesian archipelago, the result of PKG was impressive. They asserted that the implementation and practice of PKG in Indonesia reflected similar practices in industrialised countries, but with some contextual barriers, such as: less support from government to adapt the curriculum, time constraints for teachers and less availability and maintenance of laboratory equipment in schools (ibid, 1999). However, this pioneer program has provided a significant contribution to encourage other growing teacher professional development programs now.

This program was later developed as *Musyawah Guru Mata Pelajaran* (MGMP) (defined as Subject Teachers' Self-learning Association/teachers forum) (Saito, et al., 2007). MGMP activities tend to be conducted in the central cities of districts and are attended by representative members from various schools and regions as clinical, school-based activities. These activities are necessary to focus on a solid grounding in subject contents and to improve teachers' confidence, supported by shorter programs in classroom methodology and ongoing support through strengthened subject matter teacher forums (TACR, 2006). Nonetheless, although all studies above could be categorized as a good model of the mentoring practice in Indonesia, there were less empirical data on the effectiveness of these practices for teachers' quality and students' outcome improvement. Moreover, the program seems to ignore the potency of new teachers to advance their teaching competences.

There are studies on in-service training that resembled 'mentoring' practices. For instance, the in-

service training where the partnership between schools and universities in in-service training was aimed to improve science and mathematics education for both targeted secondary schools in Indonesia (Saito, et al., 2007). They suggested that teachers collaborate to improve teaching curriculum through joint lesson planning, observation, and reflection, called *Piloting Activities* (PA). The findings of the study showed that faculty members and teachers were generally more participative and the program has developed the collegiality within schools and between faculty members and teachers. This situation seems to be a collaborative teamwork as practised in mentoring. However, PA is perceived as time-consuming approach. Both teachers and faculty members complained about the tension of covering the entire curriculum while also pursuing the targeted experimental activities.

### 2.2.2 'Lesson Study' Mentoring Framework

The resembled 'mentoring' practice appears on a study of 'Lesson Study'. The program is generally undertaken through teachers' collaborative lesson planning, observation and reflection in university-schools partnership (Suratno, 2012; Suratno & Iskandar, 2010), has been categorized as a part of clinical supervision models (Acheson & Gall 2011). The clinical supervision model reinforces systemic observation of the mentees' behaviour and teaching methodology as the most important data collection approach to improve instructional strategies.

Despite its positive impacts on teachers' professionalism, the programs have a number of problems in practice. Marsigit (2007) argues that the programs provide positive impacts on teachers' instruction, but unfortunately they are perceived as time-consuming. Another study states the programs improve teachers' professionalism (Anggara & Chotimah, 2012) and encourage teacher reflection on their classroom practice (Suratno & Iskandar, 2010). However, problems in the program implementation, such as cultural barriers and teachers' low awareness of the schemes (Suratno & Iskandar, 2010) are identified. Overall, although 'similar' mentoring programs are considered to be very important, such programs are likely to provide the same types of support for both in-service teachers and novice teachers as they participate in the same mentoring programs. Since novice teachers need different teaching support from in-service teachers, they may struggle in their first teaching phase.

### 3 RESEARCH METHODOLOGY

#### 3.1 Research Approach

This study employs a qualitative, case study approach. The study focuses on a single mentoring case in a secondary school in Indonesia. The case study is an appropriate approach to adopt in order to address a case in a “bounded system” (Hesse-Biber & Leavy, 2011) restricted by time and place (Creswell, 2013). The focus of the study is bounded by one mentoring case in an Indonesian cultural context. Furthermore, the case study is the most flexible method to adapt and to probe mentoring programs as an emergent theory (Hartley, 2004). Using the design, the researcher will be able to provide in-depth understanding of a school-based mentoring program in the participants’ events in their real life.

#### 3.2 Research Site

In this study, the research site is “Permata Hati” secondary school, which has adopted a school-based mentoring for novice teachers. This site is located in East Java. The school is managed by one of the Islamic boarding schools in Indonesia and has 166 teachers and 1440 students. The selection of the school is justified for the following reasons. Firstly, the school has regular school-based ‘mentoring’ activities and the school has implemented ‘lesson study’ programs, which have been categorized as a ‘clinical supervision-mentoring model’ (Acheson & Gall, 2011) as part of the regular professional development programs. Secondly, the school has a clear agenda and policy of ‘mentoring’ and the program is mandatory for all teachers in the school.

#### 3.3 Research Participants

The research involved in total seven mentors and seven mentees in a ‘Permata Hati’ secondary school in Indonesia. In this study, all data collected are treated in a highly confidential manner and the participants and sites’ anonymity will be protected by using pseudonyms.

#### 3.4 Data Collection Procedure

As stated by Yin (2003), the strength of case study data collection is the opportunity to use many different sources of evidence to address problems of establishing construct validity and reliability of the case study evidence. The aim is to compare the perspectives of participants using multiple sources. These different sources are necessary to corroborate the same facts or phenomenon as a process of

triangulation (Yin, 2003). In this study, data collection procedures include individual interviews, focus group interviews, and document reviews. Conversely, this work-in-progress paper will only discuss the analysis from a single interview data.

### 4 TENTATIVE FINDINGS

In this work-in-progress report, a small component of the study will be outlined. The tentative findings of ‘Lesson Study’ framework from single interview are the main focus of the discussion.

#### 4.1 ‘Lesson Study’ (LS) Framework

In the research site, it seems the lesson study pattern develops from classroom observation model, which is called as ‘open class/ open lesson’ model, into a form of more structured teachers professional development, ‘lesson study’ with mentoring support.

From the data analysis of a single interview, the participants tend to compare the pattern of two LSs they had practiced in their school. To differentiate both framework, two different terms are used in this study. The overview of both school-based LS framework is shown in the following diagram.

Diagram 1. Two concepts of LS in the research site.

The first LS is called Open Class Framework (OCF). In this program, the teachers practiced LS framework using format Plan-Do-See cycle without mentoring supports. In ‘Plan’ phase, the senior teachers, new teachers and LS team (a moderator and a coordinator) gathered in a classroom to discuss a specific lesson plan and design the teaching plans for the classroom observation. They appointed a model teacher to practice the teaching.

The teaching observation was in the ‘Do’ session. All teachers observed and noted the model teacher’s teaching practices from perspective of his/her students’ reaction and behaviour in the classroom. It was not allowed to comment on the teacher’s teaching behaviour in the practices.

After finishing the observation, the ‘See’ session was a significant part to reflect upon the teaching observation practice. In this phase, all teachers

discussed the practices, provided the comment and solutions for the teaching improvement. Then, the cycle started again until they can meet the best practices for the students' learning achievement.

The second framework is LS with mentoring support, which is called as 'Lesson Study Framework'. In the cycle of 'Plan-Do-See', some essential different concepts are shown in the diagram below.

Diagram 2. LS with mentoring support cycle.

In the phase of 'Plan' of LSF, all teachers had longer preparation than OCF. They met every week within ten weeks to discuss wide-ranged teaching topics, such as: preparation and plan of teaching, classroom management, professional development, teaching media and sources, collegial relationship and other teaching aspects. In the 'Do' phase, the teachers practiced three teaching observations, they are one mentor's teaching observation as a role model of teaching for the mentees and two mentee's teaching observation for the actual practices. Furthermore, in the 'See' phase, all teachers participated in reflection session where the mentees analysed their own observation using four reflective questions: What is the most satisfying aspects in your teaching practice; what aspects should be retained in your teaching practice; what aspects needs improving in your teaching practice; what aspects should be eliminated in your teaching practice. The mentees had more freedom to share their feelings about their teaching experience. In this case, their mentors only provided comments on their mentees' self-reflection and gave solutions for better teaching practices. The reflective session offers more dynamic conversation and more active experience sharing between mentors and mentees. In all sections, the novice teachers obtained a personal and professional support from their mentors to develop their professionalism.

## 4.2 LSF is more effective than OCF to enhance novice teachers' confidence in their teaching observation.

Teaching observation is an integral part of successful professional development programs of any newly qualified teachers (Luft and Cox, 2001). Observation of teacher behaviour and methodology is the most important data collection approach to improve teaching and learning strategies.

In this study, a small component of the study findings will be drawn. The first finding is about the effectiveness of LSF in preparing novice teachers' teaching observation practices. LSF seems to be better than OCF from three diverse factors:

### 4.2.1 Greater organisation in preparing and planning the LS observation.

LSF has greater organization in preparing and planning teaching observation using mentoring supports, collaborative learning and reflective discussion. For mentees, the preparation in the mentoring program helps them to be more ready facing the LS observation. As stated by Bu Risa:

"In my opinion, LSF was really effective. Getting supports from our mentor, I could prepare the observation better, I was more excited and more motivated to make observation preparations. Consequently, I was ready to show my best teaching performance in the observation".

Similarly, the mentor feels that the support will be important part in their mentee's teaching phase. As a mentor, Pak Faiz pointed out:

"LSF was more effective because the model teacher (mentee) would feel confident that he/she would show better teaching performance after receiving mentoring support about how to make the lesson plans, the learning steps, and teaching strategies and so on. Accordingly, he/she would trust their self-competences and feel more confident to carry out their teaching observation".

The mentoring supports from the mentors improve mentees' confidence in performing their teaching in LS observation. Using LSF, mentor can observe novice teachers' behavior and methodology to improve their further teaching and learning strategies. Consistent with this finding, Gagen & Bowie (2005) stated that in a mentoring program, mentees are provided with professional and personal aid to enhance their teaching capacity and developing their confidence in their first teaching phase.

### 4.2.2 Manageable Observation Process

In practicing teaching observation, LSF tends to have more manageable observation process. The

observation practices seem to be easier to manage and the timetable does not disturb other teaching activities. As a senior teacher and mentor, Pak Faiz pointed out:

“The advantages of LSF, the timetable was organized well, not much interfering the teachers’ teaching activities. It was different with OCF. It was problematic as almost all teachers were getting involved in the teaching observation, then they should leave their teaching activities. The learning activities stopped and the students did not get any benefits from the teaching activities”.

In another affirmative point, by using LSF, there will be more sustainable program for the teachers’ professional development. Pak Irsyad affirmed:

“I think LSF was more effective than OCF as in OCF, the teachers practiced teaching observation, got reflection and there was no further activities due to difficult time management. Conversely, the LSF had more structured schedule and the mentoring support in LSF had the nature of guiding, it was like the older people guided a child and then released him when he was independent”.

Time management is one of the biggest issues to improve novice teachers’ professionalism (Kirkby, 2009). However, the findings of the study show that in LSF seems to have a more structured timetable for practicing classroom observation. Moreover, allocating time within the teachers’ teaching workload, mentors still can guide their mentees and discuss the deeper mentoring issues through formal and informal meetings in supportive relationship. Consequently, the manageable schedule can provide more opportunities to new teachers to prepare and strengthen their teaching skills and knowledge through many teaching practices.

### 4.2.3 Productive Reflective Practices

After practicing teaching observation, the teachers participate in a reflection session. This session aims to support observation practices, give analysis and obtain feedbacks on the mentors-mentees’ previous teaching performance. This activity is not only beneficial for refreshing and reinforcing the mentors’ teaching qualities, but also helpful for developing mentees’ teaching abilities. In the findings of the study, LSF shows more contented reflective practices for both mentors and mentees.

In LSF, mentors do not assess their mentees’ performance as the mentees should analyse their own teaching performance by answering four reflective questions. As a mentor who had participated in OCF before joining LSF, Pak Hafid compared two teaching observation models:

“Using the LSF model, the teachers being observed would feel less fear than using the OCF in the reflection session. In OCF, many observers often

gave negative assessments and commented on many students’ negative behaviour from the observation practice. On the contrary, the reflection phase in LSF, the mentor and mentee gathered, the mentees answered the four reflective questions and analysed her/his own teaching practices, then I only gave her feedbacks for her teaching improvement”.

Additional affirmative experience felt by a mentee. By doing reflection in LSF, the mentee has better self-awareness. Bu Nisa shared her positive feelings:

“When I received feedbacks from my mentor, I felt happy because I was able to know my strengths and weaknesses in my teaching. I also did not feel hurt when knowing my shortcomings because I think that the feedbacks could enhance my understanding, knowledge and expertise in the field of teaching and learning”.

The productive reflective practices within LSF may enhance new teachers’ teaching expertise. The purpose of doing self-reflection is to learn from experiences and create solutions for difficulties faced by the mentor (Nevzat, et al., 2010). By getting feedbacks from their colleagues, novice teachers can identify their teaching strengths and weaknesses and find solutions for better teaching performance.

## 4.3 OCF practices have many limitations

Previously, the teachers have practiced OCF in their school. On the contrary of LSF, the format of the observation in OCF lacks of organized preparation and planning, manageable observation process and dynamic reflective practices. The findings about the OCF limitations will be drawn in the next section.

### 4.3.1 Less preparation and planning in OCF

Poor preparation and planning of observation can lessen teacher model’s confidence in the teaching observation practice. As a mentor who became a model teacher, Pak Faiz affirmed:

“In OCF, all teachers in open lesson team decided to the lesson plans design, but not entirely the teaching procedures and instructions were determined together. One year ago, I was becoming a model teacher, and my team just handed over responsibility completely to me. I was not sure whether my design of lesson plans was 100% true or false. And then, the observers revealed my mistakes within the reflection session, my design was still wrong”.

Handing over all responsibility of observation preparation and plans to the appointed model teacher creates more burden to the teacher and may lessen the teacher’s confidence in their teaching performance. Furthermore, an unstructured

preparation and less support from the mentor can hinder the mentee’s learning improvement. Bu Zakia, a mentee who had practiced both LSF and OCF said:

“When I practiced observation in OCF, I obtained many difficulties to prepare and plan the teaching observation, there was no clear overview of the observation, and the preparation was not structured well, not as good as in LSF. I was so confused and did not know what I should do and there was no further guidance. Besides, there was less positive feedback given in the reflection session”.

When the model teacher is not ready and feel heavy burden in their teaching observation preparation, their observation practices will not be success. Moreover if the observers do not provide positive feedbacks, the teacher may feel isolated and less valued. Consequently, this condition can impede his/her teaching professionalism. Additionally, in many observation cycles involving novice teacher, the mentor (team)’s mind thinking, behaviours, and beliefs are often not shared or understood by the mentee. So, the mentee (model teacher) may not feel comfortable or feel that they are being spied (Lerch, 1980). When a negative perception develops, the model teacher may not perform their natural teaching practices. They would not act in a natural way. So that the observation data gathered may not reflect the authentic teaching practices. Therefore, there will be less opportunities to find appropriate solution for the model teacher’s enhanced teaching performance.

### 4.3.2 The reflective practices lead to many negative feelings

It is indicated that reflective practices in OCF create many negative feelings for the teachers. For the mentee, reflection model in OCF indirectly forms apprehension feelings. As a novice teacher, Pak Irsyad pointed out his feelings:

“For new teacher as like me, when my teaching performance was observed by many colleagues, I think I would feel very uncomfortable due to many painful comments”.

Therefore, these negative feelings can inhibit novice teachers’ professional growth, as affirmed by Bu Ratri:

“Based on my own experience as a model teacher in OCF, I felt scared and anxious being observed or judged by my colleagues. Actually, the rules of OCF emphasized that the observers would not observe the teacher model’s teaching behaviour, they could only observe the behaviour of students in teaching practices. However, such statements were actually just to increase teacher model’s confidence in OCF practices. In fact, although the teacher models could not be blamed, but it would be turned

against the model teacher. This happened because the ‘open’ discussion culture was still lacking here, the observers were not polite to criticize directly to the model teacher, so his/her students were criticized.”

In the problem solving and feedback phase, there are possibilities for personality conflicts (Lerch, 1980) due to misunderstanding of reflective analysis (Acheson and Gall, 2011) and negative evaluation or criticism (Reilkoff, 1981). Moreover, cultural barriers can obstruct a collaborative teamwork and communicative conversation. In Indonesia, open dialogue may not be truthfully achieved. As a recognized shared culture, Javanese influences many educational practices in Indonesia. In Javanese culture, “the open expression of feelings is considered of extremely bad taste” (Magnis-Suseno, 1997, p. 45). There has not been a willingness to share ideas honestly and openly. This is caused by a strong embedded Javanese principles: principle of conflict avoidance, the principle of respect and the ethics of social harmony (Magnis-Suseno, 1997). As a result, these cultural problems may inhibit the teachers’ reflective thinking improvement that influence to inadequate teaching practices.

### 4.3.3 Unsustainable program of OCF.

OCF also has time management problems due to many teachers’ involvement in the observation, as stated by Bu Ratri:

“The weakness of observation session in OCF was difficult time management. When doing observation, many teachers, might be more than 10 people, got involved in the teaching observation and they should leave their teaching jobs in the classroom. So, it meant that the teachers had to overlook their main job to educate the children in the classroom”.

In the same situation, Bu Sita pointed out the same opinion about time management problems:

“Just by doing a one-time practice of teaching observation in OCF for a group of science teacher, totalling eleven people left their teaching duties, the teachers should ignore their students’ learning needs. Moreover, there was no sustainable program of OCF due to difficult time management. I think LSF was more effective because I only engaged with one teacher in the practices and I could make an appointment with my mentee in my free teaching timetable without leaving teaching jobs. The timetable was also flexible and personally much easier to set up the preparation and so on”.

OCF as a part of clinical supervision model is considered as a time-consuming model (Acheson and Gall, 2011). In OCF, the observation phase should be repeated frequently to achieve the best practices. In this case, gathering many teachers and repeating many observations within heavy teaching workload

seem to be a demanding task. In summary, OCF cycles is considered as an inefficient process to change the teachers' behaviour and methodology.

## 5 INITIAL CONCLUSIONS

From the tentative findings of the research, it is identified three top initial conclusions. Firstly, LSF may be a more efficient way of improving new teacher professionalism in the beginning phase of teaching life. Secondly, factors that enhance novice teachers' professionalism using LSF are greater organisation in preparing and planning the LSF, manageable observation processes, and productive reflective practices that lead to mentees' confidence and self-awareness in their teaching performance. Finally, a successful OCF will be difficult to achieve due to the problems of teaching observation preparation and planning, reflective practices and program sustainability.

## 6 ACKNOWLEDGEMENTS

I would like to express my special appreciation and thanks to my supervisors: Dr. Noelene Weatherby-Fell and Dr. Narottam Bhindi who have supported me in many ways and have become incredible mentors for me. I would like to thank you for encouraging my study and for allowing me to grow as a research student. Your advice and your on-going assistances on my study have been priceless.

## Sustainability of Lesson Study in Basecamp F SMPN1 Tomo Sumedang District

Sofwan Gozali, S.Pd., M.Pd<sup>1</sup>, Radi, S.Pd<sup>2</sup>, Yuliati, S.Pd<sup>3</sup>

<sup>1</sup>Guru Matematika SMPN 1 Jatigede Kab. Sumedang

<sup>2</sup>Guru Matematika SMPN 2 Ujungjaya Kabupaten Sumedang

<sup>3</sup>Guru Matematika SMPN 1 Buahdua Kab. Sumedang

**Abstract:** This paper tells the story of the lesson study math -based subjects Region F SMPN1 Tomo Sumedang that consist of nine Country junior high school and 2 MTs., that still exist since the beginning of 2006 till now 2014. Despite having the same problems with other parts Sumedang , as not followed by the principal, the F region is relatively more stable with the number of participants who always face , quality of plan , implementation and reflection that continues to increase. This group (MGMP Matematika Wilayah F) can also send a representative facilitator that most good LS to the district, provincial and national level. Unique things that exist in this group include: The existence of the former school principal who continues to be active as a participant LS MGMP, many teachers are kept abreast of developments through the facilitator LS District, Provincial and National, many teachers who wrote the LS experience by following the seminar ICLs in UPI Bandung, the presence of supervisors in each meeting, and others listed in the contents of this paper that led to the LS MGMPs region F to implement a sustainable manner. Hopefully, this paper can infiration of sustainability-based LS Driven MGMPs or other schools in the area.

**Keywords:** Lessson Study Sustainability

### 1 PENDAHULUAN

Cerita lama mengenai Musyawarah Guru Mata Pelajaran (MGMP) yang berjalan hanya melaksanakan program belaka atau berjalan apa adanya karena ada proyek belaka, sudah menjadi konsumsi umum dikalangan guru dan dunia pendidikan pada umumnya. Akibatnya, peningkatan mutu guru yang diharapkan dari program tersebut jauh dari harapan. Sedangkan biaya yang dikeluarkan dari sekolah tetap berjalan dan menjadi sis-sia belaka.

Namun tentu ada juga program MGMP yang berjalan dengan baik, dalam artian program tersebut dapat meningkatkan mutu guru-guru pesertanya, sehingga biaya yang dikeluarkan oleh sekolah dapat bermanfaat untuk meningkatkan mutu gurunya sehingga pembelajaran yang dilakukan oleh guru bersangkutan dapat lebih bermakna bagi peserta didik-peserta didiknya dan akhirnya, peserta didiklah sebagai pihak yang sangat diuntungkan karena pembelajarannya lebih bermakna bagi peserta didik sebagai tujuan utama dari pendidikan yaitu memberikan pembelajaran yang terbaik bagi peserta didik sehingga peserta didik memperoleh pengalaman belajar yang berguna baginya baik untuk masa sekarang maupun untuk masa yang akan datang. Salah satu program MGMP itu adalah Lesson study berbasis MGMP Matematika yang berada di Kabupaten Sumedang Wilayah F yang sekolah *Basecamp*nya SMPN 1 Tomo.

Pelaksanaan keberlanjutan Lesson Study di Kabupaten Sumedang sangat di dukung dan difasilitasi oleh Dinas Pendidikan Kabupaten Sumedang. Dalam pelaksanaannya semua sekolah menengah pertama di Kabupaten Sumedang yang berjumlah kurang lebih 137 SMP dan MTs. Negeri dan swasta, terbagi dalam 8 kelompok Basscamp, dimana masing masing basecam beranggotakan 10 sampai 15 sekolah, karena tidak semua sekolah aktif sebagai anggota MGMP atau rutin mengirimkan guru-gurunya pada mata pelajaran tertentu.

Lesson Study Berbasis MGMP adalah wahana berkumpulnya guru-guru mata pelajaran tertentu untuk berdiskusi dan sharing pendapat mengenai pembelajaran yang dilakukannya sehari-hari melalui pengkajian pembelajaran yang direncanakan dan dilaksanakan bersama-sama. Dari kajian pembelajaran tersebut guru-guru dapat mengambil hikmah dan pembelajaran sehingga dapat digunakan untuk meningkatkan pembelajarannya masing –masing di tempat kerjanya masing-masing, sebagi tugas pokoknya sehari-hari. Pelaksanaannya 7 kali pertemuan untuk tiap semester pada hari-hari MGMP, yaitu hari hari Senin Untuk Bahasa Indonesia, Hari Selasa Bahasa Inggris dan Bahasa Sunda, Rabu untuk Matematika. Kamis untuk PAI dan IPS dan hari Sabtu untu IPA. Sedeangkan Untuk MGMP Matematika dan IPA, jadwalnya telah ditentukan oleh Dinas Pendidikan Kabupaten Sumedang.

## 2 PEMBAHASAN

MGMP Matematika Wilayah F Basecamp SMPN 1 Tomo yang terdiri dari 11 sekolah yaitu SMPN 1 Tomo, SMPN 2 Tomo, MTs.N Tomo, SMPN 1 Jatigede, SMPN 3 Jatigede, SMPN 1 Ujung Jaya, SMPN 2 Ujungjaya, MTs.N Ujungjaya, SMPN 1 Conggeang, SMPN 2 Conggeang dan SMPN 1 Buahdua, sedangkan satu MTs. Suasta Assalam sudah tidak aktif lagi, telah berjalan selama 8 tahun sejak tahun 2006 sampai sekarang tahun 2014. Tiap tiap sekolah mengirimkan 2 sampai 3 guru matematikanya sehingga peserta yang aktif ada 22 peserta.

MGMP ini sejak tahun 2006 sampai sekarang dapat berjalan dengan baik yaitu selalu dihadiri oleh pesertanya dengan tingkat kehadiran yang tinggi yaitu 80 sampai 100%. Diskusinya berjalan dengan baik karena sebagian besar peserta selalu memberikan pendapatnya dalam diskusi sehingga perencanaan pembelajaran berjalan lancar dan refleksi lebih bermakna, dalam artian setiap diskusi selalu ada ilmu yang dibawa sebagai oleh-oleh untuk meningkatkan pembelajarannya di sekolah masing-masing. Diskusi membahas mengenai materi ajar matematika sehingga dapat menambah ilmu matematika bagi pesertanya dan membahas mengenai metode dan teknik mengajar sehingga menambah wawasan para guru mengenai teknik pembelajaran yang menarik bagi siswa di sekolahnya masing-masing.

Selain diskusi membahas materi matematika dan teknik mengajarnya, sering juga terjadi diskusi membahas hal-hal lain yang dianggap perlu oleh peserta seperti mengenai masalah siswa yang tidak mau mengerjakan PR, mengenai kebiasaan siswa menyontek, mengenai penilaian Kinerja Guru (PKG) dan Pengembangan Keprofesian Berkelanjutan (PKB), mengenai pembuatan rencana dan rancangan pembelajaran yang berbeda-beda dari para ahli, mengenai pengembangan silabus dan terakhir masalah Kurikulum 2013 yang sedang dibahas pada pertemuan-pertemuan sekarang ini. Serta mendiskusikan masalah-masalah yang sedang hangat pada waktunya. Mengenai kurikulum 2013, sekarang pun kami sedang membahas mengenai pembuatan RPP yang berubah karena Permen yang baru serta sedang membahas penilaian sikap spiritual dan social, sehingga diperoleh produk penilaian sikap hasil diskusi kami.

Sedangkan jika melihat MGMP MIPA yang lain di basecamp yang lain, yang sama-sama penjadwalannya difasilitasi oleh Dinas Pendidikan Kabupaten Sumedang, misalnya MGMP IPA di basecamp yang sama, atau di MGMP matematika

wilayah lain yang pernah penulis kunjungi, pesertanya makin lama makin sedikit, sering tidak melaksanakan kegiatan sesuai jadwal yang telah ditentukan, pernyataan bosan dari pesertanya dan lain sebagainya yang menjadikan kegiatan MGMPnya seolah tidak bermakna bagi pesertanya dan hanya berjalan karena adanya jadwal dari pihak dinas.

Makalah ini akan membahas mengenai Sustainability MGMP Lesson Study yang masih terus terjaga sejak tahun 2006 sampai sekarang di Wilayah F SMPN 1 Tomo sesuai dengan pengalaman penulis dan beberapa orang peserta yang telah menjadi fasilitator. Hal tersebut dapat terjadi karena beberapa alasan sebagai berikut:

1. Adanya fasilitator yang dapat memoderasi jalannya refleksi, sehingga refleksi tidak membosankan dan dapat melihat kejadian-kejadian yang menarik untuk didiskusikan dari keseluruhan pembelajaran, bukan hanya memfasilitasi peserta untuk berpendapat.

Moderator yang seperti ini harus dapat melihat keseluruhan pembelajaran dan mencermati kejadian-kejadian yang dialami siswa seperti kenapa ada siswa dari kelompok tertentu tidak konsentrasi pada pembelajaran. Apakah karena pembelajaran tidak dapat difahami oleh siswa atau ada hal-hal lain yang membuat siswa tersebut tidak konsentrasi.

Di MGMP yang lain kelihatannya moderator hanya memfasilitasi peserta untuk berpendapat tanpa memberikan masalah yang harus didiskusikan oleh peserta, karena moderator tersebut tidak mengikuti pembelajaran dengan baik atau tidak mencermati masalah-masalah pembelajaran yang nantinya akan menjadi bahan diskusi dan menarik untuk dicarikan solusinya. Hal tersebut mengakibatkan peserta hanya menyampaikan kejadian-kejadian dalam pembelajaran tanpa ada pembahasan masalah yang perlu diselesaikan yang merupakan masalah yang sering terjadi di sekolah manapun. Sehingga peserta tidak merasa ada oleh-oleh yang akan di bawa ke sekolahnya masing-masing sebagai bahan perbaikan bagi masalahnya di sekolahnya.

Refleksi yang seperti itu membuat peserta bosan karena setiap pertemuan hanya membahas hal-hal yang itu-itu juga. Jadi tidak dapat disalahkan apabila ada guru yang berpendapat bahwa Lesson Study itu tidak bermakna dan hanya begitu-begitu saja. Itulah pentingnya moderator dalam pengkajian pembelajaran. Jika tidak dapat memoderasi dengan baik dapat mengakibatkan Lesson Study tidak bermakna

sama sekali. Jadi jadi moderator adalah tugas yang mulia yang dapat menjadikan pembelajaran yang dikaji bersama dapat bermanfaat atau tidak bermanfaat bagi pesertanya.

2. Adanya beberapa kepala sekolah yang menjadi peserta MGMP karena kepala sekolah tersebut mengajar di sekolahnya dan merasa bahwa *sharing* pendapat dengan guru-guru dapat meningkatkan pembelajarannya kepada siswanya di sekolahnya masing-masing.

Tugas utama kepala sekolah adalah mengajar karena sesuai dengan Permen 28 tahun 2010 kepala sekolah adalah guru yang memperoleh tugas tambahan sebagai kepala sekolah. Jadi karena sebagai guru maka tugas utamanya adalah mengajar atau melaksanakan pembelajaran yang berupa perencanaan, pelaksanaan dan penilaian pembelajaran. Karena kepala-kepala sekolah yang berlatar belakang pendidikan matematika di wilayah F mengajar di sekolahnya masing-masing dan ikut aktif sebagai peserta MGMP matematika, sehingga membuat guru-guru baik dari sekolah yang kepala sekolahnya sebagai peserta atau dari sekolah lain menjadi termotivasi untuk tetap aktif sebagai peserta MGMP.

Di MGMP yang lain karena tidak ada kepala sekolah yang menjadi peserta MGMP, maka guru-guru tidak merasa risikan apabila pada suatu kesempatan tidak dapat menghadiri acara MGMP walaupun telah diberi uang transportasi dari sekolahnya masing-masing. Sehingga tidak memaksakan diri atau berusaha sekuat tenaga untuk menghadiri MGMP. Dan dapat dipastikan bahwa kepala sekolah yang tidak aktif dalam MGMPnya biasanya kepala sekolah yang tidak mengajar, dalam artian tidak melaksanakan tugas pokoknya sebagai guru.

Disinilah pentingnya peran kepala sekolah untuk keberlanjutan Lesson Study. Kepala sekolah yang ikut aktif dalam MGMP akan merasa tidak rugi mengongkosi guru-gurunya ke MGMP, karena memperoleh imbalan guru-guru yang kinerjanya lebih baik dibandingkan sebelum mengikuti MGMP. Bahkan seorang ahli Lesson Study dari Thailand yang pernah menjadi Nara Sumber dalam Seminar Lesson Study di UPI Bandung berpendapat bahwa tanpa kehadiran kepala sekolah dalam acara Lesson Study dapat membuat Lesson study menjadi sia-sia belaka.

3. Adapaun penyebab-penyebab yang lain yang menyebabkan terjaganya keberlangsungan Lesson Study di Base Camp Wilayah F SMPN

1 tomo Kabupaten Sumedang adalah merupakan efek logis dari kedua factor di atas yaitu karena adanya moderator yang baik dan adanya kepala sekolah yang mengajar disekolahnya dan merasa MGMP dapat meningkatkan kemampuannya dalam pembelajaran di sekolahnya.

Penyebab lain tersebut seperti keakraban guru dan kepala sekolah, sehingga kepala sekolah menjadi lebih mudah mempengaruhi guru melalui media diskusi dan *sharing* pendapat. Hal lain adalah terciptanya keakraban guru dengan pengawas, yang biasanya hubungan antar guru dan pengawas adalah hubungan supervisor dan orang yang disupervisi menjadi hubungan rekan senior dengan rekan junior, sehingga pergaulan lebih cair dan pengawas lebih memahami kondisi guru dan guru lebih memahami kondisi pengawas. Hal itu mengakibatkan guru merasa senang apabila ada pengawas dan pengawas lebih tertantang untuk memberikan ilmu yang terbaik bagi guru-gurunya dengan kesan tidak mengajarnya, sehingga guru lebih mudah menerima perubahan dan hal-hal baru yang diperoleh dari pengawas.

Di wilayah lain, bahkan di kabupaten lain yang telah penulis pernah kunjungi MGMPnya hubungan kepala sekolah-guru dan pengawas – guru masih hubungan yang bersifat atasan dan bawahan sehingga MGMPnya berjalan kaku yang mengakibatkan guru tidak betah berlama-lama jika ada kepala sekolah atau ada pengawas. Hal ini mengakibatkan acara MGMPpun tidak berjalan karena guru merasa membutuhkan bertambahnya ilmu tetapi karena adanya kepala sekolah atau pengawa, sehingga apabila tidak ada pengawasan dari kepala sekolah atau pengawas acara MGMP tidak berjalan sesuai dengan harapan dan tidak mengakibatkan guru merasa bertambah ilmunya karena acaranya berlangsung hambar kembali.

### 3 PENUTUP

Dari uraian singkat di atas dapat disimpulkan bahwa terjaganya keberlangsungan Lesson Study Berbasis MGMP di Wilayah F SMPN 1 Tomo Kabupaten Sumedang dikarenakan guru-gurunya sebagai peserta MGMP merasa bahwa aktif dalam MGMP itu besar sekali manfaatnya dan dapat terus menerus meningkatkan pembelajarannya untuk kepentingan peserta didiknya disekolahnya masing-masing tanpa ada henti-hentinya (berkelanjutan). Hasil kajian penulis hal itu disebabkan bermakananya kegiatan pengkajian pembelajaran melalui Lesson Study berbasis MGMP dan memperoleh solusi-solusi dari

masalah-maslah yang sering dihadapi di sekolahnya masing-masing.

Fenomena di MGMP *Lesson Study* Wilayah F SMPN 1 Tomo Kabupaten Sumedang yang tidak ditemukan di *Basecamp* wilayah lain Kabupaten Sumedang dan Kabupaten lainnya yang telah penulis kunjungi adalah moderator yang memahami *Lesson Study* dengan baik sehingga dapat memoderasi pengkajian pembelajaran secara optimal dan tidak membosankan serta kehadiran dan ikut aktifnya kepala sekolah sebagai peserta MGMP karena mengajar di sekolahnya masing-masing.

Besar harapan kami terjaganya keberlangsungan *Lesson Study* di wilayah kami dapat terus berlanjut dan bias menginspirasi wilayah-wilayah lain yang keberadaanya tidak optimal. Amin

## Journey of Writing a Reflective Journal

Sri Diana<sup>1</sup>

<sup>1</sup>Ministry of Industry, Academy of Industrial Engineering Makassar, Jl. Sunu No.220, Makassar, Indonesia  
sridiana12@gmail.com

**Abstract:** Journey of writing a reflective journal. Learning can be achieved if one can explore themselves and know how to face challenges associated with the learning task. The article aims to explore the internal and external factors associated with confusion and difficulties of writing a reflective journal. It starts with the exploration of myself as a learner when I have to start writing my own reflective journals. I am in the state of anxiety and confusion about what to write in my reflective journals. The article also shows some evidences resulted from interviewing two international students who have learning problems with a new challenging topic. The last, this article also discusses the possibilities and issues behind using a reflective journal as a powerful tool for professional learning.

**Keywords:** journey, reflective journal, confusion, anxiety, professional learning

### 1 INTRODUCTION

Do you have any difficulties in learning a new challenging topic? Yes, everybody does have difficulties in learning but just to some extent based on strategies, motivation, behaviours, and attitudes. In addition, learning can be achieved if one can explore themselves and know how to face challenges associated with the learning task. However, in some cases, learners do not really know their own strengths and weaknesses which contribute to success in learning. Similarly, for me as an international student, I am in a condition of not knowing what to do and how to cope with new tasks; especially the task of writing a reflective journal. Thus, the purposes of this student inquiry project include looking at internal and external factors associated with confusion in writing reflective journal, exploring self as a learner, providing some evidences resulted from interviewing two international students who have learning problems with a new challenging topic. Finally, explain why a reflective journal is a powerful tool in professional learning and how it can be used in my own work context.

### 2 DATA GATHERING AND INTERPRETATIONS

#### 2.1 My Concern over the Assignments

The first session went smoothly with a lot of discussion around the term learning and professional learning. Unfortunately, I did not share ideas much, for I did not know what to express. Furthermore, confusion with reflective journal came to my minds after my lecturer introduced assignment guidelines. Several reasons which led me to confusion are first they are new to me, for instance, I consider it as new

terms even I seem to get familiar with them. Next, I have not had any experience writing a reflective journal. As I had experienced, teachers and students in my country are not required to write learning or teaching journal to reflect what they have learnt or taught in the class. In other words, majority of them do not know about the reflective journal, its importance, and way to write it. Therefore, everything is new that is why I am in the state of anxiety and confusion, especially I am not so sure where and when I should begin to write the reflective journal. Another confusion is when I led a class discussion with other students and discussed both assignments (reflective journal and action research), in fact, most of my friends were not also really clear and they did have different opinions about writing a reflective journal, so there were mixture of views came to me. As a consequence, the more I listened and read, the more I got confused with the reflective journal. “... and discover that the more I look the more I see. But I do not know how to learn from what I see” (Field, 1951 cited in Moon, 2005). For example, one student said that we just wrote our past teaching experience into our reflective journal, whereas another student did differently. As a result, I didn’t know where I had to start writing my first journal. Hertzberg (2003) asserts confusion differs from misinterpretation or miscalculation, for if one miscalculates or misinforms, then one has ideas how to go about trying to fix it, whereas being confused means that one does not know how to go on until clarification occurs.

Not only do confusions block me from writing reflective journal but also other feelings affect me such as avoidance, anxiety, frustration, and no sense of moving forwards. For example, I leave it for a while at the time I am not exactly sure from where I should start and what should be included.

Sometimes, I feel relaxed and do not put much focus on writing because I think I still have much time to write it. As a result, it wastes my time and there is no progress in writing the journal.

Hence, if I still keep thinking negatively there will be no progress and I cannot move forwards, so the ways I react in order to solve the problems first exploring myself in order to see how I can do it. Significantly, I still have motivation to complete the task, for it now becomes a challenging task. In fact, I have searched, read articles as well as written some points, but the main issue is that I seem not to have self-confidence. So it means that I need significant scaffolding to move forwards. Fortunately, communicating through email and small group discussion with other classmates, it paves me a better way to go further in writing the reflective journal. It is a kind of collaborative learning, which helps learners to move forward, for instance, Kumar (1996) states that “collaborative learning presents an environment in which a student interacts with one or more collaborating peers to solve a given problem” (p.2). Accordingly, the anxiety and confusion has lessened after several discussions with other friends in the class. From this point, I see myself as a type of learner who sometimes needs encouragement and motivation from other people so that I am capable of doing it.

From my experiences above, I attempt to interview two international students who encounter similar problems. I intentionally select two international students from Cambodia and Indonesia in order to find out the feelings towards learning new topic, factors contributed to those feelings, and how they work it out. I provide only three questions and I will record and write some notes during the interview.

1. Have you ever had the following feelings when you learn a new topic?
  - a. Confusion
  - b. Anxiety
  - c. Frustration
  - d. No sense to move forward

*The first participant is a new student from Cambodia.. The result for the first question is the student was confused and anxious about the new topic she is studying now. Meanwhile, the second participant from Indonesia who is not a new student also has encountered similar issue. Surprisingly she said “yes, I have confusion, shocked,, anxiety, and no sense of moving forwards”.*

2. What factors contributed to those feelings?
  - a. Are they from internal factors? For example, do not put more effort to do it, do not focus on the topic, no interest, do not talk to other.

- b. Are they from external factors? For example, part of the requirement, fear of failing, no encouragement from teacher, unrelated educational background, new term or not familiar with the topic, teaching methods, no time to consult with the teacher, and a big class

*The responses from both students put more emphasis on external factors. For example, the second participant said, “talking about management...how to be a good manager, leadership skills and new terms that I have not known before”. “the feelings I feel confused and anxious cause ...mmm... result from teacher who.. and from myself. From teacher I mean that usually I ...my learning experience, we need guide a lot ...a lot of guides from teachers but when we lack of the guidance from teachers we just feel that what we are going to do? So we feel like we are in the space what should I do? Teacher tells nothing ...tells nothing... that mean that some kinds of the background does not suit to me. It is new that is why we feel confused.”, said the first participant. Therefore, the internal factors do not seem influence them much, for they said they have tried their best to understand the topic but it does not help them move on.*

3. How did you work it out?
  - a. Talking to your friends
  - b. Consulting with the teacher
  - c. Trying to find it out by yourself without other advices
  - d. Searching articles related to the new topic
  - e. Reading some books related to the new topic.

*Significantly, two of them have different steps in dealing with the problems. For example, the participant from Indonesia mentioned that she would search articles related to the new topic first, then she talked to other friends who enrolled in the topic before, and if she remained uncertain she would consult with teacher. On the contrary, the other one would ask in the class if she was not clear about something, after that she would read or search books and articles, and finally she would consult with the teacher not her friends because she was not comfortable to discuss with them.*

From those answers, I can assume that some international students may meet difficulties in learning a new topic. Particularly, those difficulties are mainly from external factors such as educational background, new experience, and unfamiliar with the topic. In this sense, Dorbrovolny (2003) agrees that learners will find the course difficult if they do not have prior or relevant experiences with the instructional content. Equally, students solve their learning difficulties differently according to what

works best for them. For example, some would choose to talk with their friends first rather than turning to the lecture, whereas another would go to the teacher directly.

Based on what I faced and responses from the interview, I can identify my strengths, weaknesses, behaviours, and learning strategies. First, the positive thing to get the reflective journal done is that I am still motivated to write it during the time of my crisis. For instance, I keep discussing and sharing what I should do even though I sometimes come up with unclear descriptions. I further try to find out the answer through reading books or searching some articles. What is more, I need to force myself to complete the task otherwise I will be in crisis because I have other assignments. So, I cannot wait and keep confused for long. Meanwhile, my weaknesses may come from my behaviors, learning strategies as well as educational background. Strictly speaking, I usually keep thinking negatively about myself by the time I cannot move forwards, in other words, I may not take it seriously and keep saying not knowing what to do.

Furthermore, it may derive from my educational background, for me and some other international students are not accustomed to Australian educational systems. Additionally, my educational system tends to teach students to be dependent learners, which they need more guidance from teachers so that they can achieve the learning task. Sometimes I believe that it is not possible to meet and talk with the teacher unless I have clear visions about what I am doing. It, thus, also comes from cultural factor in which students do not get used to ask for help from teachers in case they get stuck or expect a lot of assistance from teachers.

## 2.2 How Important is a Reflective Journal for Professional Learning

After getting released from confusion and difficulties in writing the reflective journal, I now see why a reflective journal becomes an important tool for my learning and teaching context. What I get from writing the reflective journal, first of all, I have reflected my past experience and linked with the present and future situation. As Cooper (1991 cited in Moon, 2005) asserted that “We literally write our own stories, simultaneously incorporating our own future as we reconstruct our past” (p.7). Strictly speaking, my past learning experiences usually came up with a lot of confusions and no sense of moving forward, which resulted in not knowing how to construct my learning strategies effectively, but now I am getting better in recognizing our characteristics towards learning.

Next, the journal can be used as a documentation of my personal learning or teaching journey, which it will reflect what the actual outcomes are. For instance, it allows me to see myself in struggling with learning experience overseas, especially dealing with learning a new topic, which I have no background about it. In addition, I have a chance to share and express concerns over educational systems between Australia and my country, Indonesia, specifically about professional development. Finally, another aspect of writing a reflective journal is that through experiences, difficulties, and discussions with friends and other enable me to have a clear vision to plan and take action for the present and the future.

## 2.3 Possibilities and Issues behind Using a Reflective Journal in the Work Context

Basically, a reflective journal can be considered as the most powerful tool in enhancing professional learning. Therefore, as a teacher it can be used to reflect learning and teaching context. I will be able to adopt or apply a new model for my own learning and teaching strategies as what I encountered experiences and difficulties in Australia. For instance, I am now writing a reflective journal to reflect my learning, so in the future I aim to apply it with my students in my own countries. According to Mezirow’s (1990 cited in Clarke, 2003) learning occurs through learning critical self-reflection as well as using prior knowledge to comprehend a new or revised understanding of that knowledge to direct a future action. In addition, because of its importance, it is possibly effective to introduce and promote my teachers to write a reflective journal in their daily work, in other words, I can be a model to implement change in the work context so that it will enhance a learning community. Stoll, Fink and Earl (2003) point out that the main factor in the development of learning community is opportunities for everyone to learn process and understand their learning experiences. By doing this, it contributes to a sense of sharing knowledge and vision so that everyone in the organization has opportunities to learn in order to accomplish school goal.

In contrast, there will be some difficulties in introducing a new concept of writing a reflective journal in my work context. To begin with, as I have mentioned above, the task of writing a reflective journal is extremely new for me as well as everyone else in my work context, so it will takes time to introduce a new concept in the workplace. Thus, it perhaps is applicable for personal use to have self-reflection on teaching or learning. Second, my work situations, there is a problem, which people in the organization do not really have sense of belonging

and share a common goal, and as a result they do not work cooperatively. Therefore, people may not see the importance of writing a reflective journal, in other words they think that there is no use to write it, for most of the time they are not open to have a learning community to improve its organization. Finally, from cultural perspective and the working conditions, people do not really want to support or implement change. For instance, from cultural perspective if one feels comfortable in one situation, they tend not to change because they see it is not beneficial for them. However, some people are ready for change, but they feel discouraged, for everyone in the organization does not show recognition.

Although it is not easy to facilitate changes in my work context, people cannot avoid them personally and professionally. Scott and Jaffe (1989 cited in Hall & Hord 2001) proposed four stages to changes as follow:

1. *denial*: as people focus on the past and the way things were, and deny the need or desirability for a change.
2. *resistance*: as individuals consider their position and how the change will affect them personally (fear and uncertainty are not common in this phase).
3. *exploration*: as people think futuristically about the possibilities a change can bring, but are uncertain about how think will work (another word for this phase is "chaos").
4. *commitment*: as people develop a clearer focus of the change and its goal, and devise a plan to reach them. (p. 192).

Thus, there is a hope to introduce writing a reflective journal in the future through looking at the stages of changes. At the beginning of change, people may deny to a new concept, but as time passes by I hope that they will adopt it. As my friend said I cannot change the whole system completely, so what I can do is start from myself first and then other later.

### 3 CONCLUSIONS

To sum up, it is true that there are some internal and external factors in learning a new topic. Those difficulties are mainly from external factors such as educational background, new experience, and unfamiliar topic. Through a reflective journal, I am able to reflect my past experience and link with the present and future action. Also, the journal can be used as a documentation of my personal learning or teaching journey, which reflects what the actual outcomes are. The last, writing a reflective journal enable me to have a clear vision to plan and take action for the present and the future.

### 4 ACKNOWLEDGEMENTS

We would like to thank you The World Association of Lesson Studies (WALS) and Indonesia University of Education for the Intenational conference and publication. Also thank you to those who have helped me to complete this student inquiry.

# Effort to Support The Preparation of Professional Biology Teacher Candidates Through Integration Between Microteaching and Basic Skills of Teaching Course

Suciati Sudarisman<sup>1</sup>

<sup>1</sup>*Biology Education Department, Faculty of Teacher Training and Education  
Sebelas Maret University. Surakarta. Indonesia.*

[suciati.sudarisman@yahoo.com](mailto:suciati.sudarisman@yahoo.com)

**Abstract:** The principles of micro-teaching were emphasized the simplification of learning and used of peers, making micro-teaching as an teaching practice activity have full of pretended and many weakness. This research was a qualitative descriptive study has involed 8 students of 6<sup>th</sup> semester on microteaching course and 35 students of 4<sup>th</sup> semester on basic skills of teaching course in Biology Education Program, Sebelas Maret University. Data collecting was used non-test technique by observation, interview, field notes, and documentation. Qualitative data were analyzed descriptively as percentages presented by diagram. The results showed: 1) Students' performance and students' motivation were increased; 2) this model have got positive responses from all subjects. Based on the results of this research concluded that the integration between microteaching and basic skills of teaching course can be conducted as an alternative solution to increased students' performance and students' motivation to support the preparation of professional biology teacher candidates.

**Keywords:** microteaching; basic skills of teaching course; professional biology teacher candidates.

## 1 INTRODUCTION

Globalization and the rapid of science and technology development, requires qualified human resources. Education is requested to produce a superior quality of learners so that they can survive productively in the face of opportunities and challenges of a globalized world. Education needs to be supported by professional teacher resources. Therefore, Faculty of Teacher Training and Education required to produce professional teacher candidates as stated in Law Teachers and Lecturers (2005). Curriculum of education institution needs to be developed so that relevant to global context.

Microteaching is one of the compulsory courses for teacher candidates in the Faculty of Teacher Training and Education, Sebelas Maret University. Microteaching is a prerequisite of material subject before teacher candidates conducting practical field experience (PPL) in real schools. By microteaching students teacher candidates are trained to teach basic skills of teaching practically simplified by using peer as the subject of teaching (student) which the number, time, teaching materials are limited. It's related with Mc. Laughlin & Moulton cit. Asril (2010) states that: "micro teaching is as performance training method designed to isolate the component part of teaching process, so that the trainee can master each component one by one in a simplified teaching situation". However microteaching practice exercise is a vehicle with a limited learning situation, but it is important for prospective teacher candidates, especially in gaining practical teaching experience.

The importance of the role of microteaching as one effort to improve the professionalism of teachers is also emphasized in the second sub-regional workshop on teacher education in Bangkok (1971) that through microteaching activities teacher candidates are expected to be ready taught in school (real class).

Teaching skills obtained in microteaching, determine the success of student teachers in implementing the program of field experience (PPL) at the school. Student teachers gain practical exercises that teach effectively in microteaching, have better preparedness. Results of interviews with school supervisors stated that teacher candidates are generally not 100% ready to teach in the real class, they mostly feel less confident. The results of interviews with teacher candidates showed that 85% they stated unconfident and they encountered many obstacles in teaching practice in the classroom (Suciati, 2012). The number of complaints of school supervisors related with teacher candidate competencies indicated that that debriefing practices through microteaching is not optimal. Integrating between microteaching course and basic skills of teaching course to create the learning situation more challenging. On the other hand, teacher candidates for basic skills of teaching course can learn a lot of things based on their observations of teacher model.

Table 1. Students’ Skills in Making Learning Instrument in Microteaching Course

Student (M)	Average Value of Student’s Skills in Making Learning Instrument			Average
	I	II	III	
M1	54	83	96	78
M2	67	88	92	82
M3	75	88	92	85
M4	79	96	100	92
M5	79	92	100	91
M6	71	92	96	87
M7	79	96	100	92
M8	79	96	100	92
Average	72	91	97	87

There are two aspects to be assessed in microteaching course namely: 1) skills of student teachers in create teaching preparation that include: syllabi, lesson plan, assessment tools, student worksheets, etc.; 2) skills in delivering learning that includes 8 aspects of basic skills of teaching by using the peer as a subject of teaching. While the basic skills of teaching courses, students besides assessed their skills in delivering the concepts by simulating the eight aspects of basic skills of teaching. Therefore, both of students will mutually beneficial symbiosis.

## 2 RESEARCH OBJECTIVES

This study aims to determine: 1) the impact of the integration of microteaching course with basic skills of teaching courses toward performance and motivation of teacher candidates; 2) to determine responses of teacher candidates on the implementation of integration courses between microteaching course and basic skills of teaching course.

## 3 RESEARCH METHOD

This study is a qualitative descriptive study involving 8 of sixth semester of students on microteaching courses and 35 students in the fourth semester of students on basic skills of teaching courses in Biology Education Department, Faculty of Teacher Training and Education, Sebelas Maret University. Collecting data using a non-test techniques through observation, interviews, field

notes, and documentation. Data were analyzed by descriptive qualitative and presented in percentages and graph.

## 4 RESULTS

The data of student’s skills in making learning instrument are presented in Table 1.

Figure 1. Enhanced Learning Skills Making Instrument

The data on Table 1 and Figure 1 showed on first assessment (I) the average value of student’s skills in making learning instrument is only reached 72, the second assessment increased to 91 and at the final assessment (III) on reaching the average value of 97. Assessment of students’ skills in making learning instrument includes six aspects: objectives / indicators, learning materials, learning procedures, teaching methods, evaluation (learning instrument), and reference source. This means that an increase in the value of the average skills of students’ teachers in making learning instrument before and after integration between basic skills of teaching course and microteaching course have enhanced. Judging from the average performance value of each teacher candidates, there are 3 students (M4, M7, M8) which has an average value of performance are very high (92). Instead at the end of the assessment (III) is the third student to obtain a perfect score (100). While at the end assessment, there are students’ achievement (M1) with average value is lowest (77). Despite the achievements of the average values in M1 showed the lowest, but the increase is very high, that is, from the first assessment to the second assessment increased by 29% and of the second assessment to the third assessment increased by 13%.

Data of students’ skills on teaching practice (performance) of each student on microteaching course are presented in Table 2 and Figure 2 below.

Table 2. Students' Skills in Teaching Practice in Microteaching Course

Student (M)	Average Value of Students' Performance						Average
	I	II	III	IV	V	VI	
M1	54	83	96	88	92	100	86
M2	67	88	83	92	96	96	87
M3	75	88	92	92	96	100	91
M4	79	96	100	96	96	100	95
M5	79	92	92	92	100	96	92
M6	71	92	92	96	100	100	92
M7	79	96	100	96	92	100	94
M8	79	96	100	100	96	96	95
Average	73	91	94	94	96	99	

Figure 2. Students' Skills on Teaching Practice in Microteaching Course

Data in Table 2 and Figure 2 showed that the results of the assessment of students' performance in teaching practice was increased. Students' performance assessment covers eight aspects of basic skills of teaching that include skills of: asking, making reinforcement, making the variation, explaining, opening and closing lessons, guiding of students' small group discussion, managing the classroom, and to enabling students to learn. Accomplishment average value of students' performance in microteaching (M1) showed the lowest (86). While the other students (M4, M7, M8) have increased since the third assessment. In general, the average value of students' achievement (performance) indicates that all students increased. Data on motivated students are presented in Table 3 and Figure 3

Table 3. Students' Motivation in Microteaching Course

Student (M)	Average Value of Students' Motivation in Microteaching Course			Average
	I	II	III	
M1	25	50	63	46
M2	50	63	88	67
M3	50	88	88	75
M4	63	100	100	88
M5	75	75	100	83

M7	67	83	100	83
M8	75	100	100	92
Average	57	78	89	

Figure 3. Students' Motivation in Microteaching Course

Based on the data in Table 3 and Figure 3 showed students' motivation in attending microteaching was increased. The lowest average on achievement is M1, while the highest average value of students' motivation reached by M8. However, with the integration between basic skills of teaching and microteaching courses in general students' motivation to be better than ever. Students' competences (skills in making learning instrument and performance) on microteaching courses are presented in Figure 4 below.

Figure 4. Students' Competence on Microteaching Course

Student responses in both subject to the application of the integration between basic skills of teaching on microteaching course presented in Table 4 below.

Table 4: Students' Responses Toward The Application of Integration Between Microteaching and Basic Skills of Teaching Courses

Course	Students' Response
Basic Skills Teaching	<ul style="list-style-type: none"> <li>✓ Useful, because obtaining a form of practical application of the basic skills of teaching theory</li> <li>✓ Getting an experiences to observe of model teacher in implementing aspects of the basic skills of teaching theory</li> <li>✓ As preparing to started in carrying forward microteaching</li> </ul>
Microteaching	<ul style="list-style-type: none"> <li>✓ Well, it can be as a self evaluation and reflection</li> <li>✓ Train to teach in front of peoples</li> <li>✓ More challenging for making preparation better</li> </ul>

## 5 DISCUSSION

In general, the results showed that the integration between basic skills of teaching and microteaching courses have positive impact on students' skills in making learning instrument and performance. This can be explained because sense of confidence in teaching can be fostered through practice performing in front of an audiences. The more often teacher candidates perform teaching in practice in front of students, it predicted making students become confident. This is relevant to the Suciati' research (2012), based on the results of interviews revealed that students experienced the peak feeling less confident when you are beginning to teach real

classes at school when implementing field experience program. As it is known that characteristics of microteaching is emphasizing mastery of aspects of basic skills of teaching by setting specific and limited (micro). The use of peer as a student in microteaching tends to be less able to create the challenging learning situations. Interaction between teacher and student learning be created in less than optimal, because it have woken psychological forces as fellow students. In addition, teaching and discussion of learning material between a teacher and students, become less challenging, because almost all questions can be answered by the students as a peer. Teaching by other observers (basic skills of teaching course) in the activities of the microteaching is expected to create new situations that are challenging for the teacher models. At least the teacher models will be challenged to better prepare themselves both materially and appearance. In the basic skills of teaching, teacher candidate are required 8 aspects of teaching both theoretically and practically. While, on microteaching courses teacher candidates demanded better prepared both in the mastery of the material as well as in performance. The integration model between basic skills of teaching and microteaching, provide benefits on both sides. They can provide the experiences by observe how aspects of basic skills of teaching can be applied in practice in learning. In the other side, students on microteaching course expected to learn from the teacher views the model, which is expected to grow a new inspiration and confidence in the teaching practice in class. It is relevant to the research Habidin (2013) that the use of a variety of innovative learning model can improve basic skills of teaching. In microteaching conventional, student teachers in teaching practice only faced limited number of study subjects that are his own friends (peer) that is less challenging. Neither the basic skills of teaching courses, students only get knowledge about aspects of basic skills of teaching theoretically.

The results also showed a positive response from students. As such, the integration between basic skills of teaching and microteaching is intended as an alternative to efforts to improve self-esteem student teachers in teaching practice.

## Teacher Performance and Student Motivation Improvement through School-Based Lesson Study (LSBS) in SMA Negeri 1 Cipeundeuy Kabupaten Bandung Barat

Suhendiana Noor<sup>1</sup>, Ida Kaniawati<sup>2</sup>

<sup>1</sup>Principal of SMAN 1 Cipeundeuy

<sup>2</sup>Lecturer Physics Education UPI

**Abstract:** To guarantee the professionalism of the teachers which stated in the constitutions, it is necessary to create a kind of sustainable teachers' training program that is oriented in improving the quality of learning. SMA Negeri 1 Cipeundeuy is one of public high school located in the suburb area in Bandung Barat which has not shown a good quality in learning. The students' learning motivation and the teachers' performance is still considerably low, most of the teachers applied one way lecturing for their teaching and learning method, the classroom interaction occurred one way from the teacher to the students, so the students had no opportunity to explore more in the teaching and learning activities. In order to solve those problems a School Action Research (SCR) of teacher training model using School-based Lesson Study was conducted by following some stages: plan, do and see and it resulted in improving teacher's performance and students' motivation in learning. Those were proven by 4 (four) cycles in this research, the mean of teachers' pedagogical competence kept on increasing. The students' opinion towards teachers' performance also increased, it was proven by the result of each cycles which showed strong agreement in the implementation of creative teaching and learning. Besides, the students' motivation shown in each cycles increased regarding to strong agreement toward their high motivation. The implication of this School-Based Lesson Study is the prominent improvement in the National Education Standard, especially in the process standard, educator standard, management standard, assessment standard, and graduate competence standard. Furthermore, it also eases the principal in performing the learning supervision, teachers' performance evaluation, completing the professional sustainable development, and developing innovative learning models.

**Keywords:** School-Based Lesson Study, Learning Supervision, Teachers' Performance, Student Learning Motivation.

### 1. LATAR BELAKANG

Abad dua puluh satu bercirikan dengan adanya perubahan ekonomi yang sangat cepat, ledakan dan kemudahan memperoleh informasi, serta pesatnya kemajuan teknologi dan globalisasi. Hal ini memungkinkan tuntutan yang cepat untuk menguasai berbagai kompetensi baru. Hal ini menuntut adanya paradigma baru dalam dunia pendidikan. Pemerintah telah mengantisipasi perubahan ini terlihat dari rencana strategis pendidikan Negara Kesatuan Republik Indonesia tahun 2010-2014 yang disebutkan ada 4 paradigma pendidikan yang harus diperhatikan yaitu :

- 1) Pemberdayaan manusia seutuhnya,
- 2) Pembelajaran sepanjang hayat berpusat pada peserta didik.
- 3) Pendidikan untuk semua.

- 4) Pendidikan untuk Perkembangan, Pengembangan, dan/atau Pembangunan Berkelanjutan (PuP3B).

Pembelajaran abad 21 harus lebih daripada hanya sekedar menjelaskan apa isi pengetahuan, tapi pembelajaran abad 21 dapat memodelkan proses pembelajaran yang dialami guru sehingga peserta didik dapat mengamati dan mempelajari keterampilan proses, keterampilan memecahkan masalah, dan keterampilan berpikir ketika mempelajari suatu pengetahuan seperti yang dianggap cukup untuk dekade abad ke 20 (Herawati, 2009: xii).

Pembelajaran abad 21 harus mampu menjelaskan bagaimana seharusnya siswa belajar dan berfikir. Pendidikan dituntut harus mampu mendeskripsikan, mendesain lingkungan dan proses pembelajaran

sedemikian rupa sehingga cara siswa belajar dan mengetahui dapat dimanifestasikan dalam kegiatan belajar yang aktif, kolaboratif, mandiri (*self-regulated*), dan terarah (*self-directed*). Peranan guru sangat penting dalam memberdayakan kemampuan berpikir peserta didik, agar peserta didik dapat menggali proses berpikir dan meningkatkan kecerdasan dalam memecahkan permasalahan dalam kehidupan nyata dalam kehidupan sehari-hari.

Pendidikan yang berkualitas sangat bergantung pada kualitas gurunya, untuk menjamin kualitas tenaga pendidik (guru) yang profesional pemerintah juga mengeluarkan Undang-Undang RI No. 14 tahun 2005 tentang Guru dan Dosen yang mengatur hak dan kewajiban Guru dan Dosen. Kompetensi pendidik sebagai agen pembelajaran pada jenjang pendidikan dasar dan menengah serta pendidikan anak usia dini meliputi: (a) kompetensi pedagogik, (b) kompetensi kepribadian, (c) kompetensi profesional, dan (d) kompetensi sosial. Khusus kompetensi pedagogik seorang pendidik harus mampu mengelola pembelajaran sekurang-kurangnya meliputi:

- 1) Pemahaman wawasan atau landasan kependidikan.
- 2) Pemahaman terhadap peserta didik
- 3) Pengembangan kurikulum/silabus
- 4) Perancangan pembelajaran
- 5) Pelaksanaan pembelajaran yang mendidik dan dialogis
- 6) Pemanfaatan teknologi pembelajaran
- 7) Evaluasi hasil belajar
- 8) Pengembangan peserta didik untuk mengaktualisasikan berbagai potensi yang dimilikinya (UU No. 19 tahun 2005).

Staf Ahli Kemendikbud Prof. Dr. Kacung Marijan, Indonesia mengalami masalah pendidikan yang kompleks. Selain angka putus sekolah, pendidikan di Indonesia juga menghadapi berbagai masalah lain, mulai dari buruknya infrastruktur hingga kurangnya mutu guru. Masalah utama pendidikan di Indonesia adalah kualitas guru yang masih rendah, kualitas kurikulum yang belum standar, dan kualitas infrastruktur yang belum memadai. Kualitas mutu pendidikan sangat ditentukan oleh pembelajaran yang dilakukan Guru di

dalam kelas, dalam menjamin keterlaksanaan pembelajaran yang efektif dan efisien harus dilakukan pengawasan dan pembinaan yang berkelanjutan (<http://positivego.blogspot.com/2012/11/>).

Hal senada dikemukakan oleh ketua PGRI pusat Prof. Dr. Sulistiyo dalam hari Guru Nasional, bahwa ada beberapa persoalan Guru yang menonjol dan tidak pernah mendapat penyelesaian, salah satunya : “pengembangan kompetensi dan karir yang tidak berjalan sesuai tujuan. Banyak guru yang telah lulus dari Lembaga Pendidikan Tenaga Kependidikan justru malah menurun kompetensinya. Untuk itu, standard kompetensi perlu disiapkan, dijaga dan dibina” (Kompas.com, 2012).

Hasil kajian awal di atas menunjukkan kinerja guru SMA Negeri 1 Cipeundeuy relatif rendah. Jumlah Guru SMA Negeri 1 Cipeundeuy sebanyak 28 orang, 46,4% merupakan tenaga honorer, 66,67% masih golongan III/c ke bawah, pengalaman mengajarnya 64% kurang dari 10 tahun dan hanya 35,7% yang sudah lulus sertifikasi. Banyaknya guru honorer, pengalaman mengajar guru masih kurang, dan jarang guru mengikuti pelatihan baik dalam MGMP ataupun kegiatan pengembangan pendidik lainnya merupakan salah satu penyebabnya. Selain itu kualitas peserta didik yang masuk SMA Negeri 1 Cipeundeuy masih relatif rendah karena masuk tanpa melalui seleksi, semua siswa diterima. Akibat rendahnya kualitas peserta didik, guru kurang mendapat tantangan dalam melakukan pembelajaran begitupun siswa tidak pernah menuntut pembelajaran yang baik dari gurunya.

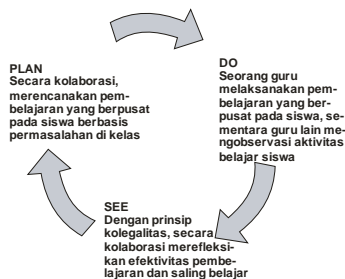

Kegiatan-kegiatan pelatihan dan pendidikan guru belum dapat merubah paradigma guru secara permanen, pembelajaran yang inovatif hanya bertahan satu atau dua bulan setelah pelatihan, selebihnya guru mengajar kembali pada biasanya hanya transfer ilmu saja. Hal ini membuat penulis bertanya, apakah ada pola pembinaan guru yang dapat membuat kinerja guru dalam pembelajaran lebih baik dan berkelanjutan?.

Sejak tahun 1998, tiga universitas di Indonesia yaitu Universitas Pendidikan Indonesia (UPI), Universitas Negeri Yogyakarta (UNY) dan Universitas Negeri Malang (UM) bekerjasama dengan JICA (*Japan International Cooperation Agency*)

mencoba untuk meningkatkan kualitas Pendidikan di Indonesia khususnya pendidikan MIPA, dengan melakukan pembinaan terhadap guru MIPA dengan program IMSTEP (*Indonesia mathematics and Science teacher Education Project*). Dalam kegiatan *piloting*, guru dan dosen berkolaboratif merancang dan mengembangkan model pembelajaran MIPA yang berbasis *hands-on activity, daily life*, dan *local materials* sesuai dengan kondisi dan permasalahan sekolah. Program tersebut dikembangkan menjadi program lanjutan dalam tahun 2003–2005, dengan melakukan insemniasi hasil IMSTEP melalui *lesson study* bekerjasama dengan MKKS dan MGMP.

*Lesson Study* adalah suatu model alternatif pembinaan guru melalui pengkajian pembelajaran secara kolaboratif dan berkelanjutan berlandaskan prinsip-prinsip kolegalitas dan *mutual learning* untuk membangun komunitas belajar. “*Lesson Study* dilaksanakan dalam tiga tahapan yaitu *plan* (merencanakan), *Do* (melaksanakan), dan *see* (merefleksi) yang berkelanjutan. Dengan kata lain *Lesson Study* merupakan suatu cara peningkatan mutu pendidikan yang tak pernah berakhir (*continous improvement*)” (Kaniawati, 2009:21).

Skema kegiatan *lesson study* diperlihatkan pada gambar 1.1

Gambar 1.1 Skema Kegiatan *Lesson Study* (Cipu, 2008:30)

Berdasarkan hasil kajian ada dua macam *lesson study* yaitu *lesson study* berbasis MGMP dan *lesson study* berbasis Sekolah (LSBS). *Lesson study* berbasis MGMP yaitu *lesson study* yang kegiatannya dilaksanakan pada kegiatan Musyawarah Guru Mata Pelajaran masing-masing. Guru-guru dari setiap gugus atau Kabupaten berkumpul disuatu tempat untuk melakukan kajian

pembelajaran bersama-sama, dengan cara merancang, melaksanakan dan merefleksi hasil pembelajarannya. Diharapkan semua guru menyadari pentingnya pembelajaran yang baik yang kreatif, aktif, efektif, inovatif dan menyenangkan dalam rangka mengembangkan potensi peserta didik. Begitupun *Lesson Study* berbasis Sekolah (LSBS) kegiatannya sama dengan LS-MGMP, yang membedakannya adalah komunitas gurunya, apabila LS-MGMP komunitas gurunya mata pelajaran yang sama se gugus atau se kabupaten sedangkan LSBS komunitas gurunya di Sekolah itu sendiri dengan mata pelajaran bervariasi.

Berdasarkan hasil *end-line survey* program PELITA (*Program for enhancing Quality of Junior Secondary Education*) yang merupakan kelanjutan program SISTTEMS yaitu program kerjasama JICA dengan Pemerintah Indonesia. Survey dilakukan di tiga kabupaten yaitu Sumedang, Bantul dan Pasuruan pada tahun 2010. Hasil survey menunjukkan bahwa melalui kegiatan *Lesson study* diperoleh hasil yang berkaitan dengan management sekolah antara lain:

- 1) Terdapat peningkatan implementasi “*school-based Teacher Development*” dalam bentuk kegiatan *open class, study group* dan pelatihan yang dilakukan oleh sekolah.
- 2) Terjadi peningkatan dalam “*supportive Atmosphere among Student*”.
- 3) Terdapat peningkatan dalam kegiatan belajar kelompok dalam menggunakan media pembelajaran dan bertukar pikiran dalam pembelajaran IPA dan Matematika.
- 4) Terjadi peningkatan pada pemahaman dan minat siswa terhadap IPA dan matematika (Kabar PELITA, 2010:1-3).

Berdasarkan kajian teori dan beberapa pendapat hasil kegiatan *Lesson Study* menunjukkan hasil yang baik dengan respon yang baik, namun hasil dan respon yang baik ini tidak menjadikan seluruh sekolah mengimplementasikan LSBS ini bahkan cenderung kegiatan ini berlangsung hanya ada proyeknya saja, setelah itu berhenti begitu saja. Berdasarkan kajian tersebut, penulis merasa terpanggil untuk meneliti sejauh mana keefektifan kegiatan *Lesson Study* ini apabila diterapkan di Sekolah tempat penulis bekerja. Sehingga apabila

*Lesson Study* ini efektif dapat meningkatkan kinerja guru, maka akan menjadi rujukan bagi sekolah-sekolah yang lain.

*Lesson Study* Berbasis Sekolah adalah kegiatan *lesson study* yang dilaksanakan di sekolah masing-masing dengan melibatkan seluruh guru di sekolah tersebut. Tujuan utama *Lesson Study* yaitu untuk :

- 1) Memperoleh pemahaman yang lebih baik tentang bagaimana siswa belajar dan guru mengajar.
- 2) Memperoleh hasil-hasil tertentu yang bermanfaat bagi para guru lainnya dalam melaksanakan pembelajaran.
- 3) Meningkatkan pembelajaran secara sistematis melalui inkuiri kolaboratif.
- 4) Membangun sebuah pengetahuan pedagogis, dimana seorang guru dapat menimba pengetahuan dari guru lainnya (Akhmad Sudrajat, 2008:1).

Menurut Akhmad Sudrajat, ada beberapa manfaat yang dapat diambil *Lesson Study*, diantaranya:

- 1) Guru dapat mendokumentasikan kemajuan kerjanya.
- 2) Guru dapat memperoleh umpan balik dari anggota lainnya.
- 3) Guru dapat mempublikasikan dan mendiseminasikan hasil akhir dari *Lesson Study*.

Banyaknya permasalahan-permasalahan di SMA Negeri 1 Cipeundeuy terutama permasalahan pembelajaran, serta dengan melihat hasil kajian kegiatan *lesson study* yang menunjukkan banyak keunggulan dalam melakukan pembinaan pada guru, maka penulis merasa penting untuk melakukan penelitian dengan inti permasalahan : Apakah kinerja guru dan motivasi belajar siswa dapat ditingkatkan melalui kegiatan *Lesson Study* Berbasis Sekolah (LSBS) ?.

Adapun pertanyaan-pertanyaan dalam penelitian ini adalah:

- 1) Bagaimanakah kegiatan *lesson study* berbasis sekolah yang sesuai dengan karakteristik guru sebagai pola pembinaan guru di SMA Negeri 1 Cipeundeuy?
- 2) Bagaimanakah peningkatan kinerja guru dalam pembelajaran di SMA Negeri 1 Cipeundeuy setelah diterapkan kegiatan *Lesson Study* Berbasis Sekolah?

- 3) Bagaimanakah peningkatan motivasi belajar siswa di SMA Negeri 1 Cipeundeuy diterapkan kegiatan *Lesson Study* Berbasis Sekolah?

## 2. METODE PENELITIAN

Penelitian ini didasari oleh adanya masalah yang dirasakan penulis ditempat penulis bekerja, yaitu tentang rendahnya kinerja guru dan motivasi belajar siswa di SMA Negeri 1 Cipeundeuy, oleh sebab itu metoda penelitian yang tepat untuk mengatasi masalah tersebut adalah metoda penelitian kualitatif dengan strategi penelitian tindakan sekolah (PTS). Penelitian ini direncanakan berlangsung beberapa siklus sampai indikator keberhasilan PTS ini tercapai dan terjadi kepuasan peneliti, dimana setiap siklus dilaksanakan sesuai dengan perubahan yang ingin dicapai, seperti apa yang telah didesain dalam faktor yang diselidiki. Untuk mengetahui awal kinerja guru dan motivasi belajar siswa dilakukan kajian pendahuluan melalui penyebaran angket dan analisis dokumen supervisi kepala sekolah, diharapkan dapat mengetahui tindakan yang tepat yang harus dilakukan dalam rangka meningkatkan kinerja guru dan motivasi belajar siswa. Dari hasil kajian pendahuluan dan kajian teori ditetapkan tindakan yang akan digunakan untuk meningkatkan kinerja guru dan motivasi belajar siswa di SMA Negeri 1 Cipeundeuy adalah pola pembinaan guru melalui kegiatan *lesson study* berbasis sekolah (LSBS). Kegiatan LSBS terdiri dari dari: kegiatan Perencanaan (*Plan*), Pelaksanaan (*Do*) dan Refleksi (*See*) sesuai dengan tahap-tahapan kegiatan *Lesson Study*.

Dengan berpatokan pada kajian pendahuluan tersebut maka dilaksanakan penelitian tindakan sekolah (PTS) dengan prosedur: (1) tahap perencanaan tindakan (*planning*), (2) tahap pelaksanaan tindakan (*action*), (3) tahap observasi dan evaluasi (*observation*), (4) tahap refleksi (*reflection*) dalam setiap siklus. Penelitian tindakan sekolah bercirikan perbaikan terus menerus sehingga mencapai indikator keberhasilan yang menjadi tolak ukur keberhasilan siklus-siklus tersebut. Setelah dilakukan refleksi yang mencakup analisa terhadap hasil pengamatan serta hasil tindakan, biasanya muncul permasalahan yang perlu mendapat

perhatian sehingga pada gilirannya perlu dilakukan perencanaan ulang untuk dilakukan pada siklus berikutnya.

### 3. HASIL PENELITIAN DAN PEMBAHASAN

Hasil penelitian diuraikan berdasarkan tahap-tahapan Penelitian Tindakan Sekolah (PTS) yang terdiri dari empat siklus, untuk siklus 1 terdiri dari tahapan berikut: 1) Tahap Kajian Pendahuluan, 2) Tahap Perencanaan, 3) Tahap Pelaksanaan, 4) Observasi dan Evaluasi, dan 5) Tahap Refleksi (*reflection*). Sedangkan siklus berikutnya hanya empat tahapan yaitu: 1) Tahap Perencanaan Ulang, 2) Tahap Pelaksanaan, 3) Tahap Observasi dan Evaluasi, dan 4) Tahap Refleksi (*reflection*).

#### 3.1 Keterlaksanaan Proses Pembinaan Guru Melalui Kegiatan LSBS

Kegiatan LSBS yang sesuai dengan karakteristik guru di SMA Negeri 1 Cipeundeuy terdiri dari kegiatan *Plan*, *Do* dan *See*, dimana guru dikelompokkan dalam setiap rumpun mata pelajaran, yaitu: rumpun MIPA terdiri dari mata pelajaran Matematika, Fisika, Kimia dan Biologi; rumpun IPS terdiri dari mata pelajaran Ekonomi, PKN, Sejarah, Geografi dan Sosiologi; rumpun Bahasa terdiri dari mata pelajaran Bahasa Indonesia, Bahasa Inggris, Bahasa Arab dan Bahasa Sunda; serta rumpun Campuran terdiri dari mata pelajaran Pendidikan Agama, Penjaskes, TIK dan BP/BK. Kegiatan *plan* dilaksanakan tiga kali, *plan* pertama digunakan untuk diskusi identifikasi permasalahan setiap mata pelajaran dan penentuan *open lesson*, *plan* kedua digunakan untuk diskusi pembuatan RPP, pemilihan *teaching material* dan pembuatan *assessment*, *plan* ketiga uji coba *teaching material* dan menyempurnakan RPP. Kegiatan *Do* dilaksanakan dua tahap, tahap pertama dilakukan *briefing* untuk memberi kesempatan guru model menjelaskan pembelajaran yang akan dilakukan dan prosedur aturan mengobservasi dan kegiatan *open lesson*. Kegiatan *Do* tahap ke dua, satu orang guru menjadi guru model dan peserta lainnya sebagai observer yang mengamati

interaksi siswa dengan guru, interaksi siswa dengan siswa dan interaksi siswa dengan bahan ajar dan bagaimana siswa mengeksplorasi pengetahuannya. Kegiatan *see* diikuti oleh semua guru yang ikut mengobservasi, menyampaikan hasil observasi pembelajaran yang difokuskan pada proses belajar siswa dan mendiskusikan saran perbaikan pembelajaran.

Berdasarkan hasil kajian keterlaksanaan kegiatan LSBS telah memberikan manfaat bagi guru sebagai berikut: 1) guru dapat saling belajar dalam merencanakan pembelajaran yang aktif, inovatif, kreatif, efektif dan menyenangkan, 2) guru menjadi lebih kreatif dan inovatif merencanakan pembelajaran dengan berbagai strategi dan metode mengajar, 3) guru dapat memperbaiki kesalahan dan kekurangan cara mengajar dengan melihat kesalahan dan kekurangan dari guru yang lain yang dijadikan sebagai model, 4) LSBS berhasil membentuk komunitas belajar yang dapat meningkatkan kinerja guru yang berdampak pada peningkatan motivasi belajar siswa.

Walaupun pembinaan LSBS sudah berhasil membentuk komunitas belajar guru, namun ada temuan baru bagi pengelola sekolah yang akan menjadi kendala pelaksanaan LSBS di sekolah yaitu terjadinya pembelajaran yang tidak efektif untuk kelas yang tidak dijadikan *open lesson* karena sebagian guru-guru pengajarnya melakukan observasi di kelas *open lesson*, oleh sebab itu bagi sekolah yang akan melaksanakan LSBS untuk mengoptimalkan proses *lesson study* diperlukan pengelolaan sebagai berikut:

- 1) Keterlibatan guru dalam menyusun rencana pembelajaran pada kegiatan *plan* sebaiknya ada pembagian tugas dalam mempersiapkan perangkat pembelajaran dan bersama-sama menguji coba.
- 2) Pada kegiatan *do* observer diprioritaskan guru pada rumpun mata pelajaran yang bersangkutan ditambah dengan guru-guru yang tidak mengajar pada jam itu, agar siswa yang lain tidak terganggu proses kegiatan pembelajarannya.
- 3) Pada kegiatan *see* sebaiknya diskusi difokuskan pada permasalahan pembelajaran yang ditemukan pada hasil observasi dan dibahas secara mendalam dan bagaimana seharusnya dilakukan.

### 3.2 Kinerja Guru

Profil kinerja guru yang akan dilihat adalah kemampuan guru dalam merencanakan pembelajaran, melaksanakan pembelajaran dan kemampuan guru dalam melakukan evaluasi yaitu kompetensi pedagogik. Profik kinerja guru dalam kompetensi pedagogik dapat dilihat dari grafik gambar di bawah:

Grafik 1. Hasil Penilaian Kinerja Kompetensi Pedagogik Tiap Siklus

Dari grafik 4.14. dapat dilihat bahwa seluruh komponen kinerja guru mengalami peningkatan dari tiap siklus, kita bisa melihat peningkatan persentase rata-rata nilai kinerja guru kompetensi pedagogik, dimana presentasi rata-rata siklus I katagori cukup (75,48%), siklus II katagori baik (86,69%), siklus III katagori baik (88,34%) dan siklus IV katagori baik (88,33%). Berarti indikator keberhasilan kinerja guru sebesar 85 % dapat tercapai.

### 3.3 Kinerja Guru dan Motivasi Belajar Siswa

Untuk lebih meyakinkan peningkatan kinerja guru dan motivasi belajar siswa dari tiap siklus, maka gambar 4.15 memperlihatkan grafik hasil persentase rata-rata pendapat siswa terhadap pembelajaran yang dialaminya.

Grafik 2. Pendapat Siswa terhadap Pembelajaran dan Motivasi Belajar

Dari grafik yang diperlihatkan pada gambar 4.15 siswa berpendapat bahwa kinerja guru dalam melaksanakan pembelajaran meningkat dari tiap siklus (siklus I = 71,5% persetujuan tinggi, siklus II = 73,2% persetujuan tinggi, siklus III = 74,76% persetujuan tinggi, dan siklus IV = 75,23% persetujuan tinggi). Dari grafik gambar 4.15 pun kita bisa melihat peningkatan motivasi belajar siswa tiap siklus (siklus I = 70,93% persetujuan tinggi, siklus II = 75,33% persetujuan tinggi, siklus III = 76,77% persetujuan tinggi, dan siklus IV = 77,83% persetujuan tinggi), dengan demikian indikator keberhasilan penelitian tindakan ini tercapai melampoi skor rata-rata 75%.

Terlihat dari grafik gambar 4.16 kinerja guru dan motivasi belajar siswa memenuhi target keberhasilan, artinya pola pembinaan guru melalui kegiatan *Lesson Study* Berbasis Sekolah (LSBS) berhasil meningkatkan kinerja guru dan motivasi belajar siswa. Temuan ini sesuai dengan teori yang dikemukakan oleh peneliti sebelumnya diantaranya: menurut Sumar Hendayana (2006) bahwa kegiatan *lesson study* berhasil: 1) meningkatkan kualitas pembelajaran MIPA, 2) meningkatkan motivasi belajar siswa dalam pembelajaran MIPA, 3) Meningkatkan nilai mata pelajaran MIPA. Berdasarkan hasil *end-line survey* program PELITA (*Program for enhancing Quality of Junior Secondary Education*), bahwa kegiatan *lesson study*: 1) meningkatkan implementasi “*School-based Teacher Development*” dalam bentuk kegiatan *open class*, *study group* dan pelatihan yang dilakukan oleh sekolah; 2) meningkatkan dalam “*supportive atmosphere among student*”; 3) meningkatkan dalam kegiatan belajar kelompok dalam menggunakan media pembelajaran dan bertukar pikiran dalam pembelajaran IPA dan Matematika;

dan 4) meningkatkan pada pemahaman dan minat siswa terhadap IPA dan matematika (Kabar PELITA, 2010). Menurut Herawati, dkk *lesson study* adalah suatu bentuk utama peningkatan kualitas pembelajaran dan pengembangan keprofesionalan guru, dalam melaksanakannya guru secara kolaboratif: 1) mempelajari kurikulum dan merumuskan tujuan pembelajaran dan tujuan pengembangan peserta didiknya (pengembangan kecakapan hidupnya), 2) merancang pembelajaran untuk mencapai tujuan, 3) melaksanakan dan mengamati suatu *research lesson* (‘pembelajaran yang dikaji’) dan 4) melakukan refleksi untuk mendiskusikan pembelajaran yang dikaji dan menyempurnakannya pada perencanaan pembelajaran berikutnya” (Herawati, 2009:3).

#### 4. SIMPULAN DAN REKOMENDASI

##### 4.1 Simpulan

Berdasarkan hasil dan pembahasan penelitian yang berjudul “Peningkatan Kinerja Guru dan Motivasi Belajar Siswa melalui Kegiatan *Lesson Study* Berbasis Sekolah (LSBS) di SMA Negeri 1 Cipeundeuy Kabupaten Bandung Barat” dapat disimpulkan sebagai berikut:

- 1) Kegiatan LSBS yang sesuai dengan karakteristik guru di SMA Negeri 1 Cipeundeuy terdiri dari kegiatan *Plan*, *Do* dan *See*, dimana guru dikelompokkan dalam setiap rumpun mata pelajaran, yaitu: rumpun MIPA terdiri dari mata pelajaran Matematika, Fisika, Kimia dan Biologi; rumpun IPS terdiri dari mata pelajaran Ekonomi, PKn, Sejarah, Geografi dan Sosiologi; rumpun Bahasa terdiri dari mata pelajaran Bahasa Indonesia, Bahasa Inggris, Bahasa Arab dan Bahasa Sunda; serta rumpun Campuran terdiri dari mata pelajaran Pendidikan Agama, Penjaskes, TIK dan BP/BK. Kegiatan *plan* dilaksanakan tiga kali, *plan* pertama digunakan untuk diskusi identifikasi permasalahan setiap mata pelajaran dan penentuan *open lesson*, *plan* kedua digunakan untuk diskusi pembuatan RPP, pemilihan *teaching material* dan pembuatan *assessment*, *plan* ketiga uji coba *teaching material* dan menyempurnakan RPP. Kegiatan *Do* dilaksanakan dua tahap,

tahap pertama dilakukan *briefing* untuk memberi kesempatan guru model menjelaskan pembelajaran yang akan dilakukan dan prosedur aturan mengobservasi dan kegiatan *open lesson*. Kegiatan *Do* tahap ke dua, satu orang guru menjadi guru model dan peserta lainnya sebagai observer yang mengamati interaksi siswa dengan guru, interaksi siswa dengan siswa dan interaksi siswa dengan bahan ajar dan bagaimana siswa mengeksplorasi pengetahuannya. Kegiatan *see* diikuti oleh semua guru yang ikut mengobservasi, menyampaikan hasil observasi pembelajaran yang difokuskan pada proses belajar siswa dan mendiskusikan saran perbaikan pembelajaran.

- 2) Kinerja guru kompetensi pedagogik dalam pembelajaran meningkat setelah diterapkan kegiatan LSBS di SMA Negeri 1 Cipeundeuy, terbukti persentase rata-rata nilai kinerja guru kompetensi pedagogik siklus I (75,48%) kategori cukup, siklus II (83,70%) kategori baik, siklus III (87,30%) kategori baik, dan siklus IV (88,33%) kategori baik, begitupun pendapat siswa terhadap kinerja pembelajaran guru meningkat dengan persetujuan tinggi di tiap siklus, terbukti pada siklus I (71,5%) , siklus II (73,2%), siklus III (74,8%), dan siklus IV (75,7%).
- 3) Motivasi belajar siswa di dalam pembelajaran meningkat setelah diterapkan kegiatan LSBS di SMA Negeri 1 Cipeundeuy, terbukti persentase rata-rata motivasi belajar siswa dengan persetujuan tinggi di tiap siklus, siklus I (70,93%), siklus II (75,33%), siklus III (76,67%) dan siklus IV (77,73%).

#### 5. REKOMENDASI

Permasalahan rendahnya kinerja guru dan motivasi belajar siswa bukan saja dialami oleh SMAN 1 Cipeundeuy tetapi juga dialami oleh sekolah pada umumnya, untuk mengatasi masalah tersebut berdasarkan hasil penelitian ini maka direkomendasikan sebagai berikut:

- 1) Bagi Dinas Pendidikan Pemuda dan Olahraga kabupaten Bandung Barat:
  - a) *Lesson Study* Berbasis sekolah (LSBS) dapat dijadikan alternatif

pola pembinaan guru berkelanjutan di lingkungan disdikpora kabupaten Bandung Barat dalam rangka meningkatkan kinerja guru dan motivasi belajar siswa.

- b) Keberhasilan LSBS dalam meningkatkan kinerja guru dan motivasi belajar siswa, seyogianya kepala dinas pendidikan menerapkan kegiatan *lesson study* di MGMP melalui LS MGMP dan di setiap sekolah melalui LSBS.
- 2) Bagi kepala Sekolah seyogianya menjadikan LSBS sebagai alternatif pola pembinaan guru berkelanjutan dalam menjamin profesionalisme tenaga pendidik dan meningkatkan pelayanan pembelajaran yang aktif, inovatif, kreatif, efektif dan menyenangkan. Selain itu LSBS dapat memudahkan pekerjaan kepala sekolah yaitu: melakukan supervisi pembelajaran, melakukan penilaian kinerja guru (PKG), pengembangan keprofesionalitas berkelanjutan (PKB) dan mengembangkan model-model mengajar yang inovatif dalam menyambut kurikulum 2013.
- 3) Bagi Guru dalam membentuk komunitas belajar LSBS sangat tepat untuk meningkatkan pengetahuan, keterampilan dan sikap menjadi guru profesional dan memberi kesadaran dalam memperbaiki pembelajaran yang berkelanjutan.
- 4) Bagi peneliti selanjutnya:
  - a) Meneliti dampaknya pada keberhasilan hasil belajar melalui penerapan *Lesson Study* Berbasis Sekolah (LSBS).
  - b) Meningkatkan kompetensi guru dalam mengembangkan pembelajaran berbasis kurikulum 2013 melalui manajemen *Lesson Study* Berbasis Sekolah (LSBS).

## Pengalaman Berharga Dari Lesson Study Bagi Guru-Guru IPA di Kabupaten Subang

Suprapti<sup>1</sup>

<sup>1</sup>SMP Negeri 1 Ciater, Subang

prapti.sudarsono@gmail.com

**Abstrak:** *Lesson Study* merupakan sarana untuk perbaikan pembelajaran yang dilakukan secara kolaboratif berdasarkan langkah-langkah : *perencanaan (plan)*, implementasi rencana pembelajaran tersebut di dalam kelas/*open class (do)* dan kegiatan *refleksi* yaitu diskusi tentang hal-hal yang terjadi pada proses pembelajaran di kelas (*see*). Hal lain yang terpenting dalam kegiatan *Lesson Study* adalah keberlanjutan proses belajar yang dilakukan guru-guru dalam upaya meningkatkan kualitas pembelajaran sehari-hari sebagai upaya untuk mencapai tujuan pembelajaran secara umum. Inti dari *Lesson Study* adalah open class, yang dilakukan oleh *guru model* dan diamati oleh guru-guru lain sebagai *observer/pengamat*. Ada 3 pedoman observasi dalam open class, yaitu : 1) Apakah siswa belajar dan bagaimana prosesnya? 2) Adakah siswa yang tidak belajar dan mengapa dia tidak belajar? 3) Bagaimana upaya guru mengatasi siswa yang tidak belajar? Pengalaman berharga yang dapat diperoleh dari open class bukan hanya bermanfaat bagi guru model saja tapi juga bagi guru observer. Ketajaman dan kedalaman observer dalam melakukan pengamatan akan sangat menentukan kualitas diskusi saat refleksi dan akhirnya dapat memperbaiki kualitas pembelajaran berikutnya. Paper ini akan memaparkan pengalaman berharga yang diperoleh dari pelaksanaan kegiatan *Lesson Study* di MGMP IPA Komisariat Jalcagak Kabupaten Subang selama 3 tahap yang merupakan *Implementasi Lesson study dalam Program Hibah Kompetensi berbasis Institusi (PHKI)* yang diselenggarakan atas kerja sama Dinas Pendidikan Kabupaten Subang, Dinas Pendidikan Propinsi Jawa Barat dan Universitas Pendidikan Indonesia (UPI). Beberapa pengalaman maupun pelajaran berharga yang didapatkan antara lain : 1) Guru dapat berkolaborasi dan bertukar pikiran dalam merencanakan pembelajaran/pembuatan design pembelajaran (*plan*). 2) Sebagai forum belajar bersama (belajar dari pembelajaran) dari kekurangan maupun kelebihan pada waktu open class. 3) Hasil refleksi dapat digunakan untuk perbaikan design pembelajaran berikutnya (*redesign*). 4) Guru model dapat mengetahui kekurangan pada saat open class sehingga dapat memperbaiki pembelajaran berikutnya. 5) Observer mendapat pengalaman/pelajaran dari pembelajaran yang dilakukan guru model (misal teknik mengajar yang pas atau media maupun cara mengatasi siswa yang tidak belajar). 6) *Lesson Study* dapat dijadikan wahana supervisi Kepala Sekolah dalam melaksanakan program *Penilaian Kinerja Guru (PKG)* dan *Pengembangan Keprofesian Berkelanjutan (PKB)*.

**Kata kunci :** pengalaman berharga, *lesson study*

### 1 PENDAHULUAN

Kemajuan suatu bangsa tercermin dari mutu sumber daya manusianya. Sedangkan sumber daya manusia (SDM) ditentukan oleh mutu pendidikan. Berdasarkan Balai Pusat Statistik tahun 2005 Index Pembangunan Manusia (IPM) Propinsi Jawa Barat menempati peringkat ke-14, jauh di bawah DKI Jakarta (peringkat ke-1) dan Daerah Istimewa Yogyakarta (peringkat ke-4). Rendahnya IPM tercermindari rendahnya mutu kehidupan bermasyarakat. Sebagai contoh, masyarakat kita sedang mengalami krisis budaya, baik budaya bersih, budaya tertib, budaya tatakrama dan budaya tepat waktu. Di mana-mana kita lihat sampah berserakan, air sungai kotor dan tercemar akibat ulah masyarakat yang membuang limbah. Krisis budaya tatakrama terlihat dari sikap anak sekarang banyak yang bersikap kurang sopan ke guru/orang tua atau terjadinya tawuran antar pelajar. Budaya antri dengan tertib susah diterapkan, semua ingin lebih dulu mendapat jatah yang kadang dapat menimbulkan musibah. Keterlambatan menjadi hal

biasa, terlambat masuk kerja, terlambat hadir rapat, maupun di suatu acara/event. Itu sebagian kecil contoh krisis budaya yang harus diperbaiki secara kontinyu melalui pendidikan.

Usaha pemerintah dalam rangka meningkatkan mutu pendidikan salah satunya, Undang-Undang Guru dan Dosen Nomer 14 tahun 2005 yang merupakan acuan tentang guru/dosen profesional. Undang-undang tersebut menuntut penyesuaian penyelenggaraan pendidikan dan pembinaan guru agar menjadi profesional. Pengakuan terhadap guru/dosen profesional diberikan manakala guru/dosen telah memiliki kualifikasi akademik, kompetensi dan sertifikat pendidikan yang dipersyaratkan (Pasal 8). Kualifikasi akademik harus "diperoleh melalui pendidikan tinggi program sarjana atau diploma empat"(Pasal 9). Sertifikat pendidik diperoleh guru setelah mengikuti pendidikan profesi (Pasal 10 ayat 1). Adapun jenis kompetensi yang dimaksud Undang-undang tersebut meliputi "kompetensi paedagogik, kompetensi kepribadian, kompetensi sosial dan kompetensi profesional". Sedangkan dalam

Peraturan Pemerintah RI No 19 Tahun 2005 tentang Standar Nasional Pendidikan berbunyi sebagai berikut :

1. Proses pembelajaran pada satuan pendidikan diselenggarakan secara interaktif, inspiratif, menyenangkan, menantang, memotivasi peserta didik untuk berpartisipasi aktif, serta memberikan ruang yang cukup bagi prakarsa, kreatifitas, dan kemandirian sesuai bakat, minat dan perkembangan fisik serta psikologis peserta didik.
2. Selain ketentuan sebagaimana dimaksud pada ayat (1), dalam proses pembelajaran pendidik memberikan keteladanan.
3. Setiap satuan pendidikan melakukan perencanaan proses pembelajaran, pelaksanaan proses pembelajaran, penilaian proses pembelajaran untuk terlaksananya proses pembelajaran yang efektif dan efisien.

Untuk mengimplementasikan UUGD serta PP 19 tahun 2005, pemerintah selalu melakukan usaha, salah satunya meningkatkan mutu guru melalui pelatihan. Sayangnya usaha pemerintah ini belum sepenuhnya memberi dampak yang signifikan terhadap mutu guru. Menurut Sumar Hendayana et al. (2006) minimal ada dua hal penyebab pelatihan guru belum berdampak pada peningkatan mutu pendidikan. Pertama, pelatihan tidak berbasis pada permasalahan nyata di kelas. Materi pelatihan disamakan tanpa mengenal daerah asal. Dengan kata lain bersifat *top down*, bukan *bottom up* berasal dari permasalahan nyata yang dialami guru. Kedua, hasil pelatihan hanya menjadi pengetahuan saja, tidak diterapkan pada pembelajaran di kelas atau kalaupun diterapkan hanya sekali, dua kali dan selanjutnya kembali "seperti dulu lagi, *back to basic*". Hal ini terjadi karena tidak ada monitoring setelah pelatihan, apalagi kalau kepala sekolah tidak pernah menanyakan hasil pelatihan, juga tidak memfasilitasi forum sharing pengalaman antara guru-guru (MGMP di sekolah).

## 2 PENGERTIAN LESSON STUDY

Untuk mengatasi kelemahan pelatihan konvensional yang kurang menekankan pada pasca pelatihan maka ditawarkan model *in-service training* yang lebih berfokus pada upaya pemberdayaan guru yang sesuai kapasitas serta permasalahan nyata di kelas. Juga dapat dijadikan alternatif untuk pembinaan bagi guru yang sudah lulus sertifikasi dan sekaligus dapat digunakan untuk Penilaian Kerja Guru (PKG) serta Pendidikan Keprofesional Berkelanjutan (PKB). Model tersebut adalah *Lesson Study* yaitu suatu **model pembinaan profesi pendidik melalui pengkajian pendidikan pembelajaran secara kolaboratif dan berkelanjutan berlandaskan**

**prinsip-prinsip kolegalitas dan mutual learning untuk membangun komunitas belajar.** Bila kita cermati dari definisi *Lesson Study* kita menemukan 7 kata kunci yaitu pembinaan profesi, pengkajian pembelajaran, kolaboratif, berkelanjutan, kolegalitas, *mutual learning*, dan komunitas belajar. Jadi *Lesson Study* bukan suatu model/metode pembelajaran tapi merupakan proses kegiatan pengkajian pembelajaran secara kolaboratif, berkelanjutan yang bertujuan untuk meningkatkan mutu pembelajaran. Menurut Suparlan (2010) di web-nya, guru yang tidak pernah mau pernah berusaha meningkatkan kompetensinya akan menjadi guru yang "beku".

*Lesson Study* telah berhasil dilakukan di Jepang dan berkembang di Indonesia mulai tahun 1998 melalui IMSTEP (Indonesia Mathematics and Science Teacher Educations Project) dan JICA (Japan International Cooperation Agency). Pelaksanaan *Lesson Study* meliputi tiga tahap yaitu:

1. **Plan (perencanaan)** : merancang pembelajaran meliputi *materi ajar, teaching material (hands on)*, strategi pembelajaran dan menentukan siapa yang berperan sebagai *guru model*. Model pembelajaran yang dikembangkan berbasis *hands on activity, dayly life dan local material*.
2. **Do (Pelaksanaan)**: implementasi rencana pembelajaran di dalam kelas/*open classyng* merupakan inti dari *Lesson Study*. Walaupun pada saat pembelajaran hadir sejumlah observer /pengamat, guru hendaknya tetap melaksanakan proses pembelajaran sealamiah mungkin. Jadi *open class* bukan *pertunjukan mengajar* tapi merupakan sarana/wahana untuk kita kaji proses pembelajarannya/sebagai bahan refleksi di tahap berikutnya. Observer tidak boleh melakukan intervensi apapun terhadap siswa maupun membantu guru model. Mereka hanya melakukan pengamatan sesuai dengan fokus masing-masing. Ada tiga pedoman observasi dalam open class : 1). Apakah siswa belajar dan bagaimana prosesnya 2). Adakah siswa yang tidak belajar? 3). Bagaimana upaya guru mengatasi siswa yang tidak belajar?. Beragamnya latar belakang pengetahuan observer yang hadir dalam suatu kegiatan *Lesson Study* merupakan kelebihan tersendiri karena fokus perhatian serta pemahaman tentang proses yang terjadi oleh masing-masing observer juga akan sangat beragam yang dapat memperkaya khasanah pengetahuan masing-masing pihak terutama pada saat terjadinya proses refleksi.
3. **Refleksi(see)**: diskusi tentang hal-hal yang terjadi pada proses pembelajaran. Kegiatan proses pembelajaran dan akan dijadikan acuan saat mengajukan pendapat atau masukan

terjaga akurasi karena masing-masing masih bisa mengingat dengan baik rangkaian aktivitas yang barusan dilakukan di kelas. Kegiatan ini dipandu oleh fasilitator atau Kepala Sekolah dan nara sumber /tenaga ahli biasanya berasal dari Perguruan Tinggi. Guru model mengawali diskusi dengan menyampaikan kesan-kesan pembelajaran yang baru dilaksanakan. Selanjutnya observer/pengamat diminta menyampaikan temuan/masukan terutama menyangkut aktivitas siswa bukan untuk mengevaluasi guru. Di samping itu observer juga dapat mengambil pelajaran/hal-hal yang positif dari pembelajaran yang sudah dilaksanakan oleh guru model. Diharapkan diperoleh kritik dan saran yang bermanfaat demi perbaikan proses pembelajaran sehingga dapat meningkatkan mutu pendidikan. Mengapa pengkajian pembelajaran harus dilakukan secara terus menerus, karena beberapa alasan seperti yang dikemukakan Sumar Hendayana et.al (2009:15) antara lain : 1).Tidak ada pembelajaran yang sempurna, selalu ada celah untuk memperbaikinya 2). Setiap siswa memiliki hak belajar 3).Pembelajaran harus memperhatikan keseimbangan antara peningkatan kemampuan berpikir dan peningkatan sikap 4).Pembelajaran harus berpusat pada siswa

### 3 PENGALAMAN BERHARGA DARI LESSON STUDY BAGI GURU-GURU IPA DI KABUPATEN SUBANG

Pelaksanaan *Lesson Study* di Kabupaten Subangdimulai semester 2 tahun ajaran 2009/2010, merupakan implementasi *Lesson Study* dalam Program Hibah Kompetisi berbasis Institusi (PHKI) yang diselenggarakan atas kerja sama Dinas Pendidikan Kabupaten Subang, Dinas Pendidikan dan Universitas Pendidikan Indonesia (UPI).*Lesson Study* di Kabupaten Subang meliputi mata pelajaran Matematika, IPA, IPS, Bahasa Indonesia dan Bahasa Inggris.

Berikut ini pemaparan pengalaman berharga/*best practice* yang diperoleh dari pelaksanaan *Lesson Study* di MGMP IPA SMP Komisariat Jalancagak Kabupaten Subang selama tiga tahap ( tahun 2010-2012). *Lesson Study* MGMP IPA Komisariat Jalancagak diikuti 13 sekolah (SMP/MTsN) se-wilayah Jalancagak dan kurang lebih 20 guru.

Kegiatan dipandu :

Fasilitator : Yaumi Basuki, SPd (SMP N 2 Jalancagak) bergantian dengan Dasum Saripudin, SPd (SMP N 1 Jalancagak)

Nara sumber : Drs. Pasaoran, MPd dosen Program Fisika UPI.

Penulis, sebagai pengurus (Sekretaris MGMP IPA Komisariat Jalancagak) periode 2009-2013, dan pernah sebagai guru model juga.

Tahap 1 (Semester 2 tahun ajaran 2009/2010), ada 4 pertemuan, **plan** di pertemuan ke satu), tahap 2 (semester 2 tahun ajaran 2010/2011, semester 1 tahun ajaran 2011/2012,ada 10 pertemuan, **plan** di pertemuan ke-1 dan ke-6), sedang tahap 3 (semester 2 tahun ajaran 2011/2012) ada 4 pertemuan, **plan** di pertemuanke-1). Plan dilaksanakan di sekolah inti di SMP Negeri 2 Jalancagak.

Tabel 1. Kegiatan *Lesson Study* MGMP IPA Komisariat Jalancagak tahap I

No.	Nama Sekolah	Nama Guru	Waktu	Topik
1.	SMP N 1 Jalancagak	Dasum Saripudin, SPd	24-10-2020	Listrik Statis
2.	SMP N 1 Kasomalang	Walis Ratnengsih, SPd	07-11-2010	Sist. Peredaran Darah
3.	MTsN Cisolak	Khotimatus S, S	21-11-2010	Asam,Basa dan Garam

Tabel 2. Kegiatan *Lesson Study* MGMP IPA Komisariat Jalancagak tahap II

No	Nama Sekolah	Nama Guru	Waktu	Topik
1.	SMPN 2 Jalancagak	Yaomi Basuki, SPd	21-05-2011	Periskop
2.	MTSn 1 Kasomalang	Dian Kusumawati, SPd	11-06-2011	Sistem Eskresi (Ginjal)
3.	SMPN 1 Cisolak	Juhaeni, SPd	13-08-2011	Pengukuran
4.	SMPN 1 Sagalaherang	Yayan Nurjaman, SPd	17-09-2011	Sistem Gerak
5.	SMPN 1 Ciater	Suprapti, SPd	15-10-2011	Makanan dan Fungsi
6.	SMPIT Asyifa	Elis Sulastri, SPd	29-10-2011	Pemuaiian Zat
7.	SMPN 2 Tanjungsian	Reva Rimatusodiq, SPd	12-11-2011	Ciri-ciri Makhluk Hidup
8.	SMPN 1 Kasomalang	Romlah Zulkaedah, SPd	26-11-2011	Reaksi Kimia

Tabel 3. Kegiatan *Lesson Study* MGMP IPA Komisariat Jalancagak tahap III

No.	Nama Sekolah	Nama Guru	Waktu	Topik
1.	SMPN 1 Jalancagak	Dra. Ema Romayati	29-11-2012	Pewarisan Sifat
2.	SMPN 2 Jalancagak	Titi Wahyuni, SPd	13-10-2012	Sistem Pernafasan
3.	SMPN 1 Tanjungsian	Yeti Suryawati, MPd	10-11-2012	Kalor (Azas Black)

Kegiatan *Lesson Study* setiap tahapannya diawali dengan **plan** yaitu merancang persiapan untuk pembelajaran meliputi *materi ajar, teaching material (hands on)*, strategi pembelajaran dan menentukan siapa yang berperan sebagai *guru model*. Di awal memang susah untuk menentukan guru model, dengan alasan guru :

1. merasa belum siap dalam mengimplementasikan pembelajaran berbasis siswa aktif
2. belum siap/malu untuk dilihat oleh temannya / observer pada saat mengajar
3. belum siap untuk diberi masukan/saran maupun kritik dari teman observer.

Pada tahap ini kami secara kolaborasi membuat perangkat pembelajaran antara lain :

- 1) Rencana pembelajaran yang berkembang menjadi chapter design yang lebih simple dan jelas langkah/sintaks pembelajarannya.
- 2) LKS (Lembar Kerja Siswa) atau petunjuk praktikum (jika menggunakan praktikum)
- 3) Media atau alat peraga, jika tidak tersedia di laboratorium sekolah, akan dicari alternatif dengan memakai bahan lokal (*local material*) yang ada di sekitar kita.
- 4) Alat penilaian proses dan hasil pembelajaran
- 5) Lembar observasi pembelajaran

Gambar 1. Suasana *Plan* yang dibimbing oleh dosen sebagai nara sumber

Gambar 2. Peserta membuat rancangan pembelajaran (*Plan*)

Tahap berikutnya dilaksanakan **Do**/pelaksanaan implementasi pembelajaran/*open class* yang jadwalnya sudah ditentukan pada saat plan. *Open class* dilaksanakan di sekolah tempat guru model mengajar. Selain kita dapat belajar dari pembelajaran yang dilakukan para peserta merasa senang dapat berkunjung ke sekolah lain, melihat lingkungan/suasana baru. Sebelum dimulai *open class*, guru model menyampaikan pemaparan Rencana Pembelajaran/chapter design yang akan dilaksanakan, model, strategi apa yang dipakai dan hal-hal lain yang dirasa perlu untuk disampaikan. Fasilitator juga menyampaikan aturan/tata tertib bagi observer yang melakukan pengamatan

Gambar 3. Pembukaan oleh Kepala Sekolah pada tahap *Do (Open Class)*

Gambar 4. Pemaparan Rencana pembelajaran oleh guru model sebelum *Open class*

Pada tahap 2 tidak selalu didampingi oleh nara sumber di setiap pertemuannya/di selang-seling. Memang dalam setiap kegiatan *Lesson Study* tidak selalu harus ada nara sumber dari perguruan tinggi atau dari expert (tenaga ahli), namun jika ada juga lebih baik untuk memantapkan dan memverifikasi pendapat atau saran dari para peserta.

Gambar 7. Penyampaikan materi oleh guru pada *Open Class*

Gambar 5. Posisi *observer* saat *open class*

Gambar 8. Guru memberi pengarahan pada kelompok

Gambar 6. Kegiatan *observer*, yang tidak mengganggu proses kegiatan belajar mengajar

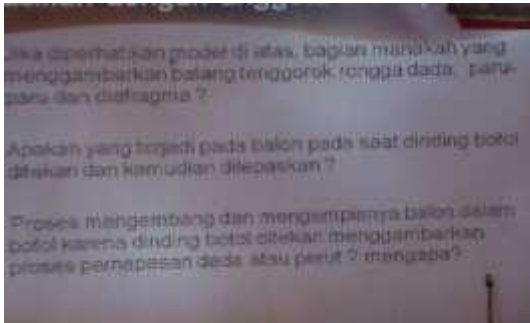

Gambar 9. Guru membimbing kerja kelompok

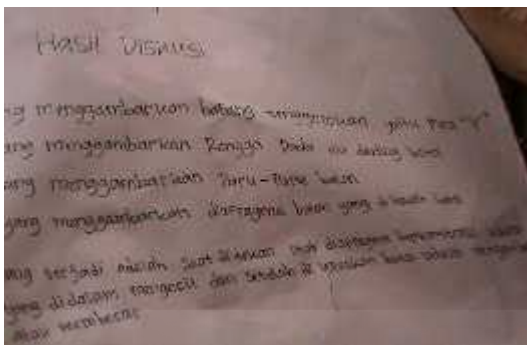

Gambar 10. Siswa sedang presentasi di depan kelas

Gambar 11. Suasana diskusi kelas

Gambar 12. Lembar Kerja Siswa

Gambar 13. Hasil Diskusi Siswa

Gambar 14. Hasil Kerja Siswa

Gambar 15. Hasil Refleksi Siswa

Selesai kegiatan pembelajaran siswa diminta menuliskan kesan dan apa yang dirasakan pada pembelajaran saat itu (refleksi siswa).

Begitu selesai *open class* dilanjutkan **refleksi**. Menurut pengakuan para guru model pada umumnya, di awal pembelajaran merasa gugup/groggi karena banyaknya observer yang mengamati, tapi lama kelamaan sudah merasa biasa dan enjoy lagi. Hal ini juga dirasakan oleh siswa, apa lagi yang baru dipakai pertama *open class*, tapi mereka senang karena pembelajarannya menarik dan menyenangkan. Berikut ini pengakuan/kesan Bu Reva Rimatussodiq, SPd sewaktu jadi guru model : "Senang karena pada saat diskusi mendapat masukan dari teman guru /observer kekurangannya di mana, sehingga dapat memperbaiki pembelajaran berikutnya.

Pada awal kegiatan *Lesson Study* banyak guru pengamat yang lebih terfokus pada cara guru mengajar, misalnya bahasa penyampaian materi yang rumit/sulit dimengerti, materi kurang lengkap, aperepsi terlalu lama, alokasi waktu yang tidak sesuai RPP, perlunya guru memberi perhatian lebih pada kelompok siswa tertentu, persiapan guru kurang, instruksi guru kurang jelas dan lain-lain. Namun setelah dijelaskan oleh fasilitator maupun nara sumber maka pengamatan guru lebih terfokus pada proses belajar siswa di kelas. Hal ini terlihat pada saat refleksi. Pengamat memberi masukan tentang siswa yang bermasalah pada saat pembelajaran, baik masalah kecakapan, kesulitan bekerja sama, kesulitan konsentrasi atau sering

memicu keramaian kelas. Kemudian secara bersama didiskusikan untuk dicari solusinya. Banyak pengalaman berharga juga di dapat oleh guru observer tentang hal-hal positif dari pembelajaran oleh guru model baik dari cara/teknik mengajar, model/strategi atau media yang digunakan, apalagi bagi guru yang latar belakang bidang pendidikan yang berbeda, misal yang dari program Fisika akan mendapat pengalaman waktu melihat pembelajaran Biologi ataupun sebaliknya. Di sinilah terlihat adanya pengkajian pembelajaran secara *kolaboratif* berdasarkan prinsip *kolegalitas* dan *berkesinambungan*, sehingga terjadi *mutual learning* (saling belajar) untuk membangun *komunitas belajar*.

Para peserta yang tergabung dalam MGMP IPA antusias mengikuti *Lesson Study* menyangkut permasalahan nyata di kelas sehingga dapat dipakai/diterapkan di sekolah masing-masing. Selain itu juga tidak monoton setiap MGMP berkutat dengan urusan administrasi seperti pembuatan RPP, pembuatan soal seperti yang sudah berjalan.

Gambar 16. Refleksi yang diawali penyampaian kesan waktu pembelajaran oleh guru model

Berikut ini beberapa *pengalaman berharga* yang kami dapat dari *Lesson Study* yang telah dilaksanakan.

1. Pada topik sistem peredaran darah dapat dilakukan dengan cara simulasi dan dibuat syair dan dilagukan, walaupun pembelajaran pada open class waktu itu belum maksimal. Syairnya :  
*Serambi kanan → bilik kanan → ke paru-paru → serambi kiri → bilik kiri → seluruh tubuh*
2. Pada topik Sistem Ekskresi /Ginjal, penyampaian materi yang menarik dengan cara dibuat syair dan lagunya (lagu seperti lagu Sedang apa). Syairnya :

*Glomerulus-Simpai Bowman ada di dalam kortex terjadi filtrasi lalu masuk ke tubula. Tubula proximal → lengkung Henle → lalu tubula distal terjadi reabsorpsi lalu ke tubula kolekta. Dari pelvis*

*lalu masuk ureter ditampung di kandung kemih keluar lewat uretra*

3. Penggunaan *local material*/materi lokal untuk media pembelajaran seperti :
  - a. Pembuatan Periskop dengan memakai pralon PVC/dus dan kaca.

Gambar 17. Siswa membuat periskop dari dus dan kaca

Gambar 18. Siswa menggunakan periskop hasil kerja kelompoknya

- b. Penggunaan betadin untuk mengganti lugol pada uji makanan dan memakai wadah bekas es krim dan pengaduknya untuk mengganti lumpang dan alu porselen (Pada topik Makanan dan fungsinya).

Gambar 19. Siswa sedang praktek menguji makanan

Gambar 20. Siswa sedang menerangkan hasil uji lemak

- c. Pembuatan model paru-paru dengan balon dan bekas botol minuman

Gambar 21. Model Paru-paru: 1.rongga hidung  
2.trakea 3.bronkus 4.paru-paru 5. diafragma  
6.rongga dada

Gambar 22. Saat balon biru (diafragma ditarik) balon kuning (paru-paru) mengembang terjadi inspirasi, jika dilepas balon kuning akan mengempis kembali (ekspirasi)

4. Pada penyampaian Pemuainan Zat menggunakan metode eksperimen :
- a. Meletuskan balon menggunakan balon yang disiram berbagai macam zat cair (air, minyak putih) untuk diarahkan pada konsep zat padat dapat memuai jika dipanaskan.

- b. Mengarahkan konsep zat memiliki koefisien muai lebih besar akan memuai lebih cepat dengan menggunakan 3 botol kecil/bekas yakult yang diisi cairan berbeda (air, minyak dan alkohol) yang diberi sedotan bening dan mulut botol dirapatkan dengan vaselin/lilin. Ketiga botol tersebut masing-masing diletakkan di wadah/baskom terbuka lalu baskom kita isi air panas dengan volume yang sama. Kecepatan muai dapat dilihat dari naiknya cairan pada sedotan.

Gambar 23. Kecepatan naiknya cairan di sedotan antara alkohol, minyak dan air

5. Pada topik Reaksi Kimia, untuk membuktikan :
- a. Adanya perubahan warna dan suhu : mencampur air dan obat luka lalu ditambahkan tablet vitamin C
- b. Adanya gas, endapan dan perubahan suhu: mengisi balon dengan soda kue, lalu memasang ujung balon ke ujung botol plastik yang sudah diisi asam cuka. Kemudian menumpahkan soda kue dalam botol tersebut ke dalam balon yang sudah berisi cuka.

Gambar 24. Balon mengembang ketika terjadi campuran soda kue dan asam cuka, botol terasa hangat dan ada endapannya

6. Dalam pengelompokan siswa harus beragam dan seimbang baik gender maupun kemampuan. Harus ada leader/ketua dan pembagian tugas yang jelas.
7. Penegasan dari nara sumber (Drs. Pasaoran S, MPd).

Dalam mengambil kesimpulan dari percobaan harus berdasarkan *data* jangan interpretasi b. Pada proses pembelajaran jangan biasakan berbicara dengan pemenggalan kata

Akhirnya kembali kepada diri kita masing-masing apakah mau atau tidak, berniat meningkatkan profesionalisme dan berusaha menjadi guru ideal yang mempunyai performance antara lain :

1. Bersungguh-sungguh melakukan persiapan pembelajaran dan berusaha mengimplementasikan rencana pembelajaran yang telah direncanakan.
2. Mendorong dan membantu siswa agar dapat belajar
3. Melakukan evaluasi/penilaian atas efektifitas dan efisiensi pembelajaran yang dilakukan
4. Kemauan untuk berkembang, melakukan inovasi pembelajaran sehingga dapat meningkatkan mutu pendidikan serta dapat membangun karakter siswa /sumber daya manusia contohnya di Jepang seperti yang diungkap Ali Mustadi (2013), yang sudah mengamalkan nilai-nilai karakter seperti disiplin waktu, ramah dan hormat termasuk dengan orang yang belum dikenal, jujur dan tanggung jawab, bahkan ada momen di beberapa sekolah siswanya belum pulang sebelum lingkungan sekolahnya bersih, sehingga siswa mengepel semua lantai sekolah, sebuah fenomena yang langka di negeri ini.

#### 4 KESIMPULAN

Dari kegiatan *Lesson Study* di MGMP IPA dapat disimpulkan beberapa pengalaman maupun pelajaran berharga yang didapatkan, antara lain :

1. Guru dapat berkolaborasi dan bertukar pikiran dalam merencanakan pembelajaran/pembuatan design pembelajaran (*plan*).
2. Sebagai forum belajar bersama (belajar dari pembelajaran) dari kekurangan maupun kelebihan pada waktu open class.
3. Hasil refleksi dapat digunakan untuk perbaikan design pembelajaran berikutnya (*redesign*).
4. Guru model dapat mengetahui kekurangan pada saat open class sehingga dapat memperbaiki pembelajaran berikutnya.
5. Observer mendapat pengalaman/pelajaran dari pembelajaran yang dilakukan guru model (misal teknik mengajar yang pas atau media maupun cara mengatasi siswa yang tidak belajar).
6. *Lesson Study* dapat dijadikan wahana supervisi Kepala Sekolah dalam melaksanakan program *Penilaian Kinerja Guru (PKG)* dan

*Pengembangan Keprofesian Berkelanjutan (PKB).*

#### 5 UCAPAN TERIMAKASIH

Dengan selesainya penulisan makalah saya ucapkan terimakasih kepada :

1. Bapak Dr. Sumar Hendayana, MSc dan Bapak Drs.Pasaoran MPd atas konsultasinya.
2. Bapak Dr. H. Mulkan Karim sebagai Kepala Sekolah SMP Negeri 1 Ciater atas ijin dan kesempatan yang diberikan.
3. Bapak Yaumi Basuki ,SPd dan Bapak Dasum Saripudin, SPd sebagai fasilitator.
4. Rekan MGMP IPA Komisariat Jalancagak atas kerjasamanya dalam pelaksanaan *Lesson Study*
5. Semua pihak yang tidak dapat disebutkan satu per satu yang telah memberi kontribusinya.

## Lesson Study on ICT-Integrated Lessons: *The Singapore Context*

Suryani Atan

Ministry of Education, Singapore City, Singapore  
suryani\_atan@moe.gov.sg

**Abstract:** According to Lewis and Hurd (2011: 3), Lesson Study is a simple idea with complex process. It provides an on-going method to improve instruction based on observations of students and their work. However, Lesson Study is not a quick fix. It is a slow and steady means of instructional improvement. It is very useful especially in researching ICT integrated lessons because only if done well, ICT has the ability to enhance students' learning, engage and motivate them. Hence, Lesson Study was conducted for 50 primary and secondary schools that implemented 10'M Programme, an ICT integrated programme for the teaching and learning of Mother Tongue Language, specifically Malay Language. This programme was initiated by Educational Technology Division (ETD) of Singapore Ministry of Education (MOE). As part of the professional development provided to teachers in the programme, 10'M Mentors worked closely with 10'M teachers to ensure the appropriate integration of ICT. The 10'M Mentors took the role of knowledgeable others in the Lesson Study conducted. This paper discusses the processes and findings of the Lesson Study conducted. Besides discussing the observations and improvements made to lesson design, students' learning, 10'M/ICT integration, classroom management, and subject content, this paper will also be sharing the processes adopted and customised to situations unique to Singapore context such as small number of classes for each level of the Malay Language class. As such, the Lesson Study has to be conducted in the following patterns: (a) 1 Teacher 1 Class; (b) 2 Teachers 2 Classes; (c) 3 Teachers 3 Classes; (d) 1 Teacher 2 Classes; and (e) 3 Teachers 1 Class. Each pattern has its strengths and weaknesses, thus, contributed to the extent of improvements observed. These strengths and weaknesses will also be discussed in this paper.

**Keywords:** lesson study, mother tongue language, ICT (information and communication technologies)-based lesson, teachers' professional development

### 1 INTRODUCTION

Teachers need to improve their skills if they want to do a good lesson even if they have good lesson plan or good textbooks. And, one good way to improve teachers' teaching skills is to do research lesson (Lewis, 2002, p. 22). This approach called Lesson Study provides an ongoing method to improve instruction based on observations of students and their work. Teachers in the research team would first formulate the goals for student learning and long-term development. They would collaboratively plan the lesson, which is the research lesson, before conducting the research lesson. One team member would be teaching whilst others gathering evidence on student learning and development. The evidence gathered would be discussed. Findings from the research lesson would then be used to improve the lesson, the unit, and instruction more generally.

This approach was conducted for all primary and secondary schools that implemented 10'M Aksara programme in 2013. This programme promotes the integration of ICT in the teaching and learning of Malay Language. It leverages on the affordances of technology. These affordances have the ability to create possibilities for students to learn at their own pace, to be self-directed learners, and to

work with each other and by doing so, learn from one another. This paper attempts to show that technology, particularly ICT, has the ability to transform the way students learn if done correctly. Therefore, to ensure the correct integration of ICT, teachers in this programme were guided and mentored by 10'M Mentor in pedagogical approaches, lesson design, and assessment. Lesson Study was conducted so that the 10'M teachers can collaboratively work towards improving their teaching skills.

### 2 BACKGROUND OF 10'CMT

Introduced in 2008, 10'CMT is a teaching and learning programme that fronts innovative ICT use for engaged learning to promote pupils' interest and hone their skills in Mother Tongue Languages such as Chinese (C) Language, Malay (M) Language, and Tamil (T) Language. The 10'CMT programme makes the most of the opportunities offered by ICT in achieving student-centred learning environment. It enhances the teaching-learning process by providing interactive learning experience that can be customised to cater to different learning abilities. In addition, this programme fosters self-paced

independent learning and provides opportunities for collaborative learning.

The 10'CMT pedagogical approach incorporates a 2-1-1 structure that represents 50% of teacher teaching time, 25% of students' practice time, and 25% of students' output time. The time set aside for students promotes self-paced independent learning during curriculum time. This helps to further student's own effort to acquire knowledge. This is further enhanced by the one to one computing environment. Each student works individually and collaboratively online.

Teachers in the programme can also leverage on the affordances of an array of ICT tools that enable individual and collaborative work to be conducted comfortably online. Teachers can set differentiated tasks for students to customise to their learning needs. Through thoughtful design of the 10'CMT lesson, students are given: (1) ample time for online reading and self-construction of knowledge; (2) ample opportunities for self-improvement before evaluation; and (3) appropriate avenue for online collaboration through peer editing, online rubrics for self-peer-teacher evaluation and peer-to-peer comments and feedback. This programme has the ability to increase students' interest and motivation to learn the Mother Tongue Languages.

### 3 LESSON STUDY

Lesson Study is an approach adopted in Japan before it is widely used in America. This research depends heavily on collaboration amongst teachers in schools. It entails the requirement for teachers to discuss and plan the lesson plan, teach based on the lesson plan whilst being observed by other teachers in the team. After which, the teachers will reflect on the teaching based on their observation. The particular lesson, known as the research lesson, will go through refinement before it can be re-taught to another group of students.

According to Lewis and Hurd (2011, p. 3), Lesson Study is a simple idea with complex process. The key to this approach is collaboration in every aspect. This will include identifying the goal, planning the research lesson, teaching and observing the lesson, discussion on the findings and refinement to be made to the research lesson.

Fang and Kim-Eng (2010) researched on Lesson Study in 2006 and 2007. The objective was to observe how this approach could increase teachers' learning and improve their teaching. The two years research involved teachers from primary schools in Singapore and researchers from the National

Institute of Education (NIE), Singapore. Their findings confirmed that Lesson Study was able to improve teaching continuously. In addition to that, teachers felt the ownership of the lesson. The teachers agreed that more time was needed to conduct Lesson Study and therefore, support from school leaders was helpful.

### 4 10'M LESSON STUDY

More than 50 primary and secondary schools embarked on the 10'M programme in 2013. This is a 5-fold growth in number since 2010 when the programme was first introduced. The programme started with just 10 schools in 2010. As part of the professional development provided to teachers in the programme, 10'M mentor works closely with 10'M teachers to ensure the appropriate integration of ICT. The Lesson Study approach was adopted in 2013 to collaboratively improve the instructions and at the same time, develop the 10'M teachers professionally.

The usual practice of improving teachers' instructions is to conduct the research lesson and improve on it during the post conference session. The refined lesson will be conducted on another group of students. Further refinement will be made and conducted on another group of students or kept for future use or reference. However, in Singapore, the number of Malay Language students per level may not be big enough to form more than one class. Hence, for schools with only one class, the exact research process described earlier could not be carried out.

Therefore, some tweaking of the standard research lesson process is needed. This resulted in the research lesson being conducted in several patterns according to the number of classes and teachers the lesson study learning community has. Therefore, guided by the programme mentor, who also acted as the knowledgeable other in the research, the Lesson Study was conducted in the following pattern:

#### 4.1 Pattern A: 1 Teacher 1 Class

This pattern is dominant. It consisted of one teacher teaching only one class. There were other teachers in the research team but the lesson was conducted by only one teacher to a group of students. Refinement was made but the refined lesson was not re-taught because the group of students is the same. The teacher, however, implemented the strategies and

ideas formulated during the post-conference or reflection stage into the newly design lesson.

#### 4.2 Pattern B: 2 Teachers 2 Classes

This pattern took place when there were two groups of students of the same level. Each group of students was taught by a different teacher. The teachers and other research team members collaborated in the planning of the research lesson. The first teacher started the research by teaching her class based on the planned lesson. The second teacher and other members of the team observed the teaching. Refinements were made during the reflection session and the second teacher re-taught the refined lesson to the second group of students. Post-conference would follow and the refined research lesson would be further refined and kept for future use.

#### 4.3 Pattern C: 3 Teachers 3 Classes

This pattern took place when there were three groups of students of the same level. Each group of students was taught by a different teacher. The teachers and other research team members collaborated in the planning of the research lesson. The first teacher started the research by teaching her class based on the planned lesson. The second and third teachers, along with other members of the team, observed the teaching. Refinements were made during the reflection session and the second teacher re-taught the refined lesson to the second group of students. Observation by the first and third teachers, and also members of the team took place and refinements were made during the reflection session before the third teacher re-taught the second refined lesson to the third group of students. Post-conference would follow and the second refined research lesson would be further refined and kept for future use.

#### 4.4 Pattern D: 1 Teacher 2 Classes

This pattern occurred when the same teacher taught two groups of students of the same level. The teacher and other research team members collaborated in the planning of the research lesson. The teacher started the research by teaching her first class based on the planned lesson whilst being observed by other members of the team. Refinements were made during the reflection session and the same teacher re-taught the refined lesson to the second group of students. Post-conference would

follow and the refined research lesson would be further refined and kept for future use.

#### 4.5 Pattern E: 3 Teachers 1 Class

This pattern occurred when three different teachers taught the same group of students. Collaboration in planning of lesson took place before the first teacher taught the students. Observation and refinements were made but because there was only one class, the refined lesson was not re-teach. However, strategies and ideas formulated during the post-conference or reflection stage were implemented into a newly design lesson. The new lesson was taught by the second teacher to the same group of students. Observation and refinements took place. The refined research lesson was not re-teach. Lessons learned from the second research lesson were implemented during the design of another new research lesson. After which, the third teacher taught the same class based on the newly designed research lesson. This particular lesson would also go through refinement during the reflection stage and kept for future use.

### 5 DISCUSSION

Each Lesson Study pattern has its strengths and weaknesses, thus, contributed to the extent of improvements observed. For teachers who conducted the Lesson Study in Pattern A and D, they were the ones who improved the most in their instructions because they conducted the first research lesson, improved on it, and then conducted the refined research lesson again. These teachers benefitted the most because of the second opportunity to teach the research lesson.

On the other hand, students in Pattern A and E benefitted the most because they received the teaching of a refined research lesson. For students in Pattern B, C and D, the second and third group benefitted more than their peers in the first group, which is the first research lesson because they received lessons that have gone through refinement.

Teachers in Pattern B, C and E, however, were the most collaborative group because they observed each other's lesson and provided inputs excessively. They were usually very focus during lesson observation and always aimed to deliver a better lesson than the first research lesson conducted by their peers. Besides that, lessons designed by these groups of teachers were always very interesting and creative.

Besides discussing the strengths and weaknesses of the different Lesson Study pattern, this paper also discusses the observations and improvements made to instructions that integrate ICT. The research lessons were conducted for lessons that taught speaking skills, reading skills that included reading aloud and reading comprehension, writing skills and grammar knowledge to groups of seven-year-olds to ten-year-olds primary school students and thirteen-year-olds secondary schools students in Singapore. These Malay Language students were learning the language in a computer-enhanced environment, namely the 10'M Programme. This paper attempts to extract the observations and improvements of the lessons in the following areas.

### 5.1 Lesson Design

10'M lesson should be organised in a 2-1-1 structure that represents 50% of teacher teaching time, 25% of students practice time, and 25% of students' output time. Majority of the lessons observed were conducted in this structure. Generally, in the 50% teacher teaching time structure, students were involved in think-pair-share activities where students work in pairs to discuss, find answers or solutions, and exploiting on students' real life experiences. Students were given ample practice and production time. However, occasionally, teachers spent more time in the teacher teaching time. The usual activities that disrupted the allotted time were the tuning-in and the induction where singing and game activities took longer than expected. This had a snowball effect on the whole structure of the lesson. It resulted in leaving the teachers with no or not enough time to summarise or conclude the lessons. During the reflection stage, it was suggested that the tuning-in and lesson inductions be simplified by way of reducing the number of time the students were allowed to sing, and the number of task that the students have to complete in the game segment. There were vast improvements in the second research lesson observed. Teachers were able to evaluate students' work as a class, summarise and conclude the lessons well.

### 5.2 Students' Learning

Generally, students were excited throughout the lesson. They participated keenly in the activities crafted for them, watched the videos earnestly, and putting up their hands to ask or answer questions, and provide feedback or comment. They showed

their understanding by their ability to re-tell stories read, watched or heard. They were able to comprehend the passages that they read by answering comprehension questions regarding the texts. Majority of them were also able to complete the tasks given to them by the teachers. Occasionally, the students had difficulty in understanding the teachers' instruction. They were not able to execute the tasks given as instructed. One example will be when students were unsure of how to log into the portal and access the correct folder in the portal. This usually happened to new users of the 10'M portal where instructions were given verbally. It resulted in time wasting as the students grappled to navigate the portal.

During the post-conference, it was suggested that teachers provide clear instructions by way of preparing in advance, the screen capture of the relevant interface, or going through the navigation once with the students before they started working on their computers. Another example would be the difficulties the students faced in answering comprehension questions and writing compositions and reflections. Observers concluded that not enough scaffolding was given, thus the confusion. Passages for reading comprehension were not discussed; structure to write or speak was not provided. It was suggested that all passages read should be discussed for understanding and teachers could apply the asking words of 5W1H (who, what, where, when, why, how) in understanding a passage, preparing a speech, and writing a composition. Reflections should be guided by way of informing the students in what areas that they could reflect on. It was observed that when the refined lessons were taught, students were able to complete the tasks more confidently. They were also able to edit their peers' work more efficiently and confidently.

### 5.3 Integration of 10'M/ICT

“Student computer expertise can supplement the limited availability of the teacher. Moreover, as inherent feature of the technology is that work in progress on the screen is public in a way that paper on a student's desk is not” (Cazden, 2001, p. 109). With appropriate integration of ICT into lessons, students' learning is enhanced. From the research lesson, it was observed that most teachers could integrate the 10'M portal well into their lessons. They were able to use suitable template for the teaching of language skills and grammar. Besides the affordances of the 10'M portal, the teachers were able to leverage on other open tools such as Google

Share to conduct sharing of ideas. The 10'M portal was optimised. Affordances like editing tools, rubrics attachment for self, peers and teacher evaluation, and comment section for providing feedback, were utilised.

However, there were instances where the portal was used for the purpose of writing composition only. During the reflection session, it was suggested that the writing of composition must be followed by self and peers evaluation by means of either the use of rubric, comment or stars. After which, students could be taught to use the editing tool to edit their peers' work. With the integration of technology, technical issues did arise. It was observed that the experienced teachers would quickly find alternative and solutions. However, for teachers who were new to the programme, they needed more time to rectify the situation. Some suggestions were given during the post-conference should the same technical issues happen. It was observed that all the teachers were better prepared in handling technical issues in their subsequent lessons.

#### 5.4 Classroom Management

Generally, 10'M teachers could manage the classroom well. Teachers were very patient in helping students with their questions and troubleshooting the computer system whenever technical issues arise, going from one computer station to another. Students were trained to waive paper cups, ice-cream sticks or paper lollipops should they need any assistance. Students were generally well behaved and followed instructions.

However, there were few instances when students became super excited after an exciting tuning-in or games. The excitement was evident throughout the lesson and the teachers found it difficult to calm them down. It was noted during the reflection stage that when left without intervention, the excitement became a classroom management problem. Students could not stop talking and they started 'visiting' each other at their computer station. It was then suggested that the teachers must ensure that the students have calmed down before going to the next stage of the lesson. When applied, the classrooms became more manageable and students' learning time was increased.

Time management is also a factor of classroom management. Time management was well executed by many teachers. Students were told the exact duration allotted to them when working at their computer and it was observed that most students abided by the time given. In classes where allocation

of time was not given or students took longer time to complete their tasks, some planned activities could not be completed. It was suggested during the post-conference that students needed to learn to work within a time frame given. But this would also mean that ample time should be given to students to complete the task given to them. Whenever it was observed that the duration given was too short or too long, adjustments were made during the reflection stage.

#### 5.5 Subject Content

Research lessons included the teaching and learning of language skills and sub-skills. Students were taught listening skills, speaking skills, reading skills and writing skills. In addition to that, students were also taught the Malay grammar. In general, the lessons were much focused on one language skills or grammar knowledge. The teachers were able to plan activities relevant to learning the skills or grammar knowledge. However, improvements were suggested in the area of scaffolding. This domain is closely related to the students' learning domain. With proper scaffolding, students were able to grasp the language skills and grammar knowledge well.

One example would be the use of first person in a reading comprehension passage for a group of seven-year-olds. Without enough explanation and scaffolding, the students could not understand the concept of 'writer' that was used in the reading comprehension question. They had difficulty relating the 'I' in the comprehension passage with 'the writer' in the question given. It was suggested in the reflection stage that the concepts be scaffold or the comprehension passage used third person as the main character in the reading comprehension passage. The team had chosen the later and vast improvement was observed in the students.

Besides this, the criteria and descriptions used in the rubric for self and peer evaluations also required explanation and scaffolding. It was observed that when explained and scaffold, the students had a better understanding of the benchmarking and were able to evaluate objectively and more accurately. In addition to that, students' understanding increased when words that were assumed to be difficult were spotted on and discussed with students. Deeper discussion and ample examples on grammar concepts also helped to make learning easier.

## 6 CONCLUSIONS

Lesson Study is definitely simple but challenging. The process is intricate and time consuming. In addition, it requires some adaptation to customise and suit situations unique to Singapore context such as small number of classes for each level of the Malay Language class. However, the end result is encouraging. The 10'M teachers have shown improvement in their instructions and they have developed professionally. They are more confident in integrating ICT into their lessons and have integrated ICT well. With better instructions, students' learning has increased and they were able to leverage ICT for self-paced, self-directed and collaborative learning. Students' ability to do self and peers evaluation has also improved because they have a better and deeper understanding of the criteria and descriptions in the rubrics used. The 10'M teachers were satisfied with their students' progress and with their own learning throughout the collaboration. The teachers' learning is aligned with that of the teachers in Japan who practised Lesson Study, that is a successful research lesson does not depend so much on what happens in the research lesson itself but also what the teachers learned from working with their colleagues (Lewis, 2002, p. 34).

## 7 ACKNOWLEDGEMENTS

This paper would like to acknowledge the 50 primary and secondary schools who participated in this research.

## Differences between A Teacher’s and Children’s Recognition to Classroom Rules

### *The Process of Removing the Differences in a Fifth Grade Class*

**Abstract:** “Classroom rules” embody a way of life for teachers and children in class. Classroom rules put the abstract aims of schooling into concrete patterns for daily activities. In Japan, it has been stated that there are differences between a teacher’s and a child’s recognition of classroom rules in fifth and sixth grade classes. Such as, some teachers recognize that some classroom rules are important, but some children do not recognize them as such. However, these differences have not been analyzed from the standpoint of the children, nor academically. This study was designed to investigate differences between a teacher’s and child’s recognition of classroom rules. In order to examine how these differences are related to children’s adjustment to their classroom, and to analyze how these differences can be addressed within the class, four kinds of questionnaires were distributed to both the teacher and the children. The authors observed the fifth grade classroom for three months and analyzed the rules qualitatively. The following results emerged from the analysis: (1) There were five kinds for categorization of the classroom rules, (2) there were four types of differences between the teacher’s and children’s recognition, the existence of the rules, the degree of importance, the priority, and the purpose, (3) the differences of recognition of the classroom rules (degree of importance) negatively influenced the children’s adjustment to their classroom, (4) one possible solution to negotiate the differences in the recognition of the existing classroom rules was to create new rules with the involvement of both the teacher and the children. It is possible that classroom rules can be changed by teacher-child interaction in classes to address differences in perception of classroom rules. It was also suggested that these differences should be addressed because they may cause maladjustment for children.

**Keywords:** classroom rules, differences of recognition, elementary school, negotiation.

## 1 THE QUESTION AND THE PURPOSE

### 1.1 Features of Classroom Rules

According to Shultz et al.(1983) and Arima (2000), there are some rules related to learning and interaction that children are required to follow in classroom. When children are accustomed to the rules, behavior of the children and the teacher gets patterned (Broomstrom, 1991), and that can make children’s learning outcomes increased (Gaddy, 1988). Some researchers said that it is very important to introduce rules in classroom management (Brophy, 1983; McGinnis, Frederick, & Edwards, 1995).

Introduction of classroom rules has been found soon after children enter elementary schools, from April to July (Kagawa and Yoshizaki, 1990; Arima, 2001; Shimizu and Uchida, 2001). During this

period, teachers explicitly instruct the way children behave in class many times. It is because teachers expect that children can adapt to classroom instruction as soon as possible, and that teachers can go on teaching smoothly.

After this period, the rules are instructed only when they are broken. Researchers observed that rules were instructed implicitly, not explicitly, over the second graders’ classes (Arima, 1999, 2000; Hori, Maruno, & Kato, 2002).

Researches on classroom rules such as mentioned above have tried to identify the implicit rules. For instance, Arima (1999; 2000) identified some implicit rules which can make classroom instruction go on smoothly by observing that teachers give children advices or praise them in class.

## 1.2 Problem of Differences of Recognition to Classroom Rules

In recent years, it has been noted that recognition of keeping rules seems to be different between teachers and children in upper graders' classes. Fuchikami (2009) found that there were some teachers with stress of not going on class smoothly because several children sometimes broke the rules. It can be said that it is necessary to review methods for solving the recognition gap between teachers and children.

Several methods for solving the problem have been found by researchers. For example, a teacher explicitly instructs the rule to a child who don't keep it. A teacher explains the rule to children (Kishino and Muto, 2005). And a teacher demonstrates how to behave to follow the rule (Matsuo and Maruno, 2007). In previous literature, there seems to be an agreement that these methods can be a solution for differences of recognition.

However, it seems that we have to consider other four kinds of problems in the studies; limited participants, unclear definition of differences, a lack review of influence of differences, and inadequate review of the hypothesis.

First, in previous studies on differences of recognition to classroom rules between teachers and children and the solution, it can be said that the major participants were teachers. One of the studies identified classroom rules conducting interviews with teachers and observation teacher's behavior in class (e.g. Arima, 1999; 2000). It seems to be necessary that we investigate how children recognize classroom rules as well as teachers.

Second, features of differences of recognition to classroom rules have not been clearly defined in previous literature. It may be because surveys on awareness of differences of recognition have been conducted, which participants were only teachers (e.g. Fuchikami, 2009). So it cannot be defined not only how children recognize the rules but also how children recognize the differences. At the same time, it is important to analyze the data both quantitatively and qualitatively to define the features. On quantitative aspects, researchers have analyzed and reviewed the degrees of importance of differences of recognition with the surveys. On the other hand, qualitative aspects have been left to investigate, such as purposes and reasons for setting classroom rules.

Third, how differences of recognition influence to children has not been investigated. Although it may be not difficult for us to imagine that differences can influence to classroom atmosphere or children to some extent, few investigation have been conducted. Fuchikami (2009) noted that differences of recognition could cause teachers stress. However, it is possible that the stress were not caused by

differences of recognition directly. It cannot be pointed out that it is necessary for only teachers to solve differences based on such kind of studies. If it is investigated that differences of recognition negatively influenced to children, the purpose of resolving differences can be clearly brought up.

Finally, it is necessary to reconsider the hypothesis which claims classroom rules cannot be changed. In previous literature, two solutions for the problems have been found. One is that a few children who had broken the rules turned to follow them. The other one is that such children understood the importance of following the rules. However, Dewey (1916) claimed that rules should be changed by negotiation between a teacher and children in democratic classroom. So it can be said that it is important that classroom rules are also changed undergoing such a process as mentioned above. More importantly, to review whether differences of recognition can be removed or not accompanied by the process is needed in the field of studies on resolving differences of recognition.

## 1.3 Purpose of the Study

Based on previous literature review, the purposes of this study were as follows: (Study 1) to analyze what kind of rules were in the classroom and to what extent the teacher and children recognized the rules were important, (Study 2) to clarify how differences of recognition to classroom rules between the teacher and children influenced to children, especially children's "feeling of adaptation to school" (Emura and Okubo, 2012), "feeling of trust teachers" (Nakai and Shoji, 2006), and "classroom climate" (Ito and Matsui, 2001), and (Study 3) to analyze the process how differences of recognition were resolved and the conditions from the data of observation classes.

## 1.4 Participants

In this study, children in a fifth grade class and their homeroom teacher in a public elementary school in Tokyo were the participants. It was because Fuchikami (2009) pointed out that differences of recognition were found in the upper grade classes. The period of the study was from October to December in 2012. Anonym was used with all participants in the study.

The homeroom teacher was Mr. Fujimoto, who was in the seventh years of teaching, and he had worked at the same elementary school since he started teaching. He worked as a homeroom teacher in the upper grade classes several times. In the previous year, he taught children in the sixth grade class. He seemed to put emphasis on communication among children. When we interviewed with him, after school on November 1<sup>st</sup> in 2012, he said, "I

want children keep their honesty and friendship in the future.”

In the classroom, there were thirty-two children, nineteen boys and thirteen girls. When the school year started April in 2012, classes of the fifth grade children were composed. In September 2012, a child went to another school and a returned child came to the school from China. There seemed to be some boys who inspired other children in the class. They raised their hands and uttered something many times in class. Sometimes the teacher gave some of the children advice about their postures. It seemed that no one deviated such as walking around during the class.

## 2 STUDY 1: IDENTIFICATION OF DIFFERENCES OF RECOGNITION TO CLASSROOM RULES BETWEEN THE TEACHER AND CHILDREN

### 2.1 Purpose

In Study 1, firstly, the purpose was to identify what rules were and what types of rules were in the class (pre-exam). Secondly the purpose was to clarify differences and agreement of recognition to classroom rules which were identified. They were analyzed from the viewpoint of priority of classroom rules (analysis 1), and of the aims and reasons of rules (analysis 2).

### 2.2 Pre-Exam: Identification Rules in Class

#### 2.2.1 Purpose

In pre-exam, the purpose was to clarify how children were required to behave in class to identify differences of recognition to classroom rules.

### 2.2.2 Method

A free description questionnaire was conducted in a class in October 2013. The teacher, Mr. Fujimoto, conducted it. Both Mr. Fujimoto and children answered it. The questionnaire had spaces for writing class and name, and lines to write rules in class. It also had an instruction sentence in Japanese, “Please write as many classroom rules (when you listen to the teacher or friends, when you say something, when you discuss in a group, when you answer the questions of textbooks or papers, etc.) as possible.”

### 2.2.3 Results

The number of classroom rules that the teacher answered to the questionnaire was fourteen. The total number that children answered was three hundred and fifty-two rules ( $11.77 \pm 4.95$  rules). How the authors counted the answers was as follows; clauses which explained conditions (e.g. “when you listen to others,”) and behaviors (e.g. “I look at the person saying something,”) were counted as one set. If there were more than two behaviors per clause, each behavior was counted as one answer. The authors excluded fifty-two answers because they were not about class (e.g. I don’t have any fight with my friends.). The rest of answers were categorized by a bottom-up method. As Table 1 shows, there were five categories of classroom rules.

The first category of classroom rules was named as “Rules to think highly of other children” because the participants answered to the pre-exam such as “When I listen to others, I pay regard to what he/she are thinking” and “I look at the person saying something” (63rules: 20.1%). The second category was named as “Rules to make up persuasive idea” because the participants answered “When I say something in class, I give reasons” and “When I listen to other children, I compare their idea with mine” (26 rules: 8.3%). The third category was named as “Rules to maintain the order” because the

Table 1. Categories of classroom rules classified from the answers

Classroom rules	Definition	Number(%)
Rules to think highly of other children	Not to bother other children, or to recognize other children approvingly	63(20.1)
Rules to make up persuasive idea	To make up idea about tasks or other children’s idea and tell it more persuasively	26(8.3)
Rules to maintain the order	To control self-serving action such as backing up the procedure of classes	34(10.8)
Rules of formal behavior	Routine rules which don’t influence the procedure of classes and what children understand in learning	144(45.9)
Rules of individual works	Rules when each child works on tasks individually	47(15.0)

participants wrote rules such as “I move on the next task quickly” and “When the teacher tells us to stop working, I quit immediately” (34 rules: 10.8%). The

fourth category was named as “Rules of formal behavior” because the participants wrote, “I write my name on papers,” “I respond to the teacher when he calls my name,” and so on (144 rules: 45.9%). And the fifth category was named as “Rules of individual works” because the participants’ answers were such as “I write something to the last line on papers” and “When I work on papers, I skip some questions I can’t answer” (47 rules: 15.0%). Also, the last category was eliminated from the analysis because the authors didn’t have any opportunities to observe children taking exams.

### 2.3 Main Survey: Identification the Differences between the Teacher’s and Children’s Recognition to Classroom Rules

#### 2.3.1 Purpose

Based on the result of pre-exam, the purpose of the main survey was to clarify the difference between the teacher’s and children’s recognition to classroom rules, from the viewpoint of the priority of classroom rules (Analysis 1) and purposes and reasons of classroom rules (Analysis 2). On the one hand, the priority of classroom rules was measured with a questionnaire that the authors made out to identify on what kind of rules the participants put a high priority when they struggle with something in class. On the other hand, the purposes and reasons of classroom rules were measured with another questionnaire which authors made to ask the participants.

#### 2.3.2 Method

On the basis of the four kinds of classroom rules categories, a questionnaire which was named as “Questionnaire about Classroom Rules in Situation You Conflict” was conducted to identify the difference of the priority of classroom rules between the teacher and children (Table 2). The authors described six situations that two rules conflict on the questionnaire. The rules on the questionnaire were chosen for the reason that children might be often required to keep in class, based on the result of pre-exam. The participants firstly wrote their class and name, and answered how important each rule was for them and on which rules they put higher priority in the six situations. Also, the participants answered the reasons why they thought the rules important as free description. Five-point scale was used to measure the level of importance (1= not important at all, 2= not important so much, 3= neither, 4= important, 5= very important). To measure the priority of classroom rules, four-choice question (for example, in situation 1 of Table 2, 1= I copy what are written on the board very carefully, 2= I’d rather copy what are written on the board carefully, 3= I’d rather listen to another child, thinking what he/she wants to tell, 4= I listen to another child, thinking what he/she wants to tell. The teacher was asked to answer how important each rule was for him). The questionnaire was conducted by the authors during a class in November 2013. It took about twenty-five minutes. The answers of thirty out of thirty-two children and the teacher were used for analysis. Two children were excluded from the analysis because one boy was absent on that day and the other boy who was returnee didn’t

Table 2. Content of “Questionnaire about Classroom Rules in Situation You Conflict”

Conflict	Situation
Rules of formal behavior: I copy what are written on the board. Rules to think highly of other children: I listen to another child, thinking what he/she wants to tell.	1 In a class, you tried to copy all of the things written on the board carefully. Then another child started talking.
Rules of formal behavior: I copy what are written on the board. Rules to make up persuasive idea: I write what another child is saying.	2 In a class, after a child talked, the teacher wrote what we learned during the class, not what the child talked about.
Rules to think highly of other children: I say what was good of another child’s utterance. Rules to maintain the order: I listen to the teacher explaining.	3 In a math class, after a child explained how to answer to the question, you would try to say what was good of the child’s utterance. Then the teacher started to explain about the next question.
Rules to make up persuasive idea: I look for the reasons from the textbook. Rules to think highly of other children: I listen to another child, thinking what he/she wants to tell.	4 In a Japanese class, you had an idea and would look for the reason of your idea from the textbook. Then a child started talking.
Rules of formal behavior: I keep on copying what are written on the board carefully. Rules to maintain the order: I start to discuss in a group.	5 In a class, when you were writing what were written on the board, it got to the time to discuss in groups.
Rules to make up persuasive idea: I say the reasons of my idea to my neighbor child. Rules to maintain the order: I listen to the teacher.	6 In a class, when you were discussing with your neighbor child, there was little time left. You talked about what you thought and would say the reasons. Then it was time to finish and the teacher started talking.

Table 3. Contents of “Questionnaire about the Purposes and Understanding of Classroom Rules”

No.	Contents	Classroom rules
1	Not to disagree with others during their utterances right away	Rules to think highly of other children
2	To switch talking and listening quickly	Rules to maintain the order
3	To be willing to discuss in pairs or groups	Rules to maintain the order
4	To look for the reasons of idea from the textbooks, data and result of experimentation	Rules to make up persuasive idea
5	To stop working right away when the teacher says “Stop”	Rules to maintain the order
6	To sit up straight in class	Rules of formal behavior
7	To find out the good points of other children’s idea	Rules to think highly of other children
8	To listen to others, thinking what they want to tell	Rules to make up persuasive idea
9	To talk about idea with the reasons	Rules to make up persuasive idea
10	To write up things when taking notes so that it is easy to review	Rules of formal behavior
11	To take notes what is important in the teachers’ or other children’s utterances	Rules to think highly of other children
12	To respond when you are named to	Rules of formal behavior

understand Japanese so much.

Additionally, another questionnaire was conducted which was named as “Questionnaire about the Purposes and Understanding of Classroom Rules” to investigate the difference of the purposes and reasons of classroom rules between the teacher and children, based on the four categories classified from pre-exam (Table 3). The authors made this questionnaire and they picked out twelve items, three items from four categories each. The twelve items were chosen because it seemed that children were often required to keep the rules, based on the result of pre-exam. The participants wrote their class and names and answered why each item was in class. The questionnaire had an instruction sentence in Japanese, “You don’t have to answer to the questions that you don’t know.” It was conducted by the authors in a class in December 2013. It took about fifteen minutes. Two children were excluded from the analysis because a girl was absent on the day and a returnee boy didn’t understand Japanese very much.

### 2.3.3 Results

#### 2.3.3.1 Difference between the Teacher’s and Children’s Priority of Classroom Rules (Analysis 1

Based on the result of “Questionnaire about Classroom Rules in Situation You Conflict,” the number of children which agreed to the teacher’s priority of classroom rules was worked out. The method was, firstly, to identify on which classroom rules the teacher and children put higher priority in situations that the participants were supposed to conflict, the level of importance in the four-choice question was graded and summed up as one and two, and three and four scores. For example, in the situation 1 of Table 2, “Rules of formal behavior”

was assumed to be graded as one point and “Rules to think highly of other children” was assumed to be graded four point side. If some of the participants chose one or two from the four-choice, it was assumed that they put higher priority on “Rules of formal behavior.” In contrast, if some participants chose three or four from the choices, they would be the ones who thought “Rules to think highly of other children” more important than “Rules of formal behavior.” Secondly, children who agreed to the teacher which rules they thought more important were scored as one point. On the other hand, if children’s choices disagreed to the teacher’s, they were scored as zero point. The authors summed up the total score of each participant answered per situation and the score was assumed to be the number of children in agreement with the teacher (Table 4).

To compare the difference of ratio of agreement with disagreement, binomial test was conducted per situation. As a result, in Situation 2,5 and 6, the classroom rules that children and the teacher thought more important were concordant ( $p < .01$  in each situation). Meanwhile, Situation 3 and 4, the classroom rules were discrepant, which the difference between the teacher’s and children’s recognition in classroom rules was indicated ( $p < .05$  in each situation). In Situation 3 (“Rules to think highly of other children” vs “Rules of formal behavior”), the teacher thought “Rules to think highly of other children” more important, but children put higher priority on “Rules of formal behavior.” In Situation 4 (“Rules to make up persuasive idea” vs “Rules to think highly of other children”), the teacher chose “Rules to make up persuasive idea,” but children thought “Rules to think highly of other children” more important. In Situation 1, any difference was not indicated (*n.s.*).

Table 4. Number of Children in Agreement with the Teacher (N=30)

No.	Classroom Rules	Number of Children	Results
1	formal behavior	12	<i>n.s.</i>
	<b>think highly of other children</b>	18

Table 5. Concordance rate of the teacher's and children's purpose and understanding of classroom rules (N=30)

Classroom rules	Concordance rate (%)	Results
think highly of other children	31.1	discrepance**
make up persuasive idea	48.9	<i>n.s.</i>
maintain the order	31.1	discrepance**
formal behavior	53.3	<i>n.s.</i>

Each concordance rate was calculated by dividing the number of "concordance children" into 90 (3items\*30children) \*\*:  $p < .01$

### 2.3.3.2 Difference between the Teacher's and Children's Purpose and Understanding of Classroom Rules (Analysis 2)

Based on the result of "Questionnaire about the Purposes and Understanding of Classroom Rules," the difference between the teacher's and children's purpose and understanding of classroom rules was investigated. The method was that two raters individually rated whether the teacher's and children's answers were concordant or not. Each rater scored one point when the answers of the teacher and children were in agreement per item. If no comment or disagreement, the score was zero. The raters calculated scores of each child and set up coefficient of correlation, which was  $r=.83$ . It can be said that the reliability of rating was indicated. If ratings of the raters were disagreement, they consulted and decided.

On the basis of the ratings, the number of differences between the teacher's and each child's purpose and understanding of classroom rules per item was calculated (no answer was included into the number of differences). The children's average of the number of differences was  $4.93 \pm 2.13$  (minimum=1; median=5; maximum=8; mode=7). Also, the children's average of the number of no answer was  $2.50 \pm 3.12$  (minimum=0; median=0.5; maximum=9; mode=0). There were fourteen children who had more than six differences, and there were also fourteen children who had at least one item of no answer.

In addition, based on the ratings after rater's consultation, the number of children who agreed to the teacher in the answers of purposes and understanding of classroom rules was calculated. And the concordance rate was computed by summing up the number of children who agreed to the teacher per item for each kind of classroom rules (Table 5). To compare the difference of the ratio of "concordant children" with "discrepant children," binomial test was conducted per classroom rule. As a result, it was indicated that there was a difference between the teacher's and children's purpose and understanding in two kinds of rules ( $p < 0.1$  in each rule). One was "Rules to think highly of other children (31.1%)" and the other was "Rules to maintain the order (31.1%)."

## 2.4 Discussion

From the result of pre-exam, it was clarified that the classroom rules of the participants could be classified into five kinds (Table 1). Until now, it has been assumed that classroom rules meant rules equivalent to "Rules to maintain the order," "Rules of formal behavior" and "Rules of individual works" in this study (Arima, 1999; 2000). It seems that this study indicated the diversity of classroom rules because "Rules to think highly of other children" and "Rules to make up persuasive idea" were found as well. It can be said that children in the class recognized some rules which were needed for social life. For this reason, it is possible to say that a wide range of classroom rules may be recognized not only in the class but also other classes.

Also, the result of main survey showed that there were differences of priority of classroom rules between the teacher and children in two situations which the participants were assumed to conflict (Table 4). Focusing on the rules that there were differences, firstly in Situation 3, the teacher thought "Rules to think highly of other children" more important. In contrast, children put higher priority on "Rules to maintain the order." This result may indicate that children had recognition to respect the teacher because children thought smooth procedure

in class more important. Children might recognize that they could get information and learn more from the teacher's explanation or instruction, and that it would be impolite to the teacher if the order was disturbed. Meanwhile, the teacher put more emphasis on communication among children than children's listening to the teacher. Therefore, the difference between the teacher's and children's recognition to classroom rules was found.

Moreover, in main survey, differences of purpose and understanding of classroom rules were found (Table 5). In the questionnaire which had twelve questions, the number of differences was seven at mode and it was indicated that there were a certain number, fourteen, of children who disagreed to the teacher in more than half items. And the result also showed that there were fourteen children who had at least no answer in the questionnaire. It is possible that a given number of children are keeping classroom rules and living their school life without purpose and understanding of classroom. It is suggested that any support for purpose and understanding of classroom rules which children didn't answer should be improved.

### **3 STUDY 2: INFLUENCES OF DIFFERENCES BETWEEN THE TEACHER'S AND CHILDREN'S RECOGNITION TO CLASSROOM LIFE**

#### **3.2 Question and Purpose**

In Chapter 2, classroom rules that the teacher and children recognized were identified. Furthermore, in was investigated that there were differences of classroom rules between the teacher's and children's recognition. This might be linked with a possibility of children's maladjustment to their school life. For example, if there was a difference of classroom rules between the teacher's and a child's recognition, the child might not rely on the teacher because of the difference. At the same time, there is a possibility that the feeling of adjustment to classroom and classroom climate could be negatively influenced by the differences. Therefore, in this chapter, the purpose was to investigate how differences between the teacher's and children's recognition to classroom rules influenced to classroom life.

Table 6. Content of the Questionnaire about recognition to classroom rules (N=30)

	Contents	Rating scores(SD)
	To find out the good points of other children's idea	4.26(0.94)
	To listen to others, thinking what they want to tell	4.35(0.73)
children	Not to disagree with others during their utterances right away	4.26(1.01)
	Not to say what bruise others	4.65(0.64)
	To pass papers to others with care	4.23(1.17)
make up	To talk about idea with the reasons	4.00(1.09)
persuasive	To compare my idea with others' when listening to others	3.77(1.14)
idea	To take notes what is important in the teachers' or other children's utterances when listening	4.23(1.02)
	To take notes others' idea when talking in groups	3.81(1.29)
	To look for the reasons of idea from the textbooks, data and result of experimentation	3.77(1.11)
maintain	To raise my hand when saying something	4.23(1.17)
the order	To be willing to discuss in pairs or groups	4.16(1.06)
	To switch talking and listening quickly	4.32(1.18)
	To say something when the teacher calls my name without hesitation	4.42(1.00)
	To stop working right away when the teacher says "Stop"	4.45(0.83)
formal	To write my name on every paper	4.45(1.12)
behavior	To write up things when taking notes so that it is easy to review	4.03(1.38)
	To sit up straight in class	4.10(1.23)
	To respond when you are named to	4.42(1.25)
	To stand up when saying something	4.32(1.18)
individual	To read sentences carefully when answering to questions	4.29(1.04)
works	To answer to questions by myself	4.23(1.10)
	To write sentences using full of lines on papers	3.84(1.38)
	To write letters carefully when working on papers	4.06(1.25)
	Not to talk with others when working on papers	4.16(1.30)

The questionnaire was conducted in Japanese. Some letters were modified by the authors so that children could read.

### 3.3 Method

#### 3.3.1 Questionnaire about Recognition to Classroom Rules

Based on the five categories of classroom rules from the result of pre-exam in Chapter 2, a questionnaire was conducted to rate the level of importance of the participants (Table 6). The authors made the questionnaire by picking twenty-five classroom rules, five items from each five category, which were supposed to keep frequently in class, based on the result of pre-exam in Chapter 2. The participants answered to each twenty-five question by five-point scale (1=not important, 2=not important so much, 3=neither, 4=rather important, 5=important). The answers were supposed to be influenced by social desirability because the questionnaire asked the importance of classroom rules. So the questionnaire didn't require class and name of the participants. Also, children were provided with envelopes each and they could hand in the answers in the envelope to the teacher without being checked by the teacher (they were required to write the student number). The authors conducted the questionnaire in a class in November 2013. It took about ten minutes. The same as Chapter 2, "Rules of individual works" was excluded because there was no opportunity of observing children worked individually such as taking exams and the consistent report was needed. Furthermore, two boys were excluded for analysis because one was absent and the other was a returnee who didn't understand Japanese well.

From the result of the questionnaire, ceiling effect was found in a lot of items (Table 6). This result could be considered reasonable because ceiling

effect might be influenced by mind of children and the teacher that classroom rules were important and should be kept.

#### 3.3.2 Questionnaire about School Life

To investigate how children were living their school life, three questionnaires about school life were conducted.

First, "Measurement of reliability on teachers (Nakai and Shoji, 2006)" was used. This questionnaire was consisted of forty items from three factors, to measure how children relied on teachers from the viewpoint of "relief", "distrust" and "legality." The authors were asked to choose items on the questionnaire by the participants, and thirteen items were chosen to measure. There were eight items about "relief," four items about "legality" and one item about "distrust." Since then, items about "distrust" were excluded because only one item was chosen. Also, the authors modified some expressions on questionnaire because the measurement was originally developed for junior high school students. The participants answered to the questionnaire with four-point scale (1= I don't agree at all, 2=I don't agree so much, 3=I partly agree, 4= I strongly agree).

Second, "Questionnaire about classroom climate shorten edition for elementary school children (Ito, 2009)" was used. This questionnaire was consisted of twenty-six items from six factors, "participation to classroom activities," "friction in classroom," "satisfaction with school," "natural self-closure," "intentionally for learning," and "manner for discipline." Also, one item for "manner for discipline" was added and the total number of items became twenty-seven (Ito and Matsui, 2001). The

way to answer was using five-point scale (1=I don't agree, 2=I don't agree very much, 3= neither, 4=I partly agree, 5= I agree).

Third, “Measurement of the feeling of adjustment to classroom for elementary school children (Emura and Okubo, 2012)” was used for the questionnaire. This questionnaire was on the basis of children's internal criteria, from the viewpoint of suitability of individual and environment. It was consisted of fifteen items from three factors, “feeling of comfort,” “feeling of trusted and accepted,” and “sense of fulfillment.” The authors didn't modify any part of the questionnaire. The participants answered with four-point scale (1=not true at all, 2=rather not true, 3=rather true, 4= true).

### 3.4 Result

#### 3.4.1 Result of “Questionnaire about Recognition to Classroom Rules” and “Questionnaire about School Life”

First, Table 7 shows the result of “Questionnaire about recognition to classroom rules,” which Pearson's coefficient of correlation and Cronbach's alpha coefficient between classroom rules categories, and, the average score of each classroom rules of children and the teacher. Second, Table 8 shows the result of “Questionnaire about school life” of Pearson's coefficient of correlation. In “Questionnaire about recognition to classroom

rules,” correlation between each classroom rule was high, from  $r=.63$  to  $r=.91$  ( $p < 0.1$  for all). Also, Cronbach's alpha coefficient was from .555 to .889. Only low alpha coefficient ( $\alpha=.555$ ) was found in “Rules to make up persuasive idea.” High correlation between classroom rules and low  $\alpha$  coefficient of “Rules to make up persuasive idea” should be further researched, with the view to distinctiveness of classroom rules category and validity in the categories. Although this matter had a limitation in practical study, the detail will be discussed in the next section.

#### 3.4.2 Influences of Differences between the Teacher's and Children's Recognition to Classroom Life

Firstly, from the answers of “Questionnaire about recognition to classroom rules,” differential score between the teacher and children was calculated (the teacher's score minus children's). Secondly total differential scores were viewed as scores of differences of the teacher's and children's recognition to classroom rules (Table 9). Differences in each item on the questionnaire were not analyzed because of high coefficient of correlation between classroom rules category and low  $\alpha$  coefficient. Instead, items were included in each category as a whole, and the scores of differences were used for

analysis. Also, positive score shows that the teacher recognized the rules more than children and negative score shows that children recognized the rules more than the teacher.

Simple linear regression analysis was conducted which independent variable was the score of differences of classroom rules and dependent variable was the result of “Questionnaire about school life.” As a result, first, about “trust for the teacher,” differences of recognition to classroom rules negatively influenced “relief” ( $b^* = -.42$ ,  $R^2 = .18$ ) and “legality” ( $b^* = -.39$ ,  $R^2 = .15$ , see Figure 1). Second, in respect of “classroom climate,” differences of recognition negatively influenced “participation to classroom activities” ( $b^* = -.48$ ,  $R^2 = .23$ ), “intentionally for learning” ( $b^* = -.41$ ,  $R^2 = .17$ ), and “manner for discipline” ( $b^* = -.40$ ,  $R^2 = .16$ , see Figure 2). Third, in respect of “feeling of adjustment to classroom,” differences negatively

influenced “feeling trusted and accepted” ( $b^* = -.59$ ,  $R^2 = .35$ , see Figure 3).

### 3.5 Discussion

In this chapter, the purpose was to investigate how differences of recognition to classroom rules between the teacher and children influenced classroom life. As a result of simple linear regression analysis, the more positive differences there were, the more negative influence to classroom life was found. Positive score of differences of recognition indicated that the teacher recognized classroom rules important more than children. In contrast, negative score of differences meant that children recognized the rules more than the teacher. We may say that children who recognize classroom rules important more than the teacher don't need to be advised to keep rules

because they are likely to adhere strictly to rules. On the other hand, children who recognized rules important less than the teacher might be instructed to keep rules. At the same time, there is a possibility that children who differently recognize classroom rules from the teacher have negative feelings such as “I’m dissatisfied” and “what the teacher says is unreasonable.” Thus it seems that differences which children recognize less than the teacher negatively influence classroom life.

First, in respect of “trust for the teacher,” the result showed that differences which children recognized less than the teacher negatively influenced “relief” and “legality” (Figure 1). This result shows a possibility that the less children recognized classroom rules important than the teacher, the less trust in the teacher children have. As mentioned in the hypotheses, it is possible that children might have distrust or anxious for the teacher and might not feel legality of the teacher because of having different recognition from the teacher. In previous literature, it was found that distrust for teacher negatively influenced high school students’ feeling of adjustment to classroom (Nakamoto, Mori, & Yara, 2008). Therefore, it can be said that differences which children recognize less than the teacher should be resolved.

Second, in respect of “classroom climate,” the result showed that differences which children recognized less than the teacher negatively influenced “participation to classroom activities,” “intentionally for learning,” and “manner for discipline” (Figure 2). “Questionnaire about classroom climate” is based on the Moos’ (1976) concept of “relationship,” “individual development and intentionally for target,” and “maintenance and change of organization,” which can investigate the nature of environment. In the result of this study, three correspondences were found, “participation to classroom activities” to “relationship,” “intentionally for learning” to “individual development and intentionally for target,” and “manner for discipline” to “maintenance and change of organization.” For this reason, the result may indicate that the less children had recognition to classroom rules than the teacher, the more three concepts Moos (1976) pointed out were negatively influenced. To cultivate better classroom climate, we can say that differences of recognition to classroom rules should be removed.

Third, in respect of “feeling of adjustment to school,” the result showed that differences which children recognized less than the teacher negatively influenced “feeling of trusted and accepted” (Figure 3). It indicates that the less children had recognition to classroom rules, the more children’s “feeling of trusted and accepted” would turn down. As mentioned in the hypotheses, it is possible that children who are frequently instructed to keep rules

Figure 1. Influence of differences of recognition to classroom rules between the teacher and children to trust for the teacher (N=30)

by the teacher tend to be recognized as “children who are often advised.” Okubo (2005) found that “feeling

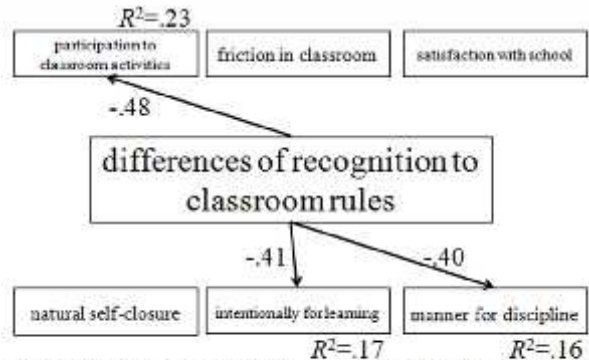

Figure 2. Influence of differences of recognition to classroom rules between the teacher and children to classroom climate (N=30)

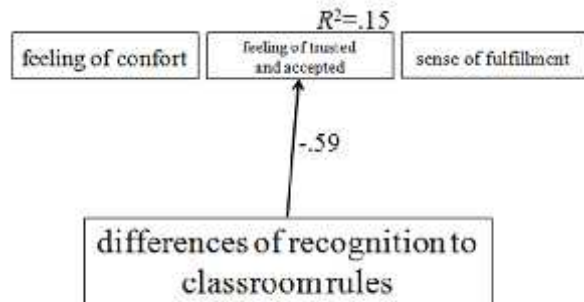

Figure 3. Influence of differences of recognition to classroom rules between the teacher and children to children’s feeling of adjustment to classroom (N=30)

of trusted and accepted” had positive relation with high school students’ feeling of blessed with school and of adjustment to school. At the same time, it was found that “feeling of trusted and accepted” negative relation with depression. Considering these positive or negative factors, differences of recognition should be resolved.

## **4 STUDY 3: PROCESS AND SITUATION THAT DIFFERENCES OF RECOGNITION TO CLASSROOM RULES WERE REMOVED**

### **4.2 Purpose**

The purpose of this chapter was to clarify the process how differences of recognition to classroom rules between the teacher and children could be resolved, and in what situation differences could be removed.

In this chapter, practical situations were focused, which the teacher gave advice to some of children who didn't keep classroom rules, and afterward the teacher and the children negotiated about the rules. There were two reasons why those situations were focused. One was that it was assumed that the teacher would advise children if there were differences of recognition to classroom rules between the teacher and children. If there were some differences of recognition between the teacher and a child, the teacher might tell the child to adhere to classroom rules. To analyze the process how differences could be removed, it is necessary to observe situations where differences were occurred between the teacher and children in class. Considering the purpose of this study, it is important that we focus on situation which the teacher gives children to keep classroom rules.

The other reason was that there could be a possibility of resolving differences by interaction, in other words, negotiation for classroom rules between the teacher and children. Classroom rules should be kept to make procedure of classes go on smoothly. If there were differences of recognition to classroom rules between the teacher and children, interaction would not proceed smoothly. In such a case, researchers have found that differences could be removed by teacher's advice to children who had different recognition to classroom rules from the teacher. However, if the class was democratic, differences could be resolved through negotiation between the teacher and children, and through shared recognition to classroom rules. To clarify the process, negotiation for classroom rules should be focused and how differences were resolved should be analyzed. Therefore, it is necessary that we focus on situations where negotiation for classroom rules between the teacher and children, after the teacher advises children who didn't keep rules.

## **4.3 Method**

### **4.3.1 Analysis Object**

Analysis objects were data of voice recording for thirteen hours, which the teacher, Mr. Fujimoto had all classes at his fifth graders' class.

Observing all recordings, two cases were extracted that the teacher and some children negotiated for classroom rules after a child were given advices by the teacher. In each case, it was inferred that that the rules which children were expected to adhere were different from the teacher wanted them to. So the authors searched situations from the data, that the teacher advised some children about the rules that he expected them to keep, or that there were negotiations for the rules between the teacher and children. Then three more cases were found. In this chapter, these five cases were analysis objects.

### **4.3.2 Procedure**

First, what kind of rules the teacher expected children to adhere, about what kind of rules the teacher gave children advices, and what kind of rules children kept or not were analyzed from the participants' utterances in the data. Second, the rules both the teacher and children recognized were compared to show differences of recognition to classroom rules between them. Third, each result of analyses was compared and reviewed for analyzing the process how differences could be removed and the situations.

## **4.4 Results and Discussion**

Two cases that the teacher gave some children advices about classroom rules and they negotiated for the rules were observed in the data. One was a situation of negotiation for a rule that children didn't say anything unconcerned with the class. The other was a situation which the teacher explained children about a rule that children who were called on had to say something. In five cases to analysis extracted from the data, two cases were related to the former situation mentioned above, and the other three cases were relevant to the latter. They were analyzed to investigate how and in what situations that differences of recognition to classroom rules between the teacher and children were removed.

#### 4.4.1 Situations that the Teacher Advises Children not to say something Unconcerned with the Lesson

In this section, situations which the teacher and children negotiated for a rule that children didn't say anything unconcerned with the class were analyzed.

##### 4.4.1.1 Case 1 Situation that the Teacher tells a Child not to say something Unconcerned with the Lesson and Negotiated with the Child for the Rule

As mentioned above, two cases were extracted from the data, which interaction between the teacher and children were found. Table 12 shows one case of the two. It was a P.E. class on November 22<sup>nd</sup>. Children were learning how to play flag football in their classroom. The teacher explained the rules and asked children whether they had questions or not, when sixteen minutes passed from the class bell. Children asked the teacher some questions about possible situations during the game and he answered to each question. Case 1 in Table 12 shows a situation which includes utterances of the teacher, Nishina and some other children, when forty-three minutes passed from the bell. Case 1 starts with an utterance that the teacher called on Nishina, who were raising his hand to say something.

Nishina, who negotiated with the teacher in Case 1, answered to “Questionnaire about classroom rules” (pre-exam in Chapter 2) that there were classroom rules such as not to disagree with others right away and not to say something during others' talk. From his answer, it can be said that he recognized such rules were in the classroom. Also, to “Questionnaire about recognition to classroom rules” (a part of analysis 2 in Chapter 3) he answered 4.88 average score in twenty-five items while others' average score was 4.18. So he might recognize the importance of classroom rules more than others.

In Case 1, the rule that the teacher expected children to keep and the rule that children would keep were analyzed below. Numbers of utterances are corresponding to numbers in the left line of Table 12.

In 101, the teacher called on Nishina who would ask a question. Nishina stood up and would ask a question in 102. However, Nishina didn't respond “Yes” to the teacher in 102, and the teacher called on him again in 103. As a result, Nishina said to the teacher, “Yes” and would ask a question again. This interaction seems that the teacher might expect Nishina to keep the rule of responding after being called on, and Nishina didn't keep the rule. In 103, the teacher had Nishina adhere to the rule without

mentioning it. In other words, it was the teacher's advice that he called on Nishina again. And Nishina replied, “Yes” in 104.

In 104, Nishina prefaced “Zettaiarienaindesukedo (It will never happen in the game, but),” before questioning. The teacher repressed Nishina's utterance, saying “iwanaide ii (then you don't have to say that)” in 105. Soon after the teacher's utterance, Dobashi (106) and another child (107, it was unclear who uttered) said, “Iunayo (Don't say)” as the teacher said to Nishina. It seems that these utterances indicated the rule of “not saying something unconcerned with the class.”

In 108, the teacher said to Nishina why he stopped Nishina's utterance. He explained that there was no need to say something wrong as a question, saying “Ari enaitteiundattara (If you say that it would not happen).” Utterance 108 may indicate that the teacher expected Nishina to adhere to the rule of “not saying something unconcerned with the class.”

To the teacher's utterance in 108, Nishina said, “Akai (Red)” in 109. He seemed that he started asking a question in disregard of repression from others because Nishina uttered “akai MP ga” as a part of his question in 117. In 109, Nishina might adhere to the rule of “talking about one's idea to the end.” In pre-exam of Chapter 2, Nishina answered to the questionnaire that there was a rule of “talking without interruption.” Also, he wrote to the questionnaire about a rule of “listening through to the end” and “not to interrupt other's talk.” Thus he seemed to adhere to the rule of “talking about one's idea to the end” in 109.

In 110, the teacher said, “Ne, kiiteru (Hey, don't you listen to me)?” This utterance meant the teacher made sure that Nishina understood that the teacher repressed Nishina's utterance in 108. It might be because Nishina started asking a question in 109, neglecting the teacher's repression.

After 110, Nishina stopped to utter for a while in 111. The teacher also did so for four seconds and explained the reason why he expected Nishina to keep the rule of “not to say something unconcerned with the class.” The reason was that the teacher didn't want to waste time. The teacher seemed to point out that it was time-wasting that Nishina would ask a question as “It will never happen.” On the other hand, the teacher required children to ask if they had questions (112). He asked whether Nishina would utter or not, saying “Docchi (Which)?”

It seemed that the teacher explained Nishina about keeping a rule of “not to say something unconcerned with the class.” On this rule, the preface was repressed, different from 105 and 108, which stopped whole utterances. It might be because the teacher made Nishina choose between stopping to utter without remediation the preface, and asking a question with

switch the preface. In 114, the teacher asked Nishina, “Docchi (Which)?” again. The teacher seemed to make Nishina adhere to the rule of “not to say something prefaced that it would be unconcerned with the class,” expecting the same choice as 112.

In 115, Nishina switched his preface of 114, saying “Shitsumonshitaidesu (I want to ask).” He turned to adhere to the rule of “not to say something prefaced that it would be unconcerned with the class” from “talking without interruption.”

Because Nishina switched his preface, the teacher urged Nishina to ask a question in 116. Nishina started to ask a question, “Akai emupiga (Red MP runs).” Then the negotiation between the teacher and Nishina for classroom rules ended up.

In other words, there could be a difference of recognition which rule to keep between the teacher and Nishina.

However, Nishina uttered, following a “new” rule in 115 because the teacher switched the rule. In 109, Nishina turned away from the rule that the teacher expected Nishina to adhere to in 105 and 108. This difference might be resolved by neglecting Nishina and calling on other children. But it seemed that the teacher recognized Nishina’s statement and negotiated with him for switching the rule to “not to say something prefaced that it would be unconcerned with the class.” As a result, the rule which both the teacher and Nishina expected to follow came to correspond and the difference seemed to be removed.

Table 10. The contents of the teacher’s and students’ utterances and the classroom rules they expected each other to follow

	Speaker	Utterance contents	In Japanese	Classroom rules
101	Teacher	Mr. Nishina (43min. 10sec.)	NishinaSan.	to respond
102	Nishina	Well	Ano	when being called on
103	Teacher	Mr. Nihina	Nishina san	
104	Nishina	Yes. It will never happen in the game, but	Hai. Zettaiarienaindesukedo.	not to say something unconcerned with the class
105	Teacher	Oh, then you don’t have to say that.	Jah, iwanaide ii.	
106	Dobashi	Don’t say.	Iunayo.	
107	Student	Don’t say.	Iunayo.	
108	Teacher	If you say that it would not happen, you may not say that.	Ari enaitteiundattara, iwanaideiyo.	
109	Nishina	Red	Akai	to talk about one’s idea to the end
110	Teacher	Hey, don’ you listen to me?	Ne, kiiteru?	
111		(4 sec.)		
112	Teacher	If the situation will not happen in the game, please do not ask. I don’t want to waste time for such a thing. If you just want to ask a question, do ask a question. Which is your will?	Ari enaindattara, kicanaidekudasai. Sonna jikanmudanitsukaitakunaidesu. jibungajunsuinisitsumonshitaaindattara, sitsumonshinasai. Docchi?	not to say something unconcerned with the class
113		(2 sec.)		
114	Teacher	Which?	Docchi?	
115	Nishina	I want to ask	Shitsumonshitaidesu.	
116	Teacher	Then, ask your question.	Jah, shitsumonshinasai.	
117	Nishina	Well, Red MP runs	Eeto, akaiemupiga	

As a summary of above, the rule that the teacher had expected children to adhere to was “not to say something unconcerned with the class,” based on his utterances 105 and 108. However, it seems to switch to “not to say something prefaced that it would be unconcerned with the class.”

In contrast, the rule that Nishina would have kept was “to talk about one’s idea to the end”, based on his utterance 109. At that point, the rule that the teacher expected children to keep and the rule that Nishina would adhere to might be different. The negotiation was going for different rules each other.

That can also be indicated from that the teacher and Nishina interacted smoothly after 117.

**4.4.1.2 Case 2 Situation that the Teacher gives Children Advices about a Rule not to say something Unconcerned with the Lesson**

Case 2 in Table 11 shows a situation where the teacher and children were discussing in a Japanese class on November 1<sup>st</sup>. They were talking about why an old man called a wild goose “Gan”, not “Zansetsu”, which was named by the man. The

situation in Table 11 starts with that the teacher called on a child, Ito.

Looking at Ito’s answer to the questionnaire about recognition to classroom rules (a part of Analysis 3 in Chapter 3), he got 3.0 average points while others got 4.19. So it can be said that he recognized the importance of classroom rules less than others. Also, his answer to the another questionnaire about the purpose and understanding of classroom rules (Analysis 2 in Chapter 2) had higher percentage of no answer (66%) than others (18.4%).

In Table 11, the rule that Ito would have follow was to preface that he would talk about something wrong in 202.

In contrast, the teacher told Ito not to say that in 203. This teacher’s utterance can be analyzed in two ways because he didn’t mention “Sore (That kind of thing).” One seems that the teacher stopped Ito to preface. The other seems that the teacher repressed Ito’s whole utterance. It would be appropriate that the former, which the teacher stopped Ito’s preface in 203 because soon after that, in 205, the teacher asked another child to talk about what Ito said. However,

Table 11. The contents of the teacher’s and students’ utterances in Case 2

Speaker	Utterance contents	In Japanese
201	Mr. Ito stand up. (from 22min. 35sec.)	
202	Ito Maybe, this isn’t right, I think	Tabun, chigau to omoundesukedo.
203	Teacher That kind of thing, you should not say now.	Sore wa, imaiwanaide ii.
204	Ito “He called the wild goose” means the other wild geese were there, doesn’t it? (The singular form and the plural form of “goose/geese” in Japanese are expressed by single word “Gan”.)	Ganniyobikaketa tteiuowa, hokanimo ganga itattekotonanjanaides houka.
205	Teacher OK. Ms. Kubo, please tell us your opinion concerning this opinion.	Hai, Kubo san, ima no ikennitaisite, anata no ikenwoittekudasai.

there is a possibility that Ito stopped talking in 203 because it also seemed that Ito’s whole utterance was repressed by the teacher.

As a result, Ito continued to talk about the reason why the wild goose was called “Gan” in 204. He didn’t say anything about the teacher’s repression. So it seems that Ito neglected the teacher’s utterance.

#### 4.4.1.3 Discussion 1: Process and Situation that Differences of Recognition to the Classroom Rule of “not to say something Unconcerned with the Class” were removed

In Case 1, it seems that the teacher succeeded in interacting with Nishina smoothly because the teacher switched the rule to another one applied at that time, taking Nishina’s utterance into consideration. Eventually Nishina seemed to adhere to the rule of “to talk about one’s idea to the end,” which he had followed at first but turned away for a while, by the teacher’s utterance in 117. In other words, we can say that the difference between the rule that children would follow (RC) and the rule that the teacher expected children to adhere to (RT) could be found. One more important thing is that it was found that how interaction between the teacher and a child changed and how the difference of recognition was removed by negotiation. Through the negotiation, the rule that the child had been required to adhere to was changed. Furthermore, the difference of recognition between the teacher and the child could be resolved and the interaction went on smoothly after all.

Compared with Case 1, Case 2 seems to have a feature that the teacher’s utterance was a little ambiguous. In Case 1, any negotiation for a classroom rule between the teacher and Ito could not be found and no rule was indicated clearly by the teacher. It is possible that the teacher could not stop Ito’s utterance because he speaks faster than others, and that the teacher could not instruct Ito to adhere to the classroom rule.

Comparing Case 1 to 2, it can be said that the teacher noticed that the child would follow a rule, which was different from the rule the teacher had expected. Then the teacher would negotiate with the child for changing a part of the rule. As a result of the negotiation, the difference of recognition could be removed.

In each case, indication of classroom rules may be necessary. As mentioned in exordium, usually classroom rules are not indicated. In Case 1, the rule that Nishina would follow was generally recognized in the classroom. On the other hand, the rule that the teacher expected Nishina to follow was in hiding in the classroom, and was not written by the participants in the questionnaire. So we can say that the negotiation between the teacher and Nishina made the implicit rule explicit. Through the negotiation, it will be necessary that the teacher and children make the rule that one expects the other to adhere to explicit.

**4.4.2 Situations that the Teacher gives Children Advices about a Rule of “saying something when being called on”**

402	((Okamoto and students laugh))	
403 Okamoto	I cannot remember.	Wasureteshimaima: hita.
404 Teacher	Well, please say again after the other students’ turns.	Mata jah, modottaraittechoudai.
405	((Okamoto was called again after the other students had been called their name.))	

Table 14. The contents of the teacher’s and students’ utterances in Case 5

Speaker	Utterance contents	In Japanese
402 Teacher	...	...

In this section, situations that the teacher gives advices to children about a rule that they should say something when they are called on by the teacher, including interaction between them were analyzed. It was also analyzed what kind of classroom rules the teacher and children had expected to follow. Moreover, compared with the results of previous section, the process and situations to remove differences of recognition to classroom rules between the teacher and children were discussed.

**4.4.2.1 Case 3 Situation that the Teacher tells a Child to say something when being called on and Negotiated with the Child for the Rule.**

Table 12 shows a situation that the teacher gave a child who turned away from a rule an advice, and they negotiated for the rule. Following Case 2, this Case 3 includes interaction between the teacher and the child when discussing what children thought about the contents of textbook.

Kubo was called on by the teacher although she had not been raising his hand. She kept silence for a while, bending down her head. After class, the authors interviewed with the teacher and asked him why he called on Kubo. The teacher answered that he did so because Kubo doesn’t usually say something in class and the teacher expected Kubo to talk about her idea. According to what the teacher said in the interview, he noticed that Kubo were talking with Takano who was next to Kubo, and he expected Kubo to talk about what she was talking.

In 301 of Case 3, the teacher asked Kubo a question again to encourage her to say something because the teacher already called on Kubo once, but she didn’t say anything.

The teacher waited for Kubo talking for thirty-two seconds (302) and said to her, “Damarareru to komaru (I’m having a trouble with your silence).” The teacher seems to have expected children to follow the rule of “saying something when being called on.” It also seems that the teacher explained to Kubo that the interaction was not going on smoothly because she didn’t follow the rule.

Kubo didn’t say anything even after that for twenty-six seconds (304) and was still turning away from the rule. Then the teacher explained her about the rule “saying something when being called on,” giving examples of “something” such as “wait,” “return,” “I don’t know” and “hold on.”

However, Kubo kept silence for a while (306). So the teacher asked her, “Don’t you understand?” and she nodded her head. This seems that Kubo followed the rule of “saying something when being called on.” After that the teacher could call on another child who had raised his or her hand before

Kubo was called, and he could keep on going interaction with children.

#### 4.4.2.2 Case 4 and 5 Situation that the Teacher gives Children Advices about a Rule of “saying something when being called on”

Table 13 shows a situation in a Japanese class on November 1<sup>st</sup> (the same as the class in Case 2 and 3). Thirty-five minutes passed from the class bell. The teacher called on Okamoto raising his hand. Then he stood up to talk.

Okamoto said that he forgot what to talk in 401. Following this, laughter of some children including Okamoto occurred.

In 403, Okamoto said, “Wasureteshimaimashita (I cannot remember).” He seems to have understood the rule of “saying something when being called on.”

Then the teacher held a chance of Okamoto’s talk and told that he would call on Okamoto again in 404. Indeed, four minutes later in Case 4, Okamoto was called on by the teacher and he talked in 405.

In Case 4, the interaction between the teacher and a child seems to go on smoothly. It can be said that there were no difference of recognition to classroom rules between them.

Table 14 shows that a situation in a science class on November 29<sup>th</sup>. Children were learning how to experiment of solving materials in the water. A few minutes later from the bell, the teacher asked a question to children and Izumi raised his hand. After being called on, Izumi stood up to talk.

The same as Okamoto in Case 4, Izumi forgot what he would say and could not answer (501).

Then the teacher asked Izumi to say that he didn’t know if he really didn’t know in 502. The teacher seems to require Izumi to adhere to the rule “saying something when being called on.”

It is possible that the teacher gave him an example of “something” as “I don’t know.” That might encourage Izumi to follow the rule.

However, Izumi got the teacher’s utterance wrong and said, “Ganbarimasu (I will hold on)” in 403. After that, the teacher and Izumi confirm the utterance of 403 in 404 and 405. In any case, there might be the rule of “saying something when being called on” explicitly, and the teacher seemed to hold Izumi’s say because another child was called on after 406. The interaction between the teacher and Izumi seemed to go on smoothly.

#### 4.4.2.3 Discussion: Process and Situation that Differences of recognition to the Classroom Rule of “saying something when being called on” were removed

Comparing the results of Case 3, 4 and 5, it seems that the interaction could go on smoothly after the difference of recognition between the teacher and a child was removed in Case 5. The process to resolve was that firstly a child’s behavior, which turned away from the rule the teacher expected children to follow, could be seen. Secondly the teacher and the child negotiated for the rule. Thirdly the teacher made the implicit rule explicit, and the interaction could progress smoothly.

Based on that, the situation that differences of recognition between the teacher and children may be that the rule is not followed, in other words, a child turns away from the rule. Children in Case 4 and 5 seemed to understand and adhere to the rule. So any negotiation for the rule could not be seen. If negotiation between a teacher and children can be linked to make the rule clear or explanation of the rule, children’s turning away from the rule should be a situation.

It may be necessary to make implicit rules explicit consciously while a teacher and a child negotiated for the rule. When the authors interviewed with the teacher after the observation on November 1<sup>st</sup>, he said that he always give advices to children about saying “something,” such as “I don’t know,” “wait,” “call on me later,” and so on. However, during the observation, any detail of “something” could not be seen, except for Case 3. Therefore, actually the rule might not be indicated explicitly although the teacher said he made the rule clear. This seemed to be linked to the difference of recognition. If differences of recognition to classroom rules between a teacher and children can be removed by indication of the rules, it is important that teachers are aware of making implicit rules in class explicit.

#### 4.5 Summary: Process and Situation that Differences of Recognition to the Classroom Rule can be removed

In this chapter, how differences of recognition to classroom rules between the teacher and children could be resolved was analyzed, focusing on two kinds of rules. One was that children should not say something unconcerned with the class. The other was that children should say something when they were called on by the teacher. Also, situations that differences of recognition were removed by negotiation between the teacher and children for the

rules were analyzed and discussed. As a result, several factors were found in negotiation: indication and explanation of the rule, indication of the rule that both the teacher and children expect to follow, and setting a new rule that both the teacher and children can adhere to.

Making inquiries about the result of Analysis 2 in Chapter 2, it is very important that teacher explains children about the classroom rules. In Case 3, the teacher explained about the rule and told he was confused when the child didn't follow the rule. The reason may be that what he did can be linked to recognition to the purpose of the rule in the result of Analysis 2. It is necessary that teacher behaves as mentioned above without hesitation because there seems to be more or less differences of recognition to the purpose of classroom rules.

Moreover, compared with the result of Analysis 1 in Chapter 2, we can say that it is also important that teacher actively negotiate with a child who turns away from a rule, and that they make the rule which both expect to follow explicit. In Case 1, a difference of recognition occurred because the teacher and the child differently expected to follow. It seems that the rules the teacher and the child put higher priority on were different in the situation that there were several rules that they had to follow. Based on the result of Analysis 1, it has been clarified that situations as above can be seen frequently. According to Ryan and Deci (2000), it can decrease children's autonomy and lower their motivation for learning that they are in the classroom without understanding what to do in class. Therefore, it is important that both teacher and children make it clear which classroom rule they expect to follow.

As situations to remove differences of recognition, we can point out that a child turns away from the rule the teacher expects him/her to follow, and that the teacher and the child negotiate for the rule. In Case 2, 4 and 5, children who negotiated with the teacher had in common: they often communicated with the teacher and other children. On the other hand, in Case 1 and 3, the children didn't frequently communicate with the teacher. Nishina in Case 1 talked about his idea, but in some cases he didn't say anything at all. Kubo in Case 3 said something only in the situation that the teacher called on her during the observation. It might be difficult for teacher to share classroom rules with children who are unlikely to interact with teacher in class. Therefore, to negotiate with those children for classroom rules is important for teacher.

Furthermore, because of time limitation in class, it is difficult that teacher has longer time to negotiate with children. However, as mentioned in Chapter 3, difference of recognition to classroom rules can negatively influence children's adjustment to school or with teacher. It is possible that negative influence

lasts in longer period if differences were left. Considering how influent differences are, it is necessary that teacher puts higher priority on negotiation with children for classroom rules.

## 5 5 CONCLUSIONS

In this study, features of a teacher's and children's recognition to classroom rules were investigated with the questionnaires and observation. Also, the process how differences of recognition to implicit rules in class between a teacher and children were removed was analyzed. As a result, several findings were as follows:

First, it was found that there were several kinds of classroom rules in participants' class such as rule to think highly of other children and rule to make up persuasive idea, not only that make procedure of classes go on smoothly. Also, children basically recognized that classroom rules are important, but there were differences of recognition to purposes and understanding of classroom rules in ordering their priority. Thus we can say that there are various kinds of differences of recognition in addition to classroom rules. As previous literature found, it is possible that there are many kinds of classroom rules in other classrooms, and that teacher and children adhere to some rules at the same time in class (Yamada, 1999). Therefore, the situation there are a variety of classroom rules and differences of recognition can occur in every classroom.

Based on these results, we can point out that there could be more factors of differences of recognition than children's weakened normative consciousness (Fuchikami, 2009). There is a possibility that children who strictly adhere to a rule would be given advices by teacher if they have different priority of rules or different purposes of rules from the teacher.

Second, it was indicated that differences of recognition could negatively influence children's school life and classroom climate. Although previous studies haven't investigated influence of differences to children yet, we may say that this study could show that differences of recognition were problematic and they should be resolved.

Third, in this study, it was analyzed how differences of recognition to implicit classroom rules could be removed with questionnaires and observation. It was found that it is necessary that teacher negotiate with a child who has different recognition from the teacher, and that teacher infer what kind of rules the child recognize from his/her behavior or utterance. At the same time, a process to remove differences through a change of classroom rule was found. In previous literature, how teachers could make children, who had different recognition from his/her teacher, follow classroom rules has been

studied. In those cases, it has been assumed that difference could be resolved by children’s adjustment to the rules. In other words, the process that teacher and a child change compoundable rule through negotiation has not been assumed. This study suggested a process that differences could be removed by changing classroom rules.

These implications can be linked to development children’s citizenship. In this study, it was found that there is a process that differences of recognition can be removed through interaction between a teacher and children and modification of classroom rules. This modification in classroom may develop children’s citizenship. Dewey (1916) claimed in his book “Democracy and Education” that democratic society is a society that members can adjust institutions through interaction, and that education of habituating to attribute changes to society is necessary to realize such a society (p.160).

As Dewey said, to habituate attribution of changes to society means “citizenship” in this study. This study suggested the possibility that citizenship can be developed in class, indicating that resolving differences can go through the process of classroom rules modification. As found in this study, children might understand that classroom rules can be flexibly adjusted through negotiation with their teacher if differences occurred in class. In addition, it is possible that children learn strategies to interact with their teacher for classroom rules modification. Although classroom rules are not the same as institutions in civil society, there are some similarities between them such as following in groups and functioning to go on group living smoothly. It is expected that children understand that intuitions can be flexibly modified as classroom rules. Furthermore, it is also expected that learning strategies to interact for modification can be linked to developing children’s citizenship habituated attribution of changes to society.

Classroom rules are inherent in the class. So it is likely that the rules are different in other classrooms. However, there are classroom rules to regulate children’s patterned behavior in every classroom. Thus there is a possibility that teachers and children recognize classroom rules, and that differences of recognition to classroom rules occur. This study focused on differences of recognition to classroom rules, not classroom rules itself. It is possible to apply the findings in this study to analysis in other classrooms because differences of recognition can occur in every classroom.

This study has some limitations: first, “Questionnaire about recognition to classroom rules” should be revised or redeveloped. The authors made out each item on the questionnaire based on classification from the pre-exam, without conducting exploratory factor analysis. It was because the results

could have been distorted by the ceiling effect found in most of the items and high correlated function between classroom rules.

Second, classroom rules are contingent. For instance, a rule extracted from Analysis 1 is also contingent. The results may be different in the questionnaire with assumption of another situation. It cannot be concluded that the rules in the result of questionnaire are universal classroom rules given priority in classrooms. The questionnaire should be revised which has more items of situation to conflict and which has answer columns to rank order more than three classroom rules.

Third, it is necessary to indicate differences of recognition. In this study, it could not be clarified that differences were actually removed based on the questionnaire. We can make a point that findings of this study are related to removal of differences of recognition by demonstrating that differences were resolved, conducting questionnaires at several times in the procedure of this study.

Finally, the process how classroom rules change should be further researched. In this study, the investigation period was from October to December, which has been said that not many explicit instructions about classroom rules are given in class. It will be necessary to investigate that findings of this study can be applied to other classrooms, for example, first graders’ classes soon after entrance and over second graders’ classes in April where explicit instructions about classroom rules are given to children. If we do this, findings of this study can be further demonstrated.

## 6 ACKNOWLEDGEMENTS

We are deeply grateful for cooperation of the elementary school. And we would like to express our gratitude to Mr.Fujimoto and children in the grade 5-1 for permission to conduct questionnaire and observation.

**Abstract** Ensuring both institution and autonomy in the teacher professional development is important, but it is not easy to realize it. Zambia has taken unique strategies of institutionalization of lesson study and formation of professional group called Kyozaikenkyu (which means literally intensive study on teaching/learning materials) team. Through analysis of their activities and questionnaire result, this paper discusses three aspects of professional group in teacher development program, especially implemented at school level such as lesson study practice of teachers. The first aspect is institution and autonomy for nationwide dissemination. It needs scaling up of local success to nation; however, it is not possible to improve teachers' competence nationwide through simply distributing particular formats. The second aspect is values shared by professional group members. In Zambia, the members selected problem solving method of teaching and Kyozaikenkyu practice of teachers as central strategies for the lesson study. The importances of these strategies are shared by the members with certain beliefs. The third aspect is quality of lesson study and participants' competence. Quality of lesson study and participating teachers' competence relate to each other, but the relation does not automatically ensure the improvement. The practices of Zambian professional group to make this relation moving forward are introduced. Based on these discussions, the importance of professional group to continuously make efforts in having practices to improve lessons and generalize their experience is emphasized as endogenous development. The work is seen as very gradual and not easy to be transferred; however, it is a work of connecting theory and practice.

**Keywords** Endogenous Development, Teacher Professional Development, Professional Group, Kyozaikenkyu

### 1. BACKGROUND

Baba & Nakai (2011) discussed necessity of looking at both institution (spreading) and autonomy (deepening) in the teacher professional development. However, the former has a tendency of uniformity and implies policy-based approach, and the latter implies and encourages individual creativity. In this sense, they are rather opposite in nature even if both intend professional development. Our discussion is that professional development and quality improvement of education at large require such a difficult task to integrate such a different and even sometimes irreconcilable nature of works. quite

Although we find difficulties in integrating institution and autonomy, we think we are able to see some possibilities in existing efforts. We would

like to take up such a case as formation of a core professional group with Zambian government's initiative. Here we are able to manifest partly integration of individual autonomy and government's institutional efforts. This group is called a team of Kyozaikenkyu (hereafter abbreviated to KK team). Kyozaikenkyu (Takahashi, 2011) is Japanese word which means literally an intensive study on teaching/learning materials. In this context, Zambia has taken unique strategies of institutionalization of lesson study with a formation of KK team, who takes professionally autonomous initiative.

In Zambia, the Ministry of Education, Science, Vocational Training & Early Education (hereafter the Ministry) introduced lesson study at the secondary schools of Central province in 2005 under the technical cooperation of Japan

International Cooperation Agency (JICA). The lesson study focuses mathematics and science, which are the most important but still weak areas. After two years of implementation, lesson study was extended to the secondary schools in Copperbelt and Northwestern province as well as the primary schools in Central province. Now it has been introduced to 2,682 primary and secondary schools in the country involving 41,243 teachers (MESVTEE, 2014). The Ministry continuously makes efforts to extend it to all the schools in nationwide with its policy and institution (MESVTEE, 2010).

In the process of introducing lesson study in the additional provinces, selected officers and teachers in the Ministry had opportunities to participate in several JICA training programs in Japan. They have learned and understood the problem solving and the inquiry method of teaching as strategies of improving quality of lessons and lesson study. Thus these strategies were introduced to the workshops and the lessons at classroom levels; however, it was found that many teachers had difficulties to apply those methods at classroom because they did not have sufficient knowledge and skills, which were required for implementation.

It is in this situation that twelve (12) officers and teachers, who were working as core technical personnel for lesson study, were selected as the above-stated KK team in 2012. They were expected to take roles of adapting and enhancing kyozaikenkyu in Zambia. And at the same time, the Ministry extended lesson study to all the ten provinces. JICA supports this Zambian government and also KK team’s efforts through training in Japan and dispatching experts to Zambia, and giving technical advices.

## 2. RESEARCH OBJECTIVES AND METHODOLOGY

The objective of the research is to take up the case of the professional group, which symbolizes

autonomy, and clarify some of their characteristics and its impact on the process of institutionalizing lesson study in Zambia. To attain this objective, the activities and perceptions of this professional group are discussed using a case method focusing on three perspectives below.

### 1) Institution and autonomy in nationwide dissemination (Baba & Nakai, 2011)

Institutionalization helps people in introducing and extending practice to nationwide, especially with uniformed format and tools; however, it does not always guarantee a quality of practice, if implementers think they conduct a lesson study because it is requested or forced without understanding the necessity and thus having sense of autonomy. In Zambia, in the process of spreading the lesson study to the whole nation, these incidences of non-autonomous participation were observed. At the same time the Ministry selected technical members as the KK team to overcome this problem of non-autonomous participation. Their experience is useful to discuss relation between institution and autonomy.

### 2) Values of professional group

While the above professional group members starts work with autonomy, they share common understanding about the background and problems, which necessitated introduction of lesson study in Zambia, and thus values within their own activities. Under this autonomy, they learned and adapted better methods for implementation of lesson study, not being forced by the outsiders. These understanding and values shared among the professional group are indication of their roles in balancing institution and autonomy.

### 3) Professional competence of professional group and its impact

Quality of lesson study is said to depend on competence of participating teachers (Fernandes, 2009). In Zambian case, it is crucial to address the issues on how the professional group

improves their competence and also how their improved competence makes an impact on the others' competence. Study on impact will give us an idea on how efforts as individuals, as a team and as wider group could be enhanced each other for implementation and improvement of the lesson study.

In order to attain the above objectives, the government reports are scrutinized and thoughts and experience of KK team members (12) and JICA personnel are gathered through questionnaire and interview.

### 3. SUMMARY OF THE ACTIVITY RELATED TO PROFESSIONAL GROUP

As stated, the professional group was intentionally formed by the Ministry under technical cooperation project with JICA. The purpose of formation is to build capacity of core professional group for the

improvement of mathematics and science lessons and lesson study. This group consists of six (6) members in mathematics and science respectively. They are mixture of educational officers such as resource center coordinators, standards officers, education office managers, educators such as principal and lecturers at college of education and teachers at schools. All of them are majored in mathematics and science.

The activities shown in Table 1 have been strategically arranged for KK team for a period of four years from 2012 to 2015 under the JICA support. One of the two main activities is the training program on the kyozaikenkyu which is organized by Hiroshima University. And the other is lesson study workshop in Zambia with experts dispatched from Japan. The activities are intended for KK team members to acquire basic knowledge and skills of kyozaikenkyu, realize them at classroom, and deepen them with practical experience.

Table 1. Activities planned for developing professional group

Year	Activity for KK Mathematics team (6 members)	Activity for KK Science team (6 members)
2012	<ul style="list-style-type: none"> <li>• Lesson study workshop supported by Japanese experts</li> <li>• JICA Training Program for kyozaikenkyu (1) in Japan</li> </ul>	
2013	<ul style="list-style-type: none"> <li>• Lesson study workshop supported by JICA short-term experts</li> </ul>	<ul style="list-style-type: none"> <li>• JICA Training Program for kyozaikenkyu (1) in Japan</li> </ul>
2014	<ul style="list-style-type: none"> <li>• JICA Training Program for kyozaikenkyu (2) in Japan</li> </ul>	<ul style="list-style-type: none"> <li>• Lesson study workshop supported by JICA short-term experts</li> </ul>
2015 (Planned)	<ul style="list-style-type: none"> <li>• Lesson study workshop supported by JICA short-term experts</li> </ul>	<ul style="list-style-type: none"> <li>• JICA Training Program for kyozaikenkyu (2) in Japan</li> <li>• Lesson study workshop supported by JICA short-term experts</li> </ul>

Apart from the above activities, KK team members have been continuously working as core technical personnel for extending lesson study to schools and

also improving its quality. And they periodically meet to exchange idea and field experience. These disseminating and improving efforts and periodical

meeting under the program for lesson study are summarized in Table 2.

Table 2. Major activities conducted by professional group members

Level	Activity	Activity/Role of KK members	Frequency
Individual	Self-study	<ul style="list-style-type: none"> <li>• Have further study on kyozaikenkyu</li> <li>• Write report/paper based on observation and experience</li> </ul>	Any time
KK team	Periodical team meeting	<ul style="list-style-type: none"> <li>• Share idea and experiences with other members</li> <li>• Have common understanding on kyozaikenkyu practice</li> <li>• Obtain new knowledge and skills</li> </ul>	Every 3 months
School	Participation in lesson study at schools	<ul style="list-style-type: none"> <li>• Implement lesson study with view point of KK and learning of student</li> <li>• Give comments to teachers based on kyozaikenkyu experience</li> <li>• Find a good practice and challenges of teachers in planning and delivering lessons, and especially in adapting kyozaikenkyu practice at schools</li> </ul>	1 – 2 times per month
District / Province	Participation in Meeting/Workshop/Seminar	<ul style="list-style-type: none"> <li>• Orient officers on lesson study and its implementation</li> <li>• Facilitate sessions related to kyozaikenkyu and teaching/learning method</li> <li>• Monitor sessions in workshops/seminars and provide advice from kyozaikenkyu perspective</li> <li>• Give technical comment to organizers to improve contents of workshops</li> </ul>	3 – 5 times per year
National	Participation in meeting for reviewing curriculum Practicing writing textbook	<ul style="list-style-type: none"> <li>• Share technical comments with curriculum officers for improving curriculum</li> <li>• Deepen understanding on subject contents and kyozaikenkyu through writing a draft textbook for pupils</li> </ul>	1 – 2 times per year

#### 4. FINDINGS IN THE FIELD IN RELATION TO PROFESSIONAL GROUP AND LESSON STUDY

Evaluation reports (MoE & JICA, 2010) mentions that one of the crucial factors for the success in extending lesson study was commitment and sense of autonomy of core officers in the program. However, the reports also tell that not all the schools are conducting lesson study effectively and some schools seem to have it as a routine or requirement by the government. In other words,

despite autonomous committed officers, there is still difficulty to influence teachers at school level and officers at district/provincial levels to create much wider autonomy.

Thus, in this research we administered the questionnaire to 12 members of KK team in order to grasp how they perceive their own change and the change of other teachers and education officers. We have received responses from 10 members. Here, we would like to analyze the responses from mathematics and science members.

The contents of the questionnaire are as follows. Firstly it is to ask important points of the

lesson and lesson study and to seek what they value in those. Secondly, it is to ask their changes and the reason for the changes. Lastly, it is to ask how their changes have made an impact on others. Through

those questions, we intend to see an indication of forming professional knowledge and values through their self-perception and assessment of their impact on others.

1. What aspect(s) of the lesson study do you think is (are) important and why?
2. What aspect(s) of the Kyozaï-Kenkyu do you think is (are) important and why?
3. How has your thinking on the above changed before and after participating in the JICA training for Kyozaï-Kenkyu and technical inputs of JICA experts under the project? Why did such change happen?
4. According to your assessment, how much do you think the above thinking has been shared among the KK team members and the members in your affiliation/province/district? In case you have felt any enhancing or hindering factors, please also state the reason(s) for them.

Figure 1. Questions regarding perceptions by professional group members

Tables 3 and 4 as Annexes summarized ideas given by ten (10) members of the KK team to each question. Answers vary among the members, although core ideas have many similarities.

- Important aspects of lesson study and kyozaikenkyu (Items 1 and 2)
  - Every phases of lesson study – Planning, delivering and evaluating lessons
  - Culture of community practice – team work
  - More focuses and studies on learners and anticipation of responses
  - Particular focus on problem solving and inquiry process
  - Importance of thinking concepts and values on subject contents
- How thinking has changed and its reason (Item 3)
  - (Previous – before studying kyozaikenkyu)
  - Before it was ‘collaborative planning’ based on a difficult topic.
  - I didn’t know what preparation is needed for quality lessons.
  - Teaching and learning materials for me were just ordinary materials used in lessons.
  - (Current – after studying kyozaikenkyu)

- Lesson planning is not just as a routine, and lesson study is not being done on scheduled days designed.
- Correlation between effective classroom deliveries and effective prior planning
- More attention to learners pre-knowledge and responses and planning based on them
- Deep study of materials
- Always look for concepts and values on the contents
- Idea on teaching materials were widened
- Have extra-eyes to see lessons in terms of preparation for pupils and process for learning
- Developed effective analytical abilities for lesson observation and evaluation
- Put pupils at a center in the lesson (Teacher as facilitator)
- Learners are not empty vessels (Reason for the change)
- Due to practical experiences on KK and observation of lessons by experienced teachers.
- Dissemination of kyozaikenkyu Practice (from results of item 4)
  - (Progress of dissemination)
  - Shared among the K.K team members quite

extensively.

- Shared among the college lecturers.
- Among the district members and some primary and secondary teachers in process
- Not so much shared among the teachers in the province
- Establishment of model schools, production of a book on kyozaikenkyu

(Difficulties in dissemination)

- Setback lies in lack of appreciation/ skepticism from colleagues, cultural nature of teaching
- Due to negative attitude and resistance among teachers
- Among the participants at subject association meetings
- Due to the cascade model used in rolling out certain interventions.
- Existence of grey areas of understanding on kyozaikenkyu among the members (not fully understood)
- Inadequate time to share due to business of KK team members caused by usual work
- Shared and harmonized understanding between mathematics and science teams
- Inadequate funding for having workshops for sharing experience

Scrutinizing ideas given by professional team members tells the following points.

The KK team members were selected by a reason that they were committed to the work under the program and understood significance of lesson study. In addition, in the process of trials and errors in introducing lesson study to schools, members had become to think that problem solving and inquiry methods of teaching could be introduced to Zambian lessons as core strategies. The words such as “problem solving”, “inquiry”, “team work” and “reflection” which they stated as important factors are related to their experiences and process of being selected as professional group. Although each member uses different expressions, all of them realized importance and necessity of problem solving, inquiry method based on kyozaikenkyu

practice to improve mathematics and science lesson and lesson study. On the level of sharing this, they are confident with the fact that same ideas are shared among the team. This tells us that, even if the expressions vary, the professional group members maintain shared time and experiences on the implementation of lesson study and improvement of kyozaikenkyu practice.

On the other hand, they answered that they were facing difficulties in disseminating knowledge and skills on kyozaikenkyu, when they work at school, district, province and national levels. One of the reasons mentioned by the members is a culture shared by teachers. It is not easy to break through current practices. Teachers neither need to have further study of subject contents once they mastered nor to analyze students’ ideas and understanding. Another reason mentioned is a cascading approach. The KK team members have to disseminate their ideas on kyozaikenkyu and teaching methods through workshops conducted at district, provincial and national levels, since it is not possible for them to go around all the schools in the country. They stated an issue that, even though teachers participated in the workshop and got some ideas of kyozaikenkyu, it was not sure that they could share it with their colleagues. The third reason which some members mentioned is the fact that the concept and practice related to kyozaikenkyu cannot be understood or mastered in a short period of time. It was pointed out that even professional group members still have “grey areas” of understanding kyozaikenkyu. Considering this fact, it would be necessary for teachers to continue their kyozaikenkyu practice for certain years of time with trials and errors.

## 5. DISCUSSION

The above findings are discussed from three perspectives mentioned earlier.

### 5.1 Institution and Autonomy for Nationwide Dissemination

Professional group has realized a certain level of autonomy both individually and as a team. An evidence of their autonomy are their initiative and commitment for continuing their own studies and writing KK handbook based on their experience. It is, however, not possible to improve other teachers' competence nationwide through simply developing handbook and formats, because those materials are simply tools made in the process of their study. This difficulty appears in the expressions such as “Lesson planning is not just a routine” and “Cultural nature of teaching”. And it is related to the thoughts and attitudes behind these expressions. Professional group faces the challenge in developing ways of transferring their thoughts and attitudes. A few teachers have started catching the thoughts but internalization will take more time, and besides the professional group still need to study and deepen themselves.

### 5.2 Values of Professional Group

As revealed in the research, some parts of competence are easily changed and others are difficult to be changed. It is similar with the transfer. Values stay behind the thoughts and attitudes in order to transfer competence which cannot be easily changed or transferred.

In this vein, problem solving lesson and kyozaikenkyu, which have been selected through practices as central strategies, represent formation of new values. This selection is made possible not

only by the technical assistance from donors but also by the autonomous judgment of the KK team. Act of selection contains accumulated knowledge as well as value-laden judgment, which is supported by understanding of context of Zambia.

### 5.3 Competence of Professional Group and Its Impact

Improvement of individual competence of the KK teams is a precondition for an effective work as a team and influences others. Quality of the lesson study and teachers' competence are considered to relate to each other (Fernandes 2009), but the teachers' competence does not automatically ensure the improvement of the lesson study. In order to make this relation moving forward, practical application and reflection are necessary. As a step forward, now KK team works hard to initiate this process at individual and group levels, and have developed a few good practices. It is, however, not simple to transfer developed good practices to other areas and topics and other teachers. Because it requires deep reflection and thoughts, other teachers need time to understand significance and digest method and such a process is seen as very gradual.

## 6. CONCLUSION

Summarily speaking, endogenous development of professional group requires overcoming tendency of dependence on manuals. In other words, it requires developing professionals, who can think and work autonomously according to the requirement of context. They are aware of institution but not bound fully by the institution, and work independently and autonomously utilizing the institution. In this sense, the professional group in Zambia – KK team – exemplifies a unique case although they are still at germination stage.

Persisting to autonomy should neither limit the

scope of work nor keep a good practice at special case alone. Or persisting to scaling up too much should not lead to mechanical dissemination at nationwide with no deep thoughts and reflection. It is there we can see the tension between institution and autonomy as mentioned in the beginning. The case in Zambia shows that the KK team is forming and sharing new professional values and knowledge under this tension. Furthermore, they cannot easily share those with other members within provinces, districts and even their own schools, despite of their tremendous efforts.

From now on, it needs a trifle expression integration between practice and theory in order to proceed in this difficult situation. That means that the leaders within each country such as the KK team, Zambia should make an effort to generalize an individual case through extensive practices and contextualize a general theory into its own situation. More specifically, it requires creation and accumulation of its country-specific professional knowledge and terms to describe the cases. For this purpose, the major universities in each country will play an important role. However, their participation into practice at school level is very slow, partly due to negative assets during the colonial period.

The future issues for the Zambian case are the two points.

It is important to discuss more specifically what is being gained in the individual case of lesson and topic by the KK team. It can lead to description of formation of professional knowledge.

Another point is the long term perspective. It concerns involvement of universities for accumulation of subject-wise research and professional knowledge. Academic association and conferring the doctoral degree are the most necessary for endogenous development of the research. Development of professionalism itself should be institutionalized. Again, the tension between autonomy and institution will stand there. If this tense relation will create driving force, then we are able to conceptualize a new dimension of lesson study.

	T1	T2	T3	T4
1	<p>Collaborative planning: Deep study of teaching/ learning materials and reflection on how to involve and utilize learner’s ideas. Discuss Lesson and Reflect on its Effect: The teachers learn how to analyze the lesson. Teaching the revised Lesson: It is important because it is an early measure of improvement.</p>	<p>Every stages of Plan-Do-See</p>	<p>Problem solving because it involves identifying topics that may be difficult to teach. In which case teachers put their ideas together to come up with the best way to teach a particular topic.</p>	<p>a) Diagnostic and detailed analysis of student learning. It helps to improve teaching and ultimately, the achievement of the intended forms of learning. b) Fellows commenting on the lesson for sharing the strengths and weaknesses. Through this practice, everyone gets enriched in both knowledge of content, and pedagogy.</p>
2	<p>The pre-requisite connections of topic at various levels and how to frame the Key or pivotal question How best to promote mathematical thinking and expression</p>	<p>Planning with viewpoints of learners, eclectic teaching, reflective lesson evaluation</p>	<p>Preparation of learner centered lessons. Improved skills. Intensive study of teaching/ learning materials. because comparing various materials and choose the most suitable one</p>	<p>The careful analysis of the topic in relation to the unit, topic or lesson: Connections of concepts in a systematic pattern i.e. the current and previous topics, within the topic and topics coming ahead.</p>
3	<p>Before it was not important to engage in the deep study of materials. Now, clear correlation between effective classroom delivery with effective prior planning</p>	<p>More attention to learners responses</p>	<p>Now lesson planning not just as a routine but as a thorough research on the materials. Analyzing the textbooks and comparing pupils’ pre- knowledge with the content of the lesson</p>	<p>Before it was ‘collaborative planning’ on a difficult topic. Now, anticipation of learners’ responses and plan based on them. Due to experiences and observation of expert teachers.</p>
4	<p>Among KK members we have had meetings to harmonize our understanding of the KK approach. Facilitators are trained and this also calls for total transformation of our attitudes.</p>	<p>Establishment of model schools, production of a book on kyozaikenkyu Setback lies in lack of appreciation/ skepticism from colleagues, cultural nature of teaching</p>	<p>Shared among the K.K team members quite extensively. Shared among the college lecturers. Among the district members and some primary and secondary teachers in process Due to negative attitude and resistance among teachers</p>	<p>Shared quiet extensively among the KK members Not so much among the teachers in the province Due to the cascade model used in rolling out certain interventions. It takes a lot of time for kyozaikenkyu to be accepted and be given the support.</p>

Table 4. Responses by science members of professional group

	T5	T6	T7
1	All the eight steps of the lesson study cycle and the facilitators & stakeholders workshops Teachers have opportunities to do the practice by collaborative planning for their lessons, implementing the planned lessons and reflecting on the implemented lessons. This way there is a culture of community practice which unifies teachers in the professional aspects despite varying levels of qualifications.	a) Planning –You can tell from the plan the amount of thinking and reflection the teachers do when planning a lesson. b) Lesson Delivery – Because it brings out the strong and weak points of the demo teacher c) Post-Demo discussions – Because the quality of the next demo – lesson depends on the input at this stage.	All aspects of lesson study are important.
2	<ul style="list-style-type: none"> <li>• Consideration of learners’ ideas and background</li> <li>• Linking instructional materials to teaching</li> <li>• Situation setting</li> <li>• Searching questions focusing on Higher Order Thinking Skills</li> </ul>	a) Planning stage: The success of the lessons is depended largely on how much time and thought we invest at the planning stage. b) Delivery stage: There are four (4) focus areas of kyozaikenkyu, 1)learner’s motivation and interest, 2)higher order Thinking, 3)Representation and expression, and 4)Knowledge and understanding.	All aspects of Lesson Study and KK are important because for a lesson to be meaningful, a teacher has to go through a process of studying the lesson before thinking of how to deliver it. This involves all the stages of studying the teaching and learning materials and other practices in the classroom that can make a great impact during lesson delivery.
3	I have acquired ‘extra eyes’ because what I viewed as good lesson before I now consider it needing more attention. The post demo discussions in lesson study at school level have gaps which the practice of kyozaikenkyu has the potential to seal. It is very true that Lesson Study is incomplete on its own without kyozaikenkyu practice.	a). developed a new way of seeing a lesson. b). The training has helped me understand the meaning and significance of the “kyozaikenkyu” practice which promote Learner - Centered education. c). developed effective analytical abilities for lesson observation and evaluation in terms of content, pedagogy and education values.	Previously I knew that it was important to prepare lessons before teaching, but I did not know much on the extent of what is involved in preparing a quality lesson. After studying and practicing kyozaikenkyu, now I know that it is important to practice enough kyozaikenkyu for lessons to be more effective.
4	The multiplier effect has not been done to a larger extent. The few model schools in Central province are trying to conceptualize the process in their science and mathematics lessons.	a) all the KK team members share the same understanding, although we still have some grey areas b) harmonization of understanding between the Mathematics and Science KK members. Major constraints: a) inadequate funds, b) negative attitudes by some teachers, c) limited knowledge	This thinking has been shared with the other KK members, teachers and officers through meetings, interact and workshops, stakeholders’ workshops and Subject Association Conferences. · Hindering factors; inadequate time to share, inadequate resources to enable KK members scale down the practice to many more teachers

	T8	T9	T10
1	The part of planning together (team work) and discussing the lesson after it has been delivered with a view of improving it.	All the 8 steps of lesson study meant a lot to me.	Collaborative planning and review of the lesson has been up-skilling for most of the teachers in both content, methodology and more in handling of practical aspects.
2	Teaching which brings out the values and concept which remain with the learner throughout his or her life.	All the aspects in Kyozaikenkyu are important especially in that; 1) need to know children 2) thinking good questions to motivate learners to think 3) arrange learners' investigation 4) enhance learners' observation and recording skills	The idea of taking teaching and learning materials as agents of change or tools for paradigm shift from popular teacher – centered to learner centered approaches. Additionally, the awareness and promotion of individual learning styles tends to impact greatly in the learners.
3	My thinking has changes to always look for concept and values in all that I do at work.	<ul style="list-style-type: none"> <li>• It has helped me to realize that as a teacher I am a facilitator of the learning process and not to dominate the process</li> <li>• My thinking after the training has helped me put the learner at the centre of the learning process.</li> <li>• The learner is not an empty vessel; they have something they know on every topic you may want to teach.</li> </ul>	Initially, teaching – learning materials was restricted, in our understanding to just those teaching aids that were normally used to consolidate an objective or learning point in a lesson, but after training the idea has widened and the application has deepened to a lot of areas.
4	We have shared with everyone during the stakeholders meeting, but it will require some time to sink in people's heads.	The aspect of kyozaikenkyu lesson has been shared and understood by some teachers, but there is need to continue practicing. The province has not yet fully been introduced to the kyozaikenkyu methodology, only a few selected schools have been oriented. There is need to introduce it to all the schools.	We have shared idea amongst ourselves as KK members and to our colleagues; however, the number of unreached teachers still remains large. There is still need to roll out the various aspects of this practice to schools. Equally, the need for more hands – on – activities for teachers remain high and, therefore, attention should be paid to our multiplier effect proposed models.

## Lesson Study in Initial Teacher Education

### *Opening The Door To A Holistic Understanding Of What It Means To Be A Teacher*

**Abstract:** This paper draws on research conducted by the Lesson Study Research Group at the University of Leicester using a modified form of lesson study in pre-service teaching practice placements. Three one-year projects were conducted involving a total of 44 student-teachers and 39 school-based mentors. Drawing on insights from our research and from the work of Hargreaves and Fullan (2012) on ‘Professional Capital’ and on Biesta’s (2014) discussion of educational wisdom, the paper proposes an alternative to the current focus on standards-driven teacher education. Lesson study opened up the pedagogic black box for inquiry and investigation by both student-teachers and mentors. As a result, the conference presentation challenges the prevailing approach to teacher education, in which student-teachers are supervised but plan lessons in relative isolation, arguing for a collaborative inquiry-oriented approach that focuses on the growth of what we term ‘pedagogic literacy’ rather than just the competences of individual student-teachers. The conference paper argues with a framework for understanding the growth of teacher professionalism as continual and collaborative, lesson study is a very useful vehicle for use in teaching practice placements, with the potential to set new teachers on the path to growing their pedagogic literacy, while also offering mentors opportunities for pedagogic growth.

**Keywords:** Your paper must have at least two but not more than six keyword. The text should be set in 9-point font size. Please use a comma as a separator between keywords.

## 1 INTRODUCTION

In this conference paper, our purpose is two-fold, firstly, to review potential impacts of a focus on standards-related ‘performativity’ on initial teacher education (ITE); secondly, to generate debate about the conceptualisation of teaching in ITE, we propose an alternative framework for understanding and supporting the ‘professional growth’ of teachers, one that challenges the current ‘managerialism’ (Stevenson and Wood 2013) that assesses individual teacher skills and performance, treating teaching as a collection of standards to be achieved. This perspective is based on our lesson study research in ITE (Cajkler et al 2014a, 2014b, Wood and Cajkler 2013; Wood and Cajkler 2014), the work of Biesta (2014) concerning the role of teachers in education and on the concept of Professional Capital (Hargreaves and Fullan 2012).

Content of ITE programmes is often determined by externally-given lists of ‘professional standards’ (e.g. DfE 2012). Consequently, a ‘performative’ and ‘technicist’ expectation may prevail (Wilkins and

Wood, 2009; Biesta 2014), leading to conceptualisations of teacher development as instrumentalist and objectives-led (Edwards and Thomas 2010), with trainee-teachers required to demonstrate competence in a set of narrowly-defined classroom standards, while often working in relative isolation. Despite this, a ‘reflective’ aspiration is seen as a ‘sine qua non’ (Edwards and Thomas 2010, 404) of any programme. Despite the fact that programmes are generally school-based in England, however, Edwards and Protheroe (2003) offer a challenging critique of current practices claiming that school placements fail to offer student-teachers real opportunities to learn from experienced mentors, largely because there is very little collaborative work. Current models of observation and feedback, they argue, do not allow student teachers to learn through ‘peripheral participation’ in the work of experienced teachers (Lave and Wenger 1991) and offer few opportunities to explore how teachers interpret and mediate subject knowledge to facilitate students’ learning.

## 2 CASE STUDIES OF LESSON STUDY IN INITIAL TEACHER EDUCATION

The Lesson Study Research Group (University of Leicester) has sought to reconcile, through the use of lesson study, the tensions between standards-driven ITE and the need for reflective inquiry in programmes of teacher preparation. In this paper, we summarise our emerging thinking drawing on research with trainee-teachers (2011-14) in a number of schools.

Drawing inspiration from the work of Fullan and Hargreaves (2012) on Professional Capital and other lesson study researchers (for example, Dudley 2011, Lewis 2002, 2009), the Lesson Study Research Group (University of Leicester) introduced lesson study to ITE programmes. The projects were conducted initially in two university-led ITE programmes (Cajkler et al. 2013; Wood and Cajkler 2013) and then, in the third project, with 30 secondary school student-teachers in a school-based initial teacher training (SCITT) programme (Wood and Cajkler 2014). We used Communities of Practice (Wenger 1998, 2000) to frame the three projects in which we evaluated the effectiveness of lesson study to support student-teachers' and mentors' professional growth.

The approach used involved a modified form of lesson study (Cajkler et al. 2013; Wood and Cajkler 2013; Wood and Cajkler 2014), employed during eight-week teaching practice placements with student-teachers and their mentors. The cycle followed a similar pattern to a standard Lesson study cycle (Lewis, 2002; Dudley, 2014), but involved the asymmetric relationship between mentor and student-teacher. A total of 44 student-teachers and 39 mentors participated in the three projects.

The distinguishing characteristic in this form of lesson study was that the mentor and student-teacher collaborated in the design, teaching and evaluation of a cycle of two (or more) research lessons. The first lesson was taught by the mentor and then, following evaluation and revision, the second research lesson was taught by the student-teacher (stages 4 and 5 in Figure 1), although in some cases participants were able to work in a triad with another participating teacher.

Where possible, the use of interviews with the students who had been observed during research lessons was encouraged. This was a useful addition

in helping student-teachers to understand in more depth the learning processes they had observed during the lessons. For the SCITT programme (the third of our studies), stimulated recall interviews were conducted in some schools and these proved to be enlightening.

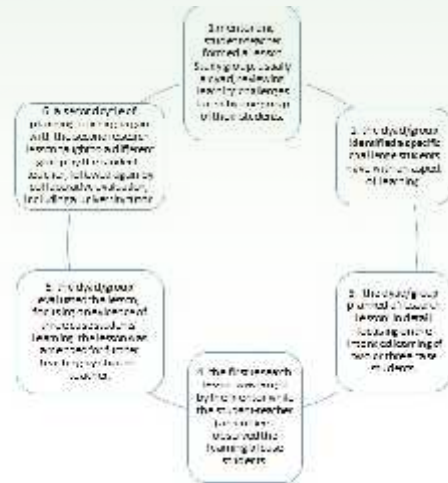

Figure 1: Initial Teacher Education Lesson Study Cycle for Use in a Practicum

The projects were framed by Communities of Practice (Lave and Wenger 1991, Wenger 1998, 2000) evaluating the effectiveness of lesson study as a vehicle to support the development of sustainable pedagogic skills (O’Leary 2014; Stigler and Hiebert 1999). Mentor and student-teacher lessons in the LS cycle (see figure 1 above) were observed and recorded. Data were collected from recordings of planning/evaluation meetings and post-lesson study interviews and subjected to detailed thematic analysis using a constant comparison approach.

It is not our purpose to present individual project findings but to draw conclusions from the work done in schools and discuss the implications for teacher education in general.

### 2.1 Benefits of mentor-student-teacher lesson study in ITE

Principal benefits identified from all three projects by both student-teachers and mentors were that, despite differences in experience, status and power, lesson study engaged mentors and student-teachers as learning-partners so that they confronted, in collaboration, the complexity of teaching and learning. This, we argue, was the principal achievement of lesson study in the teaching practice

placements, a collaborative opportunity to explore the complex system of processes that make up teaching and learning from planning through to evaluation. Edwards and Protheroe (2003, 239) have argued that if student-teachers are engaged with their mentors in guided participation in the acts of teaching this would offer a framework for mentors to act ‘as mediators of responsive pedagogy as a body of cultural and professional knowledge’. This contrasts with the traditional approach to ITE in which student-teachers’ work is subject to observation and feedback, with relatively little joint exploration of pedagogy. The typical model, criticised by Edwards and Protheroe (2003) above, has the student-teacher:

- a) usually planning alone,
- b) receiving some feedback on the plan, sometimes not long before the lesson begins (a scenario which some former student-teachers have described to us)
- c) being observed teaching the lesson
- d) receiving feedback and being asked to note some targets for ‘next-lesson’ action.

In contrast, findings from the three projects suggest that when student-teachers and their mentors engaged in lesson study in an open and critical way, both participants experienced growth in their understanding of the multi-layered nature of teaching and learning.

It must be noted that we also identified some weaknesses in using lesson study. While some student-teachers found the opportunity to be involved in lesson study a deeply reflective and generative process and identified significant changes in their levels of confidence, a small number in each group identified some drawbacks. In total, 44 student-teachers were involved, six of them reporting significant difficulties with the process. For example, one SCITT trainee wrote about the non-engagement of his mentor, a failure on the part of the mentor to learn the process and do anything other than go through the motions. Two student-teachers in the university based programmes were told what the focus of the lesson study cycle would be (with no room for negotiation) and one complained of being spoon-fed, the latter a danger in any student-teacher-mentor context.

A more general concern was expressed (often by mentors) about the availability of time to do justice to the lesson study process. So, we would not argue

that lesson study can be implemented in teaching placements without having to address and overcome challenges. In the SCITT programme, trainees reported that they were more invested in the process than their mentors. Mentor readiness and time to engage in the process were the most frequently reported challenges.

Despite these weaknesses, our three studies suggested that with mentor-led lesson study cycles could be fruitfully implemented with two research lessons during the course of an eight-week practicum. For 38 of 44 participants, lesson study opened a window into the complex processes of teaching, helping student-teachers learn how to teach from engagement in practice (Hiebert et al. 2003), opening up for investigation what we called ‘the pedagogic black box’ (Cajkler and Wood 2015).

## 2.2 Towards Pedagogic Literacy in Initial Teacher Education

At an early point in our ITE research projects, it became apparent that student-teacher and mentor collaboration in lesson study not only led to a positive impact for the student-teacher, but also for the mentor. Reflecting on this, we coined the term ‘pedagogic black box’ (Cajkler and Wood 2015) by which we mean that lesson study provides a space and a focus to open up inquiry into pedagogy, an area often left closed. Our experience in researching lesson study leads us to agree with Hargreaves and Fullan (2012) that authentic collaborative work between teachers brings professional growth. We take this to demonstrate that teachers each grow their practice, when allowed, through interplay of their values, individual experience and collaborative endeavour. In addition, this complex interaction exists within a contextual environment which plays a crucial role in establishing organisational, policy and societal frameworks. The complex network of factors and processes come together to underpin the concept of what we term ‘pedagogic literacy’.

This concept begins from a simple idea, that part of what it means to be human is ability and a readiness to teach. However, the development of pedagogic skills for use in schools is a multi-dimensional process including reflection on, and enactment of, values and philosophies, as it is values which inform judgements (Goepel 2012). To develop the skills and knowledge to become a teacher requires explicit and prolonged application. It involves reflection both individually and in collaboration with others. Teachers do not act in isolation and therefore need to understand and

accommodate organisational policies and understand the context of their work in relation to societal issues.

This leads to a model of pedagogic literacy based on a range of foundations (figure 2 below). It is important to stress that these foundations are intertwined processes that are not hierarchical or temporally disjointed. Figure 2 is an emergent yet incomplete view of the foundations and central processes that contribute to pedagogic literacy, one that we hope to explore with colleagues at the 2014 WALS conference. The notion implies a complex dynamic vision of how teaching develops.

Crucially, however, pedagogic literacy includes, at its core, the ability to interpret what is happening in lessons through a heightened awareness of how learners respond to teaching (the central core of what happens in real time in classrooms). This, we argue, is the core of pedagogic literacy. It is more than PCK (pedagogic content knowledge, Shulman 1986), we believe, as it involves learning to read

the ability to make context-sensitive pedagogic decisions:

*they have attentional skills which enable them to ‘read’ the activity of the classroom.*

This, we would argue, is the essence of pedagogic literacy, the ability to read the classroom and make appropriate learner-responsive decisions. We recognise that the difficulties of seeking to represent pedagogic literacy in a visual or written form. However, we conclude that conceptualising ‘learning to teach’ as the acquisition of a set of standards is insufficient to prepare new teachers for the complex realities of the classroom and consequently propose the concept of ‘pedagogic literacy’ as an alternative holistic framework for understanding how teachers and teaching evolve through a process of continuing and supported professional engagement.

This concept has grown out of lesson study research (Cajkler et al. 2014) and reflection on the ideas of professional capital (Hargreaves and Fullan 2012) and professional judgement (Biesta 2014).

Lesson study, as with other forms of collaborative action research, can contribute to setting teachers off on a journey of learning how to learn to teach, including the ability to research one’s own practice and develop it. There is widespread evidence, also confirmed in our lesson study projects, that the work of teachers is, in the main part, unquantifiable and relies on complex, contextualised processes and situations. As Biesta (2014, 129-130) states,

*because education is multi-dimensional, teachers constantly need to make judgements about how to balance the different dimensions; they need to set priorities - which can never be set in general but always need to be set in concrete situations with regards to concrete students.*

This results from the inherent complexity of classroom environments and the people who teach and learn within them (Cajkler et al 2013, 2014a/b). Therefore, pedagogic literacy is deliberately conceptualised as an attempt to move towards a comprehensive but always incomplete understanding of the multi-dimensional aspects of teaching: a holistic understanding which must always remain to some degree incomplete because to capture the true and total complexity of pedagogy is not possible.

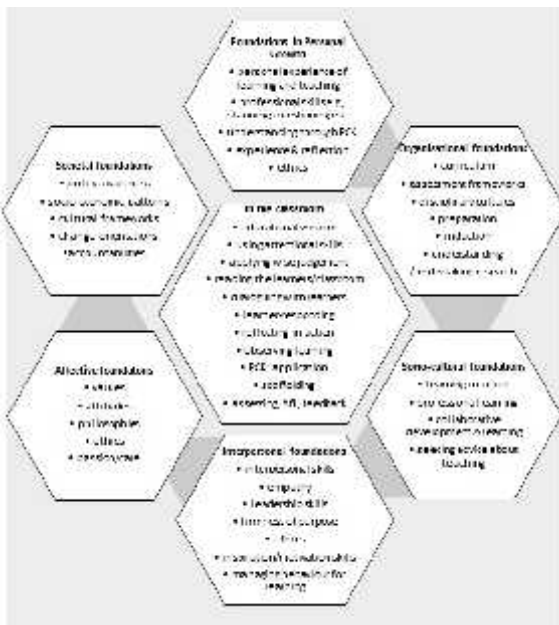

Figure 2: Outlining elements of pedagogic literacy: an emergent view

learner responses and make adjustments in action, echoing Schön’s (1983) reflection-in-action. Ainley and Luntley’s (2007, 1137) discussion of attentional-dependent knowledge makes reference to reading the classroom and offers a similarly holistic, dynamic view of what it means to be a teacher with

### 3 CONCLUSIONS

Our research into Lesson study has uncovered possibly more questions than it has answered. Far from pedagogy being a collection of discrete competences, it is the result of a complex interplay of processes and skills, many of which are highly contextual. We see the growth of pedagogic literacy as being an emergent process which takes time to develop, involving personal and collective discussion, reflection and experience. Biesta (2014, 134) considers this issue through his question 'How can we become an educationally wise person?' The answer extends beyond any simple notion of research-based practice. We argue that it is important for teachers at the very least to develop a 'research literacy' enabling them to interact with research findings in a critical but positive way to judge the validity of claims and understand how they might integrate research findings which they believe to have value within their classrooms. However, experience and reflection on experience are also crucial in the development of pedagogic literacy.

Judgement, according to Biesta, is not definable through documents and standards. It is the result of understanding and experience, a gradual process of accretion and refinement. Educational wisdom is the result of continual learning as pedagogy is a continually emergent process responsive to specific contexts and to specific learners. Use of lesson study in ITE is just one example of how student-teachers can focus on a holistic view of what it means to be a teacher, but the process takes time, dedication and all participants being open to discussion and debate.

**Abstract:** This study attempted to provide evidence that there was a distinctive difference on the effect of learning through the comparison of two different teaching methods: Method 1 used prepared handouts and cards posted on the blackboard and Method 2 used a DVD and slides which could expose the students to a visual and sound oriented learning environment. Method 1 was conducted in an English Communication class for 2<sup>nd</sup> year students in 2013. Handmade handouts contained blanks with parentheses for the students to fill in with the purpose of increasing their work output. Handmade cards were posted on the blackboard and used as visual effects to promote students' understanding. Giving the students continuous writing tasks and utilizing visual cards maintained their concentration during lessons. In Method 2, the DVD which provided pronunciation practice of new words and textbook sentences, translations of Japanese, listening questions, phrase reading, and answer checking on exercises, was programmed with native English speakers' English and well-designed colorful pages. Especially in pronunciation practice, the students had various kinds of practice. We also controlled the interval of the flash cards. We analyzed the scores of the midterm exams and conducted independent *t*-test to compare group means. The results indicated that Method 2 was more effective than Method 1 ( $t(70) = -4.86, p < .01$ ). In other words, the results suggest that the visual and sound oriented presentation of information of English has a large effect on English learning, while the use of handouts and cards has only a small effect. The results of the comparison of these two different methods showed how effective DVD teaching/learning materials were when they were used like a game to motivate students.

**Keywords:** visual effects, sound, DVDs, English learning

### 1 THE PURPOSE OF THIS PAPER

I'd like to describe our research and analysis to you and provide evidence that there was a distinctive difference on the effect of learning through the comparison of two different teaching methods:

**Method 1** We used prepared handouts and cards posted on the blackboard.

**Method 2** We used a DVD which exposed the students to a visual and sound oriented learning environment. In addition, to show grammar points, we created slides with colorful explanations on the computer and displayed them on a screen, in order to provide another visual effect. Your paper will be part of the conference proceedings. Therefore we ask that authors follow the guidelines explained in this example.

### 2.1 PREVIOUS STUDIES

Many researches on teaching with visual aids have been done before from different points of view.

Suzuki (2006) focused on a two-dimensional spatial display and graphic organizers rather than on a one-dimensional spatial display, for example, pictures, phrase reading etc and stated 'Their cognitive burden can be reduced by the advantage of increased computation efficacy through visual argument'. Sakamoto (1989) compares lessons between a student teacher and a skillful teacher from the standpoint of the use of audio-visual aids. As a result, a skillful teacher tried to support coherence with visual aids, while a student teacher tended to make incoherence. Hata (2003) introduced a method that used DVDs, especially films, with the textbook to prove it possible to teach through a textbook, not to teach a textbook but. Osawa (1995) stated that having said the role of the teacher is a key, 'using audio-visual facilities, students recognized, understood and used these features, and finally integrated them into their own learning to achieve communicative fluency.'

## 2.2 Who are the participants?

The students belong to a college of technology, a **k sen** school, 5-year science-oriented college for 15-years-old students or older. There are 63 institutions in Japan; most were established by the national government. Most of the institutions are technical schools, each with an enrollment of about 200 students per grade, focusing on engineering and mercantile marine studies.

Method 1 was conducted in an English Communication class for 2<sup>nd</sup> year students in 2013. The number of the students in a class was 45. Method 2 was conducted in another English Communication class for 2<sup>nd</sup> year students in 2014. There were also 45 students in a class. Both of the students majored in Mechanical Engineering. The levels of their English ability were fairly the same, according to the TOEIC IP Test. The TOEIC Bridge IP test scores on average were 113.7727 points as for the students in 2013, while the average scores were 114.0909 points as for those in 2014. There was only 0.3 point difference between these students. Therefore we can say that the levels of their English ability were almost the same.

## 2.3 Methods: How differently were the classes conducted?

**Method 1**: We used these teaching materials.

Text: *Powwow*. Tokyo: Bun-Eido, 2012.

Handmade handouts: handouts for each lesson part contained blanks with parentheses for the students to fill in with the purpose of increasing their work output. These handouts were made in order to lead the students to a smoother comprehension of the textbook.

Handmade cards: cards with colorful letters and signs were posted on the blackboard and used as visual effects to promote students' understanding. *In a way*, the colorful lettering was aimed at creating visual effects. Yet, I'm trying to say if it was not on the same effective level as Method 2, which is going to be talked about soon.

With these materials, giving the students continuous writing tasks and having visual cards eventually maintained their concentration during lessons. We created two remarkably different situations: one was full of sounds of pronunciation practices, and the other was a very quiet situation where the students concentrated on writing tasks.

**Method 2**: We used the DVD material.

Text: *One World*. Tokyo: Kyoiku Shuppan, 2014.

The DVD material: this provided pronunciation practice of new words and phrases, translations of Japanese, listening questions, and answer checking on exercises.

In the pronunciation practice of new words, we had a flash card practice activity and controlled the

interval from 0 to 5 seconds. We had a word practice activity from English to English, from English to Japanese, and from Japanese to English. In the past we practiced English by repeating after a native speaker's pronunciation recorded on CDs. In this method our students had both native speakers' pronunciation practice and visual effects along with a thrilling game-like time controlled interval all at the one time.

In the practice of textbook sentences, we also controlled the interval from 0 to 5 seconds. As they listened to English, the read words turned red so they could check the spelling visually and the sound of the words at the same time.

When they checked the Japanese translation, on the pre-given homework handouts with blanks, they could check each phrase by sharing their ideas in class. With a click of a mouse, a pointed phrase turned red. Therefore they could visually check the meaning in both English and Japanese.

When checking the answers in exercises, the right answers were promptly identified with colourful letters. So immediately after giving the students' own answers, they could know the result promptly with just one click of a mouse. Therefore, they could get involved in the exercises without losing their interest.

The reading practice activity had a distinctive difference from Method 1. It was programmed with native English speakers' English and well-designed colourful pages. Especially in the pronunciation practice activity, the students had various kinds of practice. For example, they could practice from English to Japanese, and vice versa. We also controlled the interval of the flash cards so that we could create an exciting game-like atmosphere where the students got involved naturally and just like a game, they even began to compete with each other.

## 3 RESULTS AND ANALYSIS

We analyzed the scores of the midterm exams that the students took in May of each year, and conducted independent t-test to compare group means. The results indicated that Method 2 was more effective than Method 1 ( $t(70) = -4.86, p < .01$ ). In other words, the results suggest that the visual and sound oriented presentation of information in English had a significant effect on English learning, while the use of handouts and cards had only a small effect. The results of the comparison of these two different methods shows how effective DVD teaching/learning materials can be when they are used like a game to motivate students. Method 2 not only motivated the students, involving them in classroom activities spontaneously, but also led them to achieve higher scores in English tests.

## The Supporting of School-Based Lesson Study (LSBS) to Teacher Performance Appraisal (PKG) and Teacher's Continuous Professional Development (PKB) in SMAN 9 Bandung

Tati Hermawati<sup>1</sup> & Riandi<sup>2</sup>

<sup>1</sup>SMAN 9 Bandung, Indonesia

<sup>2</sup>Universitas Pendidikan Indonesia, Indonesia

**Abstract:** Nowadays teachers performance and teachers professional development are important to discuss on educational context in Indonesia. The Government has developed program to assess teacher's performance and teacher's continuous professional development. The teacher's performance appraisal is called PKG to assess all teacher activities as well as developing lesson plan, teaching learning activities and student assessment. The teacher continuous professional development is called PKB to assess teacher activities as well as scientific forums. The School-based Lesson Study called LSBS has facilitated to PKG and PKB, because trough LSBS the teacher can enhanced quality of teaching, conducting class action research, developing handout, teaching media and scientific article or papers. LSBS in SMA 9 Bandung has initiated on 2005, until now more than 40 school teachers have involved to LSBS.

**Keywords:** LSBS, PKG, PKB

### 1. PENDAHULUAN

Berdasarkan Undang-Undang Republik Indonesia Nomor 14 Tahun 2005 tentang Guru dan Dosen Bab I Pasal 1 ayat 1 diterakan bahwa guru adalah pendidikan profesional dengan tugas utama mendidik, mengajar, membimbing, mengarahkan, melatih, menilai dan mengevaluasi peserta didik pada pendidikan usia dini jalur pendidikan formal pendidikan dasar, dan pendidikan menengah. Undang-undang nomor 14 tersebut mengisyaratkan bahwa keberadaan guru adalah sebagai pendidik dan juga sebagai suatu pekerjaan yang memiliki jabatan rangkap, yaitu jabatan fungsional dan jabatan profesional. Guru memiliki tugas, tanggung jawab, dan wewenang dalam melaksanakan kegiatan persekolahan formal sebagai pendidik pengajar, pembimbing, pengarah, pelatih dan penilai peserta didik ketika mereka menempuh pendidikan formal.

Tugas profesi guru selain sebagai pengajar juga pendidik dan pelatih. *Mendidik* berarti meneruskan dan mengembangkan nilai-nilai hidup. *Mengajar* berarti meneruskan dan mengembangkan ilmu pengetahuan dan teknologi sedangkan *melatih* berarti mengembangkan keterampilan-keterampilan pada peserta didik (Usman, 1989).

Pekerjaan guru yang utama terkait jabatan fungsional dan keprofesionalannya adalah melakukan suatu kegiatan yang disebut dengan kegiatan pembelajaran terhadap peserta didik. Kegiatan pembelajaran dimaksud meliputi kegiatan menyusun rencana pembelajaran (RPP), melaksanakan pembelajaran yang

bermutu, menilai dan mengevaluasi hasil pembelajaran, menyiapkan dan melaksanakan program perbaikan dan pengayaan terhadap peserta didik.

Tidaklah berlebihan kalau dikatakan bahwa masa depan masyarakat, bangsa dan negara, sebagian besar ditentukan oleh guru. Oleh sebab itu, profesi guru perlu dikembangkan secara terus menerus dan proporsional menurut jabatan fungsional guru (PMPTK, 2010). Untuk menjalankan tugas dan fungsi keprofesionalan dengan baik dan berkualitas, seorang guru dituntut untuk secara berkelanjutan melakukan program peningkatan dan pengembangan diri. Program dimaksud yang tersedia saat ini adalah program Penilaian Kinerja Guru (PKG) dan program Pengembangan Keprofesionalan Berkelanjutan (PKB). Program tersebut merupakan barometer keprofesionalan dari seorang guru.

PKG sangat diperlukan agar fungsi dan tugas yang melekat pada jabatan fungsional guru dapat dilaksanakan sesuai dengan aturan yang berlaku. PKG akan menjamin terjadinya proses pembelajaran yang berkualitas di semua jenjang pendidikan. Melalui PKG dapat diidentifikasi secara tepat berkaitan dengan kegiatan guru di dalam kelas, dan membantu guru untuk meningkatkan pengetahuan dan keterampilannya. Hal ini akan berdampak secara langsung pada peningkatan kualitas pembelajaran yang dilakukan guru, sekaligus membantu pengembangan karir guru sebagai tenaga profesional.

Implikasi dari PKG akan menuntut peran professional guru untuk senantiasa melakukan inovasi-inovasi dan kreativitas dalam melaksanakan proses pembelajaran. Tuntutan tersebut oleh guru dapat diantisipasi melalui kegiatan pengembangan profesionalisme yang diantaranya berupa kegiatan *Lesson Study*. Beberapa alasan mengapa dilakukan *lesson study* untuk meningkatkan mutu pendidikan termasuk didalamnya adalah kualitas pembelajaran adalah:

1. Program peningkatan profesionalisme guru yang telah ada kurang berdampak terhadap peningkatan kualitas pembelajaran di kelas (Widodo, Riandi, Wulan & Amprasto, 2006).
2. *Lesson study* dinilai sebagai rahasia keberhasilan Jepang dalam peningkatan kualitas pendidikannya (Stigler & Hiebert, 1999). Melalui kegiatan unggulan *lesson study* guru dapat bertukar pendapat ataupun berdiskusi dengan teman-teman dalam kelompok mata pelajaran di sekolah baik itu sebelum melakukan pelaksanaan pembelajaran yaitu pada penyusunan RPP, pada proses pembelajaran atau setelah proses pembelajaran (refleksi). Hasil dari kegiatan tersebut diantaranya adalah guru dapat mencoba menerapkan inovasi-inovasi baru dalam pendidikan khususnya dalam inovasi pembelajaran di sekolah. Bentuk inovasi pembelajaran ini meliputi berbagai aspek penting dalam pelaksanaan kegiatan belajar mengajar yang meliputi:
3. Kegiatan pembelajaran berpusat pada peserta didik (*student centered*), dimana sebelumnya pelaksanaan pembelajaran cenderung satu arah yang didominasi guru
4. Pengembangan metode dan pendekatan yang digunakan selain diskusi-informasi juga inquiri,
5. Pengembangan bentuk pertanyaan yang diajukan kepada peserta didik menjadi *pertanyaan produktif*, sebelumnya pertanyaan yang biasa diajukan guru berupa konsep/ hafalan. Dengan menggunakan pertanyaan produktif para peserta didik dituntut untuk melakukan aktivitas dan berpikir sistematis ketika menjawabnya/ para peserta didik juga lebih berani menjawab pertanyaan yang dilontarkan guru, dan dari jawaban seorang peserta didik guru dapat mengarahkan pertanyaan lainnya sehingga pemahaman peserta didik tentang suatu materi/ konsep lebih komprehensif,

6. Pembelajaran lebih mengutamakan "*hands-on activity*", sehingga kegiatan teori dan praktikum tidak lagi dipisahkan tetapi dipadukan dalam jam yang sama. Hal ini membuktikan bahwa belajar harus ditempuh dengan melihat, merasakan dan mencobakan,
7. Mengevaluasi peserta didik tidak hanya pada hasil tes saja tapi juga pada saat proses pembelajaran (*authentic assessment*), dimana sebelumnya peserta didik dinilai pada akhir suatu pembelajaran tetapi sekarang pada saat proses pembelajaran berlangsung penilaian sudah bisa dilakukan apakah itu aspek pengetahuan, praktik atau sikap.

Aspek-aspek inovasi pembelajaran sangat mendukung penerapan konsep belajar bermakna dari Ausubel (1963) yang menyatakan bahwa belajar merupakan suatu proses mengkaitkan informasi baru pada konsep- konsep yang relevan. Dimasa sekarang proses pembelajaran di kelas, peserta didik diharapkan lebih banyak belajar mandiri, sedangkan guru hanya sebagai pemandu/ fasilitator/ salah satu sumber belajar dan bukan merupakan pusat sumber belajar.

## 2 IMPLEMENTASI LESSON STUDY DI SMAN 9 BANDUNG

Perintisan implementasi *Lesson Study* di SMAN 9 Bandung dimulai tahun 2005. SMAN 9 Bandung yang merupakan salah satu sekolah mitra Universitas Pendidikan Indonesia sejak tahun 2003 telah menjadi *Piloting School* untuk mengujicobakan hasil-hasil pengembangan inovasi pembelajaran matematika dan IPA (Fisika, Kimia, Biologi) sebagai produk *The Improvement of Mathematics and Science Education Project* (IMPSTEP). IMSTEP merupakan program peningkatan kualitas pendidikan matematika dan IPA melalui peningkatan kualitas pendidikan calon guru MIPA. IMSTEP terselenggara atas kerjasama Pemerintah RI dengan Jepang melalui *Japan International Cooperation Agency* (JICA).

Sejak tahun 2005 guru-guru dari SMAN 9 Bandung mengikuti kegiatan *lesson study* di berbagai kesempatan baik di dalam sekolah sendiri maupun di sekolah lain melalui aktivitas MGMP. Aktivitas *lesson study* di SMAN 9 pada tahun-tahun berikutnya semakin berkembang karena didukung oleh program PHKI-C yang merupakan program kerjasama UPI dan Disdik Provinsi Jawa Barat. PHKI-C telah mengembangkan *Lesson Study Berbasis Sekolah* (LSBS). Melalui LSBS semua guru menjadi terlibat dalam implementasi *lesson study*, baik tahap *Plan, Do* maupun *See*.

Program LSBS yang dirintis PHKI-C, di SMAN 9 ditindaklanjuti oleh pihak sekolah dengan memasukkan program tersebut ke dalam Program APBS untuk pengembangan profesionalisme guru. Melalui LSBS mandiri ini, setiap guru mata pelajaran diwajibkan untuk melakukan *open lesson*.

Setelah melaksanakan kegiatan *open lesson* para guru terlihat:

1. lebih berani dalam mengemukakan pendapat tentang pembelajaran di kelas
2. untuk menyusun RPP didiskusikan terlebih dahulu dengan teman-teman sekelompoknya (MGMP)
3. lebih percaya diri pada waktu tampil dalam pembelajaran di kelas
4. lebih siap untuk disupervisi oleh kepala sekolah dengan timnya.

Pelaksanaan Penilaian Kinerja (PK) Guru di SMA Negeri 9 Bandung dilaksanakan pada saat yang bersamaan dengan kegiatan *open lesson*. Pada saat melakukan penilaian, penilai masuk ke dalam kelas di mana guru melakukan KBM sebagai observer. Guru yang melaksanakan pembelajaran (guru model), sebelumnya mengkonsultasikan RPP nya terlebih dahulu kepada penilai. Pada pelaksanaan refleksi, penilai ikut serta dalam refleksi dan mendapat informasi-informasi tambahan dari para observer untuk aspek-aspek yang tidak terpantau oleh penilai pada saat observasi. Kebermaknaan PKG yang dipadukan dengan kegiatan *lesson study* membuat para guru yang akan dinilai terkesan lebih siap dan lebih percaya diri.

## 2 PEMBAHASAN

Penilaian kinerja Guru (PKG) adalah penilaian dari tiap butir kegiatan tugas utama guru dalam rangka pembinaan karier kepangkatan dan jabatannya. PKG dilakukan dalam bentuk paket kerja, meliputi pembelajaran/bimbingan dan tugas tertentu untuk (PMPTK, 2010):

- a. pembelajaran mencakup aspek perencanaan dan pelaksanaan pembelajaran, evaluasi dan penilaian, analisis hasil penilaian, dan pelaksanaan tindak lanjut hasil penilaian.
- b. pembimbingan mencakup aspek perencanaan dan pelaksanaan pembimbingan, evaluasi dan penilaian hasil pembimbingan, analisis hasil pembimbingan, dan pelaksanaan tindak lanjut hasil pembimbingan.
- c. tugas lain yang relevan mencakup aspek guru menjadi kepala sekolah/madrasah, wakil kepala sekolah/ madrasah, ketua program keahlian/program studi atau yang sejenisnya, kepala perpustakaan, kepala laboratorium, bengkel, unit produksi atau yang sejenisnya, pembimbing khusus pada satuan pendidikan

yang menyelenggarakan pendidikan inklusi, pendidikan terpadu atau yang sejenisnya, wali kelas, menyusun kurikulum pada satuan pendidikannya, pengawas penilaian dan evaluasi terhadap proses dan hasil belajar, membimbing guru pemula dalam program induksi, membimbing peserta didik dalam kegiatan ekstrakurikuler, pembimbingan pada penyusunan publikasi ilmiah dan karya inovatif, melaksanakan pembimbingan pada kelas yang menjadi tanggung jawabnya (khusus guru kelas).

Secara umum, PKG memiliki 2 fungsi utama sebagai berikut (PMPTK, 2010):

1. Untuk menilai kemampuan guru dalam menerapkan semua kompetensi dan keterampilan yang diperlukan pada proses pembelajaran, pembimbingan, atau pelaksanaan tugas tambahan yang relevan dengan fungsi sekolah/madrasah. Dengan demikian, profil kinerja guru sebagai gambaran kekuatan dan kelemahan guru akan teridentifikasi dan dimaknai sebagai analisis kebutuhan atau audit keterampilan untuk setiap guru, yang dapat dipergunakan sebagai basis untuk merencanakan PKB.
2. Untuk menghitung angka kredit yang diperoleh guru atas kinerja pembelajaran, pembimbingan, atau pelaksanaan tugas tambahan yang relevan dengan fungsi sekolah/madrasah yang dilakukannya pada tahun tersebut. Kegiatan penilaian kinerja dilakukan setiap tahun sebagai bagian dari proses pengembangan karir dan promosi guru untuk kenaikan pangkat dan jabatan fungsionalnya.

Penilaian kinerja Guru sebagaimana dimaksud pada ayat (1) menggunakan nilai dan sebutan sebagai berikut pada Tabel 1:

Tabel 1. Contoh Rekapitulasi Hasil PKG untuk seorang guru

No.	Nilai Akhir Kinerja (NAK)	Klasifikasi
1.	91 sampai dengan 100	Amat baik
2.	76 sampai dengan 90	Baik
3.	61 sampai dengan 75	Cukup
4.	51 sampai dengan 60	Sedang
5.	0 sampai dengan 50	Kurang

Nilai Akhir Kinerja (NAK) yang telah diklasifikasikan dalam 5 (lima) level di atas, kemudian dikonversikan angka kredit yang telah ditentukan dengan cara perhitungan sebagai berikut (PMPTK, 2010):

- a. Nilai “**sangat baik**” diberikan angka kredit 125% dari jumlah angka kredit yang harus dicapai setiap tahun.

- b. Nilai **“baik”** diberikan angka kredit 100% dari jumlah angka kredit yang harus dicapai setiap tahun.
- c. Nilai **“cukup”** diberikan angka kredit sebesar 75% dari jumlah angka kredit yang harus dicapai setiap tahun.
- d. Nilai **“sedang”** diberikan angka kredit sebesar 50% dari jumlah angka kredit yang harus dicapai setiap tahun.
- e. Nilai **“kurang”** diberikan angka kredit sebesar 25% dari jumlah angka kredit yang harus dicapai setiap tahun.

Selain PKG konsekuensi guru sebagai profesi adalah pengembangan keprofesian berkelanjutan (PKB). Pengembangan keprofesian berkelanjutan adalah pengembangan kompetensi guru yang dilaksanakan sesuai dengan kebutuhan, bertahap, berkelanjutan dan dapat meningkatkan profesionalannya.

PKB adalah bentuk pembelajaran berkelanjutan bagi guru yang merupakan kendaraan utama dalam upaya membawa perubahan yang diinginkan berkaitan dengan keberhasilan peserta didik (buku 1 PMPTK, 2010). Dengan demikian semua peserta didik diharapkan dapat mempunyai pengetahuan, keterampilan lebih baik, dan menunjukkan pemahaman yang mendalam tentang materi ajar serta mampu memperlihatkan apa yang mereka ketahui dan mampu melakukannya.

PKB mencakup berbagai cara dan/atau pendekatan dimana guru secara berkesinambungan belajar setelah memperoleh pendidikan dan/atau pelatihan awal sebagai guru. PKB mendorong guru untuk memelihara dan meningkatkan standar mereka secara keseluruhan mencakup bidang-bidang berkaitan dengan pekerjaannya sebagai profesi. Dengan demikian, guru dapat memelihara, meningkatkan dan memperluas pengetahuan dan keterampilannya serta membangun kualitas pribadi yang dibutuhkan di dalam kehidupan profesionalnya.

Kegiatan tersebut ada dalam kegiatan *lesson study*, yaitu:

1. adanya komunitas belajar (*learning community*)
2. kesejawatan (*collegiality*)
3. meningkatkan kualitas pembelajaran secara berkesinambungan (*continuous quality improvement*).
4. Peningkatan kualitas pembelajaran secara terus menerus merupakan jiwa dari penelitian tindakan kelas (PTK).

Oleh karena itu *lesson study* juga dapat dijadikan media untuk para guru dalam melakukan penelitian tindakan (*action research*).

Pada prinsipnya, PKB sama dengan tahapan *lesson study* yaitu mencakup kegiatan perencanaan (*plan*), pelaksanaan (*do*), evaluasi, dan refleksi (*see*) yang didesain untuk meningkatkan karakteristik, pengetahuan, pemahaman, dan keterampilan sebagaimana digambarkan pada diagram berikut ini (diadopsi dari *Center for Continuous Professional Development (CPD), University of Cincinnati Academic Health Center*. [http://webcentral.uc.edu/cpd\\_online2](http://webcentral.uc.edu/cpd_online2) dalam buku 1 PMPTK, 2010).

Gambar 1 Tahapan PKB  
Sumber: Kementerian Pendidikan dan Kebudayaan (2012)

PKB digunakan untuk dapat memperkecil jarak antara pengetahuan, keterampilan, kompetensi sosial dan kepribadian yang guru miliki sekarang dengan apa yang menjadi tuntutan ke depan berkaitan dengan profesinya itu. Kegiatan PKB ini dikembangkan atas dasar profil kinerja guru sebagai perwujudan hasil PKG yang didukung dengan hasil evaluasi diri. Adapun kegiatan PKB bagi guru-guru yang hasil penilaian kinerjanya:

1. masih berada di bawah standar kompetensi atau berkinerja rendah diwajibkan mengikuti program PKB untuk mencapai standar
2. telah mencapai standar kompetensi, kegiatan PKB-nya diarahkan kepada peningkatan keprofesian agar dapat memenuhi tuntutan ke depan dalam pelaksanaan tugas dan kewajibannya sesuai dengan kebutuhan sekolah dalam rangka memberikan layanan pembelajaran yang berkualitas kepada peserta didik.

Secara umum, keterkaitan antara PKG, PKB dan pengembangan karir profesi guru dapat diperlihatkan pada diagram berikut ini (buku 1 PMPTK, 2010):

Gb.2. Pedoman Pengelolaan PKB  
Sumber: Kementerian Pendidikan dan Kebudayaan (2012)

Beberapa manfaat PKB bagi guru adalah sebagai berikut.

1. Memfasilitasi guru untuk mencapai standar kompetensi profesi yang telah ditetapkan.
2. Memfasilitasi guru untuk terus memutakhirkan kompetensi yang mereka miliki sekarang dengan apa yang menjadi tuntutan ke depan berkaitan dengan profesinya.
3. Memotivasi guru-guru untuk tetap memiliki komitmen melaksanakan tugas pokok dan fungsinya sebagai tenaga profesional.
4. Mengangkat citra, harkat, martabat profesi guru, rasa hormat dan kebanggaan kepada penyandang profesi guru.

Peter Senge (2000) mengingatkan perlunya mengembangkan sekolah sebagai sebuah organisasi pembelajar. Di antara karakter utama organisasi pembelajar adalah senantiasa mencermati perubahan internal dan eksternal yang diikuti dengan upaya penyesuaian diri dalam rangka mempertahankan eksistensinya.

Syarat mutlak terciptanya organisasi pembelajar adalah terwujudnya masyarakat pembelajar di tubuh organisasi tersebut. Ini dapat dengan mudah difahami mengingat kinerja organisasi secara tidak langsung adalah produk kinerja kolektif semua unsumnya termasuk Sumber Daya Manusia. Oleh sebab itu, dalam konteks sekolah, guru secara individu maupun secara bersama-sama dengan masyarakat seprofesinya harus didorong untuk menjadi bagian dari organisasi pembelajar melalui keterlibatannya secara sadar dan sukarela serta terus menerus dalam berbagai kegiatan belajar guna mengembangkan profesionalismenya.

### 3 KESIMPULAN DAN SARAN

Sebagai simpulan dari makalah ini, dapat dikatakan bahwa *lesson study* merupakan kegiatan

yang paling strategis untuk PKG dan PKB dalam meningkatkan profesionalisme guru sebagai pengajar dan pendidik. Semangat kesejawatan dan komunitas belajar yang terbentuk melalui *lesson study* merupakan modal untuk belajar saling menguntungkan (*mutual learning*) dalam mewujudkan guru profesional sesuai tuntutan PP 19 tentang profesionalisme guru.

## School-Based Lesson Study to Support the Government in Succeeding the Performance Appraisal of Teachers in SMPN 1 Jatigede Sumedang West Java Indonesia

Kartoma, S.Pd., Abdul Aziz Muslim S.Hut.

**Abstract:** School-based Lesson Study (LSBS) is one of two types of lesson study is implemented by all teachers of various subjects with the principal concerned with the goal of keeping the quality of the process and the learning outcomes of all subjects in the school can be improved. The academic fields of SMP Negeri 1 Jatigede Sumedang West Java province of Indonesia has implemented that program since 2007. Related to the Teacher Performance Assessment - in 2012, in which the principal and some senior teachers as school assessment team shall periodically prepare the performance appraisal of teachers, at least 2 times. the assessment are namely formative and summative. the frequency and schedule of activities at school refer to lesson study program from the head of Quality Field of Teachers Sumedang District Education Office. Teacher performance appraisal are conducted by a team of school assessors to the teacher who opened a particular model class, according to the schedule specified by the academic field. Principals and their teams carry out an assessment to teachers following the implementation schedule of lesson study. Lesson study thus support the government in assessing teacher performance.

**Keywords:** school based lesson study, support the government, performance appraisal of teachers

### 1 INTRODUCTION

SMP Negeri 1 Jatigede is a school that is implementing school-based lesson study. All subjects carry out the lesson study with typical activities:

- Designing collaborative learning plan which reflects the student-centered learning,
- Two main activities, namely are: (1) the implementation of learning activities undertaken by one of the teachers agreed or at the request of its own to practice the lesson plan that has been prepared jointly, and (2) the activities of observation or observation made by members or Lesson Study other community (read: the teacher, the principal, or school superintendent, or other invitees who acted as observers / observer)
- Reflection activities carried out in the form of a discussion that followed throughout the Lesson Study participants were guided by the principal or other designated participants. The discussion starts from the delivery of impressions that have been practicing teacher learning, by submitting comments or general impression as well as a special impression on the learning process does, for example regarding the perceived difficulties and

problems in implementing lesson plans that have been prepared.

The writers consider that teacher is a professional educator who has the task, function, and an important role in educating the nation. Professional teachers are expected to participate in national development to realize the Indonesian people who fear God Almighty, excel in science and technology, has a soul aesthetic, ethical, noble character, and personality. Implementation of the main tasks of teachers can not be separated from the ability of a teacher in the mastery of knowledge, application of knowledge and skills

In order to establish the teaching profession as a dignified profession, namely to achieve the vision of a national education through quality learning process, it should be carried out the Teacher Performance Appraisal and on a regular ongoing basis.

The Teacher Performance Appraisal System is a scoring system designed to identify the teacher's ability to carry out its duties through the measurement of competence demonstrated mastery in their performance.

### 2 THEORITICAL

## 2.1 Lesson Study

### Understanding of Lesson Study

According to Garfield, 2006 lesson study is a systematic process used by Japanese teachers to test the effectiveness of teaching in order to enhance learning outcomes. Systematic process in question is working collaboratively teachers to develop lesson plans and tools, observation, reflection, and revision of the plan pembelajaran cyclic and continuous basis. According to Walker (2005) Lesson study is a method of professional development of teachers. According to Lewis (2002) ideas contained in the actual lesson study is short and simple, that is, if a teacher wants to improve learning, one of the most obvious ways is to collaborate with other teachers to design, observe and reflect on the lessons.

In more operational lesson study is a model of professional development of educators through collaborative learning and assessment based continuous principle of collegiality and mutual learning to build a learning

community in order to improve professionalism teachers and to improve the quality of learning

The main focus of Lesson Study is the development and learning of the student, for example, whether students show interest and motivation to learn, how students work in small groups, how the students perform the tasks set by the teacher, as well as other matters relating with activity, participation, as well as the condition of each student in the learning process. Thus, the focus is no longer only focused on how teachers teach as usual in a classroom supervision conducted by the principal or school superintendent.

SlametMulyana (2007) explores the implementation of the two types of Lesson Study, which is a school-based Lesson Study and Lesson Study based MGMPs. School-based Lesson Study carried out by all the teachers of the various fields of study with the principal concerned with the goal of keeping the quality of the learning process and the results of all subjects in the school can be further improved. While Lesson Study MGMPs an assessment based on the learning process carried out by a group of teachers of certain subjects, with the deepening of the study of learning in certain subjects, which can be implemented at the level of regions, districts, or perhaps could be extended again.

All materials on each page should be set to fit the paper size of A4 (210x297 mm). The document margins should be set to the following:

- Top: 3 cm;
- Bottom: 3 cm;
- Left: 2,5 cm;
- Right: 2,5 cm.

Authors should set the Section Start to Continuous with the vertical alignment to the top and the header is set to 1,5 cm and the footer is set to 2 cm.

## 2.2 Title and Authors

This section must be in one column. The title (Times New Roman 15-point), authors' names (Times New Roman 11-point) and affiliations (Times New Roman 9-point) run across the full width of the page. We also recommend you to include e-mail address (Times New Roman 9-point). Please see the top of this page for three addresses. If only one address is needed, center all address text. For two addresses, use two centered tabs.

### 2.2.1 Title

Use 14-point type for the title, aligned to the center, linespace exactly at 18-point with a bold font style and initial letters capitalized. No formulas or special characters of any form or language are allowed in the title.

### 2.2.2 Subtitle

Use 13-point type for the subtitle, aligned to the center, linespace exactly at 18-point with bold and italic font style. The initial letters should be capitalized.

### 2.2.3 Authors and Affiliations

Authors' names should be aligned to the center with linespace exactly at 13-point. The text must be set to 11-point. Affiliations should appear aligned to the center. Affiliation information should include organization, address, and email address.

### 2.2.4 Abstract

Abstract is required all categories of paper. Your abstract should be one paragraph summarizing the content of the paper and should consist of not more

than 250 words. Use Times New Roman of 9-point size and justify with a hanging indent of 2 cm.

### 2.2.5 Keywords

Your paper must have at least two, but not more than, six keywords. The text should be set in 9-point font size. Please use a comma as a separator between keywords.

## 2.3 Sections

This section must be in two columns. Each column must be 7,5-centimeter wide with a column spacing of 0,8-centimeter. The section text must be set to 10-point, justified and single spaced.

### 2.3.1 Section Titles

The heading of a section title should be in Times New Roman 12-point bold in all-capitals flush left with an additional spacing of 12-points before and after. Sections and subsequent sub-sections should be numbered and flush left.

### 2.3.2 Subsection Titles

The heading of subsections should be in Times New Roman 11-point bold with only the initial letters capitalized. For subsections and subsubsections, a word like *the ora* is not capitalized unless it is the first word of the title.

### 2.3.3 Subsubsection Titles

The heading of a subsubsection title should be in 11-point bold with initial letters capitalized, aligned to the left with linespacing exactly at 12-point, with an additional spacing of 12-point before and 12-point after.

### 2.3.4 Tables and Figures

Place Tables/Figures/Images in text as close to the reference as possible. Tables must appear inside the designated margins or it may extend across both columns to a maximum width of 17 cm. Tables in two columns must be positioned at the top or bottom of the page within the given margins.

Tables should be properly numbered, centered and should always have a caption positioned above it. Please refer to the APA Manual. The font size to use is 9-point. No bold or italic font style should be

used. Spacing before and after should be of 12-point, respectively.

Table 1. Captions with one line need to be centered and captions with more than one line have to be justified. The word “Table” is spelled out.

Column 1	Column 2	Column 3	Column 4
Row 1	Row 1	Row 1	Row 1
Row 2	Row 2	Row 2	Row 2

Figures must appear inside the designated margins or that may span the two columns. Figures in two columns must be positioned at the top or bottom of the page within the given margins. It is advisable the use of text boxes in this case.

Figures should be properly numbered, centered and should always have a caption positioned beneath the image. Captions with one line should be centered and if it has more than one line should be set to justified. The font size to use is 9-point.

Figure 1. This caption has one line and is centered.

### 2.3.5 Reference Text and Citations

References and citations should follow the APA Publication Manual (6th edition). Please see the References section, for an example).

References should be set to 9-point, justified, with a single line spacing and hanging indent of 0,5cm.

## 3 CONCLUSIONS

This guideline/template is adapted and modified from different sources to help you with the submission of your paper.

## 4 ACKNOWLEDGEMENTS

Acknowledgements should be placed before the references section. Numbering is not necessary.

## 5 REFERENCES

Author, A. B.(2013). *Title of work: Use capital letters appropriately for title of work.* Location: Publisher.

## Implementation Of Lesson Study For Trainee Teacher Of Nautical Program At Vocational School Smkn 13 Malang

Tri Endarwati  
SMK Negeri 13 Malang.  
triendarwati51@yahoo.co.id

**Abstract:** SMK Negeri 13 Malang is one of vocational schools that gives widely chance to society, who has low income and free of educational expense. This school is third year now. The process of teaching and learning is in good preparation and well-done. One of the process is lesson study. The process has been done on schedule from the first semester until the fourth. During three months, from March to May 2014, the school received eight trainee teachers of Integrated Educational Programme for Teacher (Program Pendidikan Guru Terpadu- PPGT). The eight are trainee teachers of nautical program. They taught in the first year class of nautical program. One teacher of SMKN 13 Malang and one lecturer from Malang State University have been guided four trainee teachers to make lesson plan, learning how to teach and how to evaluate the activity of teaching and learning. There are three steps in lesson study, plan – do/see – reflection. The first step, plan, is used to evaluate a lesson plan they made as a preparation for teaching and learning. After that we continued to second step, Do and the third step, Reflection according to the schedule that was arranged. All trainee teachers have done lesson study activities and participated as model’s teacher and an observer. During the guidance in lesson study activities there are several problems in step Plan, that is the comprehensiveness in preparing syllabus, lesson plan, the media and learning strategic. In the step of Do/See, trainee teacher who acted as an observer had written all evidences in the lessons. In the step of Reflection, the observers gave suggestion to model’s teacher. Lesson study for trainee teachers give mutual and useful experiences as a preparation for their future about how to be a good teacher, how to teach well. If we manage lesson study intensively and continuously, it will improve the four competencies of teacher, professionally, pedagogic, social and personality competency.

**Key word:** trainee teacher of PPGT, Nautical program, lesson study

### 1. INTRODUCTION

Education is a longterm human resources which has a strategic value in improving human development. That is why almost all countries in the world places statistical variable of education as the most important issue including in Indonesia.

Many activities have been done in improving a quality of education by moving all components into a system. All those activities aim to make better quality for future generations. In order to reach the goals Indonesian government strengthen it by producing many regulations such as Rights of National Education System ( Undang-Undang Sistem Pendidikan Nasional No 20 tahun 2003 ) No. 20/2003 and Government Rules No. 19/2005 ( Peraturan Pemerintah No. 19 Tahun 2005) about a standart of national education. Indonesian government is also produces Rights of Teacher and Lecturer No 14/2005 (Undang – Undang Guru dan Dosen Nomor 14 Tahun 2005) as a tactic or approach in improving quality of education,

guarantee in widen and spread distribution evenly in access of education, by facing challanges according to local content demands, nationally and globally . The rule aimed to empower and improve a directing, planning and continuing quality of teachers and lectures.

As a part of education system in supporting Indonesian government improving quality of education, teachers should empowering teaching and learning process according to the goals and roles toward better changes through learning community. The role of national education in improving a quality of nations life is very important and strategic to create smart human life, peaceful, opened and democratic so that it must be a teaching and learning system to improve a better quality of education. There many components as a breakthrough in empowering teaching and learning process such as input, process and output aspects. Curicullum, teaching materials, media of education, educators, innovative strategic, classroom management and teaching and learning models are an important aspects in empowering

teaching and learning process. Teaching and learning process is an education system, in order to reach best quality in education is began from analyzing each component involving and influencing the process.

School is one of institutions that has an important role and strategic in education system. A good school management decides the success of education in preparing students meet their future. SMK Negeri 13 Malang is one of vocational schools that gives widely chance to society, who has low income and free of educational expense. This school is third year now. This school has 3 programs, namely : 1) nautical ( Nautika) 2) nursing program (Keperawatan) and 3) technology of post harvest program (TPHP).

The process of teaching and learning is in good preparation and well-done. One of the proccess is lesson study. The proccess has been done on schedule from the first semester until the fifth. Teacher as an agent of change and a part of education system should learn more in order to give interesting teaching and learning, efficiently and meaningful. Teacher may learn better by his own experience during the process of teaching and learning in the classroom. He may evaluate his teaching and understand the best practice and the worst he did. The best practice in teaching and learning process may come from another teacher. In this case, teacher, as an observer, can learn something from the other, as a model teacher, by observing a process of teaching and learning. From this process he get new experiences and he uses it as a material of reflection by himself.

Integrated Educational Programe for Teacher (Program Pendidikan Guru Terpadu- PPGT) is one of Indonesian Ministry of Education program and held by State University of Malang for one year. The university made cooperation to SMKN 13 Malang as a place to practice teaching and learning. There are 8 (eight) students as trainee teachers in this program. They are graduate from physic major program. Two of them are from non-education program and the others from education major program. They got nautical subject from Polomarin Semarang . They taught in the first year class of nautical program for 6 (six) month . One teacher of SMKN 13 Malang and one lecturer from State University of Malang have been guided four trainee teachers to make lesson plan, learning how to teach and how to evaluate the activity of teaching and learning.

Nautical program is one of 3 (three) programs in SMKN 13 Malang. Students in this program study in two curriculum, national curriculum from

ministry of education and IMO's (International Marine Organization) curriculum. Subjects such as navigation, mapping, deck, communication and signal, shipping and others are based on international marine curriculum.

Travers defines that learning is a process of someone that gives suitable action, Cronbach defines that learning is a change of action as a result of observing. Harold Spears defines that learning is observing, reading, imitating, trying something, listening and following a certain direction and Morgan defines that learning is a change of action permanently as a result of experience (Supriyono, 2009: 2-3).

Based on several definitions above, learning can be defined as a change in a personality, value, action of someone by observing, reading, imitating, trying and listening by experience in awareness or unawareness.

For those reasons above, it is important a teaching and learning process in open class; it means that a teacher welcomes to another teachers joint to the process in order to see, to observe the process by lesson study. Lesson study is a source of real examples about how to teach, how to learn and the role of teacher as an observer is used to improve teacher's ability in teaching and learning.

In the presence of lesson study can improve teacher's quality in teaching and learning, every teacher at SMKN 13 Malang should joint this program in order to no exception trainee teachers of PPGT . Lesson study prepares a good lesson plan, good in the process and minimalists mistakes in the process. Lesson study is an activity to learn together from another teacher, a situation of learning from others.

The aim of lesson study is (1) to improve knowledge and skills in teaching and learning, (2) to improve colleagues cooperation, (3) to improve attitude of teachers as a model and an observer, (3) to improve teacher's skill in managing learning society, and (4) to improve the ability in preparing and communicating in teaching and learning.

The benefit of lesson study for teacher is (1) to improve teaching and learning strategy, (2) opened mind and share to colleagues, (3) to improve a quality of lesson plan. The benefit of lesson study for students are to improve activity, motivation and result of studying and learning.

The benefit for institution or school is by lesson study can influence all teachers to improve teaching and learning strategy, so school or institution may overcome problems and difficulties in teaching and learning.

Lesson study is not a strategy or method in teaching and learning but it is an effort to improve a process of teaching and learning that held by a group of teachers collaboratively and continuously involves in planning, teaching, observing and reporting the process. Lesson study is an activity to support a learning community systematically and consistence for self improvement individually or managerial. ( Slamet Mulyana, 2007) states lesson study is one of models in educating professional teacher by collaborative and sustainable/continuous assessment according to colleagues principles and mutual learning to make learning community.

According to Slamet Mulyasa (2007) and a concept of Plan-Do-Check-Act (PDCA), there are four steps in lesson study, namely (1) step in planning teaching and learning (plan), (2) step in the process of teaching and learning in the class (do), (3) step of reflecting the process after teaching and learning (check) and (4) step of follow up (act).

Actually lesson study is a continuous and cyclic activity that has practical impact in education. The cycle consist of four steps, (1) goal-setting and planning, (2) research lesson, (3) lesson discussion and (4) consolidation of learning.

In a simple way, lesson study can be done by series of activities Planning – Doing – Seeing (Plan-Do-See) ( Saito, et al) (2005). The three activities is identified as a practical oriented lesson study.

## 2 RESULT OF IMPLEMENTATION

Lesson study was conducted by eight trainee teachers are divided in two groups at class X-nautical program of SMKN 13 Malang with 31 students on April 2014. The subject is all productive subject in nautical program, such as seamanship, signal and communication, navigation, mapping, deck, shipping based on curriculum of international marine organization (IMO). They act as model and observers alternately and guided by one teacher and one lecturer. They acts as observers too. All of them involved in step of plan - do and see.

The first step, plan, is used to evaluated a lesson plan as a preparation for teaching and learning. One teacher as a model gave lesson plan to observers and explained about the content of lesson plan and lesson scenario. Observers responded and gave suggestion to the lesson plan. Model gave response about lesson plan and made a note to improve the content of lesson plan in order

to make better process of teaching and learning in the classroom. Before discussing the lesson plan, team had prepared some kids such as notebook , name board, room for meeting, arrange schedule and list of participants form

The second step, Do. Model applied revised lesson plan according to suggestion in step Plan. All observers did their duty , paid attention to students' activity and made important notes about their activities.

The third step, See. This step activity was carried out after class. Leader of the meeting asked to model to express how did he/she feel during the class. Model explained the achievement, the strength and weaknesses. Observers gave reflection by small notes about all students activities.

During the guidance in lesson study activities there are several problems in step Plan, (1) comprehensiveness in preparing sillaby, (2) indicators in lesson plan, (3) assessment, (4) worksheet and (5) learning strategic.

In the step of Do/See, there several problems (1) less attention to passive students, (2) purpose of lesson, (3) time management, (4) time for test too short.

Trainee teachers made various media according to the topic and some of them have a good skill in teaching and learning. They did not nervous and tried to make good communication to students. They motivated students study hard. They have good personality in teaching and learning.

## 3 CONCLUSION

Lesson study was well done at SMKN 13 Malang, which model and observer worked together in order to improve the teaching and learning process based on suggestion given by observers. By lesson study, trainee teachers involved in school based lesson study . The activity of lesson study consist of plan, do and see. It developed colleagues between trainee teachers and teachers of SMKN 13 Malang, so they learned together, sharing experiences and creates mutual learning. By lesson study, students improve the ability in (1) discussion, (2) questioning and answering, (3) developing creativities to solve problems during the process, (4) students more active in the process ( student centered). By lesson study there are some chages, (1) better cooperation between trainee teachers, (2) better innovation, (3) more understanding about students characteristics. By lesson study students (1) get interesting teaching and learning, (2) more understand about the lesson,

(3) get better chance to explain the lesson by presentation in the class, (4) more understand to classmates, (5) familiar to guest and other teachers in the class during the lesson.

There are two suggestion, (1) lesson study should be developed to more schools and (2) attitude of welcoming of model and observers in lesson study at SMKN 13 Malang to be observed and reflected should be maintained and developed in order to improve four competences of teacher, professionally, pedagogic, social and personality competence.

## The Effects of “Intersubject Teaching”— In The Case of Cooperative Teaching Between An English Class and A Physics Class

Yuko Uesugi<sup>1</sup>, Shigeru Ogawa<sup>2</sup>

**Abstract:** This study attempted to provide evidence that there was a distinctive interrelated effect on learning when we used the same teaching materials in English lessons immediately before or after physics lessons. This teaching plan was called “Intersubject Teaching”, interdisciplinary teaching, because we conducted cooperative teaching between English lessons and physics lessons. Our plan was as follows: Experiment 1: English first and physics second; Experiment 2: Physics class only; Experiment 3: Physics first and English second. In an English lesson, we provided students with a manuscript of a MIT professor who explained a physics law and demonstrated it. Students read through it for a certain amount of time without being able to look up the meaning of any words or phrases they didn’t know. Then, we shared the information we had just got and checked any difficult vocabulary and phrases, asking them some comprehension questions. The time limit was carefully calculated in order to keep students’ concentration and attention at maximum levels in a kind of time-limit exciting environment. In a physics lesson, they were shown a DVD where a MIT professor talked about how mysterious the law of gravitation is. In Experiment 1, the students had already read the professor’s manuscript in English right before the physics class, so they were directly reminded of content through watching pictures on a DVD and listening to his lecture. After each experiment, we gave the students a word test in order to check how effectively words related to physics were acquired and how well they understood those two subjects. The results from these experiments revealed that Experiment 1 and 3 didn’t show a remarkable difference, but a big difference in Experiment 2.

**Keywords:** Intersubject Teaching, cooperative teaching, physics,

### 1 A PURPOSE OF THIS PRESENTATION

This presentation attempted to provide evidence that there was a distinctive interrelated effect on learning when we used the same teaching materials in English lessons immediately before physics lessons. This teaching plan was, what I call, “Intersubject Teaching”, so-called interdisciplinary teaching, because we conducted cooperative teaching between English lessons and physics lessons.

### 2 PREVIOUS STUDIES

Hiroi (2004) tried to search for the possibility of cooperative lessons at high school between physics and math, as well as between physics and chemistry in his report “Next Subjects / Curriculums Viewed from Physics.” Kusano and Motoki (2014) conducted career education classes as cooperation between subjects. They pointed out that as a merit the students could consider their future for a longer period with various advice from various teachers, while a demerit was that it was difficult to maintain the communication between the teachers whose opinions

were not the same. Hikida (2004) emphasized in his thesis “Physics Education and English” that the more technically they learned the field, the more necessary English would be. Therefore, it must be beneficial to watch a well-known professor’s specialty lecture on a DVD.

#### 2.1 Who were the participants?

This plan was conducted in an English Communication class for 2nd year students whose major was Electrical Engineering and Information Science in 2014. The number of the students in a class was 45.

#### 2.2 Lesson Plans

Our lesson plan was as follows: we had a timetable where English was taught in the 2nd period and physics in the 3rd period on the same day.

Now I’ll describe detailed lesson plans in the English lesson. We provided students with a manuscript of a MIT professor who explained a physics law and demonstrated it by throwing a ball and catching it both on the ground and in an airplane.

The students had 7 minutes to read through it without being able to look up the meaning of any words or phrases they didn't know. They just kept reading it for a certain amount of time. Then, we shared the information we had just got from reading the material and checked any difficult vocabulary and phrases. We asked them some comprehension questions about the content of the material and after giving them a translation in Japanese, they had another 7 minutes to compare both Japanese and English manuscripts, to read them once again, and to check their understanding by themselves.

The time limit was carefully calculated in order to keep students' concentration and attention at maximum levels in a kind of exciting time-limit environment.

Now I'll talk about the plans in physics lessons. Physics lessons immediately after English lessons were purposely planned. In the physics class they were shown a DVD where a MIT professor talked about how mysterious the law of gravitation is. The students had already read the professor's manuscript in English right before this class, so they were reminded of content through watching pictures on a DVD and listening to his lecture.

Now I'll describe how we cooperated between English lessons and physics ones. Here are three experiments:

Experiment 1: English first and physics second. Both in the English class and the physics class, the students went through the process which I mentioned above. The following week, they were given a quiz to check how well they retained the words they heard and saw.

Experiment 2: Physics class only. Contrary to Experiment 1, in English class, without being given any information about the DVD they were going to see, they were shown the DVD in physics class. The following week, as well, they were given the same style word test.

Experiment 3: Physics first and English second. The order of classes was opposite to Experiment 1. In the physics class, they were shown the DVD without preparing for any technical terms. And then in the English class, they were given a manuscript on the DVD. The following week, as well, they were given the same style word test.

### 2.3 How to Analyze the Results: a Word Test

We gave the students a word test especially on how many words they acquired. We conducted the word tests both when this intersubject teaching was conducted and when it was not conducted in order to check how effectively words related to physics were acquired and how well they understood those two subjects.

The results from these three different experiments on the interdisciplinary teaching plans revealed that they came to understand the physics definitions through two different learning opportunities, and that they learned both English and physics in a cross-lesson environment. Analyzing the word tests, some special terms could naturally be mastered, which we could call 'immersion' in Experiment 1. Contrary, not as many words as those in Experiment 2 were retained. Reading ahead and watching the DVD later made a significant difference on how many words they could retain.

In Experiment 3, we had a similar result to Experiment 1. There didn't seem to be a significant difference in changing the order of those two subjects. From these three experiments, it was analyzed that they obtained information from two different angles: they read some English material and they watched and listened to the same material in a lecture on a DVD: they managed to understand English and Physics with different effort from different sources.

## 3 CONCLUSIONS

The students finally came to understand the physics definitions through two different learning opportunities, and that they learned both English and physics in a cross-lesson environment. It is analyzed that they obtained information from two different angles: they read some English material and they watched and listened to the same material in a lecture on a DVD: they managed to understand English and physics with different effort from different sources.

Physics is a useful mechanism to master scientific English words. It can promote students' memorization of English words through watching real experiments in physics classes. Their interest in physics enabled them to memorize scientific English words more smoothly, compared with a situation where we just gave them tasks to memorize the same specific words without giving physics lessons. In this way two cooperative lessons can make it possible to give the students benefit for both of the lessons.

## Reflection on Lesson Studies for Teachers’ Professional Community *A Case Study of a Japanese Elementary School*

Yuta Suzuki<sup>1</sup>

<sup>1</sup>Research Center for Marine Education, Ocean Alliance, The University of Tokyo, 7-3-1 Hongo, Bunkyo, Tokyo, Japan  
yuta@p.u-tokyo.ac.jp

**Abstract:** The aim of this study is to reflect on lesson studies for teachers’ professional community by conducting a case study of a Japanese public elementary school. This examination conducts from the viewpoint of teachers’ discourse. Why is the teachers’ discourse the key element of constructing the teachers’ professional community? This study is based on a variety of data obtained from intensive fieldwork in a Japanese school over a period of three years. The data include observational data of research lessons, lesson studies, ordinary activities, interviews with teachers and administrators, and relevant school and classroom documents. This study examines the teachers’ discourse in the lesson studies focusing on the following original discursive modes: (A) Is the alternative teaching approach better? (B) What is the best way of teaching X? (C) Did the children learn what the teacher intended them to? (D) Did the teacher teach what the children actually learned? (E) What did the teacher learn from watching the children learn? and (F) Did the teacher learn from watching the children learn? This study tries to provide suggestions to deepen our understanding of the lesson studies for professional community.

**Keywords:** reflection on lesson studies, teachers’ professional community, Japanese school

### 1 INTRODUCTION

The aim of this study is to reflect on lesson studies for teachers’ professional community by conducting a case study of a Japanese public elementary school.

Constructing teachers’ professional community is one of the most important strategy for successful school reform (McLaughlin & Talbert, 2001; Little, 2002). Teachers engage in constructing teachers’ professional community within schools. This study reflects on lesson studies focusing on the teachers’ discourse. Why is the teachers’ discourse the key element of constructing the teachers’ professional community?

This study focuses on the reflection on lesson studies: the discursive or reasoning style of teachers’ utterance.

Supporting professional development of teachers includes the following sequential phases: 1) exploring the teachers’ tasks for developing as a teaching professional; 2) identifying the development tasks; and 3) acknowledgment of achievement of the tasks. Suzuki (2012) examined the first two phases through the case study of Japanese lesson studies. This study focuses on the third phase.

The third phase is significant because it shows that a teacher is accepted by colleagues as a member of the professional community. What kind of teachers’ discourse acknowledge the teachers’ achievement of the development tasks? This examination is at the crossing of the professional community and the professional discourse.

Previous educational studies on the “professional community” of teachers (McLaughlin, 1993; McLaughlin & Little, 1993; McLaughlin & Talbert, 2001; McLaughlin & Talbert, 2006) provided the insight for this study.

McLaughlin and her colleagues have identified the professional communities as a teaching context which continued to pursue innovative teaching with today’s students. The professional communities were characterized by “the norm of innovation and learning, the ability of reflection, feedback, and problem-solving, democratic decision-making, and the development of effective teaching practice for all students”.

Previous studies on the “professional discourse” of teachers (Little, 2002, 2003; Horn, 2005; Little & Horn, 2007; Curry, 2008; Little & Curry, 2008; Horn & Little, 2010) also provided the insight for this study.

Little and her colleagues have pointed “the theory-building potential that resides in records of situated interaction among teachers in the course of their everyday work” in the professional community and tried to “open the black box of professional community.”

This study builds and expand on these lines of research from the perspective of the discursive style of teachers’ utterances in the post-lesson conference.

## 2 METHOD

Intensive case study primarily focused on teachers' discourse in post-lesson conferences held at a Japanese elementary school.

A variety of data was also obtained from the school over a four-year period from April 2007 to March 2011: observational data of research lessons, lesson studies, ordinary activities; interviews with teachers; various relevant school and classroom documents.

The elementary school has engaged in school reform for more than 10 years.

Through my fieldwork, I obtained background knowledge that enabled me to understand the local and situated meaning of the post-lesson conferences at the school. All names shown in this study are pseudonyms (see also table 1).

Six discursive modes were used as an analytical framework (Suzuki, 2012): (A) *Simple question and answer*; (B) *Is the alternative teaching approach better?*; (C) *What is the best way of teaching X?*; (D) *Did the children learn what the teacher intended them to?*; (E) *Did the teacher teach what the children actually learned?*; (F) *What did the teacher learn from watching the children learn?*

In Suzuki's study, the teacher's development tasks for developing as a teaching professional were elicited from her colleagues' discourse, which was characterised by the discursive modes (E) and (F): (E) *Did the teacher teach what the children actually learned?* and No; (F) *What did the teacher learn from watching the children learn?*

Table 1. Data used for the analysis

Post-lesson conference about a research lesson in November 2008	
Research teacher	Ms. Nagashima (fifth year teaching)
Subject matter	Arithmetic, 3rd grade, 34 children in the class
Teaching unit	Introductory multiplication computation on paper
Contents:	
• main theme	17 × 3 × 5 and 180 × 13
• main question	How many pencils are enclosed in the box?
• main activity	Mainly collaborative learning [group learning]
Teacher utterances in the post-lesson conference	25 (13 participants)
Duration	Approximately an hour and a half

This study examines what kind of teachers' discourse acknowledges the teacher's achievement of the development tasks in the professional community.

## 3 RESULTS OF ANALYSIS

By the method on this case study, we show the results of analysis (see also the table 2):

- discursive mode (A) 4 utterances
- discursive mode (D) and Yes 2 utterances
- discursive mode (E) and Yes 16 utterances
- discursive mode (G) 4 utterances
- a total of 26 utterances.

A new discursive mode, which we labelled (G), was identified first in the sequence of utterances No. 5 to No. 10 (see also the table 3 and 4).

Table 2. Teachers' discursive modes in the post-lesson conference

No.	Teacher	Discursive Mode	Reference

:	:	:	
26	Konishi	G	

## 4 DISCUSSION

Based on the results of analysis, we discuss the following four points (see also table 3 and 4)

- 1) The teachers' discourse was characterized primarily by discursive mode (E) and the answer Yes; (E) *Did the teacher teach what the children actually learned?* and Yes.
- 2) A new type of discursive mode (G) was identified; (G) *Did the teacher learn from watching the children learn?* and mode of (G) examined teachers' professional development in line with children's thinking and learning.
- 3) The teacher's professional development was *acknowledged* by her colleagues' characteristic discourse. They not only said 'you accomplished,' but also acknowledged the teacher's development by discursive mode (E) and the answer Yes, discursive mode (G) and the answer Yes. This suggests that there are characteristic discursive modes in the third phase for professional development; acknowledgement of achievement of the tasks.
- 4) Discursive mode (G) was generated by the middle leader and mentor for beginning teachers. They were senior teachers in the professional community. What they acknowledged depended on the character of the professional community

and the professional community was constructed and sustained through the professional discourse.

Further case studies need to be carried out to confirm this finding and deepen our understanding of the lesson studies for the professional community.

Table 3. Teachers’ discourse from No.5 to No. 7

No.	Teacher	Excerpt	Discursive Mode	Reference
5	Mori	‘Thanks very much, Ms. Nagashima. I was also looking at <i>Hiroshi’s</i> [boy] learning process. I’ve been concerned about him since the previous lesson, and I was wondering how he would act today... [describing his wrestling with the problem $12 \times 3 \times 5 \times 13$ ]... So, as written [in Ms. Nagashima’s lesson plan] “going beyond pretending to know,” well, I think Hiroshi really wrestled with the 13 boxes $[\times 13]$ ... It was very interesting to observe...’	<b>[E]</b> Did the teacher teach what the children actually learned? →Yes.	[Tsumori, No. 4]  Teaching plan
6	Mukai [Middle Leader, Nursing Teacher]	‘... That was so much fun. When I looked at Ms. Nagashima’s face at the end of the lesson, I thought, yes, it was good idea that you did that, and I wanted to tell you that... The thing that surprised me most today was that it was <i>Akira</i> [boy] and <i>Tsutomu</i> [boy] who explained things using a diagram on the blackboard. I mean it was a pleasant surprise... [describing their learning processes] ... The idea of “designing” classes [in line with the children’s thinking and learning] that Ms. Nagashima has been talking about since spring, since last year, well, that really succeeded today...’	<b>[E]</b> Did the teacher teach what the children actually learned? →Yes.  <b>[G]</b> Did the teacher learn from watching the children learn? →Yes.	Mori  Previous post-lesson conferences
7	Inoue [Mentor for beginning teachers]	‘... Ms. Mukai just mentioned <i>Akira’s</i> learning process, so first I’d like to ask Ms. Mukai about how <i>Akira</i> arrived at that [mathematical] idea. You were looking at him really intently...’	<b>[E]</b> Did the teacher teach what the children actually learned? [to colleagues] = She expected the close description of the children’s learning process.	Mukai

Table 4. Teachers’ discourse from No. 8 to No. 10

No.	Teacher	Excerpt	Discursive Mode	Reference
8	Okada	‘... Can I say something in the meantime?... When I saw the way <i>Akira’s</i> eyes were just sparkling during the lesson, I really wanted to observe him so I went over to him even though it was in the middle of the lesson... <i>Akira</i> didn’t draw all of the diagram by himself; at the beginning it was only half done. When he did his graphic explanation to other children in the group, they constructed a better diagram together. So, the diagram wasn’t made by <i>Akira</i> on his own, rather it was constructed by the four children together.’	<b>[E]</b> Did the teacher teach what the children actually learned? ↓ Yes. (response to the <i>Inoue’s</i> question)	Inoue
9	Noda	‘... I was also really attracted by the way <i>Akira</i> was smiling at me. I really wanted to observe him so I left the video camera where it was and went over to him... When I asked him why he drew the diagram, he said, “It’s easier for everyone to understand this way.” He really remembered Ms. Nagashima telling the class to “Write it in a way that everyone can understand.” He said to me as well, “It’s easier to understand this way, isn’t it?” I replied, “Yes,” “I understand it,” “Well done.”’	<b>[E]</b> Did the teacher teach what the children actually learned? ↓ Yes. (response to the <i>Inoue’s</i> question)	Okada

<b>10</b>	Inoue	<p>I'd like to hear more about Akira's learning process, but I'd also like to say something about what I observed. I was really impressed at the end of lesson...</p> <p>I observed Atsuto[boy], Kenta[boy], Nene[girl], and Mika[girl], that group of four children. Each of them approached the problems in a completely different way... Ms. Nagashima wrote in her teaching plan that she aimed to "understand the different thinking processes of each child" and "conduct classes that closely follow" these thinking processes. Each child really thought hard about which numbers to divide, how to use multiplication and division, until they got to the answer of 180.</p>	<p><b>[G]Did the teacher learn from watching the children learn?</b></p> <p>↓</p> <p><b>Yes.</b></p>	Teaching plan

# Senior High Students’ Psychological Problems In Speaking English As Foreign Language

## *A Survey in a Senior High School in Bandung*

Alma Prisilya <sup>1</sup>

*English Education, Universitas Pendidikan Indonesia, Jl. Setiabudhi, Bandung, Indonesia*

*alma.prisilya@student.upi.edu/ almaprsl17@gmail.com*

**Abstract:** Teaching English in Indonesia is not typically same as in other countries. Not only does the changes of curriculum, the lack of teachers’ competences, but more importantly the students who learn English also faced some problems during the learning process. It is supported by Ariffansyah (2013), “...problem will appear if there is inappropriate between exception and reality. Another defines that a problem will happen if someone’s necessity does not fulfill.” The way of pronouncing the words and the written forms in English are counted as inappropriate reality. It makes students confused, because the written language and the oral language are different. Some of them get problems in those kinds of linguistic matters and some are more in psychological problems. Therefore the present study was aimed to discover the most common psychological problems that face by senior high students in speaking English. Quantitative method was employed by distributing close- ended questionnaire to 100 respondents out of 183 students. The result exhibited that students’ fear of derision, uneven allocation of turn, and students’ incomprehensible inputs are the most common psychological problems in speaking English which influence their oral performances. To conclude, most of the students’ problems in speaking English come from psychological aspects. Nonetheless, they are actually quite good in written performances. Thus, teachers can minimize the speaking failure by focusing on those common problems; creating a good classroom environment which are fair to every student in the classroom; free of embarrassment and fun activities, so that students can participate actively in speaking class

**Keywords:** Psychological problems, anxiety, speaking, English

## 1 INTRODUCTION

Learning foreign language yields different reactions from Indonesian students. Most of the students in Indonesia have at least two languages to be mastered; their mother tongues (local language) and Indonesian language as the second language (national language which are also used in formal education). Therefore, many students face some problems during learning English as foreign language. English become one of foreign language that needs to be taught at school in Indonesia, because it is an international language. Students can read more sources written in English to enrich their knowledge. It is supported by Alwasilah (2014), “More people now realize that their first and national language is far from sufficient for technological advancement, international communication, and other areas” (p.241). But in fact, learning English is quite complicated. According to Richards as cited in Brown (2001, p.267), “the conversation class is something of an enigma in language teaching”. Most of Indonesian students are failed using English in communication because of English’s differences in its written and oral language. These differences cause problem in their learning process. However, Brown (2001) states that the benchmark of successful language acquisition is almost always the demonstration of an ability to

accomplish pragmatic goals through interactive discourse with other speakers of the language (p.267). It emphasizes that speaking is as a predictor of the success of learning a language. Therefore, the most common students’ psychological problems in speaking English are going to be investigated in this study.

Having fact that language learners in Indonesia are not really good at speaking, it is being questioned why do they cannot speak well while they had have English as foreign language subject since elementary school; what factors that influenced them most? This fact is in line with what Musthafa (2013) said, “Education in Indonesia is failed. It is because of (1) unclear purpose of study, and (2) unfocused learning activities.” From his statement, it can be concluded that teaching has to focus on the teaching goals which are clearly stated at the very beginning. For example: teaching English to elementary students with the purpose/ goal at the end of study is students could describe their personal information deeply. So that, we can focus on creating activities in order to reach that goal. As supported by Brown (2001) that it is teacher’s role to design learning materials which suit the needs, styles, as well as goals of the learners.

Some previous studies had explored what are the students’ problems in speaking English. Juhana (2012) found that students have psychological factors

such as fear of mistake, shyness, anxiety, and the like that hinder them from practicing their speaking in English class. Moreover, Syam (2009) distributed questionnaires to confirm whether psychological factors which are causing students' speaking problems which are proposed by Tsui (in Nunan as cited in Syam, 2009) and King (as cited in Syam, 2009) also became the cause of students' speaking problem in students in a MAN in Riau.

Students' psychological problems in speaking cannot be generalized. Every student has different attitudes toward the causes of their problems. Johnson (2001) divides three types of students' attitudes in relation to language learning: attitudes towards success, attitudes towards teacher, and attitudes towards your own country (pp.134-135). Those attitudes influence students' success in learning a language. Harmer (2007b, p.123) believes that the more students have opportunities to activate the various elements of language they have stores in their brains, the more automatic their use of these elements become. That is why it is very important as Heffelfinger (2009) states, "Medical conditions and psychological factors can greatly influence the speech process as well."

Considering that psychological problems can affect the students' speaking performance, determines their success of learning a language, and these may also influence their confidence in their daily life and school environment, this study is conducted to portray the most frequent students' psychological problems in speaking English. In order to reach the objective of the study, research question is formulated as follows:

What are the most common psychological problems in students' speaking English at junior high school?

This study only sought the portrayal of students' psychological problems in speaking English. It was conducted only in one of senior high schools in Bandung, and it did not have purpose to confirm any hypothesis. So, it is study is expected to give positive impact in teaching and learning process; for both teachers and students, and also for other researchers. For teachers, it provides information to understand students' feeling toward classroom activities, so that teachers will have clear view of the suitable materials and methods that they need to employ. For the students, the researcher hopes that they could be better and overcome their problems after got right and effective treatment from their teacher, so that they can perform well. For the literature review, the researcher hope that this study could give more information; data that would be useful for further studies.

In order to avoid misunderstanding and misinterpretation in this study, the researcher was going to define some terms as follow:

- a) Psychological problems in this study means every affective factors which caused problems in speaking English, as proposed in Syam (2009) (Anxiety; Fear of making mistake; Fear of derision; Teacher's intolerance of silence; uneven allocation of turns; Low proficiency in English; and Incomprehensible input) that could cause problems in speaking.
- b) Speaking in this study means activities that acquire students to express verbal language in the school session.

## 2 LITERATURE REVIEW

### 2.1 Teaching Speaking

Teaching speaking deals with some aspect, as mentioned by Harmer (2007a, p.343), "... Speakers of English will have to be able to speak in range of different genres and situations, and they will have to be able to use a range of conversational and conversational repair strategies." This statement emphasizes that teaching speaking should in a package with all of its components and cultures. That is why, teachers should teach speaking with right way, right method and consider the students who do not have any idea about the foreign culture. It is supported by Harmer (2007b, p.128) that the teachers should be able to manage the lesson well and give more time to the students, because, "... people need time to assemble their thoughts before any discussion." That is why; time allocation becomes very important in teaching speaking. Moreover, the speaking class should provide great atmosphere where every student could participate and given same time to practice. When the students feel that the teachers understand them and treat them fairly, they will believe in our class. It means that they are confidence enough to follow all activities that have designed for them. Brown (2001, pp.62-63) believes that learners belief that they indeed are fully capable of accomplishing a task is at least partially a factor in their eventual success in attaining the task. The students with high self- confidences will be successful in the learning process and building their confidences is teachers' role.

Studying language is always interesting. As we know that language is part of culture; each language that we used has culture in it. Gonzalez (n.d.) said, "Learning a language is not just learning grammar and vocabulary; it is learning new sounds, expressions, and ways of seeing things; it is learning how to act in another culture, how to know a new community from the inside.") There are four skills that have to be mastered in learning a language; any language, including English. Nowadays, there is no doubt that English becoming one of the musts. People worldwide speak English as international

language; every gadget and media used English in their user guides. Nazara (2011) told us about it: “a huge number of conversation and other speaking course books, audios and videos are continuously published.”

New curriculum in Indonesia is being applied; it is called as Curriculum 2013. It demands activeness of learners (learner- centered approach). A language teacher should change their mindset of being the only source. It is learners that have to take the main role in activities. Law of the ministry of culture and education of Indonesia Number 65, 2013 on National Education System, suggested that learning process in an education system should be interactive, inspiring, fun, challenging, and motivating the learners to participate actively. Looking at the criteria of learning system that had been promoted by the government above, we can conclude that the good learning outcomes become the most important thing of education. So do for students of EFL (English as Foreign Language) in Indonesia. From the four language skills; listening, speaking, reading, and writing, speaking has important role as one of indicators so people can said as language master. The main goal of learning a language is for communication. Burnkart (cited in Nazara, 2011) stated, “They argue that speaking is the most important language skills that need to be controlled, and they assess learning achievement based on mastery of speaking skills. It is also supported by Harmer (2007a),”The conversation that take place when we buy a newspaper at a news kiosk is interactive, whereas leaving a message on an answer phone is non- interactive” (p.343). Harmer divides two types of conversation; interactive, in which we have partner to talk to, and non- interactive, which is vice- versa. Those types of communications are the form of language output; speaking. That is why, researcher said about the goal of learning a language is for communication.

## 2.2 Speaking Problems

An advance language learner could produce a good communicative language with all the culture in it, but it cannot be avoid that cross- cultural understanding takes roles; EFL students tend to make errors. Errors are common things which appear in learning process. “In oral interactions, if the main aim is to communicate, then errors mustn’t be corrected exhaustively, otherwise the communication flow will be broken” (Iseni, 2013, p.64). There are some problems faced by the learners in speaking activities. As mentioned by Beddebah (n.d.) that problems

include student inhibition, nothing to say, the low of participation, the theme to be spoken, and the use of mother tongue. These are the other factors which come from students itself. Moreover, CatherinePR (2013) also add that they (students) feel silly speaking a language in which they know they are making mistakes. It is in line with fear of derision as proposed by Syam (2009). These kinds of problems make students get difficulties in developing their abilities.

Syam (2009) confirmed that seven psychological studies that have been proposed by Tsui are also became problems for the students in MAN Riau. Juhana (2012) did explore more deep about it. She did a qualitative study and employed some instrument to understand more why and what are the each factors’ definitions based own the sample elaboration. It was gained by using open- ended questionnaire and also interview.

To synthesize, this partial section explains theories related to psychological problems which cause problems in speaking English as foreign language. Besides, there are some previous studies also discuss about the problems in speaking skill. The previous research study investigating factors that hinders students from speaking in English class reported that those psychological factors mostly same and were agreed with the theories portrayed in this study. As the Students’ psychological problems in speaking English influence their academic life, the reports shows it relationship to students’ self- confidence.

## 3 METHODOLOGY

This present study was designed to seek the most common students’ psychological problems in speaking English in one of senior high school in Bandung. Creswell (2009, p.145) explains that a survey design provides a quantitative or numeric description of trends, attitudes, or opinions of population by studying a sample of that population. Hence, survey research design aims to discover the attitudes and/ or opinions, this present study employed it to discover the answer of the research question. The population of this study is all the eleventh grade students of a senior high school in Bandung. There are six classes of eleventh grade. They are divided into three science classes and three social classes with total number 183 students. The chart below will describe it:

Chart 1. The Population of the Study

According to observation before conducting this research, it is found that there is no difference in English material that is given by English teachers there. Either science classes or social classes use the same English materials. This school also has special class for speaking, namely conversation class. It is held two days a week for around 1.5 hours. To choose which students of each class that will be the representative of each grade, researcher did random sampling technique. Tuckman (1978, p.226) stated that one way to insure that this sample will be representative of the larger population is to draw a random sample because random selection limits the probability that you choose a biased sample. The sample was taken from all the six classes of eleventh graders. Each class was taken 16 to 17 students randomly, so the sample was 100 students.

The data in this study were collected by using questionnaire. It is consisting of seven close-ended questions of possibility causes of their problem in speaking class based on psychological factors as proposed by Syam (2009). According to Tuckman (1978, p.196) that questionnaires and interviews are used by researchers to convert into data the information directly given by a person (subject). In line with Creswell (2005, p.360) who states that questionnaire is a form used in a survey design that participants in a study complete and return to the researcher. In this study, the questionnaire which was being used is a ready-made one. It was taken from previous related study by Syam (2009) in which the reliability and validity were confirmed.

### 3.1 Data Collection Procedure

At the very first time, reading literature reviews and related it to the burning issues were the first step to be taken. In daily activities, it is found that students tend to be reluctant whenever being asked to speak English. That is why, problems in speaking English

as EFL learners is chosen as a topic for this research, looking at some literature reviews; all previous studies that are related to her topic; speaking problems. There are some studies, so it is used to made a literature map to help in focus on certain aspects; psychological factors. When the object had decided for this present study (by considering the time, the access, and other possibilities in conducting the study), hypothesis and the research questions were conducted, and then the operational definition of terms in this study were explained briefly to make limit on it, so that the reader of this study would understand it clearly. Soon after having the prior knowledge of what would to do in this study (conducting instrument, etc.), sampling and data collection were collected. The respondents were asked about their opinion on what psychological problems they face in speaking English by using close-ended (Likert-scale) questionnaire that were formulated in Bahasa Indonesia. And then, the data were analyzed and discussed briefly. The research question could be answered based on analysis of the responses that were given by the sample through questionnaire; conclusion of the study were formulated and the result of the study were reported. The data also being used to give suggestions to the EFL teachers of how they create; build; choose materials in speaking English Class by considering students' needs in order to overcome their problems, which could contribute to their improvement later on.

### 3.2 Data analysis

The data were collected by using close-ended questionnaire and analyzed descriptively.

According to the questionnaire that had been distributed to 100 students as the sample, the researcher gave questionnaire which was consisting of seven items involving: *students' anxiety to speak English in the classroom, students' fear of making mistake, students' fear of derision, teacher's intolerance of silence, uneven allocation of turns, student's low proficiency in English, and incomprehensible input*. Looking at the percentage of each psychological factor that might happen or feel by senior high school students, we can describe that each psychological factor become cause of the speaking problems.

Item 1 is about student's anxiety to speak English in the classroom. From the result of questionnaire, we had information that there were only 38 students (38%) who said agree that anxiety become the cause of their speaking problems while 62 students (62%) did not really think that it is a big matter. It implies that only few of them struggle in that psychological factor as the cause of their speaking problems.

Item 2 is about student's fear of making mistake. 45 students or 45% from the whole sample agreed that this is one of psychological factors that cause

their problems in speaking English in the classroom and 55 students (55%) did not agree with that. This factor also influence their speaking skill; they believed that this factor cause problems in speaking but it was not all of them agree; it was even not half from the total sample who agreed.

Item 3 is about student's fear of derision. There are 76 students or 76% of the sample agreed to this statement. They agreed that this psychological factor is one of the causes of their speaking problems. 24% or 24 students did not agree with this statement; they did not think that it could influence them much so could cause their problems in speaking.

Item 4 is about teacher's intolerance of silence: 47% of the sample agreed but 53% of them did not agree. It was not even a half but we could not deny that it is also taking role in causing speaking problems

Item 5 is about uneven allocation of turns 66 students believed that this factor is one of the cause of their speaking problems. More than a half of the sample said that it was a big matter while actually there were also 34 students did not agree with it.

Item 6 is about student's low proficiency in English. 56 students or 56% of them realized that they do have low proficiency in English and it was a reason of the problems they faced. But 44 students or 44% of the total sample did not really think that their weakness was the cause of their speaking problems.

And Item 7 as the last psychological factor is about incomprehensible input: 62 students agreed to the statement about it. These 62% sample believed that actually they could understand and gave response to their teacher well. While in other hands, 38 students did not agree to this.

#### 4 FINDINGS AND DISCUSSION

As describe in data analysis before that each psychological factors, which are proposed in a study by Syam(2009) and being adopted in this study, became the senior high school students' cause in speaking problems.

Based on the research question number one, about the number of students who are having psychological factors which causing their problems in speaking, the researcher could inform that there are 10 students said strongly agree and 28 students said agree. In this case, the researcher tried to explain to the readers that whether strongly agree or agree is inferred as the same expression: agree and whether disagree or totally disagree is inferred as: disagree. So, from *students' anxiety to speak English in the classroom*, there are 38 students who were agreed and 62 students were disagreed. For *students' fear of making mistake*, there are 45 students agreed and 55 students did not. For *students' fear of derision*, there are 76 students agree and 24 students vise- versa. While in *teacher's intolerance of silence*, there are only 47 students agreed about it while the other 53

students did not. For *uneven allocation of turns*, students also had high agreement about it; there are 66 students and 34 students were in vise- versa. *Student's low proficiency in English* is not really the big matter in causing speaking problems. There are 56 students agreed that language proficiency was the good reason of their speaking problems, and *incomprehensible input* become other big factors. 62 students agreed about it and 38 students did not.

While in order to answer research question number 2, the data from questionnaire has answer it. The most common psychological factors that are causing students' speaking problems are (1) fair of derision, (2) uneven allocation of turn, (3) incomprehensible input and (4) low proficiency in English. These four psychological factors became the top four of the most common factors that were faced by students.

The data that had been gained through questionnaire showed us that every student had speaking problems which were causing by the seven psychological factors. But those factors were not belong to every of them. It can be interpreted that some of them felt that *fair of making mistake*, *anxiety*, and *teacher's tolerance of silence* are not the main factors which can cause speaking problems to them. So, actually the students have internal motives in learning a language: They do understand about the goal of learning a language: to be able to use it in communication: to speak! Looking at their responses to the questions about three psychological factors above (anxiety; fair of making mistake; and teacher's tolerance of silence), senior high school students nowadays have more motivation to speak. They are not feeling reluctant to speak. It is contrast to Horwitz (1991) as cited in Sylvia and Tiono (2004). He believes that anxiety about speaking a certain language can affect students' performance. It can influence the quality of oral language production and make individuals appear less fluent than they really are.

While some of the students felt that some psychological factors (that become the common factors; fair of derision, uneven allocation of turn, incomprehensible input, and low proficiency in English) are the big matters so that they are having problems in speaking. Based on these data, the researcher could infer that actually students need more encouragements from the teacher. They need more time, they want

#### 5 CONCLUSIONS AND RECOMMENDATIONS

##### 5.1 Conclusion

Psychological factors can affect students' performance in speaking. Since English is very different to students' first and second language, the problems are not only from linguistics matters but also more from themselves; psychological

problems—their attitudes towards the teaching learning of the language. Moreover when teachers do not pay attention on it, the students will struggle and suffer because of being ignored. Uneven time allocation that is given by the teachers also can make them worried. Meanwhile, the classroom environment which is not handled well cause fear of derision. Knowing these problems will help teachers aware of the classroom atmosphere and more understand of the students’ feelings; create a safe and fun classroom session. So that, everybody could get involve in speaking practice.

## 5.2 Recommendations

Based on the findings in this study, it is suggested to the EFL teacher to focus on the learning goals by considering the most psychological factors which are causing problems in speaking. These findings can help teachers focus on creating suitable materials to overcome the problems and even providing activities by considering their feeling toward speaking class.

The researcher also recommends other researchers who want to conduct typical study, to have more literature review before doing it. Since speaking skill is a common topic in EFL studies. It is important to know what will we do; what are we doing; and what have we done. So, we can keep focus on what we are trying to investigate in our study.

## The Effect of Implementation Lesson Study At Environment Science Course

*Baiq Fatmawati*

Program Studi Pendidikan Biologi - STKIP Hamzanwadi, Selong, Indonesia

([f\\_baiq@yahoo.com](mailto:f_baiq@yahoo.com))

**Abstract:** The Learning process in collage is limited on memorizing level, the process is less emphasized on higher cognitive level such as analysis and evaluation skill, creative thinking, learning independency, and other affective aspect. This is one of factor of student being passive. Often times, the knowledge they got is less useful and didn't to emphasize of high cognitive level, as durability to analysis skill, to evaluation, to development of creative thinking skill, to learning independence, and to development affective level. That is causes one of student passive and obtained knowledge oftentimes not usefully in their life and the work. One of alternative to increase the learning quality in college is by implementing Lesson Study. For student, some benefits can be achieved through Lesson Study. Those are (1) students will reach several individual quality that influences their learning called attitude and intelligence thinking (the habits of mind and heart that fundamental acre to success indium school), (2) the learning community is built between lecturer and lecturer, students and students, lecturer and students with lecturer in collage, and (3) the students learning ability is increased especially in the aspect of high cognitive process and affective aspect. This research was focusedto gathering the data about the effect of implementation lesson study at Environmental science. The subject is students of biology involved at lesson study program in STKIP Hamzanwadi Selong in the academic year 2012. The instrument research is questions about the student experience in joining lesson study during learning process at Environmental science subject matter). The Result of analysis shown that students “yes” answer in each item: (1) cooperation;100%, (2) Discussion with friends; 95%, (3) new learning experience; 86%, (4) Communication; 81%, (5) thinking skills; 76,2%, (6) Learning method;76%, (7) Learning independence; 67%, and (8) Discussion with lecturer; 61%. Based on data analysis, it's concluded that students have changed in some aspects after they learn through lesson study.

**Keywords:** Implementation, Lesson Study, Environmental science

### 1. BACKGROUND

The education is a conscious and deliberate effort to make a situation and learning process that learners actively develop their potential to have a strength of spiritual, self-control, personality, intelligence, morals character, and skills needed, society, nation and state (UU Sisdiknas, 2003, Pasal 1 ayat 1). The system of lecturer active learning, can be low effectiveness and can not grow and develop active participation in the learning process (Dikti, 2008). According Dewey (Joyce, et al., 2000), the core of the learning process is setting an environment where learners interact on learning and how to learn. Rutherford & Ahlgren (1990) stated the process of learning science, mathematics, and technology should take place effectively. Effective learning is meant

students learn to construct their own knowledge, learning through direct experience in concrete, as well as the students learn with problem solving through team work.

Many factors supporting to success of educative participant in learning, besides internal factors from educative participant also there are external factors such as teacher, facility of learning, and environment learning. Teachers has important role to success of learners between it is assisting in process understanding through a variety learning media, so that learners would construct their knowledge by self. The problem was often encountered by teachers in the learning process be sides a lack of used the method and instructional media is arrange teaching plan and teaching material, and evaluation. Planning,

implementation and reflection in the teaching and learning processes are rarely done continuously, collegiality and accountability. This is caused generally teachers prefer to work alone in preparing and do it at courses, so professionalism decrease to developed.

Therefore, needed a activities to analysis learning and professional development teachers to improve effectiveness learning, one of is through lesson study. Lesson Study is a model of professional development education through assessment collaborative learning and continuously, based on the principles of collegiality that help in learning to build a learning community. The implementing Lesson Study in learning will be able give opportunities for teachers and lecturers to learning how to learn and learn about teaching. Lesson Study was conducted in three stage namely Plan, Do, and See the cyclical implemented and sustained. The research question is "whether the Lesson Study given impact toward the learning process at environmental science courses?".

## 2. METHOD

This research used descriptive statistics that is to describe an overview the research object through the sample data or population without do the analysis and making a conclusions are general (Sugiyono, 2011). The procedure is give the students a questionnaire containing several questions related with learning experience students through lesson study. The questionnaire distributed to students in semesters 2 involved in lesson study 2012 of the years, amounting student is 21 person. The form of questions is.

Instrumen Literasi

No	Question	Answer
1	Are you feeling anxious to cooperate as a group of learning?	
2	Do you feel tired on the discussion with other students about the system materials?	
3	Are you obtain new learning experience in learning?	
4	Are you feeling things in learning as a type of learning?	
5	Are you feeling things in thinking, self's, and impact of learning?	
6	Are you feel study change about the system?	
7	Are you feeling things in learning as a type of learning, cooperation?	
8	Are you feel self's discussion with the material learning materials?	

## 3. RESULT AND DISCUSSION

A Teaching skills teacher will determines success of learning process in the classroom to transferring their knowledge, skills, attitudes, and values to students in learning process and is a part of pedagogic competence that must be have other than personal competence, social, and professional.

Rustaman, et.,al (2003) stated in the education system cannot be suspected that teacher is one of component system occupying a central position. Whatever good of educational program developed by the experts, but teachers can't execute their job, hence the implementation and results of learning can digress from purpose. In order not to digress from purpose, the teacher must have four competence which has stated in Permendiknas R.I Nomor 16 Tahun 2007 about the Academic Qualification Standards and Competencies Teachers is expressing that there are four main interests of which must be owned by teacher, that is pedagogic competence, personality competence, social competence, and professional competence.

The four competences mentioned will be appearing in learning process. At pedagogic competence; one of ability must be done by teacher is design and executes learning that is design of learning strategies, worksheet activity, and assessment. Personality competence; a teacher in stable condition in the class room during convey a content of Lesson. Social competence; the ability in communicating and interacting especially way of communicating with student during learning process. Professional competence; the ability to comprehend concept exhaustively.

At the time of implementation lesson study, activity designs learning by lecturer was done in collaborative with their team, done some revisions before executing lesson. In the class, occur active communications between lecturers and student, student and student, and discussion runs at smooth. Based on results of questionnaire analysis showed that (1) lecturer; collegiality between lecturer and students are good, two-way communication has actively be done, has using a variety learning strategies that trained higher order thinking skills for students. (2) students; cooperation was intense at inside and outside

classroom, and students are habitual to high-level thinking. Here are presented the results of questionnaires to students had experienced lesson study (see graphic 1).

Graphic 1. Increase learning process through Lesson Study

The implementation of lesson study in STKIP Hamzanwadi Selong especially in biology education study program gives a good impact at environmental science course was done during one semester. Some benefits of lesson study obtained that is: (1) collegiality between students and lecturer has been formed, (2) there are bravery suggesting opinions and crosswise opinion between students, (3) composing a lesson plan it's systematically, (4) using and developing learning strategy having of constructivist to train ability high level thinking skills of student, active and creative.

Lewis (Santayasa, 2009) stated, there is eight obtainable opportunities by teacher if teacher implementation lesson study continuously that is (1) thought of carefully about the direction of learning, content, and field study., (2) analyzing and developing best lesson can be developed., (3) deepens of knowledge about content lesson, (4) thought of exhaustively purpose long-range which will be reached by student, (5) designs lesson in collaboratively, (6) studies carefully of ways, learning process and behavior student, (7) developing of pedagogic knowledge, and (8) observe of result lesson by self through student and college.

Lesson Study can give opportunity for teacher to develop pedagogic knowledge in an optimal fashion. This thing is caused by through Lesson Study; teacher continually copes to develop and increases applicable

study strategy to interpret the curriculum. Teacher earns continually thought of how quality question capable to solve by student in learning. That question expected to motivate student to maintain enthusiasm learning consistently. Teacher also thought of how using debate that be able to maximize participation student in discussion and how pushing student to make good notes and does reflection by self (Santayasa, 2009).

#### 4. CONCLUSION

The implementation of lesson study gives a good impact, including: (1) creation collegiality among lecturer and lecturer, and lecturer and students, (2) two-way communication active be done, (3) use a variety of strategies learning, (4) the establishment of learning community among students, (5) increasing willingness of learners, (6) collaboration among students exists outside and inside the classroom, and (7) students habitual to high-level thinking.

## The Use of Traditional Games For Building Young Learners' Cooperative Skill

*(An experimental research on the fifth grade students of SD Negeri Kudaile 04 of Tegal Regency)*

Dahlya Indra Nurwanti

English Education Department, Pancasakti University, Jl. Halmahera KM. 1, Tegal, Indonesia  
viva4lya@yahoo.com

**Abstract** The problems of education in Indonesia dealing with young learners' character building and the urgent needs to preserve traditional games as parts of the nation's cultural heritage become the background of this research. There are a number of principal characteristics as parts of children's character building, such as respect and cooperation. They could be implicitly taught to children by using traditional games which basically contain moral values. This is a descriptive quantitative research conducted to describe the use of traditional games of Tegal as learning techniques for training young learners' cooperative skill. This paper also reveals the actual use of traditional games for teaching English. The games used in this research are *tempolong/boi-boian*, *gobak sodor*, *bentengan* and *remidon*. This experimental research is conducted at thirty-eight fifth graders of SD Negeri Kudaile 04 of Tegal Regency. The data is collected by conducting observation on the students playing each game and giving questionnaire about the games. The result shows that the use of traditional games as learning techniques is a meaningful way of teaching young learners as well as an effective way of preserving Indonesian culture and traditional values. Team games such as *tempolong* and *gobak sodor* are effective for training and testing learners' cooperative skill. Materials of school subjects like English could be integrated in the games to optimize the learning process. However, the games should be modified and the learning materials should be integrated in such a way that it would not be too complicated for young learners.

**Keywords:** traditional games, young learners, character building, cooperative skill

### 1 INTRODUCTION

Tegal is a small town located at the north coast of the Central Java Province of Indonesia. It is a four-hour ride from Semarang, the capital city of the province, and a six-hour ride from Bandung. The distance from the nearest big cities makes it culturally different from them. While many people living in big cities tend to have modern lifestyle, the people of Tegal are still in the transition from natural and traditional way of life to the modern one. It somehow affects to their unpreparedness of the modernity that they sometimes ignore the moral and cultural values simply because of the thought that they are old-fashioned.

This condition also influences the characteristics of the people and the process of education there. Despite the fact that there are commonly extracurricular activities at schools, many of them focus the learning processes only on the academic field. One of the likely reasons is that they have the urge to prepare the students to compete with those from big cities who have easier access to technology. As a result, the character building starts to be forgotten, and many values born by the Javanese tradition such as respect, care, and cooperation are eroded.

In the meantime, character building is one of the foci of the current Curriculum 2013. It means that learning activities are not supposed to stress only on

the students' cognitive skill development. The affective and psychomotor skills should also be developed. In other words, teachers need to find new teaching techniques and strategies involving students' character building.

One of the ways of building students' characters is by using traditional games as learning techniques. As a country famous for its rich culture, Indonesia has numerous traditional games. Some games are even familiar in many parts of the country, even though the people name them differently. By doing this, it is not only that students' characters are built, but also that the traditional values and cultures are preserved. This is important since the games start to be forgotten as children prefer playing with their gadgets to having physical activities outside.

Besides, traditional games are *explorable* and modifiable so they could be used for teaching any subjects such as English or math at school, especially for young learners. Teaching young learners is different from teaching teenagers or adults since they each have different needs and basic characteristics. Young learners learn best when they do something they enjoy doing, and playing games are among the most interesting activities for them. By applying meaningful learning principle, their cognitive, affective, as well as psychomotor skills are most likely to be developed.

This paper discusses how the application of traditional games affects effectively to young

learners' cooperative skill as one of the good characters to build. It also gives some ideas of how the games are actually used for teaching a subject – in this case is English. This paper focuses on four traditional games popular in Tegal – though some of them are not originally from the region – namely *rok gebuk/tempolong/boi-boian*, *gobak sodor/main ladang*, *bentengan*, and *remidon/rok pimpet*.

## 2 TEACHING YOUNG LEARNERS

Children basically have different characteristics with teenagers or adults. Harmer (2003) classifies the ways young learners learn a subject as follows:

- a. Upon learning a foreign language, they respond to the messages even without knowing the lexical meanings;
- b. Young learners learn by absorbing information from all sides and learning everything around them, not just the specific thing being taught;
- c. Their understanding does not come only from teacher's explanation but also from what they see, hear, and feel;
- d. They are generally enthusiastic in learning;
- e. They need the teacher's special attention and approval;
- f. They respond well to activities involving their life as the topic of discussion; and
- g. They get bored so easily.

It is obvious then that to teach young learners, a teacher needs to apply at least three main principles; they are implicit learning, meaningful learning, fun activities, as well as considering children's *short attention span* (Harmer, 2012:258). For that, Shin (2006:6-7) proposes several ideas to teach young learners:

- a. Involve the use visual media, *realia*, and movements in classroom activities;
- b. Involve them in the process of making the media and *realia*;
- c. Prepare a few other activity plans as an anticipation of their nature of not being able to concentrate on one thing for more than 15 minutes;
- d. Employ thematic learning;
- e. Use familiar stories and contexts;

By making sure that the learning activities are adjusted to the young learners' characteristics, their interest and involvement could be maximized. When they do a learning activity happily, the effectiveness could be optimized. In other words, the success of a learning is in the hands of the teachers', especially on their ability to understand the learners' characteristics and design the suitable activities for the lesson.

Therefore, a meaningful, applicable, and interesting lesson and material for children is needed. Meaningful here means that both the

technique and material could be connected with their real life, so it would be easier for them to get interested in it. Jonassen in Keskitallo (2011:19) states that a learning process is meaningful when it is correlated with things young learners could find in their life. By doing so, they would learn things they need in life. Applicable here means that the materials should be something students could apply in real communication. At last, interesting means that the learning method should be varied, suitable for children, and something that could raise their motivation.

## 3 CHARACTER BUILDING (COOPERATIVE SKILL)

Solomon *et al.* (2006:4-5) indicates twelve pillars of universal characteristics. They are goal setting, self-awareness, appreciation of achievement, value on others, self-control, caring, being responsible, nationalism, lifelong learning, self-confidence, respect, and trustworthiness. Those twelve pillars are the ones to be worked out by the learners. Having these characteristics, someone would be an excellent member of the society who is likely to gain success. Therefore, character building is obviously a crucial thing to be integrated in lessons.

Wijaya (2009:2) quotes the theory of Multiple Intelligence (Gardner, 1983) by pointing out that one of human intelligences is interpersonal intelligence. It deals with someone's ability to cooperate with others. It is the competence to communicate effectively in a social interaction. This intelligence contributes to their social life in many ways which may add to their success. Thus, the ability to cooperate is one of the characters to be built as early as possible. One of the ways is by using games as learning techniques. As Soeparno in Djuanda (2007:19) states, the use of games as learning techniques could be used for teaching cooperation and solidarity. In other words, of all the characteristics to be built in young learners, cooperative skill is one of the most significant since it would affect to their social attitude in the classroom leading to their success of learning.

## 4 TRADITIONAL GAMES AS LEARNING TECHNIQUES

Based on the principle of meaningful learning, the materials and activities in a lesson would be best understood and participated well by the students if they are integrated into something familiar for the learners. One of the ways is by integrating games into the lesson. According to Buhler in Djuanda (2007:14), playing triggers creativity. It is a good trick of changing and optimizing children's

potentials. Djuanda (2007:15-16) even argues that a learning process which involves games is very effective to convey abstract concepts.

Furthermore, Tedjasaputra in Iswinarti (2010:7) finds that playing has functions and values in many aspects, such as physical, psychomotor, social, emotional, characteristic, and cognitive developments, sensory perception, as well as soft and hard skill training. It is obviously proven that playing games is an effective way of learning especially for young learners. There are many advantages of applying games as learning techniques (Soeparno in Djuanda, 2007:19); those are: (a) it could increase students active participation in the learning process; (b) it could involve not only their physical but also psychological aspects; (c) it could improve students' learning motivation; (d) it could be used for teaching solidarity and cooperation (character building); and (e) by integrating the materials into games, children could keep the memory of it much longer.

Many evidences show that games optimize the learning process. Froebel in Sugianto (1997) believes that games are among the best tools to educate children. They would be willing to participate in a learning activity not because they have to, but because they fond of it. They also tend to pay more attention to the lesson as they enjoy the activities and in turn try harder and feel better about themselves (Vernon, 2009). While participating, children will have more reason to communicate, and it leads to their eagerness and willingness to learn more, as well as train their ability to cooperate.

Meanwhile, the focus of this paper is on the use of traditional games. Ariani in Susanti (2010) reports the value implied in the games, namely pleasure, democracy, responsibility, obedience, and cooperation. Many traditional games teach honesty, tolerance, creativity, as well as other positive values worthy of the social life of a nation. It all explains that traditional games are perfect tools for building young learners' characters.

The games used in this research are *rok gebuk/tempolong/boi-boian*, *gobak sodor/main ladang*, *bentengan*, and *remidon/rok pimpet*. Most of them are team games and chosen here as they promote cooperation and because they are among the most popular in Tegal.

(1) *rok gebuk/tempolong/boi-boian* (hit and run)

This game could be played by unlimited number of players; a half of them become the runners and the others are the chasers. Before running, the runners should take turn in trying to hit the target (a pile of ceramic tile pieces) by using a tennis ball. If the target is hit, the runners have to run and the chasers have to try hitting them with the ball. While avoiding the chasers, all runners have to make up the target without leaving any

tiles behind. The runners win when they successfully make up the target before all the members are hit with the ball. Conversely, the chasers win when they have hit all the runners before they succeed in making up the target. The next round will go with the same position if the runners win, but they switch position if the chasers win.

(2) *gobak sodor/main ladang/galah asin* (go back through the door)

It could be played by six to ten people who are divided into two groups; the guards and the runners. The essence of this game is that the runners have to go through the arena by escaping the guards who stand in different lines. The guards have to prevent the runners from getting to the back side of the arena and coming back to the front side. If one of the runners happen to be touched by a guard, the game is over and the groups must switch positions for the next round. However, if a runner makes it back to the front side of the arena, the game starts over with the same position.

(3) *bentengan* (fortress)

The two group playing this game need a tree or pole each to be their fortresses. Their job is to guard it and prevent the other group to conquer it simply by touching it. If a player of a group happens to be caught by the other group, the teammates must free him while trying not to get caught. The more hostages a group has, the more likely they are to win the game. Cooperation is very crucial here. Each of the players should be able to play different roles in order to win. Some of the shared roles are to be the attacker, spy, deceiver, savior and fortress guard. This game teaches children to make plans and strategies to win as well as testing their running speed.

(4) *Remidon/rok pimpet* (Blindman's buff)

A player of this game has to be the seekers while others have to escape him. The seeker's eyes are covered by using a scarf, and he has to fumble around to catch any of the other players. When he touches someone, he has to guess who that person is. If answer is correct, the person becomes the next seeker. If it is incorrect, he has to let the person go and try to catch someone else. All the other players are not allowed to move anywhere until a new seeker is chosen.

In order to match with the nature of each school subject and the learning materials, the procedures of each game need to be modified. Some components and tools of the games might also be added. Also, the materials being taught must be integrated in the procedures since the games are used as learning techniques. The modifications should be set in such a way that young learners would not find them difficult to do.

As it is pointed out before, this paper proposes an idea of using traditional games as English learning techniques. Language could be well taught by using games. As Mayarina (1999) argues, activities of playing games are sorts of a language laboratory. It is because while playing, children would communicate with each other, training their verbal competence. Therefore, English is perfect to be an example of subject to be taught by using the traditional games.

## 5 METHODOLOGY

This is a descriptive quantitative research conducted to describe the use of traditional games of Tegal for training young learners' ability to cooperate with each other. The traditional games (*rok gebuk/tempolong/boi-boian*, *gobak sodor/main ladang*, *bentengan* and *remidon/rok pimpet*) are specifically used for teaching English for young learners. The English materials are integrated in the instructions of the games.

This experimental research uses one-group design, conducted at thirty-eight students of the fifth grade of SD Negeri Kudaile 04 of Tegal Regency. The school is located at the suburban area of Tegal Regency. It is about fifteen kilometers away from the business center. All of the students of this school live near the school in the same neighborhood, so they have quite similar cultural and social background. Something to notice here is that they are still familiar with a number of traditional games, unlike those living in the inner-town areas. Therefore, it is not so hard to introduce them with the games.

This research is carried out by applying the traditional games as English learning techniques. The integration of materials of a school subject here is to optimize the role of the games, not only to focus on the young learners' character building but also on the cognitive ability. The application of the techniques is made as close as possible to the real classroom context.

The data is collected by doing direct observation and giving questionnaire about the procedures of the games. The direct observation is used to actually see how young learners cooperate with each other in each of the games. The questionnaire covers ten questions about the procedures of the games, learners' perception on the games and the effects on their English learning. Those techniques are used to find out the children's responses on the games and the effects on their cooperative skill. The last part of the questionnaire is to make sure that the modifications of the traditional games and the integration of school subjects' materials are doable and understandable. The result

of the observation is analyzed descriptively, and the questionnaire is analyzed statistically.

## 6 DATA ANALYSIS AND DISCUSSION

### 6.1 Data analysis

#### 6.1.1 Observation

Before playing the games outside, a classroom activity is carried out to prepare the young learners with the English expressions and to explain how to play the games. The procedures of each game are as follows:

- (1) *rok gebuk/tempolong/boi-boian*
  - (a) Every time a runner is about to throw the ball, he says, "I can do it."
  - (b) After the runner says, "I can do it," the chaser replies, "I'll catch it."
  - (c) When the target is hit, the runner says, "I did it! Run, everyone!"
  - (d) In the chase, every time a chaser is about to throw the ball, he says an English expression depending on the material being learnt.
  - (e) When a runner gets hit, the chaser says another English expression depending on the material being learnt.
  - (f) When he fails hitting the runner with the ball, another English expression is spoken.
  - (g) When the target is successfully rearranged, the runners say, "We did it! We won!" and the chasers say, "Better luck next time," and the game starts over with the same roles.
  - (h) When all the runners get hit before the target is rearranged, the chasers say, "We did it! We won!" and the runners say, "Better luck next time," and the game starts over with both groups switching roles.
- (2) *gobak sodor/main ladang*
  - (a) Before the game starts, when all the guards are on positions, every member of both groups introduces themselves by mentioning their names and roles.
  - (b) Other than the players in the arena, each team also has a player acting as guide who gives them instructions and warning in English.
  - (c) On the run to the back side of the arena and going back to the front, each runner should answer questions about the English materials being learnt from the guard.
  - (d) Upon failing, the particular runner should stay at the square where he is until he manages to answer the questions.
  - (e) When he could answer correctly, the next thing to do is to get through the guard by avoiding him so he could not reach him.

- (f) When a runner is touched, the game is over and both teams switch position.
- (g) When a runner makes it back to the front side of the arena, he says, “I’m home!” and his team wins. The game starts over in the same positions.
- (3) *bentengan*
- (a) A player who is trying to attack the opponents’ fortress says an English expression depending on the materials being learnt.
- (b) The player from the other group who is trying to catch the first player replies the English expression and shout, “I’ll catch you.”
- (c) When the first player is caught, the catcher says, “Come and get your friend.” The caught player then says to his teammates, “Save me, please.”
- (d) When the teammate makes it to save him from the opponents’ fortress, he says, “Run for your life!” to the one(s) he saves and “Come and get us!” to the opponents.
- (e) When a player makes it to touch the opponents’ fortress, he says “Conqueror! We did it!”
- (4) *remidon/rok pimpat*
- (a) Before the seeker gets his eyes covered, each of the other players wears a tag with a clue about some topics in English.
- (b) When the seeker makes it to catch a player, he has to read out the clue written on the tag he is wearing and the seeker has to mention the player’s name and guess the answer.
- (c) If the answer is correct, all other players say, “Yes, that’s right,” and the player who gets caught become the next seeker.
- (d) If the answer is incorrect, all other players say, “No, that’s wrong,” then the seeker lets the player go and try to catch another one.

### 6.1.2 Questionnaire

There are two parts of the questionnaire filled in by the students; the intercorrelation data and the interactional data. The intercorrelation data show the respondents’ personal data. Meanwhile, the interactional data show students’ perception on their usual English lesson, their understanding of the procedures of each game, and their opinion on how the games affect their English. Thirty-eight students filled in the questionnaire, and the results are calculated using simple statistics showing the frequency of the answers. The results are as follows:

- a. Tabulation of intercorrelation data

Table 1. Sex

Male		Female		Total	
15	39.5%	23	60.5%	38	100%

Note: There are more female than the male respondents.

Table 2. Age

Age	Number	
9 yrs. Old	0	0%
10 yrs. Old	21	55.3%
11 yrs. Old	16	42.1%
12 yrs. Old	1	2.6%
	38	100%

Note: Most of the respondents are in the age of 10 and 11.

Table 3. Native language(s)

Language	Number	
Indonesian	38	100%
Tegalan Javanese	32	84%
Sundanese	1	3%
Other language	0	0%
Monolingual	5	13%
Bilingual	33	87%

Note: All respondents speak Bahasa Indonesia, and most of them also speak Tegalan Javanese.

Table 4. Favorite subject(s)

Subject	Number	
Bahasa Indonesia	15	39%
English	12	32%
Javanese	4	11%
Other Subject	32	84%

Note: Most respondents choose other subjects than language as their favorite. However, more than 70% of them also like language subjects, though only 32% of them like English.

b. Tabulation of interactional data

Table 5. Tabulation of interactional data

No.	Question	Answer			
		A	B	C	D
1.	English lesson	38	0	0	0
2.	English games	1	1	21	15
3.	Favorite traditional game	4	26	2	6
4.	Procedures of <i>bentengan</i>	2	35	1	0
5.	Procedures of <i>remidon</i>	1	5	25	7
6.	Procedures of <i>tempolong</i>	0	37	1	0
7.	Procedures of <i>gobak sodor</i>	0	2	36	0
8.	Procedures of <i>gobak sodor</i>	0	23	15	0
9.	Traditional games for learning English	29	0	8	1
10.	Traditional games for learning English	27	3	8	0

Note: From the tabulation of the respondents' answers, it could be inferred that:

- (a) All respondents agree that the English lesson in their school is fun.
- (b) 55% of the respondents admit that their English teacher rarely uses games as teaching techniques. 39% others even state that she never uses any games.
- (c) 68% of the respondents prefer *tempolong* to other traditional games used in the research.
- (d) 92% of the respondents realize that teamwork is needed for winning the game of *bentengan*.
- (e) 66% of the respondents think that it is more important to avoid the seeker in *remidon* game than to help other players escape him.
- (f) 97% of the respondents think that for winning the game, guards in *tempolong* game need to cooperate by throwing the tennis ball to each other so they could hit the runners with the ball.
- (g) 95% of the respondents agree that teamwork is needed for winning a *gobak sodor* game.
- (h) 61% of the respondents agree to focus on preventing the runners from getting through them when they become the guards without bothering to care about the other guards. Meanwhile, 39% of them think that any movement a guard makes, it should conform to the other guards'.
- (i) 76% of the respondents think that the use of traditional games as learning techniques has positive effects on their English vocabulary achievement. However, 21% of them think that the games only have a little effect on their English.
- (j) 71% of the respondents admit that the use of traditional games as learning techniques makes

English easier to learn. However, 21% of them think that the games only make the subject a little easier, and 8% of them even think that they do not make it easier to learn.

## 6.2 Discussion

Based on the observation and the questionnaire analysis, it is obvious that young learners enjoy playing games so much. They think that to use games as learning technique is a preferable way to learn English in a more fun way. The fact that their real English teacher never (or rarely) uses games for classroom activities makes them very enthusiastic in doing every single activity in this research. It could be seen from their lively spirit while playing the games, despite the fact that the class is held in the heat of the afternoon.

Later on, out of all the games used in this research, most respondents choose *tempolong* as their favorite. This is in accordance with their actual response to the activity. To play *tempolong* games for several rounds is fine for them. They also show good teamwork in every round. It is even hard to get them back to the classroom as most of them still wish to play. Compared to the other games, the amount of time they spend playing this game is the longest. This is also proven by the homeroom teacher who reports that after the research the young learners play this game almost every recess.

On the contrary, they show a different attitude toward *bentengan* game. In spite of their answer saying that teamwork is needed to win it, the observation shows that most players do not really cooperate with each other here. From eight to ten students in a group, there are only two or three of them really make the move to take the opponents' fortress. The rest prefer to stay at their own fortress doing nothing. This condition makes the activity ineffective not only for the character building, but also for the English learning. Because many of them do not make any movements, no English expression is practiced then. As a result, some active players complain on the others' passiveness and the game ends very soon since they lose the spirit to play.

Meanwhile, the teamwork expected to show in *remidon* game is also not satisfactory. As it could be seen from the questionnaire, for most players it is more important to avoid the seeker than to help other players escape him. Only 18% of them realize the importance of cooperation here. It is possibly because it is originally an individual game so it is somehow problematic to modify it into a team game. However, the English learning process here is seen quite effective.

Furthermore, in a question about *gobak sodor* most respondents choose the answer saying that

runners should cooperate with each other to outwit the guards so they could get through them. Yet, the observation shows that most of them focus only on avoiding the guards' touch without being aware of the teammates' positions. In other words, the teamwork here does not really show strategically. Practically, most of them take advantage of the moment when a guard is busy with a runner to sneak in through him, and it is not really teamwork.

On the other hand, a different attitude is shown when they become the guards. Even though most of the respondents choose the answer saying that they have to move on the line to keep the runners out – which does not really show the teamwork – the observation shows something different. While watching over a runner, they shout at the other guards asking them to secure the other parts of the arena. It is in accordance with 39% of them who believe that any movement a guard makes, it should conform to the other guards'.

Comparing the results of the observation and the questionnaire analysis, it could be seen that some of the respondents' answers are still biased. In some questions, while they know the ideal choices, they do not really act them out in the real games. It could be due to their preference of the traditional games. When it is the favorite, they tend to show high enthusiasm in playing it. In contrast, when it is not the one preferred by most of them, those who are basically passive learners do not bother helping the others win the game.

Besides, the varied response shown by the young learners might also be caused by the complication of the English material integration. In addition to the original procedures of the games, some specific expressions as well as other materials of English are included in them. It seems that some students find it difficult to memorize every expression they have to say while playing. As a result, some of them choose to be passive, especially in *bentengan* game. As to other games, that the players must say some words before making any movement also causes problems. For example in *tempolong*, a chaser is not allowed to throw the ball before saying a specific expression. Unfortunately, he forgets what it is and takes some time to recall it. When he finally says it and about to throw the ball, the runner he is after has gone. It makes the pace of the game feels somewhat slow.

Noticing the problems found in the application of the traditional games as learning techniques, some considerations should be made. They are as follows:

(1) *Remidon* could not be used effectively for training as well as testing young learners' cooperative skill since it is originally an individual game which is difficult to modify into a team game.

- (2) The other three games are proven to be effective in training and testing young learners' cooperative skill.
- (3) *Bentengan* is difficult to apply as a learning technique because many players tend to be passive and unmotivated to attack the opponents' fortress.
- (4) *Gobak sodor* and *tempolong* are the most suitable traditional games for building cooperative skill compared to the other two games.
- (5) Too many English expressions and instructions involved in the games make it difficult for the players to remember them. Therefore, the procedures of each game should be revised as not to involve too many additional instructions.
- (6) The procedures of the games also need to be restored to the original ones to make it easier for the players to follow. Instead of involving many additional English instructions, additional tools such as tags are more preferable to use since they could help the players to give clue of what they need to say.

## 7 CONCLUSION

Based on the results of the research, it could be concluded that traditional games, namely *rok gebuk/tempolong/boi-boian*, *gobak sodor/main ladang*, *bentengan* and *remidon/rok pimpet* could be used as learning techniques. This way, Indonesian culture and traditional values are preserved as they are being integrated in education. The effectiveness of the learning process could also be maximized since it is designed to be meaningful for learners. Playing is the nature of young learners. Thus, learners would be more motivated when a game is included in a lesson because they are doing what they like.

In order to optimize the effects of the traditional games as learning techniques, some modifications of the procedures should be made to meet the learning needs. The specific materials to be learnt should also be integrated in the games. As to learning English, some English expression should be included in the instructions of the game. However, teachers should also make sure that the modifications and the integration of the materials would not be complicated for the young learners. Thus, a thorough consideration and possibly a trial-and-error process are needed before actually applying the technique for teaching.

At last, some traditional games could be used for building young learners' characters. Even so, for training and testing their specifically cooperative skill team games such as *rok gebuk/tempolong/boi-boian*, and *gobak sodor/main ladang* are preferable. It is because those games require teamwork and

awareness from each player that they cannot win the game alone. By modifying the games in such a way, the mission of building young learners' good character as well as effectively shaping their academic skills could be accomplished.

*gefem@hotmail.com*

Abstract :

Keywords : Childrens` Rights, Womens` Rights, Domestic Violence, Secularism

### 1. INTRODUCTION

A problem statement on this paper is that the paper reports on a project that aimed to raise the awareness of students about children-women rights via having them shoot a short film.

#### Purpose of the Study

Atatürk, the founder of the Turkish Republic, was a revolutionary thinker and a thorough reformist who made sure that Turkey was up to par with the secular and modern nations. Among the reforms initiated by this paper focuses on *children and women`s rights*.

Despite the serious post-war challenges such as poverty upon the inception of the Republic children`s right notion was coined and 23 April was accepted as “children`s day”. Since, children were regarded as symbolic and living indices of modernity and the new generation that would embrace republican ideals and projects. Children were perceived as the inheritors of the new republic and this can be observed at the Children`s Sovereignty day ceremonies. Children assume the role of the president, prime minister, ministers and other leading posts every year on April 23. In 1924 the world realized that despite the declaration of human rights there was still a need to specifically address children. Therefore, the “Geneva Declaration of the Rights of the Child” was declared and Turkey was anxious to collaborate with the sovereign states. Since then, Turkey endeavors to do her utmost to continue to promote the rights of children and to improve their living conditions. Signing and ratifying the UN Convention on the Rights of the Child in the 90`s, signing the Optional Protocol on the Sale of Children, Child Prostitution and Child Pornography and the Involvement of Children in Armed Conflicts are some examples of these efforts. However, despite the efforts put the governments have not been very successful in implementing broad-based social welfare programs targeting the perceived needs of children. Of the 15 million 247 thousand children between the age of six-seventeen 893 thousand of them are working and 50,2% of them are not going to

school. Of the 893 thousand working children 44,7% of them are in agriculture. Of the 84, 916 juvenile crime reported 32,331 is assault and battery and 24,604 is theft. 40 thousand children have been sexually harassed, abused and raped.

Similar picture is seen in women status, especially in terms of domestic violence since it has increased 1400% percent over the recent years. No, there is no mistake in the writing of the percentage. It is one thousand four hundred....One women is killed every other day. It is more than twice as high among females with no schooling /incomplete primary school compared to females with high school or higher education. The statistical data reveals that physical and sexual violence is related with educational level. The lower the educational level the higher is the physical and sexual violence. Although during the 8-year compulsory education the percentage of girls schooling increased it has decreased as of the implementation of the new system referred to as 4 + 4 + 4. Since the new system gave the home schooling right. Therefore, the low-SES families gave importance to the education of their sons and kept their daughters at home. This led to early teenage marriages. The civilian marriages is computed as 28%. However, these numbers do not reflect the religious marriages that are not recorded by the state. These marriages not being legal means women losing their legal rights and most importantly their schooling opportunity. Of the 1.237.172 births given this year, 355 of them are given by girls younger than 15 years and 93.873 of them by girls aged between 15-19. Depression, suicide, and birth mortality rates are at high level among child mothers. This is believed to be as a result of encouragement of the government for at least three children, giving birth to pregnancy as a result of rape and control over delivery mode inhibits the control and right of women of their own body. According to the OECD countries in 2011, the lowest employment rate (27,8 %) is in Turkey which means only three of the every ten people is women. Among the 134 countries Turkey is the 126th in terms of gender equality. It is very sad to see the limited almost none ownership of women of these reforms. Turkey is the only secular one among the Muslim countries. The

achievements of women and the practices of the government in those countries until today have been portraying a poor image. However, Atatürk initiated the reforms concerning women prior to women demanding them. In other words, they were given their rights without having to struggle for them. It is the only nation located in the Middle East that has abolished polygamy, which was officially criminalized with the adoption of the Turkish Civil Code in 1926, a milestone in Atatürk's reforms. Penalties for illegal polygamy set up to 2 years imprisonment and the equal rights of women in divorce, custody, and inheritance were recognized. The entire educational system from the grade school to the university became coeducational. He gave women the same opportunities as men, including full political rights. In the mid-1930s, 18 women, among them a villager, were elected to the national parliament. Later, Turkey had the world's first women supreme court justice.

## 2. METHODS

The two-phased project was carried out by non-governmental organization titled "Öz-Ge Der" (**Özgürlü ünden Yoksun Gençlerle Dayama Derne i** - Association for Solidarity with the Freedom-Deprived Juvenile) and Canadian Embassy. The primary school located at **ncesu** district of Ankara, the capital city of Turkey accepted to participate in the project. 120 7th and 8th grade students were the participants. Children and women rights are covered in the Civic Rights course. In order to assess the students knowledge level a proficiency test was given to them. One open ended questions was prompted so as to assess the students perception about what "children and womens' right meant for them" within 30 minutes. The papers were analyzed in terms of content, adequacy and relevancy, grammar and vocabulary via rubric. When the results of the test were reviewed it was seen that the students knowledge level of these rights was very low. A two weeks training was provided during the first phase of the study that consisted of providing various kinds of examples. Some of these examples were provided by the instructor while the others came from the students. Since they were asked to scan various newspaper articles or incidents reported in the internet or television. Discussions were carried out via these cases. The same test was used as post-test and results showed that students knowledge level had increased. Students were asked to shoot a short film during the second stage of the study. The test results were grouped as "low-mid-high" and nine students from these levels and among the volunteers were randomly selected to shoot the short film.. The families consent was obtained since the project was carried out after school. The theme of the movie was "*class representative elections*". The 5-minutes film was shot in three months. Some of the equipments

needed to shoot the film were obtained from members of the non-governmental organization who were working in the movie sector and some by the Canadian Embassy along with the financial support. Having watched the movie with the students and teachers discussions were carried out about "what children-women rights" meant for them. The reflective essays they wrote were used to identify their perception about the experience. Qualitative data via reflective essays were investigated, first, for evidence that students in fact learnt from the training provided, and, second, for evidence of a causal relationship between the active involvement of students and from their peers.

## 3. RESULTS AND DISCUSSIONS

Based on the data gathered it could be said that the design of the training and hands on experience enabled the students to learn from the teacher practices by adopting reflective approach and that the awareness about the children and womens` rights can be raised via hands-on experience and learning from peers.

## 4. CONCLUSIONS AND RECOMMENDATIONS

As the students graduate and move from secondary education to tertiary and from there on to their profession, they need to adapt to the new environments making use of their existing knowledge. They need to being given the opportunity to use their full potential, skills, abilities and knowledge to understand and appreciate "rights".

- Article 1: Definition of a child.
- Article 2: Children must be protected from discrimination.
- Article 3: The best interests of the child (taking into account the rights and duties of parents).
- Article 4: Legislative measures to implement the treaty.
- Article 5: The rights of parents.
- Article 6: The right to life.
- Article 7: The child's right to birth registration.
- Article 8: The child's right to a name, nationality and family relations.
- Article 9: The child's right not be separated from his or her parents against the child's will.
- Article 10: The child's right to maintain contact with both parents if they separate.
- Article 11: Measures against the illicit transfer of children abroad.
- Article 12: The child's right to be heard in any judicial and administrative proceedings.
- Article 13: The child's right to freedom of expression.
- Article 14: The child's right to freedom of thought.
- Article 15: The child's right to freedom of association.
- Article 16: The child's right to privacy.
- Article 17: The child's right to information from national and international mass media.
- Article 18: Parents or legal guardians have the primary responsibility for the child's upbringing.
- Article 19: State obligations to protect children against maltreatment and abuse.
- Article 20: State obligations to children temporarily or permanently deprived of their family environment.
- Article 21: State obligations to children with regard to adoption.
- Article 22: State obligations to children who are classed as refugees.
- Article 23: State obligations to children who are mentally or physically disabled.
- Article 24: State obligations to provide child health care services.

- Article 25: Children placed in physical or mental health care settings have the right to a periodic review of their circumstances and treatment.
- Article 26: The child's right to social security insurance and benefits.
- Article 27: The child's right to a standard of living adequate for the child's physical, mental, spiritual, moral and social development.
- Article 28: The child's right to education.
- Article 29: The goals to which a child's education should be directed, and the right of individual adults to establish and direct educational institutions.
- Article 30: The rights of children belonging to ethnic, religious or linguistic minority groups.
- Article 31: The child's right to rest, leisure and recreational activities.
- Article 32: The child's right to be protected from economic exploitation.
- Article 33: State obligations to protect children from the illicit use of narcotic and psychotropic drugs.
- Article 34: State obligations to protect children from sexual exploitation and sexual abuse.
- Article 35: State obligations to prevent the abduction or trafficking of children.
- Article 36: State obligations to protect children from all other forms of exploitation prejudicial to the child's welfare.
- Article 37: State obligations to ensure that children are not subjected to torture, inhuman or degrading treatment or punishments, including capital punishment or life imprisonment without the possibility of release.
- Article 38: State obligations to ensure that children under fifteen years do not take a direct part in wars or other hostilities, and to protect and care for children affected by armed conflict.
- Article 39: State obligations to promote physical and psychological recovery of child victims of torture, degrading treatment or armed conflict.
- Article 40: State obligations concerning children who infringe penal laws.
- Article 41: No part of the Convention shall override provisions contained in State laws which are more conducive to children's rights.

## The Developing Of The Graduates’ Professionalism At Universities: The Role Of Universities In Bridging Knowledge Into Workplace

**Abstract:** Lack of professional capability among Graduates enforced higher education changing policy from knowledge based outcome into generics skills based outcomes. This changing policy context has given weight in developing the competencies to enable graduate working in multi-disciplinary situation. This paper discusses the concept of the developing core competencies in teaching and learning at university level. It also argues on the contribution of higher education to produce qualified, capable and illegible graduates. For obtaining the current challenges of work place requirement, teachers at universities should change approach of teaching from the talking and chalking into communicative, productive, cooperative, and collaborative knowledge practice model. University must redefine the curriculum which is not only aim to develop students’ specific discipline but in more advance and relevance is to provide students’ with the professional skills namely communication skill, IT skill, numeracy, learning how to learn, problem solving, working with others, and subject content competencies. By this manner, graduates of university will be endowed with three major professional attributes namely employability, lifelong learning and good citizenship.

**Keywords:** University graduate, professional competencies, developing core competencies.

### 1 INTRODUCTION

Higher education is being exhorted, as much as government and the professional institutions, to change long-established practices and to take a broader and more integrated approach to education and training. The reasons for this relatively recent perspective on the skills debate are manifold. Most of debates claimed that higher education in particular is failing to deliver sufficient graduates with the right portfolio of skills. Some traced the problem back to the national curriculum, while most focused on the compartmentalized system of higher education, where they found that most courses were dominated by too narrow a professional focus (Robson and Bailey, 2008).

The new paradigm of HE placed quality and relevance of higher education as the main priority and core of national higher education development (UNESCO, 2006). It is expected that by 2010, Indonesia will have a competitive leverage due to the existence of highly reputable higher education institutions, and it is believed that a strong higher

education program will lead to a nation’s competitiveness (Basic Framework for Higher Education Development KPPTJP IV, 2003).

The Education Ministry of Indonesia stated that higher education has a critical role of producing qualified graduates, and if quality higher education is the target to achieve. Indonesia realizes that to improve the quality of its human resources both the problems of access and quality have to be taken into account in finding out their solution (Basic Framework for HE Development KPPTJP IV, 2003).

In short, a higher education system which provides its students with these skills will born strong generation who will contribute to the society and the country (Bennete, et al, 2000).

### 2 PROFFESIONAL COMPETENCIES

The ‘professional competencies’ is defined as observable and measurable knowledge, as well as the generic, transferable skills that students need in

order to become professional employees in the field of their study and work. The competencies most commonly referred to in the professional context are critical thinking, analytical skills, communication, team work, and problem solving (Candy et al, 1994; Tempone and Martin 2000; LTSN, 2002). In the same meaning, Robson and Bailey (2008) stated that that professional development is the place for tips on soft skill development (including performance management, communication, time management, goal setting, team building, and more), instructional design, technical training, corporate training options, and many other topics to inspire professional development and learning.

This paper is attempting to reconfigure the developing of professional competencies of graduates during their study at university. The professional competences are re-extracted from several references into seven competencies namely; numeracy, IT Skill, learning how to learn, problem solving skills, working with others, subject specific competencies. The definitions of the competencies are elucidated in Table 1 below.

Table 1. The definition of the seven core competencies

PROFESIONAL COMPETENCIES	DEFINITION
<b>Communication Skills</b>	Communication skills refers to one's ability to use active listening, writing skills, oral communication, presentation skills, questioning and feedback skills in order to establish successful communication.
<b>Numeracy</b>	Numeracy is defined as the aggregate of skills, knowledge, beliefs, patterns of thinking as well as the communicative and problem solving processes that an individual must possess in order to handle, perform and interpret real world tasks and problems in an effective manner.
<b>Information Technology</b>	Information Technology refers to one's ability to use computers, software applications, databases and other technologies as well as possessing critical cognitive skills and knowledge in order to achieve various academic, work-related and personal goals
<b>Learning How to Learn</b>	Learning how to learn is defined as acquiring sets of skills and knowledge for one to learn efficiently and effectively in any learning situation that one encounters.
<b>Problem Solving</b>	The ability of the individual to tackle problems systematically, for the purpose of working towards the solution and learning from this process.
<b>Working with Others</b>	The ability of the individual to meet own responsibilities and work cooperatively in pair or group of people for the purpose of achieving shared objectives.
<b>Subject Content Competencies</b>	One's possession of knowledge, capabilities and dispositions to organize and provide instruction at the appropriate level of the study which inter-relate with subject content learned.

(Bennett, et. al 2000; QCA, 2002; Crebert, 2003; Zalizan Mohamad Jelas, et. al, 2006)

## 2.1 Developing Professional Competencies at University

Professionalism is the ability of a worker to perform core competencies; communication skills, numeracy skills, IT skills, learning how to learn skills, critical thinking skills, problem solving skills, and subject specific competencies at a workplace also means that the workers are able to perform a good work as a professional (Bennett, et. al 2000 & Bailey, 2005)

It is a responsibility of universities to develop capacities of professional competencies through syllabus content and the method of content delivery. This will strengthens the justification for a role of HE in developing professionalism and sustain lifelong learning capacities among graduates.

In action plan at university level, the professional competencies should be embedded within the contexts of the students' discipline or professional field. Some studies had been toward the development of professional competencies at University. The combination of theory and practice of teaching and learning is used together the development of professional competencies into curriculum of university. Here below the guidance of development of professionalism for graduate during at university are discussed. The discussion encompass seven core competences namely; numeracy, IT Skill, learning how to learn, problem solving skills, working with others, subject specific competencies.

## 2.2 Developing communication skills

There is a concurrent commitment among universities to the integration of teaching and learning communication skills across discipline. Communication skills can be taught using an experiential learning approach and focusing on verbal and written forms of communication. The Learning and Skills Development Agency (LSDA, 2004) which manages the Key Skills Support Programmed has suggested the teaching and learning of communication skills in three main areas. For speaking and listening skills, LSDA suggests ample opportunities be given to learners to develop their confidence in speaking and listening particularly during presentations. For reading and information skills, students need to be trained in the ability to locate information sources as well as extracting relevant data from these sources. As for

writing skills, students will need to be exposed to different forms of written communication such as reports and business letters as well as spellings and punctuations.

### 2.3 Developing numeracy skills

Curry et al (1996) study numeracy in relation to adults' working experiences and their suggestions are taken into account of in the teaching and learning of Mathematics so as the adult numeracy curriculum is seen to be restructured in a more meaningful way. Their suggestions are summarize as follows;

- Use learner-centered approaches to ensure learners see the relevance of what they are learning (Curry et al, 1996).
- Use an interdisciplinary approach to teaching – it should be incorporated into other literacy development like reading and writing and also using math content/skill like reasoning and problem solving (Curry et al, 1996).
- Link new math learning to previous learning – Linkages/Connections must be made with other math concepts, skills and prior knowledge (Kerka, 1995).
- Teach concepts before rules (Curry et al, 1996).
- Practice contextualized Mathematics using the constructivist approach to learning. This means students use their prior and new knowledge to construct their own understanding and make new meanings (Kerka, 1995).

Individual learning style preferences should be considered in numeracy instruction (Kerka, 1995).

### 2.4 Developing information technology skills

The Dearing Report suggests the use of computer-based program such as tutorials, exercises, educational games, learning tools helps to develop students' understanding of ideas and articulate their own views or ideas (Dearing Report, 1997). Kruger (2000) stated that learners are placed in the virtual learning resources, and are exposed to interactive communication with other learners, experts and mentors. Thus, they are engaged in lifelong, active learning with the easy access to information and knowledge. Here general guidance for lecturer to enhance students' IT skills:

#### a. Computer Literacy

- Practice the basic operation and maintenance of computer
- Running basic program Installer (window installer, Microsoft office installer, antivirus installer and updater, etc.)
- Using computer-assisted to complete assignment effectively, efficiently, practically, systematically and safely.
- Using specialized computer applications like music composition software, computer assisted drawing and drafting programs, mathematics modeling software, etc.

#### b. Cyber Learning

- Integrating an online collaborative projects into your classroom
- Managing classroom and technology resources available (e.g. searching, accessing, and promoting information)
- Use synchronous (teleconference, chatting room, virtual learning, e.tc) and in-synchronous (email, e-learning, web-based learning, etc).
- Downloading, transferring and converting online resources (music, film, video, etc) into computer.
- E.tc.

### 2.5 Developing information technology skills

Smith (1982) suggests three ways of incorporating learning how to learn skills. Self-directed learning allows learners to be autonomous and direct their own learning. Collaborative learning improves group membership skills and teamwork development. And institutional learning is using instructors as resources for learning and study skills improvement. The way how we use and interpreted the methods, it is rely on lecturer and classroom creativity. The point is the students are able to determine and obtain their learning outcomes after the actual learning experiences. However, Hosnkins and Fredriksson (2008) suggest some practical review for the competence development as follows:

- Establishes the extent to which learners regard the process of learning is itself learnable;
- Demonstrates learner's desire to find out new things;

- Affirms the extent to which learners are on the lookout for links between what they are learning and what they already know;
- Finds out how easily learners are disheartened when they get stuck or make mistakes;
- Establishes the learners' ability to look at things in different ways;
- Establishes the learners' ability to manage the balance between sociable and individual approaches to learning;
- Finds out learners' awareness of their own learning processes.

(Hosnkins and Fredriksson, 2008)

## 2.6 Developing learning problem solving skills

Kirkley (2003) suggest that developing problem solving should be offered in context, and students should learn content while solving realistic problems. While Mettler (1995) proposed a developing problem-solving method that he called "structured discovery learning." This method requires students' active involvement and self-direction in the *problem-solving* process. It consists of the following three phases: (1) the preparation phase: identifying a *problem* and its nature, (2) the search phase: relating the *problem* to similar past experiences and devising hypotheses to explain it, and (3) the resolution phase: finding a solution to or an explanation of the *problem*.

Everyone has a particular approach to dealing with *problems*, which is called *problem* orientation. *Problem* orientation is comprised of cognitive, emotional, and behavioral components. The cognitive component includes recognizing and appraising the *problem* and one's ability to cope with it. However, the features of learning problems solving are commonly comprise following procedures;

- Using stimulus material to help students discuss an important problem, question or issue;
- Presenting the problem as a simulation of professional practice or a 'real life' situation;
- Appropriately guiding students' critical thinking and providing limited resources to

help them learn from defining and attempting to resolve the given problem.

- Having students work cooperatively a group, exploring information in and out of class, with access to a tutor (not necessarily a subject specialist) who knows the problem well and can facilitate the group's learning process;
- Reapplying this new knowledge to the original problem and evaluating their learning processes.

(Bennete; 200; QCA, 2002; Lesmeiste, 2005)

## 2.7 Developing learning problem solving skills

Watson (1997) state that the developing working with others is based on experiential learning theory, as well as teamwork theory developed largely in the industry context. However, developing working with others is not a constant, experienced in the same way by all learners, but rather, a dynamic interaction between the whole learner (including conceptions of learning, values, beliefs, emotional responses, pre-existing knowledge, skills, learning style, motivation, attitudes, prejudices, etc), the learning environment, subject matter, learning process and a host of other factors. The main role of lecturer is motivating students to learn more effectively together, improving behavior in class, on the playground and socially, and helping students take responsibility for themselves and each other. Group discussion, individual sharing idea, getting conclusion remark from a topic of lesson in order to obtain teamwork's product of activity is examples of working with others development.

## 2.8 Developing and learning subject specific core competencies

Subject core competencies refer to students' area of knowledge at university. Ellis, et. al (2005) draw that developing students subject specific competencies include the requisite knowledge, principles, and concepts of their field of the study. The development of core competencies is emphasized upon specific knowledge materials which is developed together with others competencies; communication, numeracy, IT skills, learning how to learn, problem solving, and working with others. The delivering method of subject specific core competencies can be lecture,

discussion, group task, PBL, IT usage, fieldwork visit, assignment, presentation et cetera, with refer to the integration of knowledge and skills development in the classroom.

Learning and Skills Development Agency-LSDA (2000) posters guidance of the development of specific knowledge and skills in the classrooms;

- Identifying the areas they need to work on
- Planning activities with students
- Helping them gain knowledge as well as develop skills
- Reviewing their progress and giving feedback
- Learning to reflect is an important step to achieving independence.
- Reflecting critically one’s own experience is essential. Reflect on how you used particular knowledge and skills and what might work better.

(LSDA, 2000:25)

## 2.9 Outcome of Professional Competencies Development at Universities

Three intended outcomes of higher education namely employability, lifelong learning and good citizenship.

**Employability**, one’s possession of qualities and competences in order to meet the changing needs of employers and customers. It is to do with ‘the capacity to gain initial employment, maintain employment and obtain new employment if required.

**Lifelong Learning**, lifelong learning lifelong learning places certain roles and responsibilities on individuals to develop or upgrade their own capacity based on ‘the notion of learning from the cradle to the grave’. This seems to imply that learning is an ongoing process which occurs throughout one’s lifetime.

**Good Citizenship**, the abilities of graduate to perform the core competencies as also technical academic skills will much contribute to their country development. It involves several elements such as ‘a commitment to the pursuit of truth, a responsibility to share knowledge and a willingness to listen to alternative views and judge them on their merits.’

(Bennett, et. al 2000; QCA & Zalizan Mohamad Jelas, et. al, 2006)

## 2.10 The summary of developing professional competencies

The teaching approach is no longer monotonies on lecture and slide presentation only where a lecture standing in front of class exchange slide by slide. The teaching and learning at university level now, is students centered where the student build their core competencies by various activities in the classroom. The graft below attempted to draw the summary of core competencies development and practice in the classroom. (see the picture on appendix)

## 3 CONCLUSION

However, one’s ability of combining specifics knowledge with other competencies is a tremendous professional achievement that can be applied in taking a quick and accurate action in real work environment. Both specific knowledge and skills rely heavily on generic skills; communication skills, IT skills, numeracy skills, problem solving skills, learning how to learn and working.

The university in should envisage that every single graduate of the university posses the seven attributes. The seven skills could be carried out in delivering course content. Finally by equipping students with the professional competencies they will succeed as professionals and responsible members of society. Employability, lifelong learning, and good citizenship as quality measurement of university outcome could be attained.

turmudi@upi.edu

**Abstract:** One of the purposes of statistical learning is to develop students' statistical reasoning. To determine students' statistical reasoning required assessment to measure the statistical reasoning skills. Assessment is used as information for teachers about students' understanding and reasoning processes, to develop instructional practices, and to help students learn how to improve their performance. This article uses assessment as bases, developed from the SRA and ARTIST instruments, consists of 20 multiple choice items, based on the type of reasoning from Garfield (2003). The results showed that the mean score are less than 60 (Mataram University:  $\bar{x} = 54,39$ ; Nusa Cendana University:  $\bar{x} = 53,88$ ; STKIP Garut:  $\bar{x} = 38,10$ , and Galuh University:  $\bar{x} = 37,06$ ). These results indicated that students statistical reasoning are still low, so it needs a real effort to improve the learning process.

**Keywords:** Statistical Reasoning, Assessment, Statistical Reasoning Assessment (SRA), The Assessment Resource Tools for Improving Statistical Thinking (ARTIST)

### 1. INTRODUCTION

The study of statistical reasoning has been done by experts and researchers (e.g., Garfield, 2002, 2003; Wang, Wang, & Chen, 2009). These studies emphasize the importance of statistical reasoning and try to develop statistical reasoning skills in middle school students and analyze the difficulties/misconceptions in statistical reasoning. The importance of literacy, reasoning, and statistical thinking, encourage the development of instruments that can measure such capabilities. There are some assessments that have been developed by experts to measure the literacy skills, reasoning, and statistical thinking, like: 1). The Statistical Reasoning Assessment (SRA), 2). The Statistics Concepts Inventory (SCI), 3). The Assessment Resource Tools for Improving Statistical Thinking (ARTIST). These instruments assess literacy, reasoning, and statistical thinking skills of students.

A good assessment, of course, is an assessment prepared in accordance with the learning objectives that have been set. These instruments also have done it. In this study, researchers tried to combine the two instruments, the SRA and the ARTIST to measure statistical reasoning skills of students who have taken courses in Introductory Statistics. The reason for choosing these two instruments because The SCI “was written for a specific audience of engineering students in statistics” (Delmas, Garfield, Ooms, & Chance, 2007: 29). Because the study was conducted in Mathematics Education program at the college, it was decided not to use the SCI.

According to Garfield (Delmas, et al. 2007), ‘SRA focuses heavily on probability, and lacks

items related to data production, data collection, and statistical inference’. ARTIST consists of Comprehensive Assessment of Outcomes for a first course in Statistics (CAOS) with 40 multiple choice items and 11 multiple choice section, namely Data Collection, Data Representation, Measures of Center, Measures of Spread, Normal Distribution and Measures of Position, Probability, Sampling Variability, Confidence Interval-One Sample, Tests of Significance, Bivariate Data, Quantitative, Bivariate Data, Categorical. From these considerations, researchers compile instrument adapted from the SRA and ARTIST, consists of 20 multiple choice items as bases on the type of reasoning, developed from Garfield (2003).

This study only provides about using instruments that have been made to see how the statistical reasoning abilities of students who have taken Introductory Statistics. The results are expected to be a reference to improve the learning process for this case, which is expected to increase student achievement.

### 2. GOALS FOR STUDENTS IN AN INTRODUCTORY COURSE

To compile the assessment instrument, adapted to the learning objectives to be achieved. Learning objectives in an Introductory Statistics from GAISE report (American Statistical Association (ASA), 2010: 12-13), are:

Students should believe and understand why:

- Data beat anecdotes
- Variability is natural, predictable, and quantifiable

- Random sampling allows results of surveys and experiments to be extended to the population from which the sample was taken
- Random assignment in comparative experiments allows cause and-effect conclusions to be drawn
- Association is not causation
- Statistical significance does not necessarily imply practical importance, especially for studies with large sample sizes
- Finding no statistically significant difference or relationship does not necessarily mean there is no difference or no relationship in the population, especially for studies with small sample sizes

Students should recognize:

- Common sources of bias in surveys and experiments.
  - How to determine the population to which the results of statistical inference can be extended, if any, based on how the data were collected.
  - How to determine when a cause-and-effect inference can be drawn from an association based on how the data were collected (e.g., the design of the study).
  - That words such as “normal,” “random,” and “correlation” have specific meanings in statistics that may differ from common usage
- Students should understand the parts of the process through which statistics works to answer questions, namely:
- How to obtain or generate data
  - How to graph the data as a first step in analyzing data, and how to know when that’s enough to answer the question of interest
  - How to interpret numerical summaries and graphical displays of data—both to answer questions and to check conditions (to use statistical procedures correctly)
  - How to make appropriate use of statistical inference.
  - How to communicate the results of a statistical analysis

Students should understand the basic ideas of statistical inference, including:

- The concept of a sampling distribution and how it applies to making statistical inferences based on samples of data (including the idea of standard error).
- The concept of statistical significance, including significance levels and p-values .
- The concept of confidence interval, including the interpretation of confidence level and

margin of error goals for students in an introductory course: what it means to be statistically educated

Finally, students should know:

- How to interpret statistical results in context.
- How to critique news stories and journal articles that include statistical information, including identifying what’s missing in the presentation and the flaws in the studies or methods used to generate the information.
- When to call for help from a statistician

Seeing the goals recommended by the ASA, requires a lot of skills to achieve that. To measure the skills, of course, takes a long time and continuously. Due to time constraints, the researchers tried to adopt learning goals by type of reasoning developed by Garfield (2003: 25), consists of:

*Reasoning about data:* recognizing or categorizing data as quantitative or qualitative, discrete or continuous; and knowing how the type of data leads to a particular type of table, graph, or statistical measure.

*Reasoning about representations of data:* understanding the way in which a plot is meant to represent a sample, understanding how to read and interpret a graph and knowing how to modify a graph to better represent a data set; being able to see beyond random artifacts in a distribution to recognize general characteristics such as shape, center and spread.

*Reasoning about statistical measures:* understanding what measures of center, spread, and position tell about a data set; knowing which are best to use under different conditions, and how they do or do not represent a data set; knowing that using summaries for predictions will be more accurate for large samples than for small samples; knowing that a good summary of data includes a measure of center as well as a measure of spread and that summaries of center and spread can be useful for comparing data sets.

*Reasoning about uncertainty:* understanding and using ideas of randomness, chance, likelihood to make judgments about uncertain events, knowing that not all outcomes are equally likely, knowing how to determine the likelihood of different events using an appropriate method (such as a probability tree diagram or a simulation using coins or a computer program).

*Reasoning about samples:* knowing how samples are related to a population and what may be inferred from a sample, knowing that a larger, well chosen sample will more accurately represent a population and that there are ways of choosing a sample that make it unrepresentative

of the population; being cautious when making inferences made on small or biased samples.

*Reasoning about association:* knowing how to judge and interpret a relationship between two variables, knowing how to examine and interpret a two way table or scatterplot when considering a bivariate relationship, knowing that a strong correlation between two variables does not mean that one causes the other.

The type of reasoning by Garfield, based on the concepts and key ideas in Statistics, are: data, probability, samples, sampling variability, inference, and association. The goals for students are achieved in introductory statistics simpler than in ASA, but covers all the big idea/ key aspects in Statistics.

### 3. DEFINITION AND DEVELOPMENT OF STATISTICAL REASONING

Reasoning skills role in understanding concepts and problem solving. Delmas (2002), separating three learning outcomes (cognitive) in Statistics, are literacy, reasoning, and thinking. Tasks that can distinguish three learning domains can be seen in Table 1 below:

Table 1. Tasks that distinguish learning outcomes in Statistics

BASIC LITERACY	REASONING	THINKING
IDENTIFY	WHY?	APPLY
DESCRIBE	HOW?	CRITIQUE
REPHRASE	EXPLAIN	EVALUATE
TRANSLATE	(THE PROCESS)	GENERALIZE
INTERPRET		
READ		

Source: Delmas, 2002.

From the table 1, reasoning asks students to explain why or how the results obtained, describes the process that occurs. According to Rumsey, Garfield, and Chance (Delmas, 2002), ‘the difference is not clear because of the overlap in the domain’. Often, the skills of the area included in the skills of others. However, from a learning perspective, it shows that the learning activities may have the potential to develop more than one such capabilities.

To describe the definition about statistical reasoning, Garfield, Delmas, & Chance (Ben-Zvi & Garfield, 2004) defined Statistical reasoning as the way people reason with statistical ideas and make sense of statistical information. This involves making interpretations based on sets of data, representations of data, or statistical summaries of

data. Statistical reasoning may involve connecting one concept to another (e.g., center and spread), or it may combine ideas about data and chance. Reasoning means understanding Reasoning means understanding the concepts and can explain why, how, and explain the process.

So the statistical reasoning is the ability of students to explain why, how about sets of data, representations of data, or statistical summaries of data. To develop statistical reasoning, Garfield & Ben-Zvi (2009), make a design model for improving students' statistical reasoning ability called Statistical Reasoning Learning Environment (SRLE). SRLE is a class of effective and positive statistics to help students develop statistical reasoning. This approach is called learning environment because that is interactive combination of text materials, classroom activities, and culture, discussion, technology, teaching approaches, and assessment. This model is based on constructivism learning model.

In a constructivist classroom teacher does not teach how to resolve the issue, but the present problems and encourage students to find their own way to solve the problems (Suherman, Turmudi, Suryadi, Herman, Suhendra, Prabawanto, Nurjanah, & Rohayati, 2003). The role of students in the setting of constructivism, is student centered. Students actively utilizing prior knowledge to forming new knowledge by students, either true or false. The role of the teacher, as a facilitator to correct misconceptions. Students are required to express their opinions according the level of thinking, or teachers make groups, and students learn from other students in a group setting to share information and develop a common understanding. Students must proactively engage and facilitate teachers support students so as not to be hampered in the formation of new knowledge. Maximize the principles of constructivism, which was originally expected misconceptions by students can be improved with active student involvement in learning.

### 4. ASSESSMENT OF STATISTICAL REASONING

When the lecturer wants to determine the skills of students in learning, it requires assessment. By conducting the assessment, the lecturer will know the difficulties experienced by students and may be a reflection of the lecturer. However, “assessment results are only estimates of what a person knows and can do” (Garfield & Ben-Zvi, 2008: 66). Definition about assessment proposed by (Berry & Adamson, 2011: 3), “assessment has a variety of connotations for different people, depending on the

nature of their participation in the assessment process". For schoolchildren, an impending examination, test or euphemistic quiz can be a cause for alarm and despondency; for teachers, there is the administrative burden of setting and grading assessments, with the concomitant concern that they will be judged on their students' results; for admissions officers in tertiary institutions and employers, assessments are required to provide important information for the purposes of selection; for government ministers, assessment results enable them to evaluate the effectiveness of the education system and how it compares with that of other states through the rankings in comparative studies. Assessment can be used for grading, selecting, diagnosing, determining mastery, guiding and predicting.

Thus, the assessment describes the various measures taken to collect and use information about knowledge, attitudes, or skills of a person. "The functions are mainly two folds: (1) for making judgments of the performance of individuals or the effectiveness of the system and (2) for improving learning" (Berry & Adamson, 2011: 5).

Popham (1994), divides into several assessment, ie select-response tests, tests of construct-response, performance assessment, portfolio assessment, and assessment of affective. Although statistical reasoning may best be assessed through one-to-one communication with student (e.g., interviews or observations) or by examining a sample of detailed, carefully designed paper-and-pencil instruments can be used to gather some limited indicators of students reasoning (Garfield, 2003: 24). From this, to measure the statistical reasoning can be used SRA. In addition, instruments have been developed to measure literacy, reasoning, and statistical thinking is *Assessment Resource Tools for Improving Statistical Thinking* (ARTIST). ARTIST instruments downloaded from <http://app.gen.umn.edu/artist/> with advance registration. After successful registration, will be obtained several components of matter that consists of the Comprehensive Assessment of Outcomes in Statistics (CAOS) which consists of 40 multiple choice questions and 11 multiple choice questions section is divided into key content Statistics, namely Data Collection, Data Representation, Measures of Center, Measures of Spread, Normal Distribution and Measures of Position, Probability, Sampling Variability, Confidence Interval-One Sample, Tests of Significance, bivariate Data, Quantitative, bivariate data, Categorical. Test instruments developed by type of statistical reasoning from Garfield (2003).

## 5. RESEARCH METHODS

This research uses descriptive method in order to determine the students statistical reasoning in Introductory Statistics. Subjects were students who have take the course of the school year 2014/2015, Mataram University, in West Nusa Tenggara, consists of 49 students, Nusa Cendana University, in NTT consists of 58 students, STKIP Garut, in West Java, consists of 50 students, and Galuh University in West Java, consists of 34 students. The sample total in this study was 191 students. Sampling was done by using purposive sampling. Purposive sampling is a sampling technique with particular consideration (Sugiyono, 2012). The consideration include: Introductory Statistics is an essential subject in Mathematics Education courses in Indonesia and has the same syllabus, researchers get a friend who teaches Introductory Statistics in various universities, both public and private college. This was done to compare the ability of statistical reasoning in public and private college students.

The number of incorrect could be a clue how far the student mastery of the material. The data collected from answers given test students on statistical reasoning. Instruments to measure the ability of statistical reasoning adopted from the problems that exist in *Assessment Resource Tools for Improving Statistical Thinking* (ARTIST) and *Statistical Reasoning Assessment* (SRA). Below in table 2 and 3 are given the relationship between the type of statistical reasoning and the instruments ARTIST, SRA, and the development instrument.

Table 2. The relationship between the type of statistical reasoning and instruments used ARTIST and SRA

The Type of Reasoning	ARTIST Component	Number of ARTIST	Number of SRA	Item
Reasoning about data	ARTIST Scale - Data Collection	1,5		1,7
Reasoning about representation of data	ARTIST Scale - Data Representation	7,12		7,8
Reasoning about statistical measures	<ul style="list-style-type: none"> <li>• ARTIST Scale - Measures of Center</li> <li>• ARTIST Scale - Measures of Spread</li> <li>• ARTIST Scale - Normal Distribution and Measures of Position</li> </ul>	<ul style="list-style-type: none"> <li>• 1</li> <li>• 1,4</li> <li>• 1,3</li> </ul>	<ul style="list-style-type: none"> <li>• 1</li> <li>• 7,5</li> <li>• 9,10</li> </ul>	<ul style="list-style-type: none"> <li>• 5,6</li> <li>• 7,8</li> <li>• 9,10</li> </ul>
Reasoning about uncertainty	ARTIST Scale - Probability	2,9		11,12
Reasoning about samples	<ul style="list-style-type: none"> <li>• ARTIST Scale - Sampling Variability</li> <li>• ARTIST Scale - Confidence Interval-One sample</li> <li>• ARTIST Scale - Tests of Significance</li> </ul>	<ul style="list-style-type: none"> <li>• 2</li> <li>• 3</li> <li>• 2,1,4</li> </ul>	<ul style="list-style-type: none"> <li>• 2</li> </ul>	<ul style="list-style-type: none"> <li>• 13</li> <li>• 14</li> <li>• 15</li> <li>• 16,1</li> <li>• 7,16</li> </ul>
Reasoning about association	ARTIST Scale - Bivariate Data, Quantitative	0,1		19,20

Table 3. Development of statistical reasoning test instrument

Item no.	Indicator	Item	MCQ	Yes/No	Yes
Measuring data type	1. Identifying the appropriate data type for a given situation (text, graph, or table).	1. Identifying the appropriate data type for a given situation (text, graph, or table).			12
Measuring data visualization	2. Interpreting data visualization (text, graph, or table).	2. Interpreting data visualization (text, graph, or table).			14
Measuring data analysis	3. Analyzing data visualization (text, graph, or table).	3. Analyzing data visualization (text, graph, or table).			16, 17, 18, 19
Measuring data interpretation	4. Drawing conclusions from data visualization (text, graph, or table).	4. Drawing conclusions from data visualization (text, graph, or table).			11, 12
Measuring data application	5. Applying data visualization (text, graph, or table).	5. Applying data visualization (text, graph, or table).			13, 14, 15, 16, 17, 18
Measuring data synthesis	6. Synthesizing data visualization (text, graph, or table).	6. Synthesizing data visualization (text, graph, or table).			19, 20

Table 5. Items with less than 60% of the student correct (adapted from Delmas et al. 2007 and Garfield, 2003)

Item	Type of Reasoning	Minimum Learning Objective
1	Reasoning about data	Ability to recognize data as quantitative or qualitative, discrete or continuous
2	Reasoning about data	Ability to recognize types of data: discrete, categorical, experimental, and other
3	Reasoning about statistical measures	Understanding the context when measures of central tendency about a data set
4	Reasoning about statistical measures	Understanding how to select an appropriate average
5	Reasoning about statistical measures	Ability to compare the statistical about scores contained in identical normal distributions
6	Reasoning about statistical measures	Ability to identify statistical distributions
12	Reasoning about sample	Knowing how samples are related to a population and statistical conclusions
14	Reasoning about sample (Confidence Interval - One sample)	Ability to calculate a confidence interval
15	Reasoning about sample (Confidence Interval - Two sample)	Ability to calculate a confidence interval
17	Reasoning about sample (Confidence Interval - Two sample)	Ability to identify the significance of a p-value
18	Reasoning about sample (Confidence Interval - Two sample)	Ability to identify the significance of a p-value
19	Reasoning about sample (Confidence Interval - Two sample)	Ability to identify about error type
20	Reasoning about sample (Confidence Interval - Two sample)	Ability to identify statistical significance with respect to correlation
21	Reasoning about association	Ability to recognize a relationship between two or more variables from a scatterplot

Here is some picture when the college students take the test.

## 6. RESULTS AND DISCUSSION

### 6.1 Results

This test is a 20 multiple choice test about statistical reasoning. The test is given to students who have taken Introductory Statistics. The sample totaled 191 students, consisting of 49 college students from the Mataram University; 58 college students from the Nusa Cendana University; 50 college students of STKIP Garut, and 34 college students of Galuh University. Tests conducted on October 29, 2014 at the Mataram University; October 31, 2014 in Nusa Cendana University and Galuh University, November 1, 2014 in STKIP Garut. The timing of the test as much as 60 minutes. Table 4 shows the percentage of students who answered correctly.

Table 4. Percent of students correct on the test

Item	Mataram University		Nusa Cendana University		STKIP Garut		Galuh University	
	Correct (%)	Incorrect (%)	Correct (%)	Incorrect (%)	Correct (%)	Incorrect (%)	Correct (%)	Incorrect (%)
1	51.31	48.69	41.38	58.62	42.00	58.00	35.29	64.71
2	28.77	71.23	31.03	68.97	34.00	66.00	23.53	76.47
3	71.23	28.77	68.97	31.03	66.00	34.00	76.47	23.53
4	40.84	59.16	37.93	62.07	38.00	62.00	32.35	67.65
5	33.51	66.49	35.29	64.71	36.00	64.00	27.06	72.94
6	50.26	49.74	42.03	57.97	43.00	57.00	38.24	61.76
7	60.21	39.79	57.97	42.03	58.00	42.00	51.47	48.53
8	78.53	21.47	76.27	23.73	77.00	23.00	70.59	29.41
9	53.40	46.60	51.70	48.30	52.00	48.00	45.88	54.12
10	53.40	46.60	51.70	48.30	52.00	48.00	45.88	54.12
11	67.54	32.46	65.52	34.48	66.00	34.00	60.29	39.71
12	33.51	66.49	35.29	64.71	36.00	64.00	27.06	72.94
13	42.41	57.59	40.34	59.66	41.00	59.00	34.71	65.29
14	42.41	57.59	40.34	59.66	41.00	59.00	34.71	65.29
15	31.41	68.59	33.51	66.49	34.00	66.00	23.53	76.47
16	61.26	38.74	59.16	40.84	60.00	40.00	55.88	44.12
17	53.40	46.60	51.70	48.30	52.00	48.00	45.88	54.12
18	53.40	46.60	51.70	48.30	52.00	48.00	45.88	54.12
19	53.40	46.60	51.70	48.30	52.00	48.00	45.88	54.12
20	53.40	46.60	51.70	48.30	52.00	48.00	45.88	54.12
Mean (SD)	48	52	48	52	48	52	48	52
Standard Deviation	24.22	25.78	23.33	26.67	23.20	26.80	21.04	28.96

Interestingly, the mean from public university (Mataram University and Nusa Cendana University) is almost the same, around 54.39 and 53.88. Same as, the mean from private university (STKIP Garut and Galuh University) is almost the same, around 38.10 and 37.06. Items about which less than 60% of students answered correctly for Public universities are also relatively the same, is item 2, 6, 9, 12, 14, 15, 17, 19, and 20. For private universities, items with less than 60% of the students correct answer is item 1, 5, 6, 9, 12, 14, 15, 17, 19, and 20.

And here is some items with less than 60% of the student correct.

6). A small object was weighed on the same scale separately by nine students in a science class. The weights (in grams) recorded by each student are shown below.

6.2; 6.0; 6.0; 15.3; 6.1; 6.3; 6.2; 6.15; 6.2

The students want to determine as accurately as they can the actual weight of this object. Of the following methods, which would you recommend they use?

- A. Use the most common number, which is 6.2
- B. Use the 6.15 since it is the most accurate weighting.
- C. Add up the 9 numbers and divide by 9
- D. Throw out the 15.3, add up the 8 numbers and divide by 8.

Questions relating to the reasoning about statistical measures. Related to the question, Garfield (2003: 27) reveals that misconceptions involving averages (averages are the most common number, fails to take outliers into consideration when computing the mean, compares groups based on their averages, confuses mean with median).

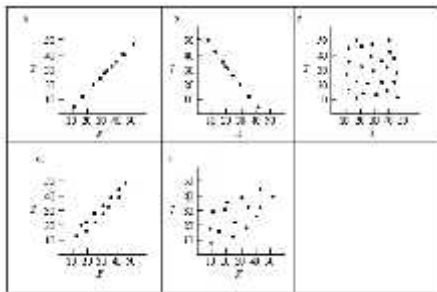

17). The following message is printed on bottle of prescription medication:

WARNING: For applications to skin areas there is 15% chance of developing a rash. If a rash develops, consult your physician.

Which of the following is the best interpretation of this warning?

- A. Don't use the medication on your skin, there is a good chance of developing a rash.
- B. For application to the skin, apply only 15% of the recommended dose.
- C. If a rash develops, it will probably involve only 15% of the skin.
- D. About 15 of 100 people who use this medication develop a rash.
- E. There is hardly a chance of getting a rash using this medication.

The question relating to the meaning of probability. This relates to the risk factors that may occur in a study.

20). Select the scatterplot that shows the strongest relationship between the X and Y Variables?

- A. a
- B. b
- C. a and b
- D. a and d
- E. a, b, and d

This question, of course, can be answered if the students have been accustomed to learning supported by technology, in this case by using the software.

## 6.2 Discussion

Of all the types of reasoning, it all still be difficulties experienced by students. From the results obtained, the mean <60. This indicates statistical reasoning skills is still low. Based on results, the lecturers should be emphasize statistical reasoning on learning process, not only skills and procedures, but students are also able to explain why and how the concepts and ideas of Statistics. One effort that can be done by setting constructivism learning. Of course, a good assessment that can measure students statistical reasoning in Introductory Statistics need to be improved continuously. Also about the only form of multiple choice, need to be made about the description so that the ability of the students can be measured properly.

**Abstract:** Chemical equilibrium is often considered as one of difficult concepts in chemistry. According to the literatures, most students have different degree of understanding on chemical equilibrium and related topics leads them to misconceptions. The aim of this study is to investigate eleventh grade students’ understanding on chemical equilibrium and on related subject. Diagnostic test containing six multiple choices and four open-ended questions has been developed to investigate students’ misconception on chemical equilibrium and related subjects. The test was examined by two experts for its validity and its alignment to the instructional objectives. The test was distributed to 30 eleventh grade students from a senior high school found in Bandung. The data obtained from multiple choices and open ended questions were analyzed based on students’ understanding criteria of Sound Understanding (SU), Partial Understanding (PU), Specific Misconceptions (SM) and No Response (NR). The Results showed that students still have some misconceptions on definition of equilibrium state, factors affecting Le chateliers principle, relating Kc and Kp values and their expressions, effect of concentration on acid base reaction and common ion effect in equilibrium state, relationship between reaction quotient with equilibrium constant, and equilibrium expression for steps of reaction. Students have these misconceptions due to some possible factors. Such as teachers have lack of information on learners already know and how they acquire knowledge, students’ difficulty on relate the levels macroscopic properties of equilibrium to their sub-microscopic properties.

**Keywords:** Chemical equilibrium, misconception, student’s understanding.

### 1 INTRODUCTION

Misconception is mismatch between what a person knows and what is known to be scientifically correct. It also refers to preconceived notions based on cultural influences or school made. School-made misconceptions are chemical misconceptions which are caused by inappropriate teaching methods and materials (H.Dieter B. et.al.2009). Personal perceptive could cause incorrect understanding of a specific process, concept, or idea is said to be misconception (David C. Swanson, 2011).

A number of literatures have identified common misconceptions held by students at the secondary level. Chemical equilibrium is one of the most difficult topics to learn (Butts & Smith 1987). Chemical equilibrium structures have many basic chemistry concepts which are abstract to understand due to chemistry teachers are not aware of student’s prior knowledge and words used in everyday language have different meanings (Finley et al. 1982;

A.Erdemir. et.al, 2000). According to Johnston (1991) the particular difficulties at secondary schools that cause school-made misconceptions are coming from the transition from the macroscopic level directly to the representational level as shown below. Students can’t identify substances from the macroscopic level with particles from the sub-microscopic level. Determining and overcoming these difficulties should be the primary goal of teaching chemistry (Ghassan Sirhan, 2007).

Fig.1 conceptual understanding of chemistry as learning model

Most students had common misconception on arithmetic relationship between the concentrations of

reactants and products which are concentrations of the reactants and concentrations of the products are equal (Mark W. Hackling A. & Patrick J. Garnett, 2007). This leads to failure to use concentrations (number of moles is used instead) for equilibrium-constant expression. Students believe that mass and concentration mean the same thing for substances in equilibrium systems (M. Kousathana et.al, 2001).

Some students considered that equilibrium constant for the reaction didn't affect with an increase in temperature. They believed that the equilibrium constant has a fixed value and are applying that idea to situations where it is not appropriate. In contrary others considered that the equilibrium constant is greater after increasing the concentration of reactant because this produced an increase in the product concentration (Mark W. Hackling & Patrick J. Garnett, 2007). Errors in the calculation of equilibrium constants had occurred due to the failure to use coefficient in Kc expression. (David C. Swanson, 2011).

Students have confusion on the different between rate reactions with equilibrium reaction as Mark W. Hackling A. & Patrick J. Garnett, (2007) addition of catalyst to equilibrium system affects that the rates of the forward and reverse reactions could be affected differently.

The results of whole studies listed above showed; students had different degree of understanding on different concepts of chemical equilibrium with different backgrounds of students. This study tries to explore the misconceptions of chemical equilibrium in one of senior high school found in Bandung city. It aimed to investigate eleventh grade students' understanding on and also conceptual difficulties on related subjects.

## 2 METHODOLOGY

Indonesia education system has three levels of education which are early childhood education, basic education and secondary education. Early childhood education includes kindergarten, basic education also incorporates elementary school (grade 1-6) and junior secondary school (grade 7-9) whereas secondary school include (grade 10-12), and higher education (university and colleges). Chemistry subject is given as science through integrating with other natural science subjects up to grade nine, but starting from grade ten up to twelve is given independently. The topic of the study I.e. chemical equilibrium is taken in grade eleven.

### 2.1 Sample

The sample under investigation comprised 30 students ranged from age of 16-17 years who are taken from one of senior high schools in Bandung.

The school was selected based on purposive sampling which is one of the levels 'A' in 2014 academic year. All students had included in the study of the topic under investigation at a fundamental level in grade 11.

### 2.2 Instrument

The study was applied chemical misconception test to collect data. Test containing multiple choices and open-ended questions has been developed in English version first and translated in to Bahasa Indonesia with help of two chemistry instructors based on the Indonesian chemistry syllabus to avoid language barrier of students who can understand the items easily. This helps to explore student's misconception on chemical equilibrium and related subjects easily. Multiple choice items were six in number most of them consisting of five distracters with one correct answer and require justification for each answer. Each distracter of an item was prepared in such a way that it was confronted with students' misconceptions. The open ended items had four in number which gives the freedom to write what they have in their mind which supports to dig out their understanding. The items were adapted from literature and designed by the author. The test was examined by two experts both of them have PhD in chemistry education and suggestions on the questions were taken in to consideration; its Content validity and its alignment to the instructional objectives. Moreover the experts were evaluating its affinity to explore misconception of the students on the topic and related topics. Test was also given after eleventh grade students studied the chemical equilibrium topic.

### 2.3 Data Analysis

The data obtained from multiple choices and open ended questions were analyzed based on four categories of students' understanding criteria such as Sound understanding (SU), Partial understanding (PU), Specific Misconceptions (SM) and No Response (NR). According to Abraham et al., 1992; these categories are detailed below.

- Sound Understanding  
Scientifically complete response and correct explanations.
- Partial Understanding  
Responses that included
  - Correct or partially correct explanation with wrong choice
  - Correct choice with wrong explanation.
- Specific Misconceptions:

Responses that included illogical or incorrect information including

- Wrong choice with wrong explanation.
- Correct or incorrect choice without explanation.
- No Understanding: students whose don't choose any response and make any explanations or repeat the question are label in this category

### 3 RESULT AND DISCUSSION

This study focused on the students misconception on chemical equilibrium of senior high school of grade eleven students. The study presented the misconceptions based on the data's obtained from open ended and multiple choice items with percentages of students who have engaged in answering the set questions are discussed in the three tables below.

Table 1 Definition of chemical equilibrium

	Category of students response							
	SU		PU		SM		NR	
	No of sts	%	No of sts	%	No of sts	%	No of sts	%
1	12	40%	10	33.3 %	8	26.7 %	-	-
2	2	6.67 %	4	1.33 %	21	70%	3	10 %

Item -1 which one is *true* about the Equilibrium state?

- A. The state of forward reaction is being faster than the reverse reaction.
- B. Condition at which reaction goes to completion.
- C. Condition at which the concentration of reactants and products equal.
- D. There is no change in chemical reaction.
- E. \*\* Back and forth reactions are constantly happening at an equal rate.

NB \*\* indicates correct answer of the item.

Item one investigates whether or not students could distinguish between reactions that go to completion and reversible reactions; may believe that the forward reaction goes to completion before the reverse reaction commence. The student responses of in each category for item one is shown in the table above, 40% of students responded in the category of *sound understanding*, 33.3% of them responded in that of *partial understanding* and 26.7% of them responded in that of *specific misconception*. Students whose answers were sorted in category of sound understanding defines the equilibrium is a dynamic process and explains that equilibrium occurs for reversible reactions when the forward and reverse reactions rates are equal and there is no net conversion of reactants to products. The equilibrium

reactions do not go to completion, all species from reactants and products exist at equilibrium.

Students who have categorized as partial understanding; equilibrium state is a condition of rate of forward and reversible reactions are equal in which reactants are consumed to products at the same time reversed in to products but it isn't the same as reactants transformed to products.

Students whose answers were sorted in category of specific misconception; incorrectly defines equilibrium state with scientifically unacceptable reason are listed below.

"Equilibrium state is a condition at which the concentration of products and reactants are equal. Due to this reason during chemical equilibrium no compositional change did occur i.e. physical change as a result no chemical reaction happened during reversible reaction. And others considered that the reaction goes to completion from reactant to products, but forward reaction goes to completion before the reverse reaction begins. In addition forward and reverse reactions are like weighing balance which has equal amount of the species comparing with the standard."

The conceptual difficulty about the state of equilibrium might be due to unable to recognize the definition which states that it is equal rate of forward and reverse reactions directly related with daily life of students of weighing, balancing and stability. This is the same with A.Erdemir.et.al (2000). Students had misconceptions in chemical equilibrium due to everyday terms such as equal, balanced are used in statements of equilibrium stated. Likewise during equilibrium condition reaction is not going to completion, this also leads them to conclude it is a physical change no compositional structure alters. Moreover the mis understanding of forward reaction goes to completion before the reverse reaction begins, is take place because of considering it undergoes in separated system rather than in closed system. Similar misconception have been reported by Gussarsky and Gordetsky, (1990) Secondary school students could hardly understand the dynamic nature of chemical equilibrium.

Item -2- in a closed system, the following equilibrium can develop between the compounds  $\text{PCl}_5$ ,  $\text{PCl}_3$ , and  $\text{Cl}_2$ .

At the beginning of the reaction 8 mol of  $\text{PCl}_5$  are present, at this time  $\text{PCl}_3$  and  $\text{Cl}_2$  have not yet been formed. At equilibrium, 3 mol of  $\text{PCl}_3$  are formed. How many moles of  $\text{PCl}_5$  and  $\text{Cl}_2$  exist at equilibrium?

- A. 2 mol of  $\text{PCl}_5$  and 3 mol of  $\text{Cl}_2$
- B. 3 mol of  $\text{PCl}_5$  and 3 mol of  $\text{Cl}_2$
- C. 4 mol of  $\text{PCl}_5$  and 1 mol  $\text{Cl}_2$
- D. \*\* 5 mol of  $\text{PCl}_5$  and 3 mol of  $\text{Cl}_2$

E. 6 mol of  $\text{PCl}_5$  and 3 mol of  $\text{Cl}_2$ .

Item two examined whether the students have the misconception of equilibrium state means having an equal amount of concentration of reactants and products as well to differentiate equal rate and equal concentration of species.

As seen in table one above, 6.67% of students responded in the category of sound understanding, 1.33% of them responded in that of partial understanding, 70% of them responded in that of specific misconception, and 10% of them responded in that of no response. Students whose answers were sorted in category of sound understanding calculate the number of moles in equilibrium which is “not necessary to have equal number of moles of reactants and products.” they calculated as follows:

Since the coefficient of the species is the same, reversible reaction decomposes with equal rates, and then  $\text{PCl}_3$  and  $\text{Cl}_2$  have 3 moles each. whereas  $\text{PCl}_5$  8 mol - 3mol = 5 mol of  $\text{PCl}_5$ . Students whose categorized as partial understanding had explained that decomposition reaction of  $\text{PCl}_5$  completely transformed in to products of  $\text{PCl}_3$  and  $\text{Cl}_2$ . At equilibrium reaction Zero mole of  $\text{PCl}_5$ , 4 moles of  $\text{PCl}_3$  and 4 moles of  $\text{Cl}_2$ , formed from 8 mole of  $\text{PCl}_5$ .

Students whose answers were sorted in category of specific misconception; response with scientifically unacceptable reason are listed below.

“Total amount of species are the same on both sides of reaction which is 6 moles  $\text{PCl}_5$  is equals to the sum of 3 moles of  $\text{PCl}_3$  and 3 moles of  $\text{Cl}_2$ . In addition equilibrium  $\text{PCl}_3$  has 3moles while  $\text{Cl}_2$  the same number of coefficients which has 3 mole followed by sum of products become 6 moles. In the beginning of reaction  $\text{PCl}_5$  has 8 moles, then subtract it by total numbers of moles of products (8 mol-6mol = 2 mole). Moreover others also responded that in equilibrium, the amounts of species are the same. It has to be 3 moles of  $\text{Cl}_2$ ,  $\text{PCl}_3$  and  $\text{PCl}_5$  each. Equilibrium is occurred when the same amount exists on both sides of reactions.”

Students who have such misconception might be resulted from the definition of equilibrium which is rate of forward and reverse reactions are equal. Then the  $K_{eq}$  is calculated from the concentration of products and reactants thus if there are equal concentrations  $K_{eq}$  will be 1. Here students forget that  $K_{eq}$  is dependent neither concentration of product nor reactant. This is analogues to the literature by Mark W. Hackling A. & Patrick J. Garnett, (2007) which said most students had common misconception on the arithmetic relationship between the concentrations of reactants and products which are concentrations of the

reactants and concentrations of the products are equal; the misconception was obviously due to consideration of the coefficients in the chemical equation. This misconception gives to the considerable emphasis placed on reaction stoichiometry in introductory chemistry topics

Table 2 Applying Le Chateliers principle to predict direction of equilibrium to acid-base equilibria and common ion effect

	Category of students response							
	SU		PU		SM		NR	
	No of sts	%	No of sts	%	No of sts	%	No of sts	%
3	-	-	2	6.67 %	27	90%	1	3.33%
4	1	3.33 %	2	6.67 %	27	90%	-	-
5	-	-	10	33.3 %	17	56.7 %	3	10%
6	2	6.67 %	11	36.6 %	15	50%	2	6.66%

Item-3 which of the following systems at equilibrium could be affected by changing the volume of container?

- $2\text{CrO}_4^{2-}(\text{aq}) + 2\text{H}^+(\text{aq}) \rightleftharpoons \text{Cr}_2\text{O}_7^{2-}(\text{aq}) + \text{H}_2\text{O}(\text{l})$
- $\text{FeO}(\text{s}) + \text{CO}(\text{g}) \rightleftharpoons \text{Fe}(\text{s}) + \text{CO}_2(\text{g})$
- $\text{SO}_2(\text{g}) \rightleftharpoons \text{S}(\text{s}) + \text{O}_2(\text{g})$
- $2\text{H}_2\text{S}(\text{g}) + \text{O}_2(\text{g}) \rightleftharpoons 2\text{S}(\text{s}) + 2\text{H}_2\text{O}(\text{g})$
- Neither of them could be affected.

To look over students understanding about at what position changing volume of container can affect direction of equilibrium and further the relationship between partial pressure and volume in changing the position of equilibrium.

As seen in table two above, 6.67% of students responded in the category of partial understanding, 90 % of them responded in that of specific misconception, and 3.33% of them responded in that of no response. Students whose answers were sorted in category of partial understanding “The reactions containing substances in the form of pure liquid and solid have less effect on the position of the equilibrium because it has occupied less space than gaseous state. More over they believed volume of container affects only if excess water molecules presence in the equilibrium reaction.” They choice the reaction of

Students whose answers sorted in category of specific misconception; incorrectly explains the

effects of volume on equilibrium position with scientifically unacceptable reason are listed below

“When volume of the container increases the amount of substance also increases then equilibrium will shift to greater amount of moles. Moreover others responded that changing volume of container couldn't affect direction of equilibrium, a container is a place where the reaction occurs thus it couldn't have any influence in the given chemical reaction however factors such as pressure can affect the equilibrium.”

The students who have misconception on effect of volume on equilibrium might be coming from lack of prior knowledge of Avogadro's law which can relate mole and volume as stated in literature of A.Erdemir. et.al, (2000) chemistry teachers are not aware of student's prior knowledge and a common conceptual error thus causes some misconceptions regarding chemical equilibrium. According to Avogadro's law, the number of moles is directly proportional to the volume of the gas. There are 3 volumes (1 vol + 2 vol) on the reactant side and 2 volumes on the product side. The increase in pressure always affects the side that has more volume, and mainly they gave emphasis to physical behavior of gases not to the chemical property of the equilibrium caused by the change in physical behavior.

Item - 4 - In the first step of the Ostwald process for the synthesis of nitric acid, ammonia is oxidized to nitric oxide by the reaction

$\Delta H = -901.2 \text{ KJ}$  which of the following is correct alternative?

- Removing the concentration of  $\text{NH}_3$  shift the direction of equilibrium to right
- Adding Helium gas will shift the direction towards right.
- Addition of platinum-rhodium catalyst will proceed to form more concentration of  $\text{NO}$ . Decreasing pressure shifts the direction of equilibrium towards left.
- \*\* Increasing temperature leads to decrease equilibrium constant  $K_c$ .

To investigate students misconception on Le Chateliers Principle which is useful in predicting how a system at equilibrium will respond when certain changes are imposed?

To show effect of changing the concentration of a reactant or product, addition of catalyst, changes partial pressure of gases in direction of chemical equilibrium, and changing the temperature in  $K_c$  value.

As seen in table two above, 3.33% of students responded in the category of sound understanding, 6.67% of them responded in that of partial understanding, and 90% of them responded in that of specific misconception. Students whose answers were sorted in category of sound understanding

clearly stated how an equilibrium can be minimized which is disturbed by changing concentration, temperature and pressure, where the stress is diminished. However adding catalyst couldn't affect the position of equilibrium simply affects speed of both forward and reverse reaction in the same way. Moreover the value of  $K_c$  primarily depends on temperature; this reaction is exothermic reaction increasing temperature leads to decrease equilibrium constant  $K_c$  using van't Hoff equation. Students who were categorized under partial understanding explained that the position of equilibrium is affected by the add/remove concentrations and temperature, but they didn't explained it well. One of the students clarified their reason as follows: “While the reaction is exothermic reaction, as the temperature increases the equilibrium shifts in to left direction to minimize the stress of product side. This affects to increase concentration of reactants which leads to decrease value of  $K_c$ . Moreover addition of Pt-Rh catalyst speeded up the reaction and made it to increase the concentration of reactant and shift the equilibrium towards product side.”

Students whose answers were sorted in category of specific misconception; incorrect conception or erroneous on Le chateliers principle with scientifically unacceptable reason are listed below.

- “Adding Helium gas affects to increase concentration of  $\text{O}_2$  which shifts direction of equilibrium to right.
- Addition of catalyst speeded up forward reaction that can form more concentration of nitrogen monoxide  $\text{NO}$ .
- Removing concentration of  $\text{NH}_3$  considers transforming to form new product that's why removing  $\text{NH}_3$  shift to right.
- Decreasing pressure shifts the direction of equilibrium towards left, because the reaction is exothermic; the product side has more heat stress thus to minimize the stress the reaction shift to left.
- Students were also found to possess about an increase in temperature always increases the value of the equilibrium constant for both exothermic and endothermic reaction.”

Students who have conceptual difficulty on  $K_c$  value it arises from inferring Le Chateliers principle using the rate reaction and thus confuse the rate and the extent of a reaction. Similar literature was studied by Anil C. Banerjee, (1991) Students and teachers believe that increasing the temperature in an exothermic reaction would decrease the rate of the forward reaction. Whereas the conceptual difficulties on effect of catalyst coming from adding catalyst only affects forward reaction which is also explained using the concept of rate of reaction, and as in item one explained above they believe that the forward and reverse reaction is occurred in different systems

this is the same as literature by Mark W. Hackling A. & Patrick J. Garnett, 2007 addition of catalyst to equilibrium system with the notion that the rates of the forward and reverse reactions could be affected differently. This probably reflects incomplete understanding by students of the existence of a common reaction pathway and transition state for the forward and reverse reactions. For those who have difficulty on addition of noble gases can undergo chemical reaction might arise from lack of knowledge about properties and stabilities of noble gases are chemically inactive or considered gases have affected by change in pressure.

Item-5- What is the effect of adding sodium acetate to a solution of CH<sub>3</sub>COOH?

To explore the students' conception in relating stress of concentration with the concept of common ion effect describes the effect on a solution of two dissolved solutes that contain common ion.

As seen in table two above, 33.3% of students responded in the category of partial understanding, 56.7% of them responded in that of specific misconception, and 10% of them responded in that of no response. Students whose answers sorted in category of partial understanding have responded adding sodium acetate to aqueous acetic acid caused to increase the concentration of acetate ion which has more stress in right direction, to minimize the stress the reaction shifts to left direction, and then increases value of K<sub>c</sub> because there is less concentration of reactants than concentration of products. Students whose answers were sorted in category of specific misconception had responded as follows. One of the student responses in this category is

- There is no sodium acetate substance in the reaction thus adding sodium acetate has no effect on the equilibrium reaction. It is spectator substance; no change can cause acetic acid.
- Aqueous of CH<sub>3</sub>COONa has acetate ion which can cause to increase the concentration of CH<sub>3</sub>COOH; as a result the equilibrium will shift to product side.
- It causes to increase concentration of H<sub>3</sub>O<sup>+</sup> which leads to increase dissociation of acetic acid.
- Excess concentration of H<sub>3</sub>O<sup>+</sup> react with CH<sub>3</sub>COO<sup>-</sup> then the equilibrium will shift to left direction.

This difficulty of students on the relating both common ion effect and Le chateliers principle might arise from lack of knowledge of dissociation of ionic compounds. They didn't really understand ions formed from dissociation of sodium acetate which can affect the dissociation of acetic acid. As the same time they considered that effect of concentration in

Le chateliers principle is only to the same molecule/compound not the common ion. In this case acetate ion is a common ion because it is "common" to both the acetic acid and sodium acetate solutions; that is, acetate ion from the acid enters a solution in which it is already present. The common-ion effect occurs when a given ion is added to an equilibrium mixture that already contains that ion, and the position of equilibrium shifts away from forming more of it.

Item - 6 - Consider the following reversible reaction in a state of equilibrium at a constant temperature.

When aqueous HCl is added to the equilibrium reaction what will happen to OH<sup>-</sup> concentration?

This item investigates students' misconception how Le chateliers principle could relate with acid base equilibria. As seen in table two above, 6.67% of students responded in the category of sound understanding, 36.67% of them responded in that of partial understanding, 50% of them responded in that of specific misconception, and 6.66% of them responded in that of no response. Students whose answers have sorted in category of sound understanding stated that when aqueous HCl acid is added, it produces hydronium ion to the system then H<sub>3</sub>O<sup>+</sup> reacted with OH<sup>-</sup> to form water; more OH<sup>-</sup> is consumed, to reestablish the equilibrium it shifts towards right side. Students who have partial understanding, responded as concentration of OH<sup>-</sup> decrease because OH<sup>-</sup> react with H<sup>+</sup> as result OH<sup>-</sup> is consumed but the equilibrium shifts to left direction to produce more water.

Students whose answers were sorted in category of specific misconception couldn't relate the acid base reaction with Le chateliers principle. Mostly students are familiar with effect of concentration in direction of equilibrium if the stress is coming from the same substance, but not in acid base reaction. Some of the respondents' reasons are listed below:

- Addition of HCl causes an increase concentration of H<sub>2</sub>O and water ionizes in to more OH<sup>-</sup>.
- Students thought that there are no hydroxide ions in an aqueous solution of hydrochloric acid in distilled water because the students failed to recognize the presence of the vital equilibrium present in aqueous ionic solutions.
- Concentration of OH<sup>-</sup> is constant because there is no OH<sup>-</sup> concentration in aqueous HCl.
- Addition of HCl doesn't affect system of equilibrium. While no HCl concentration in the reaction at all, thus OH<sup>-</sup> is constant.

The students have difficulty in acid base equilibria is the same as in common ion effect those realized that change in concentration could affect the equilibrium state if the same substance is present in the reaction

otherwise acid base reaction couldn't relate with the Le Chateliers principle. This is arising from lack of

knowledge of dissociation of aqueous acid/ base which can produce hydronium or hydroxide ion. Similarly it can be occur due to lack of practical works in chemistry it hinders interest of students as well as conceptual understanding. When well planned and effectively implemented, practical work is applied it can stimulates and engages students' learning at varying levels of inquiry challenging them both mentally and physically.

Table 3 Equilibrium constant expressions and Le chateliers principle

Item-7-In the reaction of “X” gas and “Y” aqueous gives “XY gas compound” at a constant temperature.

To have greater value of equilibrium concentration constant Kc than equilibrium partial pressures of Kp, the value of the coefficients should be?

- Number of moles of product is less than number of moles of reactants ( $C < a + b$ )
- Number of moles of product is equals to number of moles of reactants ( $a + b = C$ )
- Number of moles of product is greater than number of moles of reactants ( $C > a + b$ )
- Number of moles of product and reactants couldn't say ant thing about Kc and Kp.

To explore students' misconception about relationship between Kc the equilibrium values expressed as concentrations and Kp the equilibrium values expressed as partial pressure through the mathematical formulas of the constant value of Kc with Kp.

As seen in table three above 16.7% of students responded in the category of sound understanding, 6.67% of them categorized in partial understanding, 76.7%of them responded in that of specific misconception. Students whose answers were sorted in category of sound understanding clearly put the formula of Kc related with Kp;  $K_p = K_c (RT)^{c - (a + b)}$  prove from idea gas law; in which Kc has greater value than equilibrium partial pressure Kp while number of moles of gaseous reactants are greater than number of mole of gaseous product.

Students whose responses were categorized as partial understanding put the mathematical formula of  $K_p = K_c (RT)^{\Delta n}$  however they didn't elaborated how Kc can be greater than Kp.

As a result Kc has greater value than equilibrium partial pressures of Kp. Some of the students whose answers were sorted in category of specific misconception clarified their responses as listed below.

The constant values of Kp and Kc couldn't compare through coefficients of products and reactants. Because the values of those constant values are depend on temperature not in coefficient of products and reactants. Other respondents said that while number of moles of product are greater than to number of moles of reactants ( $a + b < C$ ) the Kc has greater value than Kp because the reactant occurred in aqueous is not included in calculating sum of moles of reactants. Simply counting the number of species of reactant and products in the chemical reaction, which has two numbers of reactants (X and Y), and one product are found in the reaction, there is more number of reactants than product.

Students whose faced difficulty to relate the formula of Kc and Kp might arise from lack of knowledge about the equation of idea gas law,  $VP = nRT$  and stoichiometry reaction relation of products and reactants. As model learning of chemistry stated by Johnston, 1991 and Gabel, 1993 Chemical knowledge is learned at three levels: “sub-microscopic,” “macroscopic “and “symbolic”, and the link between these levels should be clearly taught and also the interactions and distinctions between them are important characteristics of chemistry learning and necessary for achievement in comprehending chemical concepts. Therefore, if students possess difficulties at one of the levels, it may influence the other. Students have a problem in symbolic part which explains about equation. As the model of learning explains as one corner of the triangular relation missed the other corners would missed too. The mathematical formula of the ideal gas law is categorized under “representational” corner of a triangle without these corner students unable to understand the macroscopic and sub-microscopic concepts well.

Item- 8 - A 5.0 L flask is filled with 0.25 mol of  $\text{SO}_3$ , 0.50 mol of  $\text{SO}_2$ , and 1.0 mol of  $\text{O}_2$ , and allowed to reach equilibrium. At constant temperature, equilibrium Constant  $K_c$  is 0.12. To achieve equilibrium by using reaction quotient  $Q$ , which one is **correct** about the effect on the concentration of  $\text{SO}_3$ ?

- $2\text{SO}_3(\text{g}) \rightleftharpoons 2\text{SO}_2(\text{g}) + \text{O}_2(\text{g})$
- Decreases concentration of  $\text{SO}_3$
  - \*\*Increases concentration of  $\text{SO}_3$
  - Concentration of  $\text{SO}_3$  as it is

To explore whether students could have misunderstanding on the effect of concentration in position of equilibrium by associating concepts of reaction quotient and equilibrium-constant.

As seen in table three above, 26.66% of students replied in the category of partial understanding, 66.67% of them responded in that of specific misconception, and 6.67% of them in that of no response.

Students whose answers were sorted in category of partial understanding calculated the value of  $Q$  by converting the amount of mole to molarity, however failed how the reaction can become at equilibrium using concentration of  $\text{SO}_3$  whereas students whose answers sorted in category of specific misconception confused with the amount (moles) and concentration (molarity). They didn't convert the given moles to molarities which calculated the value of  $Q$  directly from the amount of moles than molarity. They have calculated following this procedure the value of  $Q$  became 4 which is greater than value of  $K_c$  thus to achieve equilibrium the concentration of  $\text{SO}_3$  required increasing until value of  $Q$  and  $K_c$  are equal. In addition other respondents calculated the value of  $Q$  without using coefficients still value of  $Q$  i.e. 0.2 is greater than  $K_c$  (0.12) then to reach at equilibrium needed to raise concentration of  $\text{SO}_3$ . One of the student responses in this category is:

"Both reaction quotient and equilibrium constant are the same, it didn't depend on initial concentration like  $[\text{SO}_3]$ ; primarily depend on temperature thus Concentration of  $\text{SO}_3$  will remain the same. Other respondents replied while Concentration of  $\text{SO}_3$  is raised  $Q$  will be less than  $K_c$  most of the students here mislead by calculating the concentration without converting the moles to molarity. The equilibrium system will shift to overcome the change finally more product will be produce which can increase value of  $Q$  than  $K_c$ . In addition when  $\text{SO}_3$  is more concentrated it caused a stress in left side of reaction then value of  $Q$  will be raised because of equilibrium system shifts to right to encounter the stress."

Students have the difficulty on the effect of change in concentration on the reaction quotient value with equilibrium constant is mainly arises from unfamiliarizing the formula of concentration

expressed by molarity and considering reaction quotient is not also depend on concentration like equilibrium constant values. In contrary A.Erdmir.et.al, (2000) claimed that Students solve problems successfully solving mathematical problems without understanding the chemical concepts behind their memorized algorithmic solutions. However in this study students have both mathematical and understanding the chemical concepts problems. Those who have calculated the value of  $Q$  without using coefficients might come from failed to use stoichiometrically relations of products and reactants. This is in analogues with the finding of David C. Swanson, (2011) mostly fundamental errors in the calculation of equilibrium constants had occurred due to the failure to use coefficients in  $K_c$  expression.

Item -9- Write expression of  $K_p$  and  $K_c$  for the following reversible reactions at equilibrium with constant temperature.

This is to investigate students understanding on expression of  $K_c$  equilibrium values expressed as concentrations and  $K_p$  equilibrium values expressed as partial pressures. As seen in table three above, 6.67% of the students have sound understanding that articulated the  $K_p$  and  $K_c$  correctly, expressed the equilibrium constants by excluding the solid concentration of silicon. Solid species couldn't include in the  $K_p$  and  $K_c$  expressions because, concentration of pure liquid and pure solid is equal to one so do not include pure solid or pure liquid in equilibrium expression. Only include gases and dissolved species that are in solution. 16.67% of them have partial understanding who expressed the  $K_p$  or  $K_c$  expressions correctly with wrong explanations and 66.67% of the respondents had specific misconception and 10% of students had no response. Students' misconception about  $K_p$  expression elaborated as follows:

- They didn't include the coefficients of hydrogen and  $\text{HCl}$  in the expression.
- Include the concentration of solid silicon in the expressions.

6.67% of the students have sound understanding that expressed the constant  $K_p$  correctly, by excluded the liquid concentration of water, 30% of them were responded under partial understanding, 60% of them have specific misconception and 6.67% with no response. Some of the students' explanation and expressions are written as follows:

- Impossible to express  $K_p$  because of two reasons first none of the species are in gas phase. The partial pressure is only includes

the species with gaseous phase. But here the species are aqueous and liquid. The second reason was liquid species which couldn't include in expression. They considered that aqueous phases are the same as liquid reactant.

- Involve all concentrations including pure liquid water in expression of Kc.

The difficulty of the students in Kp expression is due to lack of understanding of how products and reactants are stoichiometrically related which stoichiometry must be considered when forming the equilibrium equation. Likewise fundamental errors in the calculation of equilibrium constants had occurred due to the failure to use coefficients in Kc expression (David C. Swanson, 2011).

Item -10- Consider the reaction between NH<sub>3</sub> and O<sub>2</sub> to form N<sub>2</sub> and H<sub>2</sub>O

This reaction involves a two step mechanism

Write the Kc expression of the overall reaction.

As table three above, students' response to the expression of equilibrium constant to steps of reaction were; 26.66% of the respondents had partial understanding, they found Kc of overall reaction, however they didn't explain why they followed such way to calculate Kc.

Multiply step one by 3X

Reverse and multiply by 2x for step two

equilibrium constant for the overall reaction is the equilibrium constants for the elementary steps

$$K_c = K_{c1} \times K_{c2} = X^3 \cdot (1/Y)^2$$

66.67% of them had specific misconception and 6.67% of them no response. Students who have partial understanding claimed Kc expressed using the slowest step. The slowest step is used to determine Kc like rate law, expressed as follows

$$K_c = \frac{[\text{N}_2]^2 [\text{H}_2]^6}{[\text{NH}_3]^4}$$

However other respondent's stated equilibrium constant expression is expressed by using the overall reaction, because the overall reaction has an average speed of both fast and slow reactions. They expressed as follows:

$$K_c = \frac{[\text{N}_2]^2 [\text{H}_2\text{O}]^6}{[\text{NH}_3]^4 [\text{O}_2]^3}$$

Students with specific misconception expressed Kc equilibrium express the using the overall reaction by neglecting the elementary steps.

$$K_c = \frac{[\text{H}_2\text{O}]^6 [\text{N}_2]^2}{[\text{NH}_3]^4 [\text{O}_2]^3}$$

The student's difficulty in this item is unable to differentiate the rate (how fast) and extent (how far) of reaction simultaneously. Equilibrium applies to the extent of a reaction, the concentration of product that has appeared after an unlimited time, or once no further change occurs. Rate reaction applies to the speed of a reaction, the concentration of product that appear (or of reactant that disappears) per unit time. Just as reactions vary greatly in their speed, they also vary in their extent. A fast reaction may go almost completely or barely at all toward products. In the step of reaction the slowest step is the rate determining step, however for equilibrium constant first obtain the expression for the overall reaction combine the expressions for the individual steps. That is, overall reaction is the sum of two step reactions, and then overall equilibrium constant is the product of the equilibrium constants for the steps (fast and slow reactions).

## 4 CONCLUSION

Acknowledgements should be placed before the references section. Numbering is not necessary.

From the analyses of students' responses of the diagnostic test, it can be concluded that students have misconceptions in different areas of chemical equilibrium related topics, some of these misconceptions are parallel to those in the literature and others are identified by this study. The most significant misconceptions revealed by this study were:

- Equilibrium state is a condition at which the concentration of products and reactants are equal.
- The reaction goes to completion from reactant to products, but forward reaction goes to completion before the reverse reaction begins.
- When volume increases the amount of substance also increases then equilibrium shifts to greater amount of moles.
- Changing volume of container couldn't affect direction of equilibrium; a container is a place where the reaction occurs thus it couldn't have any influence in the given chemical reaction.
- Addition of noble gases can affect the concentration of gaseous species which can shift the reaction to the direction of the stress can be minimized.
- Addition of catalyst speeded up forward reaction that can form more concentration of product.

- An increase in temperature always increases the value of the equilibrium constant for both exothermic and endothermic reaction.
- Addition of common ion to a reaction has no effect on the equilibrium reaction. It is spectator substance; no change can be caused.
- Addition of acid to a reaction which has OH<sup>-</sup> does not affect system of equilibrium.
- The constant values of K<sub>p</sub> and K<sub>c</sub> couldn't compare through coefficients of products and reactants. Because the values of the constant values are depend on temperature not in coefficient of products and reactants.
- Both reaction quotient and equilibrium constant are the same, it didn't depend on initial concentration; primarily depend on temperature.
- Express K<sub>p</sub> only includes the species with gaseous phase not aqueous phase.
- For steps of reaction K<sub>c</sub> expressed by the slowest step similar to rate law expression.

The researcher suggests that the study should be conducted in different senior high schools found in the city with different instruments to collect validated data overall it will full and better work. Moreover exploring pedagogical content knowledge of chemistry teachers will also help to know the basis of the problem and to solve it at hand. For those who will desired to study in this area should investigate on how those already identified misconceptions can be overcome for quality and better chemistry teaching in class room.

## 5 ACKNOWLEDGEMENT

First, I would like to cordially thank to JICA who give me a chance to conduct a study and acquire an experience in the science subject in Indonesia with covering all expenses. I'm grateful to Indonesian and Ethiopian governments for their cooperation to succeed the third country training programme. In addition an appreciation to JICA office of Indonesian university of education and Laboratorium Senior high of UPI for their collaboratly working for adjusting a time to meet students and collect data as well as provide availing whenever I needed their support. Thank to chemistry department lecturers whose evaluate the alignment of the diagnostic test to explore the misconception of students for taking their time and effort from their busy schedule to read and review the instrument. At last not the least warmly thank to Dika Harliadi who translates the data collected from students from Bahasa Indonesia to English version

**Appendix: Chemical equilibrium conceptual test**

**Instructions:**

- Thank you for your willingness to fill the questions
- No need of writing your name, but write your school name.
- Questions require you to circle for multiple choice answers and a reason out for your answer.
- Remember that more than one answer may be correct.

Name of school \_\_\_\_\_  
Age \_\_\_\_\_ sex \_\_\_\_\_

Item -1 which one is true about the Equilibrium state?

- The state of forward reaction is being faster than the reverse reaction.
- Condition at which reaction goes to completion.
- Condition at which the concentration of reactants and products are equal.
- There is no change in chemical reaction.
- \*\* Back and forth reactions are constantly happening at an equal rate.

Answer \_\_\_\_\_  
Reason out \_\_\_\_\_

Item -2 in a closed system, the following equilibrium can develop between the compounds  $PCl_5$ ,  $PCl_3$ , and  $Cl_2$ .

At the beginning of the reaction 8 mol of  $PCl_5$  are present, at this time  $PCl_3$  and  $Cl_2$  have not yet been formed. At equilibrium, 3 mol of  $PCl_3$  are formed. How many moles of  $PCl_5$  and  $Cl_2$  exist at equilibrium?

- 2 mol of  $PCl_5$  and 3 mol of  $Cl_2$
- 3 mol of  $PCl_5$  and 3 mol of  $Cl_2$
- 4 mol of  $PCl_5$  and 1 mol  $Cl_2$
- \*\* 5 mol of  $PCl_5$  and 3 mol of  $Cl_2$
- 6 mol of  $PCl_5$  and 3 mol of  $Cl_2$

Answer \_\_\_\_\_  
Reason out \_\_\_\_\_

Item-3 which of the following systems at equilibrium could be affected by changing the volume of container?

- $2CrO_4^{2-}(aq) + 2H^+(aq) \rightleftharpoons Cr_2O_7^{2-}(aq) + H_2O(l)$
- $FeO(s) + CO(g) \rightleftharpoons Fe(s) + CO_2(g)$

- $SO_2(g) \rightleftharpoons S(s) + O_2(g)$
- \*\*  $2H_2S(g) + O_2(g) \rightleftharpoons 2S(s) + 2H_2O(g)$
- Neither of them could be affected.

Answer \_\_\_\_\_  
Reason out \_\_\_\_\_

Item - 4 - In the first step of the Ostwald process for the synthesis of nitric acid, ammonia is oxidized to nitric oxide by the reaction  $4 NH_3(g) + 5 O_2(g) \rightleftharpoons 4 NO(g) + 6 H_2O(g)$   $H^\circ = -901.2 kJ$  which of the following is correct alternative?

- Removing the concentration of  $NH_3$  shift the direction of equilibrium to right.
- Adding Helium gas will shift the direction towards right.
- Addition of catalyst will proceed to form more concentration of  $NO$ .
- Decreasing pressure shifts the direction of equilibrium towards left.
- \*\* Increasing temperature leads to decrease equilibrium constant  $K_c$ .

Answer \_\_\_\_\_  
Reason out \_\_\_\_\_

Item-5- What is the effect of adding sodium acetate to a solution of  $CH_3COOH$ ? Explain why?

Item - 6 - Consider the following reversible reaction in a state of equilibrium at a constant temperature.

When aqueous  $HCl$  is added to the equilibrium reaction what will happen to  $OH^-$  concentration? Explain why?

Item-7-In the reaction of "X" gas and "Y" aqueous gives "XY" gas compound" Keep constant temperature.

To have greater value of equilibrium concentration constant  $K_c$  than equilibrium partial pressures of  $K_p$ ; the value of the coefficients should be?

- \*\* Number of moles of product is less than number of moles of reactants ( $C < a + b$ )
- Number of moles of product is equals to number of moles of reactants ( $a + b = C$ )
- Number of moles of product is greater than number of moles of reactants ( $C > a + b$ )
- Number of moles of product and reactants couldn't say anything about  $K_c$  and  $K_p$ .

Answer \_\_\_\_\_  
Reason out \_\_\_\_\_

Item- 8 - A 5.0 L flask is filled with 0.25 mol of SO<sub>3</sub>, 0.50 mol of SO<sub>2</sub>, and 1.0 mol of O<sub>2</sub>, and allowed to reach equilibrium. At constant temperature, equilibrium Constant K<sub>c</sub> is 0.12. To achieve equilibrium by using reaction quotient Q, which one is correct about the effect on the concentration of SO<sub>3</sub>?

- A. Decreases concentration of SO<sub>3</sub>
- B. \*\*Increases concentration of SO<sub>3</sub>
- C. Concentration of SO<sub>3</sub> as it is

Answer \_\_\_\_\_

Reason out \_\_\_\_\_

Item - 9 - Write expression of K<sub>p</sub> and K<sub>c</sub> for the following reversible reactions at constant temperature. Support your answers with explanation.

Item -10 - Consider the reaction between NH<sub>3</sub> and O<sub>2</sub> to form N<sub>2</sub> and H<sub>2</sub>O. This reaction involves a two step mechanism reaction.

Fast step K<sub>c1</sub> = x

Slow step K<sub>c2</sub> = y

Write the K<sub>c</sub> expression for the overall reaction.

## The Development of Experiential Learning Model in Entrepreneurship Course

heny\_hendrayati@yahoo.com

**Abstract:** Unemployment rate in Indonesia is increasing from time to time. One of the efforts to support job creation is by encouraging entrepreneurial interest among youngsters. Educational institution has the power of doing so by delivering entrepreneurship course. However, entrepreneurship education cannot be delivered by only giving theory in class but also by giving students experience on how they do their business or what we call a field practice. Therefore, an experiential learning model that could increase student interest in entrepreneurship is needed. The objectives of this research are to understand and to analyze 1) student typology 2) student interest on entrepreneurship before the implementation of experiential learning model and 3) to develop experiential learning model in entrepreneurship course. Research method used is Research and Development. The sample of this research is students who enroll entrepreneurship course in Management and Sociology Education Study Program, total of 165 students. The research shows that majority of students of Sociology Education Study Program are scholars while the majority of students of Management Study Program belong to Social Group as well as Creative Individualist. Student interest on entrepreneurship in both study program shows the similar result and it is considered not that high, with the highest index is on self efficacy while the lowest one is on feasibility dimension. It is needed to improve the syllabus of entrepreneurship course by concluding not only theory but also entrepreneurship field practice for students so that students will have an experience on how to run the business.

**Keywords:** experiential learning model, entrepreneurship, student intention

### 1 INTRODUCTION

According to Central Statistics Agency (BPS –*Biro Pusat Statistik*), in 2010, the unemployment rate in Indonesia reached 7.14% or 8.3 million of 116.5 million workforce. The number released by BPS, according to some observers, is actually undervalued. It means that the number is far greater because some indicators are not included. For instance, informal workers that are actually looking for work are considered as employed. The high unemployment rate in Indonesia is caused by several factors such as low levels of education, health, and lack of employment. The lack of employment is the most influential causes of unemployment and poverty. This is triggered by a lack of creativity and independence of the community to create jobs. They always depend on jobs availability. However, the available jobs will not always be able to accommodate the whole workforce because the labor force is higher than the labor need.

McClelland, a scientist from the United States (US), concludes that a country can be said prosperous

when it at least has a number of entrepreneurs as much as two percent of the population. According to the Minister of Cooperatives and Small-and-Medium Enterprises, Syarifuddin Hasan, the number of entrepreneurs in Indonesia in 2011 is only about 0.24 percent of the total population of about 238 million. The number is lower than the number of entrepreneurs in several other countries with high economic growth rates, such as the United States (11 percent), and developing country, such as Singapore (7 percent) and Malaysia (5 percent). The more surprising data came from BPS. It shows that the number of new entrepreneurs is only 0.18% of the total population of Indonesia. The figure is lower than the data sourced from the Ministry of Cooperatives and Small-and-Medium Enterprises ([www.kompas.com](http://www.kompas.com)).

The low number of entrepreneur in Indonesia is pushing the government to continue to make breakthrough in developing entrepreneurship activity. One of the efforts is the National Entrepreneurship Movement (GKW –*Gerakan Kewirausahaan Nasional*). The purpose of GKW is to enhance the

entrepreneurship spirit of the Indonesian people. The GKW is directed primarily to support national economic activity in promoting the improvement of people’s welfare that rests on four strategic pillars. They are

- a) to increase the high rate and quality of economic growth (pro-growth);
- b) to create and to expand employment (pro-job);
- c) to increase people’s welfare through programs of social safety net for the poor (pro-poor);
- d) to improve the quality of environmental management (pro-environment).

Other efforts made by the government to encourage entrepreneurship are through education policies. Various entrepreneurship programs initiated by the government through the Ministry of Education, like the inclusion of entrepreneurship into national curriculum, grants to support training for entrepreneurship at universities. One of the examples is the provision of grants for students through the Student Entrepreneurship Program (PMW –*Program Mahasiswa Wirausaha*) at the Indonesia University of Education. PMW has been started from 2009. The students who won the PMW program will be awarded a grant of 7-10 million dollars as the initial capital for pioneering efforts. Each year, the fund awards to nearly 100 students in average. Based on the preliminary study of 30 students, the majority of PMW winners have not been able to capitalize this grant effectively. This is because many winners were confused how to start their business when they obtain grant. Most of the students do not have a real picture or experience to run business. Most of them managed to win the program because they passed the stages of selection with high communication skills and promising business plan to be presented in front of the jury. In practice, they do not even have any experiences in running a business.

The essence of entrepreneurship is a creative and innovative thinking. Both of these elements cannot be given only in theories in classrooms. Students should be encouraged to understand and to feel or to be trained to think creatively and innovatively. Entrepreneurship requires a different way of teaching. Starting from providing motivation, examples, and the most important is the effort to practice because entrepreneurship cannot only be learned in the form of theoretical concepts on papers. Based on the phenomenon of the problems, it is necessary to reform and to improve the model of entrepreneurial learning from TCL (teacher-centered learning) to SCL (student centered learning). Lecturers do not only give verbal material, but also actively ask the students to involve. Therefore, the students can get the “real experience” on how to run a business. One of the models that is suitable to use in entrepreneurship teaching is experiential learning model. Experiential Learning Theory (ELT), which is

the basis of the model of experiential learning, was developed by David Kolb in the early 1980s. This model emphasizes a holistic model of learning in the learning process. In experiential learning, the experience has a central role in the learning process. The emphasis makes ELT different from other learning theories. The term “experiential learning” is used to distinguish it from cognitive learning theory, which tends to emphasize cognitive aspect rather than affective aspect, and behavioral learning theory that eliminates the role of subjective experience in the learning process (Kolb, 1984). Based on this background, the research is focused on “The Development of Experiential Learning Model in Entrepreneurship Course.”

The research questions of this study are as follows.

1. How is the typology of students taking entrepreneurship course in Management Study Program and Sociology Education Study Program?
2. How is the entrepreneurship intention of students prior to the model of experiential learning in entrepreneurship course in Management Study Program and Sociology Education Study Program?
3. How is the development of model of experiential learning on Entrepreneurship Course in Management Study Program and Sociology Education Study Program?

In general, this study aims to develop a model of experiential learning in the entrepreneurship learning process. In specific, the purposes of this study are to determine the following.

1. The typology of students taking entrepreneurship course in in Management Study Program and Sociology Education Study Program?
2. The entrepreneurship intention of students prior to the model of experiential learning in entrepreneurship course in in Management Study Program and Sociology Education Study Program.
3. The development of experiential learning model on Entrepreneurship Course in Management Study Program and Sociology Education Study Program.

## 2 THEORETICAL BACKGROUND

### 2.1 Experiential Learning Model

Experiential learning is a model of learning through concrete experiences, by way of role playing, simulations, and group discussions. The combination of “hear, see, and experience” enables experiential learning to affect the learning in three ways: changing cognitive structures, modified attitudes, and

expanded skill sets. Experiential learning focuses on individual learning and its environment. Learners can learn by observing and interacting directly with the material they are learning to provide opportunities to engage in an active learning. Experiential Learning Theory (ELT) model emphasizes a holistic model of learning in the learning process. In experiential learning, the experience has a central role in the learning process. The emphasis makes ELT different from other learning theories. The term “experiential learning” is used to distinguish it from cognitive learning theory, which tends to emphasize cognitive aspect rather than affective aspect, and behavioral learning theory that eliminates the role of subjective experience in the learning process (Kolb, 1984).

This theory defines learning as the process whereby knowledge is created through the transformation of experience. Knowledge is the result of a fusion between understanding and transforming experience (Kolb, 1984). Experiential learning can also be defined as the act to achieve something based on experience, which is continuously changing in order to improve the effectiveness of the learning outcomes itself.

Experiential learning emphasizes the strong desire of the student to succeed in learning. Motivation is based on the purposes to be achieved and the learning method chosen. The desire to succeed can enhance the student’s responsibility to conduct their study and they will be able to control their behavior. The model of experiential learning gives students the opportunity to decide the type of experience that will be their focus; the skill that they want to develop; and how to make the concept based on their experiences. This differs from the traditional learning approach where students are passive and teacher control without involving student in learning process. According to Baharuddin and Wahyu (2008: 166), learning through experience (experiential learning) refers to the process of learning that involves students directly in issue or the material being studied. Based on the concept of learning through experience, all activities of life experienced by the individual are learning tools that can create knowledge. Mardana (2005) suggested that learning from experience covers the link between doing and thinking. If the student is actively involved in the learning process, the students will learn much better. This is because in the process of learning enable students to actively think about what is learned and how to apply what they have learned in real situations.

From the above definition, it can be concluded that the model of experiential learning is learning as a process of constructing knowledge through the transformation of experiences. This model refers to the process of learning that involves students directly in issue or the material being studied. Thus, this

model of experiential learning takes advantage from student’s new experiences and of reactions to understand and to transfer of knowledge, skills, and attitudes.

Experiential learning model was introduced in 1984 by David Kolb. It defines learning as the process of how knowledge is created through the changes of experiences. Knowledge is caused by a combination of understanding and transforming experience (Kolb, 1984: 41). The excellences of the Experiential Learning Model are as follow.

1. Improving learner spirit as an active learner.
2. Creating a conducive learning atmosphere where learners rely on individual discoveries.
3. Bringing up excitements in the learning process where learning are dynamic and open from all directions.
4. Encouraging and developing creative thinking where learners are participated to find something.

The learning procedure in experiential learning consists of four stages: real experience stage, reflection observation stage, conceptualization stage, and implementation stage.

In the above stages, the learning process starts from concrete experiences. The experience is then reflected individually. In the process of reflection, someone will try to understand what is happening or what happened. Reflection is the basis for the process of conceptualization or understanding of the principles underlying the experience and forecasts the possibility of its application in the context of the new or the other situation. The implementation process is the situation and the context that allows the application of the concepts already mastered. The possibility of learning through real experiences then is reflected by reviewing what had been done. The experience that has been reflected then rearranged to form new understandings or abstract concepts that will be a guide for the creation of new experience or behaviors. The process of experience and reflection is categorized as a process of discovery (finding out), while the conceptualization and implementation processes are categorized in the implementation process (taking action).

## 2.2 Entrepreneurship

Actually, humans have talent and potential to be far more than what is expected and used. Therefore, an achievement of someone is not dependent on the extent of talent and potential, but also on how much and in what way the talent and potential are used. The nature and attitude will determine the success in the purpose of life.

Attitude is important for humans because its presence enable humans to interact with the surrounding environment without forgetting the

norms prevailing in the community. That attitude can be formed with the development of the individual and is met by some factors, both internal factors (including physiological and psychological factors), and external factors (including experience, situation, norms, and values in society). Suryana (2003: 1) states that the entrepreneurial attitude is not only owned by businessmen but can be owned by any creative and innovative thinking person among both businesses and the general public such as farmers, workers, employees, government, students, teachers, and leaders of other organizations.

Entrepreneurial attitude can also be formed by education and training of entrepreneurship because education and training is a way for humans to learn to be more advanced, independent, and creative. In addition, the presence of entrepreneurship education and training is expected to change both skills, knowledge, and attitudes. Alma (2005: 7) states that students should be given attitudes and behaviors to open a business, and then we will make them talented entrepreneurs. Riyanto (2000: 6) also states that entrepreneurial education and training is a kind of education that teaches people to be able to create their-own business activities. Such education is pursued by building faith, soul, and spirit; building and developing the mental attitude and the nature of self-employment; developing entrepreneurial thinking and spirit, promoting and developing the power of self-propulsion; Understanding and mastering the techniques in facing risks, competition, and a process of cooperation; understanding and mastering the ability to sell ideas; having the ability stewardship or management, as well as specific skills including mastery of specific foreign languages for communication purposes.

Entrepreneurship education, family environment, and activity in student organizations can be valuable to make young entrepreneur of educated persons. This is in line with the opinion of Alma (2005: 6) that transformation of knowledge entrepreneurship has expanded lately. Similarly, in Indonesia, entrepreneurial knowledge can be taught in primary schools, secondary schools, colleges, and various courses of business. Purnomo (2001: 15) argues that the basic self-employment is education, infrastructure, and training, Information, counseling, and guidance, management, and protection, and legal certainty, approach strategies, intrinsic appreciation of life, and Repair.

Entrepreneurship education and training is education that is oriented to the formation of entrepreneurial spirits: courage and willingness to face problems of life and living a natural and creative life, and to find solutions to overcome the problems, independent spirit, and not rely on others (jk\_stn@plasa.com). Through the entrepreneurship education and training, it is expected to result new

attitudes, skills, and knowledge. This is consistent with the objective of entrepreneurship education and training according to Soemanto (1999: 79): "Preparing individuals to responsibly obtain welfare with all aspects of personality development".

In line with the demands of rapid change in the paradigm of growth-equity shift and the change in the direction of globalization that demands excellence, equity, and competition, today there is a paradigm shift of education. According Suharto (1997: 4), the Entrepreneurship Education has been taught as a discipline that is independent, because entrepreneurial contains an intact body of knowledge and real (distinctive), that there are theories, concepts, and complete scientific method.

Entrepreneurial attitude is the basis for improving the success that is the basis for increasing success in various fields or vocational required in the broad life. So someone who has a mental attitude of entrepreneurs will have the ability to hard to reach his goals and needs, both for his own life and the lives of their families.

## 2.3 Previous Study

Based on Andari (2010), entrepreneurship education and training is one of the important parts to transfer knowledge, skills and entrepreneurial attitudes of students, in order to achieve the expected success of the goal of learning the various components necessary to support activities in the education and training such as materials, methods, instructors, facilities, and evaluation of learning. The entrepreneurial attitude of Vocational High Schools in Bandung may be formed through a process of education and entrepreneurship training. The influence of entrepreneurship education and training variables to the variable of entrepreneurial attitude in Vocational High Schools in Bandung is 52.5%.

Hendrayati (2011) in her study reveals many challenges faced by businessperson to maintain the viability of the business and achieve success. To overcome these problems and to realize the success of a business, of course, there should be real efforts on the part of businessperson. In order to truly be a successful entrepreneur, it requires a true entrepreneurship mental reflected in the operations of entrepreneurship characteristics: self-confidence, results-oriented tasks, risk-taking, the nature of leadership, originality, and oriented to the future to achieve business success. Development in the understanding of the characteristics and backgrounds owned by someone who wants to start a business is an important step to encourage an entrepreneurship potential and improve their probability of success. Based on statistical calculations by using path analysis, it turns out to affect the success of the entrepreneurship characteristics of nickel scrap

screen in Bandung either simultaneously or partially. Simultaneously, then the Entrepreneurship Characteristics Influence on Business Success is equal to 75.06%. Individually, then the sub-variables that most influence is the orientation of the task and the results of 23:22% while the smallest sub-variables that influence is on the future orientation of 1:18%.

Based on Andari (2012), the creative industries have been recognized by various parties. It is one of the main drivers of a country's economy. As we know, Indonesia Creative Industry does not only contribute to the Gross Domestic Product (GDP) but also a significant national job providers, increase in the value of exports, the creation of a positive business climate, building the image and identity of the nation, based on renewable resources, innovation and creativity which is a competitive advantage of a nation, and also provide a positive social impact. The role of creativity-based education institution is very significant, especially in response to the global increasing need to the results of the creative industries.

Based on the research by Hendayati (2011) and Andari (2012), the attitude and behavior of student entrepreneurship should be fostered by the entrepreneurship education both in intra education in schools and in practice in the industry. Entrepreneurship is a discipline that is not enough by theories derived from education, but should be applied through training. Entrepreneurial training provides opportunities for students to apply the material they have learned

### 3 METHODOLOGY

The research was conducted in April - November 2014. The study was conducted in the Management Study Program and Sociology Education Study Program of Indonesia University of Education.

A study needs a method to derive a conclusion. This study uses a method of research and development for a product or an outcome. In this regard, it is a learning model. This method consists of several stages, starting with the potential and problems, the design revision, data collection, product design, design validation, testing usage, product revision, and production.

This study analyzes data about the typology of students taking entrepreneurship courses, as well as interest in entrepreneurship prior to the implementation model of experiential learning.

The research subjects can be found in the sample population of this study. Population is a generalization consisting of the object or subject that has certain qualities and characteristics determined by the researcher to be studied and then drawn

conclusions (Sugiyono, 2009). Based on this definition, the population in this research is the entire students taking entrepreneurship courses at Management Study Program for a total of 75 students and Sociology Education Study Program for a total of 90 people.

The data collection technique is a process of procurement for the purposes of research in which the collected data describing the variables studied. The data were obtained through interviews with students taking entrepreneurship courses, observation on the object under study during the learning process, a questionnaire about the typology, students interest of entrepreneurship, and the literature on models of experiential learning and entrepreneurship.

## 4 RESULT

### 4.1 Profile of Management Study Program, Faculty of Economics and Business Education, Indonesia University of Education

Management Study Program is one of the non-educational study programs that was founded in 2002 under the Faculty of Economics and Business Education, Indonesia University of Education. Graduates of this study program will gain a degree in bachelor of economics. Entrepreneurship is taught in the study program as one of the compulsory courses given in semester 5. Currently, the number of students taking this course is as much as 75 students. From the observation, many students in this study program have an experience in running their own business. Some of those even participated in various entrepreneurship competitions in local, regional and national level.

### 4.2 Profile of Sociology Education Study Program, Faculty of Social Sciences Education, Indonesia University of Education

The Sociology Education Study Program is one of educational study programs that was founded in 2011 under the Faculty of Social Sciences Education, Indonesia University of Education. Graduates of this study program earn a bachelor of education. Entrepreneurship is taught in the study program as one of the compulsory courses given in Semester 3. Students that take this course are 90 students. From the observation, only a few students in this study program that has been trying to do the entrepreneurship.

### 4.3 Typology of Students

Based on the research instruments that have been developed previously, the typology of students is divided into the following.

1. Scholars
2. Social Group
3. Creative Individualist
4. Wild One
5. Political Activist

Based on the results of the questionnaires it is known that the majority of students of Management Study Program is considered to be Social Group while the majority of the students of Sociology Education Study Program is considered Scholars. It can be seen in the following chart.

Grafic 1. Student Typology Management Study Program

Based on the graphic above, it can be concluded that majority of students are considered to be social group (25%), while creative individualist reached the second highest with 20%. There is 15% of scholars, 10% of political activist and only 5% considered to be the wild one. This means that majority of students love to socialize with others, like to engage in non academic activities on and off campus as well as making friends with others.

Graphic 2. Student Typology of Sociology Education Study Program

The result is different with student typology for Sociology Education Study Program which most of the students considered to be in a scholars group (60%). They love to study, they really consider on their academic performance and they measure their success by their academic achievement. Only 10% which belongs to creative individualist, 18% political activist, only 2% is in the social group and none of the student considered to be wild one.

### 4.4 Entrepreneurship Intention

The research instrument was designed to determine the extent of the intention of the students to entrepreneurship. The questionnaire was given at the initial session before the Experiential Learning Model being implemented to the students. The assessed aspects are

- a) Self Efficacy;
- b) Feasibility;
- c) Perceived Value;
- d) Intention; and
- e) Necessity;

We can see the result from the table below.

Table 1. Entrepreneurship Intention of Student

The table shows that the overall index for entrepreneurial intention of student in Management Study Program is higher than the entrepreneurial intention of student in Sociology Education study Program, with the index of 71,18% and 68,26% respectively. This result is before the students go for a field practice. Questionnaires were given away on the second meeting of the course. The dimensions which have the highest index for students of Management Study Program is self efficacy (77,64%) as well as perceived value (77,60%), while the lowest one is feasibility (56,89%). This shows that the students realized the skills that they have and willing to use it for self development. Moreover, they have a good score in negotiation and leadership skills, as well as in creativity and innovativeness. The students are aware of the benefits of having their own business and they realize their role in their business. For intention and necessity dimension, the index is 68,88% and 70,4%.

The result for entrepreneurship intention of student of Sociology Education Study Program is almost similar. The highest index lies in self efficacy (77,56%) with perceived value in the second highest (74,44%). Necessity and intention scored 71,11% and 59,33%, while feasibility has the lowest index which is 52,59%. Based on the data we can conclude that self efficacy has the highest index and feasibility in the lowest in index, both for Management and Sociology Education Study Program. This shows that they realized that they have special skills but they don't see a certainty on how they will run the business and whether their business will success or not.

#### 4.5 The Development of Experiential Learning Model

In order to develop the experiential learning model in entrepreneurship course, several stages of implementation are conducted and the hierarchy in the course syllabus will eventually be spanned. Instead of giving theory in every meeting (16 weeks

of meetings), we conclude theory as well as field practice in the syllabus. Here is the detail:

- Session 1: Syllabus Presentation, House of Rules and Group Formation
  - Providing material to strengthen the understanding of the concept of entrepreneurship.
  - Distribution of the questionnaire that is related to typology and student entrepreneurship intentions. This week each group has begun to discuss what will they run.
- Session 2: Introduction on Entrepreneurship concept
- Session 3: Business Establishment
  - Providing material to strengthen the understanding of the concept of entrepreneurship
- Session 4: Business Plan
  - Providing material to strengthen the understanding of the concept of entrepreneurship
  - Each group is assigned to design a business plan
- Session 5: Business Plan Design
  - Assistancy on Business Plan Design
- Session 6: Business Plan Presentation
- Session 7: Mid-Term Examination  
Evaluation of entrepreneurship concept and business plan they have created
- Session 8-10: Field Practice  
Each group implement their business plan
- Session 11: Progress Report  
Each group makes progress report to be evaluated by a team of lecturers. This includes the course practice, challenges, and obstacles faced and the suitability of the implementation of the plan.
- Session 12-14: Field Practice  
Each group returns to the field to continue the practice of entrepreneurship based on input from the faculty team (based on the progress report given to the faculty team questionnaire on entrepreneurial intention after they undergo entrepreneurial practices
- Session 15-16: Final Presentation  
Each group presents the outcome of the entrepreneurial practices that have been implemented

Based on the observation in the field, students get an “entrepreneurship feeling” after they have experienced entrepreneurship field practise. Starting from designing business plan, until finally they practice what they have planned.

## 5 CONCLUSIONS

Based on the research results, there are several conclusions. They are as follow.

1. Student typology is divided into scholars, social group, creative individualist, wild one and political activist. The result shows that the majority of Management Study Program Students are in social group and creative individualist group, while most of students of Sociology Education Study Program are scholars.
2. The entrepreneurial intention index of the students of Management Study Program is higher than that of students of Sociology Education Study Program. It can be seen from its dimension, which are self-efficacy, feasibility, perceived value, intention, and necessity.
3. The implementation model of experiential learning in entrepreneurship courses is developed by combining theoretical concept of entrepreneurship and field practice to increase student interest in entrepreneurship.

chigazun@yahoo.co.id

**Abstract:** This study aims to describes lesson study group activities, and students' changing in emotional intelligence in teamwork. This is a type of descriptive qualitative study. In data collection, the researcher acted as the main instruments and supporting instruments, namely observation sheet of Lesson Study and collaboration development aspects. Technique of data collection was done through observation, visual documentation and video. Data was analyzed by qualitative data analysis techniques by using and analyzing the results of observation: whereas the quantitative analysis techniques conducted by using descriptive statistics. Description of the results showed that: the activities of students who performed are influenced by a) students' teamwork, b) students' understanding of Kaulinan Barudak. Students' development of emotional intelligence in team work showed 60% increased. The study recommended for (1) teachers can applied Kaulinan Barudak to increase students' emotional intelligence; (2) the government can improve Kaulinan Barudak in lessons which have relation with preservation of culture.

**Keywords:** Kaulinan Barudak, Lesson Study, emotional intelligence

### 1 INTRODUCTION

In this era of globalization, many emerging game, especially the modern game with some creativity. Along with the progress of course have an impact erosion of the traditional game, even if there is only they who live in the village. We need to preserve the traditional game, considering it was all inclusive cultural traditions and ancestral heritage. In addition it should also be imparted to the present generation of teenagers that we need to preserve these results as a cultural heritage.

In addition to preserving the ancestral culture, traditional game needs to be preserved because it provides many educational benefits for adolescents. Play a very significant to the development of adolescent physical, social, emotional, and cognitive. Playing is a way to explore and develop the motor skills of children, including understanding the values of life. Unfortunately, space is very limited play for teenagers, especially in big cities nowadays.

Modern games certainly have a different characteristic with traditional games. These differences will affect the character of a person, especially teenagers who are experiencing developmental.

Previously, small children fill the time with various games (kaulinan) to pass the time after learning or helping their parents. Sundanese culture, known as Kaulinan Barudak or children's games. with advances in technology, the spirit Kaulinan Barudak began to decrease and have some impact on the game that uses technology.

As a summary, the National Institute on Media and the Family (see [http://www.mediafamily.org/facts/facts\\_effect.shtml](http://www.mediafamily.org/facts/facts_effect.shtml)) suggests the following potential negative effects of inappropriate video games are over-dependence on video games could foster social isolation, as they are often played alone; practicing violent acts may contribute more to aggressive behavior than passive television watching. Studies do find that playing violent video games may be related to aggressive behavior; games can confuse reality and fantasy; academic achievement may be negatively related to over-all time spent playing video games.

### 2 LITERATURE REVIEW

#### 2.1 Kaulinan Barudak

Children games wellknown as Kaulinan Barudak in Sunda culture. In this part, we focus in one of Kaulinan Barudak. The game is Galah Asin. Galah Asin or in another area called Galasin or Gobak Sodor is a game similar regions of Indonesia, which is currently still can be encountered played elementary school children. This game is a group game that consists of two groups, where each team consists of 3-5 people. The core game is facing an opponent that can not pass through the line to the last line back and forth, and to win all members of the group must complete the process back and forth in a predetermined area of the field.

Figure 1. How to Play Galah Asin

The game is very interesting, fun and extremely difficult because each person must always be on guard and ran as fast as possible if necessary to achieve victory. Spiritual values in this game other than unity, we can also learn a compact cooperation between the guard and another guard that the opponent does not spiral out of control to get out of the confines us. On the other hand for the breakthrough that is accomplished, there are still many doors open if the perceived gap has closed. This game teaches how a group works together, also to understand each other.

## 2.2 Lesson Study

Lesson study is a professional development process that Japanese teachers engage in to systematically examine their practice, with the goal of becoming more effective. This examination centers on teachers working collaboratively on a small number of "study lessons". Working on these study lessons involves planning, teaching, observing, and critiquing the lessons. To provide focus and direction to this work, the teachers select an overarching goal and related research question that they want to explore. This research question then serves to guide their work on all the study lessons.

While working on a study lesson, teachers jointly draw up a detailed plan for the lesson, which one of the teachers uses to teach the lesson in a real classroom (as other group members observe the lesson). The group then comes together to discuss their observations of the lesson. Often, the group revises the lesson, and another teacher implements it in a second classroom, while group members again look on. The group will come together again to discuss the observed instruction. Finally, the teachers produce a report of what their study lessons have taught them, particularly with respect to their research question.

There are three steps in lesson study. First, research and preparation. The teachers jointly draw up a detailed plan for the study lesson. Second, implementation. A teacher teaches the study lesson in a real classroom while other group members look on. Third, reflection and improvement. The group comes together to discuss their observations of the lesson.

Figure 2. Steps of Lesson Study

## 2.3 Emotional Intelligence

Emotional Intelligence - EQ - is a relatively recent behavioural model, rising to prominence with Daniel Goleman's 1995 Book called 'Emotional Intelligence'. The early Emotional Intelligence theory was originally developed during the 1970s and 80s by the work and writings of psychologists Howard Gardner (Harvard), Peter Salovey (Yale) and John 'Jack' Mayer (New Hampshire). Emotional Intelligence is increasingly relevant to organizational development and developing people, because the EQ principles provide a new way to understand and assess people's behaviours, management styles, attitudes, interpersonal skills, and potential. Emotional Intelligence is an important consideration in human resources planning, job profiling, recruitment interviewing and selection, management development, customer relations and customer service, and more.

Emotional Intelligence links strongly with concepts of love and spirituality: bringing compassion and humanity to work, and also to 'Multiple Intelligence' theory which illustrates and measures the range of capabilities people possess, and the fact that everybody has a value.

The EQ concept argues that IQ, or conventional intelligence, is too narrow; that there are wider areas of Emotional Intelligence that dictate and enable how successful we are. Success requires more than IQ (Intelligence Quotient), which has tended to be the traditional measure of intelligence, ignoring essential behavioural and character elements. It means a high IQ rating, success does not automatically follow.

The five Components of Emotional Intelligence (Goleman, 1995) include first self-awareness, it is the ability to recognize and understand personal moods and emotions and drives, as well as their effect on others. Hallmarks of self-awareness include self-confidence, realistic self-assessment, and a self-deprecating sense of humor. Self-awareness depend on one's ability to monitor one's own emotion state and to correctly identify and name one's emotions.

Second, self-regulation, it is the ability to control or redirect disruptive impulses and moods, and the propensity to suspend judgment and to think before acting. Hallmarks include trustworthiness and

integrity; comfort with ambiguity; and openness to change.

Third, Internal motivation. It is a passion to work for internal reasons that go beyond money and status -which are external rewards, - such as an inner vision of what is important in life, a joy in doing something, curiosity in learning, a flow that comes with being immersed in an activity. A propensity to pursue goals with energy and persistence. Hallmarks include a strong drive to achieve, optimism even in the face of failure, and organizational commitment.

Fourth, empathy. It is an ability to understand the emotional makeup of other people. A skill in treating people according to their emotional reactions. Hallmarks include expertise in building and retaining talent, cross-cultural sensitivity, and service to clients and customers. (In an educational context, empathy is often thought to include, or lead to, sympathy, which implies concern, or care or a wish to soften negative emotions or experiences in others.)

Fifth, social skills. Proficiency in managing relationships and building networks, and an ability to find common ground and build rapport. Hallmarks of social skills include effectiveness in leading change, persuasiveness, and expertise building and leading teams.

In this part, we focus in social skill of emotional intelligence. The more spesific is leading teams or team work.

### 3 RESEARCH DESIGN

The respondents involve twenty students from ninth grade. The current study is based on data generated by a questionnaire. The questionnaire consisted of questions to explore the extent to which students' understanding of the *galah asin* and the increase students' ability to work in team. questionnaire processed with simple data processing to determine the effectiveness of the results of giant game salty through pre-test and post-test.

Lesson study used in this study to examine the practice, with the goal of becoming more effective. Lesson study involved five teachers. After the team was formed, made planning and selected a model teacher. after it was implemented in the classroom and outside the classroom to practice the game pole salty. after implementation is complete, conducted by a team reflection.

### 4 FINDING AND DISCUSSIONS

The relation between the respondents needed in the game Galah Asin. Proximity be a major factor for respondents to be able to bring out and enhance cooperation skills in the game. The relationship between the respondents tend not to be emotionally

close before Galah Asin done (25%). After the game done, respondents feel close to one another even though the level increase until (60%). This is consistent with that presented by Simon Priest in Misbach (1986) which states the outdoor education is a method of "learning by doing", which is a learning situation that participants will gain a better experience to develop skills of self and social skills, which can be concluded that the game can increase emotional closeness between players.

Team work skills are a must exist at the time will do the *galah asin* game. Before performing these skills, respondents need to understand the meaning of teamwork skills. Understanding of the notion of cooperation alone is not enough. Therefore, the ability to work together in groups is also required in addition to an understanding of the meaning of cooperation. This capability is needed so that when the game is done, the group can work together well. In addition to the ability to be able to work together, the respondents should know that it is actually in the game contains the value of cooperation. Researchers want to know how many respondents who find the value of cooperation before and after play.

It can be stated that the game requires skill in Galah Asin need good team work among the players. In addition, issues related to cooperation skills is understanding what it means to work together for each respondent. Can be seen, that the respondents did not know the meaning previously team work but after they play Galah Asin, they know what the meaning of such team work. Respondents were able to and can feel the skills of cooperation arising from the *galah asin* game. This statement can be seen from the chart above that the respondents are able and can find the value of working together as a whole (60%). This can be evidenced by Misbach (2006) in a research report that the role of traditional games in the social aspects that establish relationships, cooperation, social maturity train with peers and lay the foundation for practicing role socialization skills training with older adults, people. A similar sentiment was expressed by Iswinarti (2005) that the traditional game provide benefits for child development.

Reflection lesson study results showed that the students enthusiastic in participating in the activities. The students are actively involved in the activities. Shortage of lesson study this activity is the limit line easily lost because of trampled by students so that replaced using duct tape.

## 5 CONCLUSIONS

Team work is a skill that should be owned and understood by each adolescent. Because these skills are skills that will be taken continuously by each individual to the old days. Interpersonal skills can be enhanced cooperation through *galah asin* game. However, knowledge of adolescents against traditional games is minimal, therefore, the need for preservation in every school to boost their reintroduction heritage of our ancestors, especially the traditional game, which contains the values of life, especially team work. Lesson study is very helpful to the extent to which the effectiveness of the methods used and also increase cooperation with fellow teachers.

## 6 ACKNOWLEDGEMENTS

The author received no financial support for the research, and/or publication of this article.

## The Art of Connotation for Visual Texts through Lesson Study: A collaboration between two schools in Singapore

Tyrus Chua Chin-Lung<sup>1</sup>, Rafiyah Begum Sharif Mohd<sup>2</sup>

<sup>1</sup>Evergreen Secondary School, Singapore

tyrus\_chua\_chin-lung@moe.edu.sg

<sup>2</sup>Zhenghua Secondary School, Singapore

rafiyah\_begum\_sharif\_mohd@moe.edu.sg

**Abstract:** This article documents a parallel Lesson Study (LS) conducted in two different secondary schools in Singapore as part of a project under the Ministry of Education, English Language Immersion Programme (EIP) 2013-2014. Working collaboratively, a common area of concern in the teaching of the English Language was identified, namely visual literacy pedagogy - a key highlight of the Singapore English Language Syllabus 2010. To scaffold the process of thinking and analysing information in a systematic and logical manner, the Ethos, Pathos, Logos (EPL) framework was used to help students apply critical reading and viewing skills by focusing on implied meaning, higher order thinking, judgment and evaluation to the visual texts, which are essential 21st century skills. Though the theoretical underpinnings and framework for both LS were identical in both schools, each differentiated the lesson to cater to their respective learner profiles; one to 14-year old students consisting mostly of audio-visual learners and the other to 16-year old students who were more inclined towards cognitive processing of information. Research lessons were crafted using exemplars, video clips, and other resources. The outcomes clearly suggest students were more engaged and aware of the need to read and process visual stimuli critically in the real world. They recognised the interconnectedness of textual and typographical elements of a range of visual texts through the art of connotation. The process of crafting the focus, involving teachers in the process, implementing the research lesson(s), and learning from the post-research lesson discussion will be examined in the article.

**Keywords:** Lesson Study, Visual texts, Visual literacy, Ethos, Logos, Pathos

### I BACKGROUND

#### 1.1 Executive Summary

Two secondary school English Language teachers in Singapore were selected to participate in a week-long local English Immersion Programme (EIP, 2013-2014) organised by the English Language and Literature Unit of the Curriculum Planning and Development Division (CPDD). The programme seeks to provide participants with the opportunity to observe, learn and reflect on the pedagogy and programmes offered in several local and international schools in Singapore. After the attachment, the two teachers from School A and School B collaborated on a project to help their students ‘apply critical reading and viewing [skills] by focusing on implied meaning, higher-order thinking, judgement and evaluation’ (Curriculum Planning and Development Division, Ministry of Education, Singapore). More specifically, visual texts were chosen as the focus as ‘academic literacies in the twenty first century entails being able to navigate multiplicity, to critique representations in multiple modes, media and genres, and use of technologies in composing multimedia texts’ (Archer, 2012). Both teachers who have been

teaching for over a decade in the local schools in Singapore, saw the need to adjust and adapt their pedagogy to allow greater alignment ‘to the explicit teaching of the associated language features which in turn demands students’ acquisition of the metalanguage involved’ (O’Neill, 2012).

To equip students with the necessary metalanguage to analyse a visual text, the Aristotelian rhetorical appeals of Ethos-Pathos-Logos (EPL) framework was used. Based on Aristotle’s *On Rhetoric*, Ethos is ‘achieved by the speaker’s personal character when the speech is so spoken as to make us think him credible’ (Aristotle); Pathos when the speech stirs their emotions (Aristotle); and Logos ‘when we have proved a truth or an apparent truth by means of the persuasive arguments suitable to the case in question’ (Aristotle). More than a tool to analyze and evaluate visual texts, it also ‘provides our students with the critical vocabulary to transfer skills from the literary domain of literary analysis to the domain of composition’ (Kemp, 2001), allowing them to also create more effective visual texts of their own.

Though both schools shared the same EPL Framework, they differed in their adoption of the

pedagogical approach based on their students’ needs. School A’s class consisted mainly of 16 year old students who were being prepared for the high-stakes GCE O Level Examinations at the end of the year. The Professional Learning Community (PLC) team thus worked to craft a lesson explicitly focusing on helping the students to improve their understanding of the visual text assessment in the English Comprehension paper. School B’s class consisted of 14 year old students who were more inclined to respond positively to a hands-on delivery of concepts. The PLC team thus crafted their lesson using a video clip that required students to apply the rhetorical appeals.

## II THE LESSON

### 2.1 How to Teach the Lesson

#### 2.1.1 Research Lesson in School A

Prior to the lesson, the class of twenty six, 16-year old students were divided into seven groups, each consisting of an average of four members belonging to the same Co-Curricular Activity (CCA) group. Each CCA was tasked to bring a recruitment poster that they had used for the year’s CCA Recruitment Campaign. All posters were collected beforehand and kept by the teacher in preparation for the lesson.

The class began with a statement of the learning goals for the lesson. A Big Question was also asked to set students thinking: ‘Given that the purpose of a visual text is to communicate its message clearly and persuasively to its reader, what makes it successful?’ With that in mind, the EPL framework was introduced: Ethos the credibility of the message, Pathos the emotional appeal of the message and Logos dealing with the logical appeal of the message. Students were given examples of each rhetorical appeal, followed by a short quiz to check their understanding of the concepts.

Using a graphic organiser, the teacher then modelled using the EPL framework to deconstruct and critique of a visual text based on the appeal to its intended Purpose, Audience, Context and Culture. Students then used the EPL framework and the same graphic organiser to do the same for another visual text in their respective groups before finally attempting a third visual text individually to assess their personal learning. This first half of the lesson lasted 35 minutes in total.

Using their newly acquired skills, the students collaborated in their respective groups to analyze and evaluate the efficacy of their respective CCA posters using the EPL framework and the same graphic organizer. They then proposed three amendments to their original CCA poster before they started to create a new and improved version, which would be completed by and reviewed during the next lesson. This second half of the lesson lasted 30 minutes.

Students spent the final five minutes before the end of the lesson writing a reflection on the extent to which they have achieved the learning objectives. Their reflections were collected by the teacher and used to help analyze the impact of the lesson. Students were also tasked to complete the redesign of their CCA posters as homework and bring both versions for the next lesson for evaluation.

#### 2.1.2 Research Lesson in School B

Prior to the lesson, the class of forty, 14-year old students were randomly divided into seven groups, each consisting of an average of 6 to 7 members. The PLC team prepared seven visual texts, each differing in type, as well as a video entitled ‘SK-II: The Discovery - Japanese Bamboo Flute’ (Hooper) which captures the essence of EPL.

The lesson began with a pre-activity, wherein each group analyzed a different visual text to identify its purpose, which were collated and written on the whiteboard by the teacher. The learning goals were then introduced to students. Emphasis was also given on the purpose of the visual text – to allow the writer/reader to communicate messages in a persuasive manner, and that visual texts can be in both print and non-print form. This first part of the lesson lasted 10 minutes.

The word ‘SK-II’ was then written on the whiteboard to check on and bridge students’ schema through a word splash prior to showing them the video and eliciting information of the non-print visual.

The video was first viewed from the start to the end continuously. During the second viewing, it was paused at two separate points. At 0:26 seconds, students expressed their reactions to the girl wanting to explore the place where people do not grow old (to demonstrate how pathos is evoked). At 1:35 seconds, students identified the effects of rice wine. To demonstrate how Logos is evoked, the teacher also conducted a survey on how many students would consider buying the product at a later stage of their lives.

After the video was discussed, the EPL framework was then introduced and explained to students. To help students remember the framework, images were used to represent each rhetorical appeal: Ethos by the image of a doctor, Pathos the image of a heart, and Logos by the image of a brain. Following that, students were asked which rhetorical appeals were utilized in the SK-II video. This second part of the lesson lasted 20 minutes.

Subsequently, students’ understanding of the rhetorical appeals was assessed via a quiz, where each group identified the answers to three statements relating to EPL. They had to place the appropriate

image on their paper before holding up their answers for the rest of the class to see and comment.

After confirming the quiz answers, to check on students' understanding and retention of the concepts, students were then shown a poster which they had to analyse using the EPL framework based on the stylistic, textual and typographical elements. The teacher also modelled the process by analyzing the image in the poster, explaining that not every part of EPL is applicable to the textual and typographical features of a visual text. This final part of the lesson lasted 25 minutes.

Students spent the final five minutes before the end of the lesson completing a feedback form on their learning experience for the lesson. The feedback forms were collected by the teacher and used to help analyze the impact of the lesson. Students were then assigned a worksheet as homework to further consolidate and apply the concepts taught.

## 2.2 Student Learning Goals

Both School A and School B shared common learning goals; first, to identify features of the visual text; second to use the EPL framework to infer the ideas communicated by the author; and third to apply the EPL framework when annotating and deconstructing other visual texts. These served to help raise students' awareness of techniques utilised by the creators of visual texts. With careful examination of the elements of visual texts, it is hoped that students will be able to process questions that test their understanding of language used for impact. In the quest to achieve the desired objectives, students were expected to first understand visual texts, second to analyse the text in depth based on how they are put together and third to attain a set of critical skills that allows them to analyse both written and visual texts.

In addition, both schools seek to make the understanding of the EPL framework relevant to their students' lives. School A aimed to have students apply their understanding to improve their existing CCA recruitment posters to increase the enrolment rate of the following year's Secondary 1 students. School B sought to have students apply their understanding to critique advertisements in non-print media.

## 2.3 How the Lesson is Intended to Work .

School A's research lesson is designed to appeal to students' intrinsic motivation to do their best for their CCA. Through this, the learning of the EPL framework is made relevant to their daily schooling life, and thus becomes authentic. The lesson employed the lecture format for information transmission, followed by structured group work for collaborative learning. As students designed and

created a new and improved version of their CCA posters, they were also activating the highest-order thinking skill to Create through planning and producing in Bloom's Revised Taxonomy (Krathwohl, 2002).

School B's research lesson leveraged on the use of New Media to engage and stimulate students to not only think about the textual and typographical features of visual texts, but also infer and present their understanding of the concept of persuasion using EPL with greater depth, organization and structure of print and non-print visual texts.

## III THE STUDY

### 3.1 Approach

The two teachers focused on aligning a suitable and coherent framework (EPL) that could assist their students to gain greater familiarity with the metalanguage to unpack visual texts: Purpose, Audience, Context, and Culture (PACC) (Curriculum Planning and Development Division, Ministry of Education, Singapore). Observations made by the two teachers and feedback for from their fellow PLC mates clearly showed students were not clear and confident in analysing visual texts on their own.

Hence, each EIP teacher then worked with his/her school's PLC members to customize and refine their respective research lesson plans. While the process differed from the standard lesson study by virtue of the fact that the goal and pedagogical method were predetermined, each PLC team continued the process of crafting, brainstorming and tailoring the concept to the research lesson plan. After identifying the target class as well as the teacher conducting the lesson, the respective PLC teams brainstormed the best strategy to facilitate students' learning and maximize engagement based on the class learning profile. From there, the research lesson plans were formulated.

As there were some teachers in the PLC team who were unfamiliar with Lesson Study, they were introduced to the basics of Lesson Study using various resources such as a video interview (CBSNews, 2010) of Catherine Lewis on what Lesson Study is, as well as a series of videos on a Japanese Lesson Study, 'Can You Lift 100 kilograms?' (Komae School #7, 1998).

In addition, research lessons in both schools were not only observed by their own PLC members, but by teachers from the partnering school as well as CPPD Curriculum Officers. Each observer was randomly assigned to observe a specific group. Care was taken to ensure that all groups were observed by 1 to 2 observers. A running record template was given to all observers to use, in addition to a copy of the lesson plan and the seating plan. Before the

lessons commenced, observers were briefed on their roles and intent of the respective research lessons.

The post-lesson colloquium was held immediately after the research lesson. The teacher of the research lesson began by sharing his or her reflections on the lessons, after which each portion of the lesson was discussed by all observers.

### 3.2 Findings / Discussion

#### 3.2.1 School A

Firstly, students’ body language indicated that they were engaged throughout the lecture segment of the lesson. Distracted students were only distracted for a few minutes at most before re-orientating their attention to the teacher, while others were observed to be actively taking down notes of their own accord throughout the lecture. Observers attributed this to not only the variety and relevance of the visual texts used, but also to the fact that the lecture was regularly interspersed with opportunities for students to do both group work and self-assessment. This allowed students to evaluate their understanding and participate in the lesson instead of being passive recipients of information.

Secondly, observers agreed that during the activity segment, students in each group were actively collaborating to analyze and evaluate the efficacy of their recruitment posters, often questioning the efficacy of the words or graphics in their existing poster. This was followed by suggested changes to increase the impact of the visual text element in question, indicating the higher order thinking skills of analysing, evaluating and synthesising. Observers attributed this to the fact that group members all had a huge stake in the outcome of the activity, having a common desire to improve their recruitment posters to recruit as many new members as possible to their CCA. Hence, learning was authentic and applicable to their lives.

Thirdly, throughout the lesson, observers were pleasantly surprised to hear students use the specific metalanguage (Ethos, Pathos and Logos) correctly and with ease. This was unexpected as it was the first time that the students were exposed to these terms. Observers concluded that there were several reasons for this. Having Ethos being represented by a picture of a human figure, Pathos a heart, and Logos a brain in both the lecture slides and the graphic organizer helped students associate each rhetorical appeal to a specific picture. This was further reinforced by the following explanations of each rhetoric appeal in the graphic organizer:

- Logos (Logic): What LOGIC does it use?
- Ethos (Credibility): How can I TRUST what it is saying?

- Pathos (Emotions): What makes me FEEL for it?

Together with the quiz to test their understanding, students thus became familiar and comfortable with using the metalanguage. This indicates that complex terms can be made accessible to students using appropriate pedagogical strategies.

In terms of areas for improvement, observers noted that though the sample visual texts shown during the lecture were varied and interesting, which cognitively and affectively engaged students, the visual texts were primarily visual in nature. Hence, the observers recommended that the learning materials engage multiple senses in order to increase engagement of non-visual learners through the use of mediums such as videos.

In addition, observers provided several suggestions to help groups with their assignments. While the graphic organizer made groups analyse and evaluate their existing visual text according to its title, text and graphics, rubrics for each of these three components could have been crafted and given to students to help them analyse and evaluate the efficacy of their revised recruitment poster. This would also serve to help groups evaluate each others’ recruitment posters come the next lesson.

Lastly feedback obtained from students’ reflection on the extent to which they have achieved the learning objectives indicated that 25 of the 26 students indicated that the lesson has helped them to better understand and analyse the visual text more effectively. However, five students, including the remaining student who did not understand the use of EPL, indicated that they did not know how to use what they have understood from using the EPL to answer comprehension questions, since the questions do not explicitly question students about EPL. This indicates that the next lesson study cycle should explain the relevance of the EPL Framework as an aid to better understand the visual text, rather than being direct answers to comprehension examination questions.

#### 3.2.2 School B

Firstly, observers noted that the group dynamics played an important role in sustaining students’ attention to instructions and tasks. The element of surprise was maintained throughout the lesson as the teacher employed the means of calling on different groups to respond. The groupings were not random but were based on a good mix of gender and ability so as to allow as much equal participation as possible.

Secondly, in terms of student motivation, using an audio-visual (video) encouraged active student discussion as it appealed to their senses and retention. The observers noted that students were on task and clearly enjoyed working on and completing the given task with their teammates.

Thirdly, the behavioural data collected indicate that students displayed a greater sense of pride in fulfilling group tasks. They were also noted to be attentive as well as interested in the lesson. Many took the initiative to contribute willingly to the group tasks. They also took turns to present instead of relying on one presenter throughout the activities.

In terms of areas for improvement, observers reflected that a mix of more open-ended questions and guided questions would have helped students gain a better appreciation of visual texts. One example cited was that the question ‘Why are visual texts important in our lives?’ should have been used instead of ‘Where would you find visual texts in our daily lives?’ as the former would require students to analyze the textual and typographical features to justify their responses.

In addition, observers noted that whilst students were highly engaged in the different group activities, this came at the expense of time to end the lesson at a comfortable pace. It was recommended to narrow the class discussion to one learning activity and to allow students to critique the responses of another group’s answers to check their understanding and to extend their thinking on why they agree or disagree with another group’s answer.

Lastly, feedback collated from students indicated that of the 40 students present, 37 agreed that the lesson has taught them how to better understand a visual text using persuasive techniques like Ethos, Pathos and Logos, with three disagreeing. One recommendation was that students should be explicitly shown the interrelation between EPL and PACC when analyzing visual texts. This would leverage and build on students’ existing knowledge of textual analysis (PACC), allowing them to better utilize EPL to understand a visual text.

### 3.3 Conclusion

This lesson study was the result of the efforts of the teaching fraternity in Singapore to innovate and improve both curriculum and pedagogy. Without the initiative of the English Language CPDD to spearhead the English Immersion Programme (EIP), it would be highly unlikely for secondary school English Language teachers to be given the opportunity to learn and adapt good practices from a school for a full week and to receive tutelage under the Curriculum Officers who also acted as their critical friends. Through their guidance, the teachers were able to gain a deeper understanding of Lesson Study.

Most importantly, the Lesson Study benefitted the teachers involved in both schools’ PLC teams. Through the two EIP participants who served as the team facilitators for their PLC teams, other English Language teachers were introduced to the workings of Lesson Study. The opportunity to observe another teacher in action, as well as share their observations in a non-threatening environment during the post-colloquium allowed every member to reflect on how they each played an important part in owning and improving the lesson they had all collaborated on. Thus, learning is cascaded to teacher colleagues as well. The additional input through the representation from the other school as well as the CPDD curriculum officer allowed for a valuable external perspective to the lesson. Moreover, the Lesson Study cycle ensures that come next year, when the lesson is repeated for the next batch of students, they will receive an even more polished lesson.

<sup>3</sup>*Humanities and Social Sciences, National Institute of Technology, Kure College, 2-2-11 Agaminami, Kure, Japan uesugi@kure-nct.ac.jp*

**Abstract:** This paper proposes a new type of engineering education for universities be introduced from the standpoints of innovative new products. Generally speaking, the development process for new products consists of four stages, namely, target setting, scenario establishment, structuring and validation. To meet several targets such as cost, weight and performance at higher levels, the process is divided largely into two phases. The former half of the process, target setting and scenario establishment plays a critical role in not only making the layout of the new products best but also allocating the functions of the parts of new products for meeting the targets. Without this phase new products would not be successfully developed as number one. Therefore, the former half of the process is the key to the innovation of the new products in the globalization era. Based on the experience of the author, he exemplifies development of vehicles which can meet both high safety performances and light weight. Afterwards, in engineering education this paper describes how the phase should be taught and learned. The phase is associated with innovative and creative researches. Our final goal is to light the fire of students's learning. The first, and most important, ability students should develop in the globalization era is the ability to "learn how to learn"- constantly absorb, and teach themselves, new ways of doing old things or new ways of doing new things. Authors strongly wish that students can acquire this ability and become self-educators and self-motivators to survive in the era.

**Keywords:** Engineering Education, Innovative Products, Development Process, Target Setting, Scenari Establishment.

### 1 INTRODUCTION

The author has been working for a certain automobile company for about 30 years. Based on his experience, it will be proposed that new engineering education aiming at innovative products in the globalization era be introduced in the education of universities as well as national colleges of technology. This paper proposes and focuses on the process of innovative new products and the process is to be taught in the lectures and graduation researches for university students.

There are so many types of researches and developments in automobile industry. However, this paper describes the examples on the development of safety performance of the vehicle since he has been engaged in this region until last year. Although examples cited here are associated with safety performance, the authors strongly believe that the way of thinking and the concept on developing the innovative products can cover other performances of vehicles.

The development circumstance especially for safety is becoming severer and severer all over the world in recent years. Safety performances of vehicles newly introduced into the market are

evaluated, for example, in the form of NCAP (New Car Assessment Program).

### 2 CURRENT STATUS AND ISSUES OF THE DEVELOPMENT OF AUTOMOBILES

Recently every automotive maker all over the world is focusing on high fuel consumption efficiency with combustion engine, Hybrid or Electric Vehicle in an attempt to be environmentally friendly to the earth. New technologies are making great progress. In order to develop such automobiles, it is essential that the vehicle weight itself should be reduced in addition to the development of highly efficient engines. Regarding weight reduction, material substitution is one of the ways to reduce the weight by adopting aluminium and other light materials such as plastics instead of iron. Some engineers are struggling to incorporate countermeasures into vehicles by balancing weight effects with costs. Others attempt to get an ideal crash pulse analytically based on mathematical models. However, few papers have discussed the vehicle framework from standpoints of safety performances and weight at the scenario stage.

## 2.1 Development Process

Basic development process consists of 4 stages, namely target setting, scenario establishment, structuring and validation. To make the development creative and innovative, the two processes of target setting and scenario establishment are extremely important.

## 2.2 Target Setting

First, target setting is explained. In the conventional development, the performance targets of newly developed vehicles have so far been set by researching the competitors so that the new vehicles can overcome those of the current competitors. However, it is extremely difficult to keep the higher performances than competitors in the sharply changing world.

Therefore, the targets of performances should not be BIC (Best in Class) but theoretical limits. The theoretical limits mean the highest targets introduced by theoretical approaches. Although the theoretical limits are the highest targets, the targets are essential to produce innovative products.

## 2.3 Scenario Establishment

A good scenario has a well-balanced way of thinking with respect to safety performances and weight reduction. Optimizations should be conducted at this stage. Although recent in-depth CAE (Computer Aided Engineering) technologies enable us to determine the structure with components targets, numbers of elements consisting of a vehicle are too large to optimize the vehicle as a whole. Therefore a simpler model should be developed for the optimal allocation of functions to each individual component on the framework of the vehicle.

The present paper involves the determination of the framework of the vehicle using the newly developed three dimensional spring-mass models at the scenario stage for the purpose of the optimization from the standpoints of safety performances and weight reduction.

## 3. INNOVATION OF PRODUCTS

### 3.1 Frontal Crash Test Modes

To assess the safety of occupants of a vehicle in a collision, cars are crashed into a barrier and onto each other to obtain the information and deceleration of the vehicle. The barrier tests employed in NCAP (New Car Assessment Program), namely the full width barrier and the offset deformable barrier, will be explained as follows.

### 3.1.1 Full Width Barrier (Full Lap)

This test is a 56km/h full width crash test into a rigid barrier. This rigid barrier represents either a rigid wall or a heavy truck. This frontal crash test is schematically represented Figure 1 (left). The full lap mode tends to give rise to high injury of occupants due to large deceleration of a vehicle. Therefore, the crushable body is preferable to make deceleration of the vehicle smaller.

### 3.1.2 Offset Deformable Barrier (ODB)

This test uses a deformable barrier. An offset deformable barrier (ODB) test involves impact with only the driver's part of the vehicle. The test speed is 64km/h for this 40% offset test. In an offset test there is a significant degree of deformation which makes it suited to evaluate injury to passengers from such deformations. The deformation aluminium barrier represents in its way the opponent's front-end in a frontal car-to-car collision. Figure 1 (right) represents schematically this test. The test mode makes the cabin compartment largely deformed. This leads to strengthening the cabin.

From the standpoints of lessening the occupant injury, therefore, it follows that the full lap mode needs the crushable body whereas the offset mode has the cabin strengthened. Basically, these two modes have the opposite countermeasures.

Figure 1 Full width barrier (left) and offset deformable barrier (right)

### 3.2 Spring Mass Model

The framework of the vehicle affects greatly safety performances as well as weight reduction. It is no exaggeration to say that safety performances and vehicle weight depend largely on the vehicle framework itself. Therefore when a new vehicle is designed, the skeleton of the vehicle should be optimized. In order to obtain the optimal solution, thousands of cases have to be conducted for the parametric study. However, in-depth CAE of full car models using FEM (Finite Element Method) is too complicated to adapt the optimization method to the full car model due to time-consuming calculations.

Simpler models are, therefore, essential to optimize the skeleton of the vehicle.

Figure 2 shows the schematic outline of spring-mass model. The three dimensional spring-mass model describes the main components of the vehicle using elements of springs and masses. The spring-mass model was produced, based on the skeleton of the current actual vehicle. The model for (a) full lapand (b) offset is shown in Figure 3. The model is composed of 60 mass and 75 springs. The 3D model sophisticatedly constructed by incorporating uncrushable components such as an engine and a transmission system enables us to reproduce the cabin deformation and the rotation of the vehicle.

Figure 2 A schematic view of spring-mass model

Figure 3 Spring-mass models for full lap and offset

### 3.2.1 Determination of Vehicle Framework

Two steps are taken to determine the framework of the vehicle. The first step is to establish the compatibility between the full lap and the offset mode for safety performances. The second step is the optimization of safety performances and weight reduction.

### 3.2.2 Compatibility between Full Lap and Offset

Figure 4 shows the bubble chart on the relationship between pulse index (PI) and dash intrusion for full lap mode at 56km/h, while the diameter of circle shows the dash intrusion for ODB mode at 64km/h. The vertical axis shows PI value for the injury indices and the horizontal axis designates dash intrusion. Both indices mean that the smaller or the lower is the better. For the offset mode, the larger size of the bubble indicates the larger dash intrusion. The smaller the bubble becomes, the smaller the dash intrusion becomes. Two solid lines in Figure 4 show target lines to be met. The zone where PI and dash intrusion are satisfied for the full lap mode and the offset mode, which is called OK area, should be enlarged from the robust perspective. However, it is found that the conventional model before improvement has the smaller OK area. This is due to the fact that safety performances rely upon front rails, which is hard to achieve a proper balance between front rails and the cabin compartment in strength.

In order to enlarge the OK area, therefore, a new concept is introduced. The new concept is shown in Figure 5, compared with the conventional one. The conventional structure has a single load path which depends largely on front rails. On the other hand, the new concept has multi-load paths. The loads generated during the crash are transmitted to the cabin through three paths, namely, the upper, the middle, and the lower. The new concept will be designed by putting the conventional one together with apron reinforcements for the upper, and sub-frame for the lower. The load path concept has been shifted from the concentrated single load path to the dispersed multi-load paths. Using the spring-mass model with the new concept, the optimization was conducted. The result is shown in Figure 6. Compared with the conventional framework, the new one gives the larger OK area. PI indices become lower at the full lap mode, and dash intrusions at the offset mode designated by smaller circles are improved as well. Owing to the new load path concept, loads induced during frontal crash are dispersed to more components of the vehicle. Therefore it follows that the multi-load path concept gives the higher compatibility to lessen an occupant injury for the full lap as well as to reduce dash intrusion for the offset.

So far using the multi-load path concept, safety performances on the full lap mode and the offset mode have become compatible. To establish the multi-load path concept, the two components; apron reinforcement and sub-frame are incorporated into the vehicle. This leads to the increase of the vehicle weight. The next step is, therefore, taken to optimize the safety performances and weight reduction.

Figure 4 Bubble chart on relationship between injury indices PI (m/s<sup>2</sup>) and dash intrusions (mm) at 56km/h full lap and 64km/h ODB for the conventional concept

Figure 5 Difference of framework between the conventional concept and the new concept

Figure 6 Bubble chart on relationship between injury indices PI (m/s<sup>2</sup>) and dash intrusions (mm) at 56km/h full lap and 64km/h ODB for the new concept

### 3.2.3 Optimization of Safety Performances and Weight Reduction

The next step is to find out the optimal solution with respect to safety performances and weight. The strength of each component is expressed as the function of tensile strength and material thickness related to weight. Safety performances can, therefore, be associated to weight.

The relationships between safety performances and weight are obtained by means of the multi-objective optimization method. Using this method, parametric studies were conducted for thousands of cases as shown in Figure 7. The horizontal axis shows the weight of the front body components associated with frontal crash. Regarding safety performances, the vertical axis indicates dash

intrusion for the offset mode (ODB) at 64km/h while diameters of the circles indicate pulse index (PI) for the full lap mode at 56km/h, which means that large circles have large PI values. As a result, the bubble chart clarifies the Pareto line to satisfy both safety performances and the front body weight. Based on the bubble chart, it is possible to determine the optimal solution to meet the targets regarding dash intrusion, PI value, and weight.

The final goal at the scenario stage is to optimize target characteristics from the standpoints of safety performances and weight reduction. According to the procedure mentioned above, the optimized target characteristics of each component of the vehicle have been determined in the form of material strength and crushable amount (displacement), as shown in Figure 8. Based on the target characteristics, the detailed structures can be determined efficiently.

Figure 7 Optimization between safety performances and front body weight

Figure 8 Target characteristics (strength-displacement) of individual components of the vehicle

## 4. SMART ENGINEERS IN GLOBALIZATION ERA

As mentioned above, the development process for new products consists of four stages, namely, target setting, scenario establishment, structuring and validation. To meet several targets such as cost, weight and performance at higher levels, the process is divided largely into two phases. The former half of the process, target setting and scenario establishment, is the phase to Think. The latter half of the process, structuring and validation, is to Act. So far it was found that the “Thinking phase” is the stage which plays a critical role in not only making the layout of the new products best but also allocating the

functions of the parts of new products for meeting the targets. Without this phase new products would not be successfully developed as number one. On the other hand, the “Acting phase” is to determine the structure of the vehicle framework, based on the “Thinking phase”. Therefore, the “Thinking phase” is the key to the innovation of the new products in the globalization era.

Creating innovative products is essential to survive in the era of globalization since competitions become harder and harder in the global scale. What kind of students can survive in the flat world where we can get new information immediately wherever you may be? Goal image of smart engineers who can survive in the globalization era is the students who can learn the way of producing new products. The first, and most important, ability students should develop is the ability to “learn how to learn”- constantly absorb, and teach themselves, new ways of doing old things or new ways of doing new things. Students with curiosity and passion can become self-educators and self-motivators.

Therefore, the former half of the processes, “Thinking phase”, is the key to the innovation of the new products in the globalization era. The phase is associated with innovative and creative researches. In the phase, first clarifying the phenomena by experimental and numerical methods, then the

mathematically solved. The final goal is to find out the governed equations for the phenomena. This leads to determining the theoretical limits as target setting in the first stage of the process. Based on the Figure 8 Target characteristics (strength-displacement) of individual components of the vehicle solutions, the scenario to achieve the target will be established. Students are interested in clarifying the unknown or mechanism of the phenomena they are facing. Such students have the potential for being curious and passionate. From now on we are going to give the students the lessons to learn how to learn as incubation lessons. What are mentioned above will be done.

## 5 CONCLUSIONS

The present paper proposes a new type of engineering education for universities be introduced from the standpoints of innovative new products. The results discussed here are as follows.

- 1) The development process for new products consists of four stages, namely, target setting, scenario establishment, structuring and validation.
- 2) The former half of the process, target setting and scenario establishment plays a critical role in not only making the layout of the new products best but also allocating the functions of the parts of new products for meeting the targets.
- 3) Students are interested in clarifying the unknown or mechanism of the phenomena they are facing. Such students have the potential for being curious and passionate. Students with curiosity and passion can become self-educators and self-motivators.

figure4.Circuit board

### 3.3 See session

In SEE session as shown in fig.5 we observe and analyze the video and record findings from observers. Our finding when viewing the video and reading the observations during introduction time in opening part as shown in fig.6 most students were participating actively in answering oral questions and exited by simulation. In main activity as shown in fig.7 all students directly engaged learning process in closing part as shown in fig. 8 teacher ask students to present their finding in front of the class and at the end teacher and students together summerized the lesson.

Fig .5 during see session

Based on Observer-1,observer -2, and observer-3and video analysis on Group -1 We found At the beginning when the group started to construct simple circuit they were confused about the red and black colors of the cable with the hole, which issued to connected one cable with another, most members of the group said the black cable

should fix with black hole others said black cable should connect with red at the end with most of the group agreed to connect black cable with black hole when they did it the lamp light up. But one student from the group wanted to test the connection black cable with red hole but rejected by some members of the group they said already the lamp is turned on but other members said please let us give him chance to let him try.They agreed the student to test it he connected the black cable with red hole and black hole with red cable at the end the lamp light up the group member admired him clap for him and they called him “good boy”. In this experiment the group realized that the color of the cable has not effect to make the lamp turn on. In this experiment what we have seen is first the group raised conflict ideas explained it with supported evidence and gave appreciation and value for those who gave solutions for the problem in democratic way. In this experiment we got findings which are not predicted during plan session because when we make the circuit board for learning material we didn’t give attention for the colors of cables but the students raised it as a problem and solved by themselves.

The students were actively engaged with the learning material. In their daily life the students use switch on and off lamps in their house without realizing it. After the lesson the students got experience on constructing simple electric circuits, series and parallel connection. They also identified the difference between series and parallel connection based on the brightness of the bulbs.

Based on Observer-4,observer-5,and observer 6 and video analysis.group 2were concentrated how to solve the problem and they have solved the four

problems, but observer-4 was focused on one student, who was not even touching the learning material but was taking careful observation on activities took place on the learning material by his group members, at the end when the teacher gave some written questions to be answered based on the experiment already they have done, in one question his group member answered it wrongly. Later on observer-3 asked him that question again orally he answered it correctly, based on his observation. This student couldn't share his idea to his group members for his different answer instead he changed his correct answer by the wrong one because he couldn't get confidence for convincing others.

Based on observer-7, observer 8 and video analysis on group -3 we found that group 3 faced two challenges, the first challenge was while they were constructing simple circuit; the group constructed simple circuit correctly, but the bulb didn't give light after that they discussed where is their mistake they asked the teacher to bring another new lamp and gave them. When they replaced it the lamp light up. From this group the observer found that a problem is existed the group discussed about it and put hypothesis then after tested it finally confirmed their hypothesis was correct. The second challenge was when they construct series circuit they were confused and their connection were wrong. Even both switches were switched OFF the lamps were giving light. After the teacher helped them to follow the procedures in the worksheet they easily correct it

Figure 6. Simulation in introduction

Figure 7. Cooperative learning among students

Figure 8 Students 's presentation in front of the class

The observers suggested that there had been lack of learning materials. All students couldn't get the same chance while constructing a circuit due to limited number of learning materials. in each group there were six students with one learning material. To overcome this barrier more learning materials should be needed for the next lesson. It shown several students still were very eager on engaging the learning materials they were not listen when one presents in front of the class. Therefore the teacher should take serious follow up on students to listen presentation

#### 4 CONCLUSION

Our findings shown that the students' engagement on the learning material, work sheet, and simulation was accomplished successfully. The lesson met the intended learning goals. The students could construct simple electric circuits, series circuit, and parallel circuit and its combination. They also developed understanding about; the materials they need to construct simple electric circuit, difference between open circuit and closed circuit, and the difference behavior of series and parallel circuits, The overall, our lesson shown a remarkable progress in students understanding by applying Inquiry strategy incorporating cooperative learning to enhance student's analysis of electric circuit

The recommendation are 1) if someone intend to use these learning materials, we suggested there should be enough learning materials therefore all student can engage. 2) To make the implementation effective teacher guidance through the process is needed. 3) because the learning material make all the student eager to explore, in the closing session when students present their result and teacher summarization in front of the class make sure all students are paying attention towards the presentation such as students sitting position, should facing in front of the class

## 5 ACKNOWLEDGEMENT

I (Yohannes) have deepest gratitude to JICA for helping me financial support during my training program in UPI

I (Yohannes) would like to thank physics department members and students in UPI for all their hard work and constructive comments in every step of the lesson study implementation

Last but not least we also thank to S.D.P.N setiabudhi public primary school, Bandung, Indonesia for their help starting from the beginning of lesson study implementation up to the end.

**Abstract:** Children can develop better understanding in any concept if it contextual and meaningful for themselves. As additional, children need to be active and enjoy their activities so that concept can be understood easily. Dinosaurs are fun concept for children in 4-5 years aged; they are very enthusiastic and curious on this theme. However, Dinosaurs is abstract concept to connect with real experiences of children. Teachers have to carefully designing the activities so children can get meaningful experiences during the theme. On this case study, the authors will describe about dramatic play activity that selected by teachers to provided the contextual experiences and real sense of the Dinosaurs’ extinction. Class teachers together with participants of Lesson Study discussed the goals of the activity, designed the narrative of the activity, and prepared the materials to support children activity. On post lesson discussion, we found the interactions between imagination, knowledge, and experiences during children dramatic play. Such activity gives benefits for children to develop better understanding about Dinosaurs’ extinction.

**Keywords:** Dramatic play, dinosaurs theme, develop children understanding, contextual experiences, preschool

## 1 INTRODUCTION

In one year term, GagasCeria Preschool has 6 big themes. One of the most favorite themes is a Dinosaurs theme which tells about time and place concept. The students of Awan class can be easily to know the kinds of dinosaurs including their names. The children also looks excited when they were playing the dinosaur’s miniature and playing the role playto show the dinosaur’s power. By the end of the theme, some childrens questioning this question, “Why the dinosaurs has no longer exist?”. This Lesson Study will try to answer the question, according to the question, we designed the strategy to develop children understanding the extinction of dinosaurs.

The dinosaur is a represent of the animal that lived in the past. By using animals as objects of learning, children are expected to be easier to understand the purpose of this theme. The consideration is the children aged 4-5 years are at the pre-stage of the operational cognitive development where the children have been able to understand the symbols. By manipulating symbols in so many ways, children at this age are thinking in a way that

has not been able to do by younger children, that is thinking about something that is not present in sight. (Piaget in Boeree, 2005). We represented the dinosaurs in symbols, such as picture, miniature and lettering.

On this theme, the children could be easy to know the kinds of dinosaur including their name. The children also looked enthusiast when they played a miniature of dinosaur and play dramatization by showing dinosaur’s power. In the end of the theme, there was a question by the children, such as, “Why the dinosaur has no longer existed?”. According to the question, we agreed to make a lesson study to explain about the concept of dinosaur’s extinction, to tell them the time concept that dinosaurs lived in the past.

## 2 A SCENARIO OF DINOSAUR’S THEME

On this Dinosaurs theme, the teachers agreed to introduce some major topic to children for seven weeks. Those topics are explore and find the dinosaurs in the land of Dinosaurs, the concept of

time, introduced similarities and differences between animals in past and present, and also introduced the allegation of the dinosaur’s extinction. Each topic started with brainstorming, namely the process to introduce of initial information about a topic.

### **2.1 Adventure to Dinosaur’s Land Topic (during 1 week)**

At the beginning of the theme, we asked the children to brainstorm about land dinosaurs (the room that we set as a dinosaur’s land) and found the dinosaurs that they want to know.

Their adventure started by following some mysterious footprints. Teachers formerly made a setting room as a land of dinosaurs. The room made with minimal lighting to get a threatening atmosphere. The room decoration was full of trees and hanging roots. Teachers also put some dinosaur’s miniature in the room. Then kids invited to enter the room to explore. Come into the land before dinosaurs, most of the children looked enthusiastic and curious to see the land of dinosaurs.

Some children were looked skeptical and tears when they were in the forest. Some children said that, “I don’t want to get in to the room.” Azki said with her fear face. Meanwhile, Takha’s face was almost crying and said, “That’s dark, I’m scared.” Some of the children actually looked enthusiastic and asked Azki and Takha to come and join into the land, “It’s okay to be here, don’t be afraid, there are a lot of dinosaurs here, come on!” said Elsa to her friends. Finally all of the children came into the dinosaur’s land and found so many kinds of dinosaurs. This condition increased their curiosity to know about dinosaurs that they found. The curiosity of the children seemed in some comments, such as, “Miss, I find a T-Rex, but what is this?” said Mike holding a miniature of triceratops, while Zahra said, “Miss, I don’t know any kinds of dinosaurs, but I want to buy some books of the dinosaurs.” and then Ariana asked this question, “Is this Stegosaurus, right? But why are they having different color?” When they built their own imagination, the teacher began to introduce the kinds of dinosaurs and including their physical features, their habitat, and the concept of time where they lived.

### **2.2 topic of time concept (during 1 week)**

In this topic, children were introduced about the concept of present, past time and also the concept of

the day in a week and the concept of yesterday, today and tomorrow.

### **2.3 Topic of Similarity and Difference of Animal in Present and Past (during 3 weeks)**

In the next topic, the teacher explained about the kind of dinosaurs, physical features and habitat of the dinosaurs. The teacher used some various playing methods to attract their interest to understand and actively involved in the class activities. Some of those methods were exploring the miniature’s dinosaurs, watching movie or video of dinosaurs, pairing a picture (between the name and the kinds of dinosaurs), making a dinosaur’s song, reading a dinosaur’s book, role playing of dinosaur’s life, pictorial, puppet’s storytelling, visiting to the dinosaur’s museum and. After the children know the dinosaurs, the teacher asked them to compare the characteristics of the dinosaurs with the characteristics of animal that lives in the present day.

### **2.4 Topic of The Assumption of Dinosaur’s Extinction (during 1 week)**

A topic about the extinction of dinosaurs was the last topic that we introduced. This topic discussed further more about the concept of place and time of the dinosaur’s life. In early of this topic, the teacher asked the children to watch a film that explained about the cycle of the dinosaur’s extinction, then provided some sequence pictures about the extinction of dinosaurs which will be arranged by the children.

## **3 USING LESSON STUDY TO IMPROVING CHILDREN UNDERSTANDING ABOUT THE EXTINCTION OF DINOSAUR**

The teacher found difficulty on the last topic, which was about how to introduce the concept of dinosaur’s extinction. After some playing methods are used to introduce the concept of dinosaur’s extinction, the teachers thought that children do not fully understand and get the concept. So we agreed to make an open lesson which consists of teachers, school leaders, and education expert, hoping that we could find some possibilities methods for the children to be more understand the concept of dinosaur’s extinction.

At first, we planned to design some activities for open lesson. We agreed to use a role play method about the extinction of dinosaurs in the group time. While in choice time, we opened some choices area, such as arranging the cycle of dinosaur's extinction in literacy area, pairing a dinosaur picture with their name of dinosaur in toys area, and digging some fossils of dinosaur's miniature in discovery area.

Based on our observations, the learning style of children majority were a kinesthetic visual study where they would be faster understand new information through visual stimulative (picture, video, photograph) and motion or direct experience or a kinesthetic felt (senses activity, dancing, and role play), so we decided to use a role play method as a compatible method for children to introducing the concept of dinosaur's extinction. This method facilitate the needs of kinesthetic visual learning style, because there are some move activities such as played act like dinosaurs that they had learned in the previous learning.

In addition, role play activities also facilitate children language development, because the children made a dialogue and expressed the character of the figure that they played. Another benefit of role play is expressing how the children play in their fun activity, pushing activity, the initiative and creativity of children so they can actively participate in learning, and also helps to deprive of a feeling of shame, indisposition and moodiness of the children (Setiyowati, 2013).

According to our discussion, finally we agreed to close choice time area, because the activity that activity in the area was less continuous with the aim of classical activity (group time).

### 3.1 Planning of Lesson Study

Before we designed activities, first we mapped out the goals we want to achieve. As the indicators, we made predictions about behavior and comments that might come from the end of learning as the target/goal this activity. Then on the next step after we made predictions comment, we made the scenario of dramatization activity. As well as making a movie plot, we divided it into a number of chapters, namely the peaceful phase, thrilling phase and extinction phase.

Phase of peace is a phase that the kids were playing the dinosaurs in the stable conditions that they might eat of his food freely, they would life peacefully and well being, because their demand is fulfilled. They were also able to interact with another dinosaurs well.

Meanwhile Thrilling phase is a condition where the earth struced by meteor rain. The forests were getting burned and some dinosaurs injured by meteor. When the time goes by, the food supplies of the herbivore dinosaur was gone. They ran around to save themselves. The last phase is extinction phase where gradually the herbivores dead. The carnivores also ultimately died because there was no longer another dinosaur meat they can eat.

After lesson plan described clearly in every steps, we continued prepared the materials and set room that will support situation of dramatization so that it felt more real by children. These are the material that we set:

- Chosed large room enough for children to move in dramatization.
- Made some life-set area of dinosaurs, such as : sea with pictures of fish, savannah, threes fruits, and pictures of wanted meat.
- Prepared meteors from red and orange balls.
- Prepared lights and wind setting.
- Prepared music effect which accordance for every phase of dramatization.

In this preparation of lesson study, we also determined some tools we used to measure how deep the concept absorbed by the children. We would ask children to draw dramatization situation that they had played then asked them to tell their pictures in front of friends, teachers and observers.

### 3.2 Topic of time concept (during 1 week)

The activity began with circle time. Children sang dinosaur's song, moved like dinosaurs, and played the guesswork game about dinosaurs. The teacher gave prolog that today children will be invited to the role play about dinosaur extinction. After that, dramatization started.

Teachers gave the children opportunity to choose their own dinosaurs characters that they would play. In that time we provided pictures of Triceratops, Brontosaur, Stegosaur, Pteranodon and for they stick in their clothes. After each child had their own dinosaur, the children were invited to sing and dance a dinosaur movement. The teacher repeated briefly stage by stage of dinosaur's extinction in the picture. Children were still focus while listening to the story. After that the dramatization began.

#### 3.2.1 Peace Phase

“Rawr, rawr, nyam..nyam”, said Rakha when he ate some meat.. “I want that meat too.” Said Rizki suddenly came to the crowd. Their body facedown like T-Rex who ate their hunted meat ravenously. After they had satisfied, Takha said, “ I have saturated”. “Lets move to other places” Zahwa added. Then they went to look for some meat in other places. In another side, there were Mike, Ghali and others T-Rex were struggling to get their food.

The Pteranodons such as Adzra, Sakhi and Putra were flying in the edge of the beach. When they saw some fish, Putra said “There are some food. Lets catch them!” Then Pteranodons caught some fish quickly and ate their hunted fish.

In another side of forest, the Brontosaurus were eating leaves and fruits from the tree. “Am, nyam..nyam.. The fruits are so delicious.” Said Dian to other Brontosaurus near her. Then Ken, the male Bronto, came closer and took the fruit that was hanged on the tree.

In the grass field, Triceratops and Stegosaurus were chewing green and fresh grasses ravenously. Kayla, female Triceratops looked so happy when she ate grasses. Her cheeks were puffy. It seemed that her mouth was full of food. When she was eating, Kayla consistently attached her three fingers on her forehead as Triceratops horn.

In that day all of dinosaurs lived quietly and peacefully. They got enough food. They also could take some rest comfortably and played with another until came one time that they have never taught before.

### 3.2.2 Thrilling Phase

At that time, the wind was blowing strong. Leaves and papers were flying into the air. Red and orange balls were thrown from all over the room as meteors which bombarding the earth. The dinosaurs was running arround to get a save place. “Aaa help, help. There’s meteor rain.” shouted Mike, the male T-rex. The dinosaurs felt so scared with that meteor rain. Some of them squated in the room corner as they crossed their hands over their chest. There were also dinosaurs that kept running to look for hiding places.

Suddenly, a T-rex fell because of raging meteors. He didn’t move. “T-Rex is faint” said Aretha, The female Bronto. Other dinosaurs spontaneously

approached T-Rex and tried to wake the predator. Some of them also became weak and some were walking with a limp because they got hit by a meteor. In the midst of heavy meteor shower that attacked the Earth, the dinosaurs continued to attempt to save themselves while also helping fellow dinosaur slowly until finally they fell asleep because of fatigue.

### 3.2.3 Extinction Phase

A few moments they were unconscious. When they woke up, the atmosphere was silence instantly. Butthen the forest, habitat they lived, has been ravaged. In the rest of the energy, they woke up and tried to save themselves. But that happenedoutside their imagination. The meteor rain happened again. This time, it was worse than before.

A meteor attacks over and over again. Fire blazed everywhere, burn all wood and foliage so that no leaves and wood anymore. The dinosaurs could no longer sustain their life. One by one dinosaur large bodied plant-eating died because could not escape from the fire. Overtaken by carnivore’s dinosaurs eventually was gone because there were no herbivores dinosaurs that they could eat. There were no more left over since the events of the meteor shower. The forest was once fertile have become a sea of gray. The lake was no longer watery. Unfortunately, there were no more dinosaurs on Earth. They have become extinct.

### 3.2.4 Review Activities (Through Pictures and Story Telling)

After pretend play, kids are invited to review the activities of dramatization by asking them to retell what they already do in that dramatic play. Children were also asked to tell the feelings they felt when played into adinosaur. To measure the extent to which children's understanding of the concept of dinosaur’s flow extinction, they were asked to draw the flow of dinosaurs’s extinction. They are allowed to choose the most memorable phase for them. After that, they told the picture they have made.

One of the student who was asked to tell the story is Keenan. “Bwonto (Bronto), Pteradon (Pteranodon), T-Rex and Stego. T-Rex eat meat. Brontosaurus eat leaves, then Stegosaurus eat leaves too. Pteranodon eat some fish. There are sun and cloud there. Then all dinosaurs feel happy.” Said Keenan when he told the story. Keenan could

describe and told the peace situation when dinosaurs have enough food to eat and could life calmly.

Another children’s picture that was selected to tell is Sigi’s work. He drew some big circles and some little circles and make random curved lines. Teacher confused with his simply picture because forms he made was unclear delineates dinosaurs. Finally teacher asked him to tell story. “This is the time when the meteor attack. Many of them run because of fear of being attacked. And then no food anymore, then the dinosaur run out.” The teacher asked how was his feelings when he became Triceratops who affected by meteor rain. Sigi said, “I’m sad because of hit by meteor rain.”

### 3.3 Reflection and Discussion: Post Lesson Discussion

According to lesson plans that we made before, we review indicators of children comments that we have written in the lesson plan and we have predicted will be out. We found that almost all of the predictions appear. In pretend play, there was children who commented, “Dinosaurs die because hit by meteor rain.” Venota said. There was also Zahra who commented, “The forest is burned out. Dinosaurs have no more food.” Others children gave various comment. Comments that were said by the children reflected that by dramatization, their language capability is developed. This is because when joined with other children in the dramatization, they will learn to choose and use the words that appropriate with the role that they played (Dodge, Colker & Heroman, 2011).

Mika’s comment that said, “T-rex hungry cause there’s no food so that he die.” appear in dramatization and on the work of a child. We saw activity that dramatization with support condition, children could living up the concept they being learned. The children began to understand the abstract concept.

We see that childrens can more understand the concept of the dinosaur’s extinction. It is visible from more varied work and stories that more complete and flows. Kim (in Bergen : 2002 ) declaring that child in dramatization of can tell the story more and has the ability to tell stories better. The ability to tell stories is necessary to improve the capabilities literacy. A child who performs dramatization can repeat the story more

actively and more complete. It is proven by the story of work from some kids who were more complete if it is compared with the stories work before they made. Child has own sense of the experience of being dinosaurs, so that when the storytelling they can express in a wider what they have experienced. This opinion was expressed also by Dheini (2008) that revealed that one of dramatization benefits is children can understand the contents of the story because play with it.

In post lesson discussion, we saw a child picture example which showed their understanding of the dinosaurs extinction. It makes us agree that dramatization activities with good setting of areas made an abstract concept be more meaningful and contextual for kids.

Based on the results of observations, children looked so animates the role that they played. There were some children who calmly eating grass while remains form horn in her head as triceratops. There were also a child ran in and out as with fear and hiding when meteor rain attacks. During extinct phase, some children pretend to be faintness dinosaurs and there were those who acted like dead dinosaur because he was simply not move.

They use imagination that there was in their minds to involve the life of the dinosaurs. This is in accordance with the definition of dramatization according to Depdikbud in Dhieni (2008) which said that dramatization is playing a role as people or object with the aim to develop imagination and inspiration. Dodge, Colker & Heroman (2011) revealed that, when children play a role, they created the image in their minds about the experiences that they have before and of the situation that they imagine. The outlook for this process is a kind of abstract reasoning.

Behavior that they show in dramatization, is an accumulation of experiences and knowledge which they got in previous lessons. The kids have taught about the type and the characteristics of each dinosaur. So that when they acted like dinosaurs, they could show the behaviors as dinosaurs characteristics they had known. Bergen (2002) said that the qualified pretend play is important facilitator from the perspective taking and further abstract reasoning. The division of time in the dramatization which is divided into three phases makes children easier to understand the process of the extinction of dinosaurs which occurred gradually.

We argue that the effect of dramatization of understanding abstract concept to the extinction of dinosaurs more easily understood children because children get direct experience of the situation of extinction that incremental supported by setting an area in accordance with the condition in every phase. In dramatization, it is visible relations between the imagination, knowledge and experience while children playing a role. So these activities can increase better children understanding about the extinction of dinosaurs.

#### 4 CONCLUSION

Lesson Study team that the election of dramatization method to introduce the concept of dinosaurs extinction is the right methods because with this method children can easily understand the process of the extinction of dinosaurs. Dramatization can develop some developmental aspects such as cognitive, languages, physical and social emotional. This is evident from children's expression of internalization when they played their favorite dinosaurs and commentaries in dramatization which is suitable with teacher taught. Beside of that, the results of work made more varied and more 'rich' than the work before. When they told the story, they could tell you with more spontaneous and more detailed. Because activities that they directly experienced more meaningful to them.

## Lesson Study in Application of Faculty of Mathematics and Natural Science UNDIKSHA for Development Higher Order Competence and Local Wisdom and Local Genius

I Gusti Agung Nyoman Setiawan<sup>1</sup>

<sup>1</sup>*Lesson Study Team Leader, FMIPA UNDIKSHA*

**Abstract:** Activities Lesson study in the FMIPA Undiksha based on internal awareness to develop an innovative model in the professional development of teachers and lecturers in full in accordance with the context of the life of the Indonesian nation. This is done to increase the excellence and competitiveness by FMIPA Undiksha in the global competition. Implementation of lesson study in the FMIPA Undiksha based on the principles of professional development on an ongoing basis-oriented characteristic the following three: (a) Development of higher order competencies; (b) The utilization of information and communication technology (ICT), c) The development of local wisdom and local genius. Results of Lesson Study activities in the form of a real lecture preparation designed collaborative, collegial, and application of innovative learning with Higher Order Competencies, unchanged local wisdom and local genius, and the use of ICT had a positive impact on the learning process. It looks at several indicators such as the following. ( a ) Interaction between students occurs maximally means students are very active in university classes in accordance with the planning of the team. ( b ) The interaction of students with teaching materials is very good as a result of instructional materials prepared in the form of the Student Worksheet and other similar tasks that could challenge the ability of the student . ( c ) The interaction of students with lecture occurs maximally because lecturers are always ready to be a facilitator in the lecture. ( d ) The interaction of students with an excellent environment for learning environments have been designed in such a way that students can learn maximal. ( e ) a model motivated faculty to prepare higher quality lectures. ( f ) The creation of the exchange of knowledge about the students' understanding of thinking and learning . ( g ) the occurrence of collaboration and collegial fellow lecturers . ( h ) Reduce alienation lecturers from the community.

**Keywords:** Lesson Study; higher order competence; local wisdom and local genius

### 1 INTRODUCTION

In accordance with the demands of PP 19/2005 on Teachers and Lecturers, the increase in the professionalism of teachers and lecturers are intact and sustainable is an urgent requirement. One indicator of the professionalism of the faculty can be seen from the quality of her care lecture. Class is a core activity that determines the quality of education in universities. The role of the lecturer is crucial in the process and outcome quality lectures primarily as a facilitator and mentor students in the learning process. Preparation activities in the classroom that are designed and implemented so that the student can empower potential learning outcomes for the better.

During these innovations have been carried out by lecturers in the FMIPA- UNDIKSHA in lectures, for example through research and teaching program in get through various research grants and teaching such , PPKP, Grant A2, DUE -like, I- MHERE, SP4,

funds DIPA . Innovation lecture done by the lecturer during the time in order to research and evaluation after the study was over was done individually by the lecturer concerned, if there is one subject that was raised by more than one lecturer tends in practice carried out separately by dividing the study materials . Lecturers who together guide the team teaching university classes, but its implementation has not been optimized and limited to practical activities . These problems have been tried to overcome through the implementation of lesson study during the last 2 years.

Activity lesson study in the FMIPA- UNDIKSHA based on the internal consciousness to discover-develop an innovative model in the professional development of teachers and lecturers in their entirety in accordance with the context of the life of Indonesian people. This is done to increase the excellence and competitiveness of the FMIPA UNDIKSHA in global competition. The

implementation of lesson study in the FMIPA-UNDIKSHA based on the principles of professionalism in sustainable development-oriented characteristic of the following three .

- a) The development of competence is higher (higher order competencies); through lesson study that educators (teachers and lecturers) are expected and given ample opportunity to innovate collaboratively in order to achieve higher level of competence to increase competitiveness (competitiveness) graduates in this global era.
- b) The utilization of information and communication technology (ICT); through lesson study that educators (teachers and lecturers) are expected to perform a variety of innovations by utilizing ICT, especially in the enrichment of the learning resources, exchange of information and the utilization of shared resources .
- c) The development of local wisdom and local genius. Learning-oriented local wisdom and excellence is an appropriate strategy to increase the excellence and competitiveness of the nation. Because it needs to be grown and fostered a new awareness in order

## 2 IMPLEMENTATION OF LESSON STUDY

Lesson Study Period grants Ganesha University of Education was in 2009 to 2011. Coverage of the courses involved are four (4) departments in the Faculty of Mathematics and Natural Sciences ( Natural Sciences) UNDIKSHA and departments in the Faculty of Sports and Health (FOK) as well as a school that UNDIKSHA high School (SMA) UNDIKSHA Laboratory. Each department in the Faculty UNDIKSHA implement Lesson Study team for 2009 and 2010 is as much as two (2 ) teams per semester while for the third year as one team per semester , so that each department for three years is 10 ( ten ) teams or ten subjects , whereas in FOK conducted at the Department of *Penjaskesrek* is as much a team for 2010 and one for 2011 so the team during this grant there are 40 ( forty ) teams or courses in Natural Sciences and two (2 ) teams or eyes FOK while studying at the Laboratory School Lesson Study activities carried out with funds Faculty Community Service, so that is no longer funded by this activity. Lesson Study activities carried out in the four cycles of plan do see. Participation lecturer for three years in the Faculty already all involved in this team, although not all lecturers had become a model, while in FOK only involved five lecturers .

Implementation of Lesson Study that need to be reported on this occasion is the use of ICT, students

are required to become more ICT literate, as well as other characteristics of Lesson Study in UNDIKSHA that apply the advantage and local knowledge in the relevant courses makes students better understand the linkages science cultivated with wisdom and local advantages, especially in Bali

### 2.1. Progress And Result Have Been Achieved

Lesson Study activities at the FMIPA-UNDIKSHA in fiscal year 2011 can be grouped into two: workshops and implementation of Lesson Study . The results of the workshop are as follows ; a) Understanding FMIPA-UNDIKSHA lecturer about the concepts, principles and practice of Lesson Study has increased . This is demonstrated by the ability of the lecturer to explain the concepts , principles and lecturer lesson study was able to demonstrate the steps of Lesson Study well ; b) The ability of faculty to develop and implement innovative learning models through Lesson Study rise. This is demonstrated by the ability of faculty to develop and implement some innovative learning models such as cooperative learning models , learning cycle model, PBL, and Mathematics Learning Constructivist Perspective Oriented Cognitive Style and Culture (PMKGB) , and others ; c ) Ability to make the college lecturer charged local knowledge through Lesson Study rise. This is demonstrated by the ability of faculty in preparing learning device charged local wisdom such as : RPP , LKM , Hand Out , Textbook , and others .

The results of the implementation of Lesson Study activities activities that have achieved results are as follows : a) The ability of implementing lecture lecturer in charge of local wisdom through Lesson Study rise. This is shown by the integration of local knowledge in each lecture for faculty models tailored to the characteristics of each course . In addition to being able to implement local wisdom - laden lectures , lecturers are also able to develop a learning model that charged local knowledge ; b ) Collegiality among faculty increases. This is indicated by the good cooperation between the lecturers in the preparation of lesson plans, tools, and other lecture material . In addition , through collaboration in terms of improving the quality of learning will be increased collegiality among faculty , especially faculty who engage in Lesson Study activities . With Lesson Study activities will reduce the alienation of lecturers from the community so that there is no gap between lecturers between senior faculty with junior faculty and between superiors and subordinates . This leads to an increase collegiality among person in faculty ; c ) The ability of faculty in developing Higher Order Competencies students

increased . This is demonstrated by the ability of faculty in designing learning such as the preparation of lesson plans , MFI, Instructional Materials, Hand-out, and others have to explicitly load the Higher Order Competencies . In addition, the implementation of learning is also applied to the Higher Order Competencies as planned. One example is the use of Higher Order Competencies in terms of asking questions that do not just ask about the "what" , but has been asking questions about the " why " and " how " . This will affect the thinking ability of students leads to Higher Order Thinking. The ability of faculty in the use of ICT in learning activities is increasing. This is demonstrated by the ability of the faculty in using ICT not just as just like watching a TV show but has been used as cognitive tools ( Cognitive Tool) .

## 2.2 Best Practices

Having regard to the preparations made lecturer in Lesson Study activities are collaborative, collegial , and application of innovative learning with Higher Order Competencies, charged local knowledge, and the use of ICT had a positive impact on the learning process as follows .

- a) The interaction between students occur optimally means that students are very active in following the course in accordance with the planning of the team .
- b) The interaction of students with very good teaching material as a result of teaching materials prepared in the form of MFIs or other similar tasks that could challenge the ability of the student .
- c) The interaction of students with faculty occurs maximally because the lecturer is always ready to be a facilitator in the lecture .
- d) The interaction of students with an excellent environment for learning environments have been designed in such a way that students can learn masimal .

The impact of increasing the quality of learning is characterized in particular in the FMIPA-UNDIKSHA during and after the implementation of Lesson Study activities . In addition to increasing the quality of learning , there is also an increase in the quality of lecturers in the FMIPA-UNDIKSHA which is characterized by the following points .

- a) Motivated lecturers prepare a model for higher quality lectures .
- b) The exchange of experience among students membelajarkan faculty in a collegial group .
- c) The creation of the exchange of knowledge about understanding student thinking and learning .

- d) The occurrence of collaboration and collegial fellow lecturers .
- e) Reduce alienation teachers (from the community).

## 2.3 PROBLEMS IN THE IMPLEMENTATION

There are several obstacles encountered in conducting Lesson Study in Mathematics and Natural Sciences UNDIKSHA are as follows .

- a) The difficulty of presenting all team members complete at each of Lesson Study activities as a result of another task of the institute .
- b) Another difficulty is experienced in integrating local knowledge in a particular topic in courses on subjects such as calculus 2 at the Department of Physics , and several courses in mathematics education majors .

Efforts are being made to overcome the obstacles identified above include:

- a) By taking the course contact hours in the afternoon with fellow team members before discussing Lesson Study .
- b) Equalization of time before scheduling the course of lectures at the Faculty so that all the members are ready to Lesson Study in accordance with the schedule of lectures .
- c) Trying to bring a resource associated local knowledge and then discuss / match between local knowledge along with the lecture material resource.

## 2.2 Plans To Maintain Sustainability

Actions taken with regard to the planned program , among others, as follows .

- a) Implement the plan Lesson Study activities that have been planned in the proposal .
- b) In the long run this policy as a policy set faculties / departments that are supported by all parties , including funds / facilities needed .
- c) Lesson study used a model in coaching students in conducting lectures Teaching and Learning Strategies , micro teaching activities and PPL - Real on the ground , in hopes of fostering pattern himself as a candidate for a professional teacher, will be transmitted and continued after they became a real teacher in the school where they serve

### 3 CONCLUSIONS

Based on the above , it can be concluded that the Lesson Study activities can improve :

- a) Understanding lecturer FMIPA-Undiksha of concepts, principles and practice of Lesson Study,
- b) The ability of the lecturer FMIPA-UNDIKSHA in developing and implementing innovative teaching models ,
- c) The ability of the lecturer in FMIPA-UNDIKSHA laden lectures make the local wisdom,
- d) The ability of the lecturer FMIPA-UNDIKSHA to implement local wisdom and local genius,
- e) Collegiality among faculty ,
- f) The ability of the lecturer FMIPA-UNDIKSHA higher in developing competence ( higher order competencies ) students , and
- g) The ability of the lecturer in FMIPA-UNDIKSHA utilize ICT in learning

#### Recommendation

Based on the results and benefits derived through Lesson Study activities, it is recommended to continue the activities of Lesson Study in Mathematics and Natural Sciences UNDIKSHA and expand targeted to other faculty in Undiksha, as well as to high school

## Improving Students' Interactions In Learning Mathematics Through Lesson Study

Linda Vitoria

Prodi PGSD FKIP Universitas Syiah Kuala, Banda Aceh, Indonesia

[lindamarsaidah@gmail.com](mailto:lindamarsaidah@gmail.com)

**Abstract:** This article reports a lesson study conducted to improve students' interactions in learning mathematics. Three aspects of students' interactions were assessed: 1) student-student interaction, 2) student-teacher interaction, and 3) students' interaction with learning resources. Three observers and a class of 30 students at PGSD FKIP Syiah Kuala University participated in the study. Prior to the study, the teaching and learning process in the class had been highly dominated by the teacher so that students' interactions were very limited. This condition may be the reason for the students' low achievement in mathematics. Implementation of various teaching strategies through lesson study was conducted as an effort to improve students' interactions. Data was gathered through documentation, observation, and reflective discussion with the observers. During lessons, the observers assessed whether the three aspects of students' interactions took place by giving scores: 1 (almost never), 2 (seldom), 3 (sometimes), 4 (often), and 5 (very often). In the first lesson, the students were asked to work in groups to solve a set of real numbers problems. Data showed that students' interaction with the teacher took place often, but their interaction with their peers and learning resources seldom took place. Despite the instruction to do group discussion, many students worked alone and only shared their answer when they were finished working individually. In the second lesson, Snowball Throwing was implemented. Data showed that the three aspects of students' interactions took place often. In the last meeting, modification of Two Stay Two Stray was employed as the teaching strategy. Data showed that the three aspects of students' interactions took place very often throughout the lesson.

**Key Words:** lesson study, students' interactions

### 1 INTRODUCTION

Basic Mathematics is a compulsory course for first-year students at PGSD FKIP Syiah Kuala University (Primary Teacher Training at the Faculty of Teacher Training and Education, Syiah Kuala University/Unsyiah). It covers number system and number operations among other contents. Good understanding of number system and number operations is crucial for learning other contents in the course and other mathematics courses offered at PGSD. Based on observations conducted at the beginning of Basic Mathematics course in 2013, it appeared that students' understanding of numbers was unsatisfactory. The students did not show thorough understanding of number system, number operations and their properties.

Students' achievement in learning is closely related to how teacher designs the teaching and learning process in the classroom (Wright, Horn, & Sanders, 1997). In Basic Mathematics course at PGSD FKIP Unsyiah, the class usually begun with material presentation by the teacher followed with group assignments and ended with a test which was designed to assess students' understanding of the material. The students would pay attention to the teacher's presentation and do their assignment diligently. But the teacher's domination may have diminished the students' interaction with each other and in turn, hindered students' learning.

Active learning approach proposes that students need to construct their own knowledge and experience it in order to fully understand the knowledge (Brown, 1994; Karpicke, 2012). Engaging students in mathematical activities is a crucial component of teaching mathematics because active learning is the core of meaningful learning (Prince, 2004). Through interactions in the classroom, students gradually build their understanding of mathematics. Therefore the teaching and learning process needs to be designed to assist the students make sense of mathematics.

Three consecutive lesson-study-based sessions reported in this article describe the implementation of active learning approach intended to improve students' interactions in learning real number system at PGSD FKIP Unsyiah. Three aspects of students' interactions were assessed: 1) student-student interaction, 2) student-teacher interaction, and 3) students' interaction with learning resources.

### 2 CONCEPTUAL FRAMEWORK

Lesson study is a continuous process of teachers' professional development through collaborative planning, implementing, observing, evaluating, and revising a lesson and sharing the results (Sato, 2011; Rock, 2003; Ibrohim, 2013; Chassels & Melville, 2009). Lesson study originated from Japan and widely accepted and implemented by educators

around the world. Mathematics teachers in Japan conducted lesson study in their classrooms aiming for two important goals: establish students' interest in mathematics and promote creative mathematical activities (Takahashi, 2006).

The collaborative process of lesson study follows the following stages: 1) formulate learning goals for students; 2) develop lesson plan to address the goals; 3) observe students' interactions during lesson and record students' works which show their understanding; 4) share data; and 5) discuss and analyze the data for next lesson revisions. The whole process is documented to enable the teacher and observers to critically reflect on their professional teaching and development.

### 3 LITERATURE REVIEW

Based on the constructivism philosophy that knowledge cannot be transferred but constructed by learners (Clements & Battista, 1990), teaching and learning process in schools and universities should be carefully designed to facilitate learners constructing their knowledge. Two most important aspects of knowledge constructions are: 1) learners build their knowledge based on their pre-existing knowledge, and 2) learning is an active activity not passive (Hoover, 1996). Even more important in students' learning process is collaboration (Sato, 2011). Through collaboration, students actively express and share ideas and construct their understanding. In other words, students learn when they collaborate.

In the learning process, students interact with the environment in the classroom: the teacher, peers, and learning resources. The quality of the interactions is highly influenced by the teacher's and the students' perspective of the classroom practices and norms (Cobb & Yackel, 1996). For example, students who are used to learn in a conventional classroom are usually confident answering a question asked by the teacher only when they are certain that they have the right answer. They are used to sit down quietly while the teacher is exposing them to content materials and are not used to being asked to express their opinions. These practices can be improved by implementing more interactive teaching and learning activities that allow students to interact with their peers, the teacher, and with the learning resources.

Students' interactions can be facilitated by engaging students to work in pairs or groups and presentations. Silver (2010) reported a study conducted in primary classrooms in America which employ active learning that about sixty percent of the activities in the classrooms is group work and twenty percent is students' explanation or presentation. In group work, students are given the opportunity to work collaboratively, share informations, and

improve their social skills such as respecting others and being tolerant. While during presentation, students improve their communication skills such as expressing ideas, giving statements, and responding to others.

### 4 LESSON STUDY

Lesson study is a professional development model implemented by teachers who are collaboratively and intellectually involved in the act of teaching for understanding aiming to improve students' learning (Lewis, 2002). In lesson study, teachers work together to discuss learning goals, plan lessons to achieve the learning goals, observe the delivery of the lessons, and discuss their observations to refine next lessons (Chassels & Melville, 2009). The practice of lesson study is not meant to criticize teachers, but it is to improve teaching practices (Ibrohim, 2013).

The phases of lesson study according to Lewis (in Ibrohim, 2013) are as follow: 1) forming the team; 2) determining the focus of lesson study: deciding the topic, lesson unit and its goals; 3) planning a lesson corresponding to the learning goals; 4) delivering the lesson and observing the delivery of the lesson; 5) discussing data gained from the observation during lesson delivery; and 6) planning what to do next based on discussion and reflection. In Indonesia, lesson study was introduced by experts from Japan through a development program of mathematics and science for elementary and high school at the end of 2004 (Ibrohim, 2013). A cycle of lesson study encompasses three phases: plan, do, and see.

Ibrohim (2013) explains further the three phases in lesson study: In phase 'plan', lesson study team identifies the problems occur in a classroom and design a good lesson plan to solve the problem. At this phase, lesson content is decided, fitting teaching method is selected, suitable learning sources are organized, and observation sheet is formulated. In phase 'do', model teacher delivers the lesson as planned. The other team members observe the teaching and learning process and make record of the lesson. During the delivery of the lesson, observers are not to interrupt in any way. In phase 'see', the team gathers together to discuss the teaching and learning process started with personal reflection by model teacher. And then one by one the other team members communicate their analysis based on their observation during the delivery of the lesson. Photos and videos are used to clarify statements. Next, the teacher or the team design next lesson plan.

Lesson study benefits all parties involved: the model teacher, fellow teachers, and the students. The model teacher gains advice, assistance, and

suggestion to improve his or her teaching practice; fellow teachers can learn from the observation and discussion processes. Chassels and Melville (2009) state that lesson study provides the opportunity for teachers to build a professional learning community, improve their knowledge of the curriculum and pedagogical knowledge, and develop critical, analytical, and reflective thinking. Lesson study also benefits students, especially preservice teachers. Rock (2003) reports her study on lesson study model for preservice teachers that the collaborative works enhanced preservice teachers’ knowledge, cooperative skills, and professionalism. The participants declared that lesson study gave them the chance to observe, analyze, and understand the development of a lesson plan.

## 5 METHOD

The study was conducted at PGSD FKIP Unsyiah at the beginning of odd semester in the academic year of 2013-2014 in Basic Mathematics Course. Four teachers (one model teacher and three observers) and thirty students participated in the study. The study was organized in three lessons. Each lesson contained the three phases of plan, do, and see as shown in the following figure.

Figure 1. The Procedure of Lesson Study (Ibrohim, 2013)

Data collection for this study was gathered through documentation of teacher’s personal reflection, observation notes, and group discussion throughout the whole process of the lesson study. The focus for this study was students’ interaction: 1) student-student interaction, 2) student-teacher interaction, and 3) students’ interaction with learning resources.

First, the team carefully planned a lesson plan. Next, the model teacher carried out the lesson plan. During the delivery of the lesson, the observers recorded their observation on the observation sheet. Their observation focused on, but not limited to, students’ interaction. They were to give scores 1 (almost never) to 5 (very often) for the three aspects of students’ interaction according to the frequency of the aspects’ occurrence. After the completion of the lesson, all team members gathered in a colloquium to discuss the lesson. Firstly the model teacher submitted a personal reflection detailing her lesson study experience. Then the other team members were to elaborate their observation. The whole discussion was documented as well as the teaching and learning

process. The documents served as the foundation in the planning for next lesson.

## 6 DISCUSSION

### Lesson 1

As the focus of the lesson study was to improve students’ interaction, the team agreed to implement group work and group presentation in Lesson 1. The subject matter was Real Number System encompassing natural numbers, integers, rational and irrational numbers. The learning resources to be used were power point slides, hand-outs, and worksheets. The teaching and learning process in lesson 1 started with the teacher’s statements of learning goals continued with a number game to get the students motivated. Core activities started with teachers’ explanation followed with questions and answers. Then the students were asked to work in groups of 5. The students submitted their worksheets before the lesson ended. Group presentation was canceled due to time limit. The teacher spent more time than was planned in giving explanation at the start of the lesson and allowed too much extra time on the students’ demand in finishing their group task.

In phase ‘see’, the whole team agreed that students’ interaction in Lesson 1 was unsatisfactory. The teacher dominated most of the teaching and learning process. The model teacher expressed that she took a lot of time explaining subject content because the students’ mastery of prerequisite topics prior to learning real numbers was inadequate. She feared that lack of explanation would hinder the students from following the learning activities for the day. The observers argued that student-student interaction only occurred in the last thirty minutes when the students worked together in groups. Even then, discussion was not adequate. Many students did not join the work and merely relied on their friends in completing the group task. On the other hand, the interaction between students and the teacher was fairly satisfactory: the students paid attention to the teacher when she was explaining and they asked and answered questions offered by the teacher. As for the interaction between students with the learning resources, two observers gave score 3 which meant that the interaction only occurred occasionally that was when the teacher asked the students to pay attention to the power point slides. The other observer gave score 2 which meant that the interaction seldom occurred. According to the observer, few students actually paid attention to the learning resources.

During the colloquium session, the team agreed on improvement in teaching strategy to allow student-student interaction, better hand-outs, and better time planning. Special attention should be paid

to student-student interaction and time management. Getting students to get used to finish tasks on time is important. It is not only to make sure that every activity in the lesson plan is carried out, but it is a good habit that students and teachers alike should practice in their daily life.

## Lesson 2

The subject matter for Lesson 2 was real number operations word problems. This was an important and challenging topic. Students usually considered word problems to be difficult and hence lost interest in learning them. On the other hand, word problems hold a very crucial role as a bridge to connect mathematics with real world (Haghverdi, 2012). Word problems present mathematics in real life context. Students' fear of word problems can be reduced if they can see that word problems help them understand the use of mathematics in real life. In planning Lesson 2, the lesson study team intended to give a guessing game at the beginning of the lesson to engage students in learning number operations word problems.

The teaching strategy to be implemented was a modified Snowball Throwing model as an effort to improve student-student interaction. After the guessing game, the teacher would expose the learning objectives for the day which were to solve number operations word problems. Then the teacher would invite the students to collaboratively solve five word problems in front of the class. After that each student would be asked to create two number operations word problems and write them on a piece of paper. The paper would be folded and thrown to other group to be solved individually by the members of the group. After the word problems were solved in a given time, the paper would be returned to the original owner for checking. And finally all papers would be submitted to the teacher. Group presentation would be done by calling a member of every group to present their work in front of the class. The class would be ended with individual evaluation for ten minutes.

Phase 'do' for Lesson 2 was started by dividing the students into five groups of six. The teaching and learning process went nearly according to plan. The opening guessing game caught the students' interest that they actively offered their answers to the question. Visual illustration also helped in engaging the students. On the other hand, the next activity which was the snowball throwing activity took more time than expected because the students needed more time in designing and answering word problems, and also in checking their friends' solution to the word problems. This caused less time for the remaining activities. As a result, group presentation done hastily with no spare time for questions and answers; classical conclusion at the end of the class was

executed hurriedly; and only one out of two planned problems was given for individual evaluation.

Observation showed that the execution of Lesson 2 was better than the previous lesson. The model teacher stated that the students were actively involved in learning and their interactions were improved. On the other side, as the students were not used to word problems, they seemed to find it difficult to design and answer word problems hence they asked for more time to do the task. However, the lesson study team agreed that interaction among students took place very often throughout the lesson. But improvement is needed so that students could collaborate better. The students were not used to communicate freely in a class. Therefore lesson plan revision was needed to allow students to experience a more collaborative learning.

The atmosphere of the class during Lesson 2 seemed to be enjoyable, students participated actively, and the teacher did not dominate the teaching and learning activities. Through the activity of trading word problems, the students shared their existing knowledge. This is a good exercise to help the students be aware of what they know and what they need to learn more. It also helps the teacher to see what the students already understand. During Lesson 2, the interaction between the students and the teacher was satisfactory: the students listened intently to what the teacher had to say and they actively answered questions. During the lesson, the students did not only learn from hand-outs provided by the teacher, but also from their peers through snow ball throwing activity.

Based on the observation, the lesson study team agreed that there were some aspects that needed improvement: 1) students' communication with each other; 2) the teacher needed to be more precise with the time so that the activities designed in the lesson plan could be completed well in order to achieve planned learning goals; 3) provide flipcharts for the students to write their work on so that they would not need more time to rewrite their answers on the board while doing their presentation. There was another finding during Lesson 2: there were some students who were used to ask directly to the teacher whenever they found something they did not understand without trying to figure out it for themselves first. The team worried that this habit may influence students' self confident, collaboration, and their analytical thinking. Therefore, the teacher needed to remind the students to always read information carefully, and practice to understand them on their own carefully.

**Lesson 3**

In phase ‘plan’ for Lesson 3, the team designed the lesson plan to teach properties of real numbers. Modification of Two Stay Two Stray was chosen as the teaching strategy where every student would be given the opportunity to play their role actively in giving information to their peers and also carefully listening to their peers’ explanation. It was crucial to ensure that all the groups would be heterogenic in order to avoid the low achieving students to be selected into the same group. Based on previous observation that the students needed a lot of time in finishing group task, more time was allotted for group work for Lesson 3. Flipcharts were prepared for the students to write their work on. Two worksheets were designed to guide the students in doing their task. The first worksheet was aimed to help students understand the properties of real numbers and the second worksheet was to assist students in visiting other groups.

Phase ‘do’ for Lesson 3 was started with the teacher’s explanation on learning goals for the day. Then the students were divided into two main groups where each group consisted of three smaller groups A, B, and C each consisted of five students. The teacher then gave explanation on one property of real numbers which was the closure property. This activity was followed with questions and answers. Next, the students were asked to work in groups.

Before start working on their task, each member of the groups was given a specific task. First, every group worked on their group completing a worksheet in a given time. Then, three members stayed in their group to explain their work to visitors from other groups while the other two members strayed to other group to listen carefully to the group’s explanation. Then every group member returned to their own group to dispatch information they received from the group that they had visited. The last activity was group presentation.

Observation showed that the execution of Lesson 3 was a lot better on the whole than the previous lessons. The model teacher reflected that each student seemed to study seriously and took responsibility of their own role during the stay and stray activities. The opportunity to share information to others and listening to others’ explanation was conducted sincerely that they must have learnt a lot from each other. The observers agreed that interaction between the students took place very often throughout the lesson. Every single student participated actively playing their role in learning, listening to others’ explanation, and giving explanation to others. Having given a specific job to accomplish, all the students participated seriously during group discussion to make sure that they fully understand the content so that they could pass the information satisfactorily. During presentation, the student who represented their group delivered their conclusion adequately and responded well to other students’ questions and responses. The interaction between the students and the teacher was also satisfactory where the students, as in previous lessons, paid attention to teacher’s explanation, asked questions, and actively answered questions proposed by the teacher. Students’ interaction with learning resources was adequate through hand-outs and worksheets.

During phase ‘see’ for Lesson 3, the lesson study team agreed that the minus thing during the delivery of the lesson was the time management. As in Lessons 1 and 2, group works proved to take more time than anticipated. However, everyone’s time discipline has improved in Lesson 3 so that every planned activity could be completed.

Data shows that there were improvements in students’ interaction in learning mathematics through lesson study at PGSD FKIP Unsyiah. The following table describes those improvements.

Observed aspects	Scores (Lesson1)	Scores (Lesson2)	Scores (Lesson3)
1) Student-student interaction	2	5	5
- Observer 1	3	5	5
- Observer 2	2	4	5
- Observer 3			
2) Student-teacher interaction	4	4	5
- Observer 1	5	5	5
- Observer 2	3	3	5
- Observer 3			
3) Students’ interaction with learning resources (hand-outs, worksheets, etc)	3	4	4
- Observer 1	3	4	4
- Observer 2	2	4	5
- Observer 3			

Each group worked on different task. Group A discussed about commutative properties, group B discussed about associative properties, and group C discussed about identity and inverse properties.

Table 1. The Improvement of Students’ Interactions in Lesson Study Based Learning.

Note: 1 = never; 2 = seldom; 3 = sometimes; 4 = often; 5 = very often

Students' mastery of subject content during the lessons was also assessed using individual assessment instruments given at the end of Lessons 2 and 3. The result showed that 86.7% of the students could answer the assessment in Lesson 2 correctly and 93% in Lesson 3. This information shows that the students understand more when they interact more.

As supporting data, students' responses were also collected at the completion of Lessons 1, 2, and 3 in order to gain insight into how the students felt about participating in a lesson study based learning. The questionnaire asked students' opinion if the teaching and learning process was interesting. For Lesson 1, twenty nine students said that the lesson was interesting because the teacher's explanation was clear and concise that they could understand easily and the mathematical problems were challenging. For Lesson 2, twenty nine students declared that the lesson was interesting because they got to work in groups, decipher and solve word problems, and try to make their own word problems but they wished for more time finishing their work. One person consistently said that the lesson was less interesting because he felt that he could not keep up. For Lesson 3, seven students said that the lesson was very interesting because the activities were varied and fun; twenty two said it was interesting because they got to learn from their peers and the subject content was new to them; and one student still felt that the lesson was not interesting because he was not used to explain knowledge to other people.

Although there was one student who seemed to struggle participating in the study, but he showed improvement in every lesson. He was very quiet and not active during Lesson 1. In Lesson 2, however, he showed more confidence. He stayed close to a friend that he was apparently comfortable with to ask for help when he needed it and the friend was always helping. This showed that the student had initiative to improve himself. Finally in Lesson 3, where every individual was given a certain task, he worked hard to do his task as good as he could. At the end of the lesson, he appeared to be relieved that he managed to complete his task along with the other students.

During colloquium, fellow teachers who acted as observers during the lessons declared that open lessons gave them opportunity to reflect on their own teaching practice and students' learning that they also intended to improve their lesson designs. They agreed that lesson plan revisions were very crucial in determining students' activities. Time management and active learning were very important to make sure that students could learn enjoyably and meaningfully. Teachers needed to facilitate students' interactions in order to help the students build their own knowledge.

## 7 CONCLUSIONS

Lesson study experience enhances academic and social achievement of teachers and students alike. This study provides significance evidence that personal reflection, discussions with colleagues, continuous lesson plan revisions, and listening to students' opinions can improve teachers' teaching practice which in turn could contribute to the improvement of quality of education in schools and universities in Indonesia. Collaborative work between teachers helps maintain good practice of placing students at the core of every learning activity in order to help the students actively construct their knowledge, be aware of their own knowledge construction, and take responsibility in it. Teaching and learning process should provide opportunities for students to make sense of knowledge and learning experience through interaction with each other, with the teacher and learning resources.

## Lesson Study Solution of Learning Economic Improvement in SMAN 1 Wringinanom Gresik

Luqman Hakim

<sup>1</sup>Faculty of Economics, Universitas Negeri Surabaya, Indonesia  
Luqmanhakimb114@gmail.com

**Abstract:** There were many factors cause the low the quality of education. Based on the results of the national examination in 2010, subjects still low, one of these subjects economy. Of factors causing the low test scores national among the learning process in class who not optimal, competence teacher low, device of learning (standard processes), standard education facility and infrastructure and eight educational standards as a whole not fulfill ideal standards. Settlement problems done through priority scale. See the condition in SMAN 1 Wringinanom district Gresik, priority solving problems through improving the learning process in class. Improvement a learning process in class performed with the lesson study. Stages as done 'plan' through focus group discussion 'do' through the learning in the classroom and 'see' do reflection the observation in class. The lesson study exercised effective improve the education quality through improving the quality of learning in class. All parties involved give a positive response really hope can be tried in future time

**Keywords:** Lesson study, learning, economy, high school

### 1. INTRODUCTION

The implementation of the ASEAN Economic Community in 2015 demanding the quality of its human resources ASEAN members should have a good competence. Good competence will be able to win the competition in the region

Indonesia as one of the ASEAN member countries, in the year 2015 will certainly face more severe competition. Currently Indonesia, including the State, who has abundant human resources aspects of the amount, according to data from the Central Bureau of Statistics, (2010) the number of Indonesian population as much as 237 641 326 the soul. The large number of people who do not have a high value, if it has high competence. Improved human resource competence continuing through the development of education. Since the reform era in the development of the education sector has increased significantly. Improvement on all elements of the education system continues to be done.

According Basaruddin, Chan, 2013 describes the Organisation for Economic Cooperation and Development (OECD) periodically measure the quality of education in the country through a program suatau for International Students Assessment (PISA), which measures three basic capabilities, namely reading, math, and science. The results of PISA

2000, 2003, 2004, and 2009 consistently showed, the quality of education in Indonesia is far below the OECD average. Even the test results in 2009 showed that Indonesia was under Cambodia.

According to the Law of the Republic of Indonesia Number 20 Year 2003 on National Education System Article 3 which states that: The National Education serves to develop the ability and character development and civilization of dignity in the context of the intellectual life of the nation, aimed at developing students' potentials in order to become a man of faith and devoted to God Almighty, noble, healthy, knowledgeable, capable, creative, independent, and become citizens of a democratic and accountable. According the Act education should be able to develop the potential of students to even become a man of faith and devoted to God Almighty, noble, healthy, knowledgeable, capable, creative, independent, and become citizens of a democratic and accountable. Indonesian human resources when appropriate with these provisions, is expected to compete in the global era.

The results of the study W.S., Rustono. (2008). among others, an increase in students' ability to apply learning strategies is also a good response from students and teachers on the implementation of Lesson Study in primary schools.

Research Hakim, et al. (2011), describes some basic competence on subjects national tested in 2008, 2009 and 2010 achieving consistency acquire low value. Results of teacher competency test subjects in school national tested the sample in the study Hakim, et al. (2011) obtained an average value of 60, meaning that the teacher's competence can not be considered good. this affects the learning process is done in the classroom.

Conclusions from the study Hakim, et.al (2011, factors that cause the high-low competence mastery of high school students on subjects that national tested, covering all eight national education standards, proving the quality of education is still not able to meet the quality standards education. the recommendations of the study Hakim, et al. (2011), the model it is possible to improve the quality of education that can be done is to improve the implementation of the learning on the subject teachers who national tested.

Darmadi, et al. (2011), Nur, (2011) and Sanusi (2011). That did the Do stage can improve the quality of learning in the classroom. The results of the study Winarsih, (2012) describes the lesson study can improve profesional teachers, improve the process and student learning outcomes. Haryanti, et al. (2013), describes the Lesson study helps faculty and students in learning effectively and efficiently can improve critical thinking skills.

Research Suprpto, (2013) an increase in the competence and professionalism of teachers, improving the quality of processes and outcomes, and the development of democratic learning based on constructivism.

Refers to the phenomenon and the results of these studies Improvement Solutions Learning Lesson Study Economics in SMAN 1 Gresik Wringinanom.

## 2. RESEARCH METHODS

The method of research is a Lesson. Following the steps as follows: first prepare the necessary instrument activities, both to validate the instrument by experts in this regard will be made by the research team, the third stage of coordinating with related parties for the implementation of activities. The next phase of implementation in collaboration with the principal, subject teachers (through MGMPs subjects Economics, and the last stage of evaluation feedback from representatives of teachers and other interested parties).

Lesson Study Implementation Phase include: 1). Activity Focus Group Discussion (FGD), followed by all subject teachers in the sample schools and the UN Department of Education; 2). Implementation of learning observation and reflection, discussion and deepening / recharging materials needed based on the observation; 3). Analysis of student learning

outcomes from the implementation of observation of the implementation of learning.

Draft Evaluation through: 1). Assessment IPKG 1, the completeness of the data analyzed by the percentage of the learning device. Especially for the ability of teachers to develop lesson plans lesson plan are classified as follows: Very well, if  $r \geq 4$ ; Well, if  $3 \leq r < 4$ ; Medium, if  $2 \leq r < 3$ ; Less, if  $1 < r < 2$ ; Very less  $r = 1$ ,  $r =$  the ability of teachers to develop lesson plan (RPP). 2). Assessment IPKG 2, data on the results of classroom observations were analyzed with the following criteria: Very well, if  $m \geq 4$ ; Well, if  $3 \leq m < 4$ ; Medium, if  $2 \leq m < 3$ ; Less, if  $1 < m < 2$ ; Very less  $m = 1$ , with  $m =$  the ability of teachers to teach. 3). Ask for feedback and input from representatives of the participants at the end of the activity (reflection). 4). The response of students towards learning undertaken by teachers.

## 3. RESULT AND DISCUSSION

The location is at the stage of research carried out at the Department of Education Plan Gresik, which was attended by the research team; Chairman / caretaker Economics MGMPs subjects; Principal / representing SMAN 1 Wringin Anom SMA PGRI Kedamaean, SMA YPI Darussalam Cerme Gresik; Economics Teacher subjects came from three sample schools; School Trustees; and the Department of Education (Secondary and Vocational Education) Gresik

### 3.1. Plan

Place the first Implementation Plan activities implemented in Gresik District Education Office on Saturday November 3, 2012 at 8:00 to 12:00 pm. Participants were representatives of the Economic MGMPs SMA Gresik, 4 school superintendent in Gresik, as well as representatives of the school teachers among other samples Wringinanom SMAN 1, SMA and SMA YPI PGRI Kedamean Darussalam Cerme.

Event activities begin with the opening of Plan/briefing, followed present information about lesson study, the procedures for implementation, and preparation of the device followed by a question and answer. This was followed by direct determination of the model teacher participant, determination of SK/KD and materials shall be in accordance with the low value of the National Examination, then participants will be selected to compose the discussion of matter lesson plans with guidance from the facilitator.

The agreement subjects the model teacher Economy Class XII: Sri Wulandari, S. Pd., M.Pd. of SMAN 1 Wringinanom. Plan activities continued with the revision and refinement of the device in

accordance with the advice of teachers and friends advice lecturers.

Of the activity in this group appeared several problems, including (1) Teachers are still hesitant in the preparation of lesson plans, (2) Determination and selection of learning scenarios according to the nature of the material to be delivered.

Solutions were made, namely: (1) RPP directed learning according to the assessment format IPKG 1, (2) Use of media owned and optimize its use in meteri to be practiced to make it more interesting. Assessment results Processing Standards (Completeness Learning Tool) Subject Economics in SMAN 1 Wringinanom data obtained Hakim, et al. (2012) following the completion of learning from data obtained in the subjects of Economics prior to service activities for completeness learning device based assessment IPKG 1 of 2.1, meaning being, and after the service activities obtained values of 3.59 including both criteria, it showed no change and improving the quality of learning devices.

### 3.2. Do

The "do- See" begins with a briefing held at SMAN 1 Wringinanom started at 08.00 and was opened by the Vice Principal of SMAN 1 curriculum areas Drs. Imam Hadi, MM, then performed some guidance related to the implementation of lesson study in the classroom as well as how to fill out observation sheets provided by the researcher. Attended by participants of the lesson study consisted of a team of researchers; XII class model teacher, Vice Principal of SMAN 1 Wringinanom teachers, Observer (subject teachers SMA PGRI Kedamaean Economics, SMA YPI Darussalam Cerme Gresik); and Supervisors.

As the core of the event is the presentation of RPP Briefing by the model teacher of SMAN 1 Wringinanom class XII will be conducted open lessons. After a short break right in the open class to implement the lesson. The workshop participants acting as an observer. Open lesson Do-see done in class XII with 36 people and the number of students led by teacher models. Open lesson done this time is metri cost of goods sold in a trading company with direct instructional model.

Results of classroom observations about the learning processes Hakim, et al. (2012), the data obtained in the classroom learning process in SMAN 1 Wringinanom average value IPKG 2 subjects before the implementation of the Economics of 3.07 and an increase in research activities is 3.64 with a percentage of 91%. This is because teachers try to make learning better and do the maximum with the variation of methods, media and evaluation.

Observations Activities Students in the Learning Process (Do) the second stage of Lesson Study. Hakim, et al. (2012) obtained observations of activity in the social studies class XII students of SMAN 1 Wringinanom in Economics lesson, students begin to concentrate when studying the early events of all students of 30 people that is equal to 100%, the core activities of the observation of as many as 29 students or 96.66% concentrate on learning and concentration that is not only one student or 3.33% and closing as many as 6 people do not concentrate their study in the amount of 20%.

Results Response Students in the Learning Process (Do) in Lesson Study. Hakim, et al. (2012), the subjects in class XII Economics Wringinanom SMAN 1 states that there are 30 students delighted in learning, motivation, and were actively involved in learning by 100% and the students do not find it difficult to learn, the material is too dense and does not feel disturbed in learning as much as 100 % answered no.

### 3.3. See

Advantages of the teacher during the learning process that we can emulate. In taking questions from students with patience and diligence of the students replied to understand.

Valuable experience gained from this learning activity. Can answer all questions about the students both in the book as well as in everyday life.

Based on the minutes of reflection (see) Lesson Study there is some input/suggestions from observers, among others, there are still some students who are not the focus, but students are asked to do in front of no one having trouble, as well as teachers are less able to provide feedback and to give attention to students is uneven. The responses of teachers regarding the implementation of learning models is that he said that no difficulty in teaching the material cost of goods sold in the trading company.

From the implementation of Lesson Study in SMAN 1 Wringinanom for Economic subjects, that most of the students of class XII IPS is pleased to Economic lessons on that day, because the student response data no student is annoyed. Although there are still students who are passive, but no students who have difficulty in accepting material or in doing exercises.

Stages of Lesson Study: Plan, Do, and See proven to improve learning in particular Economics in SMAN 1 Gresik Wringin Anom, this is consistent with studies that have been carried out by a senior official, et al. (2011), Nur (2011) and Sanusi (2011). conducting phases Do can improve the quality of learning in the classroom. Winarsih research results, (2012) describes the lesson study can improve

professional teachers, improve the process and outcomes of student learning. Haryanti, et al. (2013), describes the Lesson study helps faculty and students in learning effectively and efficiently can improve critical thinking skills. The research of Suprpto, (2013) an increase in the competence and professionalism of teachers, quality improvement processes and learning outcomes.

#### 4. CONCLUSIONS

Implementation of Lesson Study has been carried out well and responded very well by the parties involved. The effectiveness of the application of the model implemented in Lesson Study to improve the quality of education can be considered successful. This is evidenced from the results of most of the increase related to the quality of the learning, classroom management, observation of student activities, and student response to learning, and the results of the reflection is done. Habituation make improvements of learning by observing student activity (do) in the stages of lesson study, is a very effective way to provide feedback to teachers, schools and education authorities to improve the quality of education, because this model does not directly blame the teachers or the school or department. Because based on observations of student activity. Reflection is done with a relaxed atmosphere and help each other to improve learning is a place of learning to all those involved.

## Implementation of Lesson Study in Teaching Assessing Learning (Case Study at Biology Department the Education Faculty of Almuslim University)

M. Rezeki Muamar<sup>1</sup> and Zahara<sup>2</sup>

<sup>1</sup>Department of Biology, Teacher Training and Education Faculty, Almuslim University, Bireuen-Aceh, Indonesia  
muamar.mrezeki@gmail.com

<sup>2</sup>Department of Economy, Teacher Training and Education Faculty, Almuslim University, Bireuen-Aceh, Indonesia  
zahara@kip@yahoo.co.id

**Abstract:** The study was conducted due to the low quality of teaching and learning process in Assessing Learning. The aims of study were to develop the lecturer’s professionalism, to enhance the quality of the students in learning, lecturer performance in teaching and learning process, and collegiality among lecturers. The study was conducted in 4 cycles. Each cycle consisted of 3 steps, namely plan, do, and see. In planning, a lecturer team held a discussion to prepare a lesson plan. Then, in action, the lesson plan which had been prepared was implemented in teaching assessing learning. In this step involved observers to observe teaching and learning process. In See (reflection) step, the lecturer and observers reflected on the lesson that had been implemented, and then the results were analyzed to improve teaching and learning process in the next cycle. The results of this study showed an improvement in teaching and learning process in each cycle. The study also indicated an improvement on the students to share their ideas in the class. Therefore, the students learned effectively.

**Keywords:** Lesson study, assessing learning

### 1. INTRODUCTION

The study was motivated by the problems that occur in teaching and learning process. The learning process in teaching assessing learning tends to decline in the last two years. It was shown from the students had difficult in generating the ideas in learning process. Therefore, the students were passive in learning process and the interaction in teaching and learning activity focused on the lecturer.

Due to those problems above, students’ outcome in assessing learning course were declined. In addition, the students tend to unable to achieve predetermined competences of the lecture. Therefore, the lecturer needs to improve and enhance teaching and learning process by develops their professionalism. One of the strategies that improve the quality of teaching and learning process was lesson study. Lesson study provide the lecturer to collaborate with another lecturer were acted as observers in teaching and learning activity (Groningen & Sarah, 2012)

Lesson study is a school-based, collaborative and professional development which is introduce by Japanese teachers to develop their teaching and learning in the classroom. Lesson study involves a number of teachers meeting frequently on planning, implementing, observing and reflecting “research

lessons” (Stigler & Hiebert, 1999). According to Lewis & Tsuchida (1998, cited in Rock & Cahty, 2005),

Research lesson are actual classroom lessons, taught to one’s own students, that are (a) focused on a specific teacher-generated problem, goal, or vision of pedagogical practice, (b) carefully planned, usually in collaboration with one or more colleagues, (c) observe by other teachers, (d) recorded for analysis and reflection, and (e) discussed by lesson study group members, other colleagues, administrators, and/or an invited commentator.

Generally, the purpose of the paper is to present lecturer professional development which is developed by the group lecturer of Education Faculty of Almuslim University. Specifically, the aims of the study are to develop lecturer professionalism, to enhance the quality of student learning, lecturer performance in teaching and learning process, and collegiality among lecturers.

### 2. METHOD

The study was conducted in 4 cycles. As can be seen in Figure 1, each cycle consisted of 3 steps, namely plan, do, and see (Saito, *et al.*, 2005, cited in

Santayasa, 2009). In planning step, a lecturer team held a discussion to prepare a lesson plan. Then, in action step was implemented the lesson plan had been prepared in previous step in teaching and learning process. In this step involved observers to observe teaching and learning process. The last step was see (reflection), in this step the lecturer and observers reflected on the lesson that had been implemented, and then the results were analyzed to improve teaching and learning process in the next cycle.

Figure 1 Cycle in lesson study

The study involves a group of lecturers. According to Cerbin and Kopp (2006) said that lesson study teams usually consisted of 3-6 instructors from the same discipline although there could be interdisciplinary teams. Therefore, a group of lecturers in this study consisted of 5 lecturers at Biology Department the Education Faculty of Almuslim University.

### 3. FINDING AND DISCUSSION

#### 3.1 The Description of First Cycle

##### 3.1.1 Planning and presenting the lecture

This study was conducted in assessing learning course of Biology Department the Education Faculty of Almuslim University. The concept that was taught in the first cycle was evaluation in Education. In planning step, a model of lecturer spent his time to plan the lecture. The lecturer prepared lesson plan which included contents and pedagogy, power point, and worksheet.

The model of lecturer then presented and discussed the lesson that had been prepared to the group of lecturers. The members of group proposed several feedbacks to improve the lesson which has been prepared.

The next step was open lesson or implemented, the lecturer asked the students to recall or to brainstorm their memory about definition of

evaluation, measurement, assessment, and test in individually. Based on the result of the students' brainstorm their ability, the lecturer asked the students to formulate about definition of evaluation, measurement, assessment and test in group.

After they had finished their worksheet about definition of evaluation, measurement, assessment and test, the lecturer asked the students to take the conclusion about the advantages and purposes of evaluation in Education in group. After the students discussed in group they should presented their task to another group. The presentation was done through gluing all of the result in the wall. And then, each group should visit and read the result of the other groups. After they read, if the students had the suggestions for the other groups, they should write their suggestions on the paper of the group that they gave the suggestions.

The last step was took the conclusion. In this step the lecturer asked the students to take the conclusion about the material had been they learned. And then, the lecturer gave reinforcement toward the conclusion of the material given. Before the lecturer finished the lecturing, the lecturer asked the students to answer the formative test had been prepared in planning step.

##### 3.1.2 Observing and reflecting the lecture

Open lesson in the first cycle was observed by three observers. Based on the observation, the lecturer and observer did the reflection of the activities. The result of the first cycle as follows below:

1. The students learn the theory only, was not to solve the problems
2. The lecturer had the mistake in giving students' worksheet in groups.
3. Only one student that was active in group 2.
4. Some of the students used hand phone for sending the message.
5. One student came late to the class.
6. Some of the students did not understand what they should do.
7. The students had difficult in giving the ideas.

#### 3.2 The Description of Second Cycle

##### 3.2.1 Planning and presenting the lecture

Second cycle was focused on the materials about the principles of evaluation and clarification of evaluation based on the function of its. Second cycle was conducted to repair the weaknesses in the first cycle. There were some suggestions of the observers in improving the teaching and learning process in the second cycle, such as:

1. The students should can solved the problems were they faced.
2. The lecturer should ask to the students were not use hand phone while they learning in the classroom.
3. Each student in group should have job description.
4. To make the lecturer and also the observers had known the students, the students should use badge.
5. The lecturer must give the name of groups, to make the lecturer organize the students in learning.

In conducting the second open lesson, the lecturer had prepared students’ worksheet that contained of the problems that had been solved by them. The lecturer asked the students to match between two sentences had prepared, so that the students can understood the materials about the principles of evaluation and clarification of assessment based on the function of its. The task can be seen in Figure 2 and 3.

After the students had finished their worksheet in groups, they wrote the result of their job description on the paper. And then, each group should patch the paper on the wall. Then, two of members of each group should stand for in front of their paper on the wall. Those students should present their result of work to another group that visited their group.

### 3.2.2 Observing and reflecting the lecture

As previous cycle, in this cycle also was observed by the observer. There were some notes

were found by the observer during teaching and learning process, such as:

1. The students were active during learning activity.
2. There were some groups did not finish their work on time.
3. The students did use other references in finishing work in groups. They only use the literature had been given by the lecturer. So, the lecturer asked the students to bring another reference or literature for the next meeting.
4. The paper used by the students in writing the result of the discussion was little, so made the students had difficult in looking the result of another group.

Based on the reflection above, concluded that there were some improvement in teaching and learning process than the first cycle.

## 3.3 The Description of Third Cycle

### 3.3.1 Planning and presenting the lecture

In this cycle the materials were given was same in the second cycle about the principles of evaluation and clarification of assessment based on the function. But, the students was conducted was different unit in the second cycle. This suggestion was suggested by the lecturer toward the students two weeks before implemented was conducted, so the students can brought the suitable references were

Ukuri prosedur pembelajaran berikut.

1. Berikan pengertian prinsip-prinsip evaluasi (kolom kiri) berdasarkan kalimat-kalimat yang berada dalam kolom sebelah kanan.

Prinsip-Prinsip Evaluasi	Pengertian
1. Shahih/valid	a. Evaluasi merupakan suatu komponen yang tidak terpisahkan dari kegiatan pembelajaran
2. Objektif	b. Evaluasi didasarkan pada data yang mencerminkan kemampuan yang diukur
3. Adil	c. Evaluasi tidak menguntungkan atau merugikan peserta didik karena kebutuhan khusus serta perbedaan latar belakang agama, suku, budaya, adat-istiadat, status sosial ekonomi dan gender.
4. Terpadu	d. Didasarkan pada prosedur dan kriteria yang jelas tanpa dipengaruhi oleh subjektivitas evaluator.
5. Terbuka	e. Evaluasi dilakukan secara berencana dan bertahap dengan mengikuti langkah-langkah yang baku
6. Menyeluruh & berkesinambungan	f. Prosedur evaluasi, kriteria penilaian, dan dasar pengambilan keputusan dapat diketahui oleh pihak yang berkepentingan.
7. Sistematis	g. Evaluasi dapat dipertanggungjawabkan baik dari segi teknis, prosedur maupun hasil.
8. Beracuan kriteria	h. Evaluasi mencakup semua aspek kompetensi dengan menggunakan berbagai teknik penilaian yang sesuai untuk memantau perkembangan kemajuan peserta didik.
9. Akuntabel	i. Evaluasi didasarkan pada ukuran pencapaian kompetensi yang telah ditetapkan

Figure 2 Students’ worksheet of Evaluation of Instruction

will up there were groups only a half had finished their work.

1. Berikan pengertian jenis-jenis evaluasi berdasarkan fungsinya (Tabel A) berdasarkan kalimat-kalimat yang ada pada Tabel B (satu jenis evaluasi dapat terdiri dari lebih satu kalimat pada tabel B).

TABLE A	
Jenis-jenis evaluasi berdasarkan fungsinya	
1	Diagnostik
2	Formatif
3	Sumatif
4	Selektif
5	Penempatan

TABLE B	
Pengertian	
a	Berfungsi agar guru dapat memperbaiki program dan strategi pembelajaran yang digunakan dalam proses pembelajaran.
b	Penilaian yang dilaksanakan pada akhir unit program.
c	Penilaian berorientasi pada produk, bukan proses
d	Penilaian yang dilaksanakan pada akhir pembelajaran, untuk melihat tingkat keberhasilan pembelajaran itu sendiri.
e	Tujuannya untuk mengetahui hasil yang telah dicapai oleh peserta didik selama program berlangsung.
f	Contohnya, Seleksi penerimaan mahasiswa baru (SPMB) di Perguruan Tinggi.
g	Penilaian berorientasi kepada proses pembelajaran
h	Penilaian yang dilakukan untuk tujuan seleksi.
i	Peaksanaan yang dilaksanakan untuk mengetahui kelemahan-kelemahan peserta didik serta faktor penyebabnya.
j	Penilaian yang ditujukan untuk mengetahui ketarampilan prasyarat yang diperlukan bagi suatu program pembelajaran dan penguasaan belajar seperti yang diprogramkan sebelum memulai kegiatan belajar untuk program itu.
k	Dilaksanakan untuk keperluan bimbingan belajar, remedial dan lain-lain.
l	Dengan perkataan lain, penilaian ini berorientasi kepada kesapan peserta untuk menghadapi program baru dan kecocokan program belajar dengan kemampuan peserta.
m	Soal disusun agar dapat ditemukan jenis kesulitan belajar yang dihadapi peserta didik.

Figure 3 Students' worksheet of Clarification of Assessment based on the Function of its

asked by the lecturer in teaching and learning process took place. Thus, the lecturer prepared the paper was bigger than the second cycle to make the students easy in working the students' worksheet and also in presenting. Besides that, in the process of the instruction the lecturer also remembered the students to manage the time to be effective in working students' worksheet.

### 3.3.2 Observing and reflecting the lecture

Observation in the third cycle was observed by two observers. There were some suggestions were given by the observer in this cycle, such as:

1. The problems were given did not make students to think creatively.
2. The students were not active in learning activities.
3. Some groups did not understand about of each job description.
4. There were some groups did not manage the time was given, when 5 minutes the time

5. Less in giving reward by the lecturer toward the groups or the students had finished the work was good.
6. Require to be emphasized to the students that when their presentation not merely read the result of the discussions but also have to present of it.
7. Not all of the students had read the directions of students' worksheet in beginning work in group.

## 3.4 The Description of Fourth Cycle

### 3.4.1 Planning and presenting the lecture

In the fourth cycle the materials had been taught was focused on evaluation in instruction. Implemented in this cycle was done based on the result of reflection in the third cycle. Therefore, in planning in this cycle had prepared students' worksheet that contained the problems that should

solve by the students in group. The problems were solved by the students using mind mapping strategy. The students were hoped can think creatively in

doing the task or students' worksheet by using mind mapping. There were some vocabulary that must form in main mapping by the students (see Table 1).

Table 1. Vocabulary that must form in main mapping by the students

Isian	Meniru
Kompetensi	Pilihan Ganda
Afektif	Menggunakan
Objektif	Mengingat
Bloom	Menjodohkan
Menganalisis	menciptakan
Tulisan	Naturalisasi
Menerapkan	Tes Standar
Menerima	Mengevaluasi
Mengerti	Menanggapi
Benar Salah	Menganalisis
Psikomotor	Menjadi Pola Hidup
Mengingat	Menghargai
Subjektif	Mengevaluasi
Menerapkan	Revisi Bloom
Buatan guru	Tes Hasil Belajar
Lisan	Essay
Kognitif	Merangkai
Mensintesis	Mengatur Diri
Ketepatan	Memahami

Main mapping had been arranged, should wrote by the students on the paper had been prepared by the lecturer. And then, each group must present the result of their work in front the class. Then, the lecturer asked the students to take the conclusion. After that, the lecturer gave reinforcement toward the materials were given and discussed. The lecturer think this was important if there were students was not understand yet about the material had learn.

### 3.4.2 Observing and reflecting the lecture

In observing step there were two observers. There were some problems were found by the observer in this cycle, such as:

1. There were students' uses the first language when they discuss the task in group.
2. There were two groups not finish the task when the time was up.
3. There were two students in different groups were not active while in doing the task.

## 4. CONCLUSION

The results of this study were showed had the improvement in teaching and learning process of each cycle. The study also was indicated the improvement on students in sharing their ideas in the class. Therefore, the students learned effectively.

**Abstract:** This study is aimed to develop the learning devices of the environmental science course through Lesson Study Activities in Biology Education Program of Hamzanwadi School of Teaching Training and Education (STKIP) of Selong. Learning devices developed consist of: syllabus, lesson plans, students worksheet, handouts, and learning instrument. Learning devices which are developed used the Problem Based Learning model combined with Group Investigation which is aimed at improving the critical thinking ability, the cognitive learning outcomes, and the attitudes toward the environment. The subject of the Lesson Study activity I was the second semester students of Biology education program 2012/2013 consisted of 25 people, while the subject of the Lesson Study activity II was the second semester students of Biology education program 2013/2014 numbered 73 people which consisted of two parallel classes. Lesson Study (LS) team of the environmental science course involved six people, consisting of one lecturer model and five observers. The implementation of LS I was 4 cycles and LS II was 16 cycles, in which each cycle consisting of three phases namely Plan, Do and See. The research instrument consisted of: observation sheets and questionnaires to know the learning process which had been carried out and the development product outcomed through LS activities. The data of the learning process related to the process and the learning devices developed were analyzed by qualitative descriptive. Based on the results of Plan, Do and See, there were several findings and improvements, namely: the determination of the appropriate time allocation at the beginning, core, and closing activities, the more communicative of the tasks on the students worksheet so that the students understand what is implemented, the use of the media needed to give the reinforcement to the students, it is necessary to use of technique such as direct designation which makes the students become more active, the learning which involves the students through direct investigation to the object learned can improve the students' learning motivation, the learning which involves the students to solve the environmental issues that are contextually is able to train the critical thinking ability of the students and change the attitudes as well as their views on the environment, the cooperative learning can grow the togetherness among the students, the learning which is carried out through LS as the learning mean for other lecturers which are involved in it and as a mean to develop the better learning.

**Keywords:** Development, Learning Devices, Environmental Science, Lesson Study

### 1. INTRODUCTION

One of the learning standard process mentioned in the Nasional Standards for Higher Education (SNPT 2014) is the plan of the learning process. The plan is outlined in the learning devices compiled by a lecturer or a group of lecturers on a subject.

Based on the observations in biology education program of Hamzanwadi STKIP of Selong, the learning devices of the environmental science course have not been made by the lecturer itself. The syllabus used all this time is taken from the internet without considering whether the materials are appropriate or not with the conditions in East Lombok region. Besides, the process teaching and learning during this time is still conventional, which means that the students are not actively involved in the learning process and have not been trained to solve the

problems that exist in their surrounding. The learning still tends to be teacher centered in which the lecturer as a source of information and the materials being taught are still just a concept which has no relation to the real life.

Especially on the subject of environmental science course which is the subject of expertise in biology education program, the lecturer never use the environment as the learning source whereas the natural potential of East Lombok is very appropriate with the materials of the course. The materials on the environmental science are: natural resources, biodiversity, environmental pollution, environmental degradation, and environmental health.

According to the conditions explained, it needs to be developed the learning devices which are appropriate with the potential environment in East Lombok region through Lesson Study (LS). Lesson Study is one of the development efforts to enhance the

learning process performed by a group of teachers/lecturers collaboratively and sustainable in planning, implementing, observing and reporting the learning outcomes (Syamsuri & Ibrahim, 2008). Hopefully, through the Lesson Study, the quality of teaching in biology education program in general and the environmental science courses in particular, which is still low can be improved. The involvement of other lecturers as the LS team in preparing the lesson plans at the *Plan* stage will train them in designing the course plan that is taught so that the learning devices can be designed by themselves, not just copied and paste from the internet that do not appropriate with the conditions in the college itself. Through Lesson Study, the lecturers can learn together from each other from the learning process implemented, starting from learning designing, learning implementing, including the concepts taught up to the learning outcomes so that the quality of teaching can be improved. The learning devices developed refer to the model of Problem Based Learning combined with Group Investigation which consist of: syllabus, lesson plans, students worksheet, practicum instructions, handouts, assessment instruments of critical thinking ability, instrument of cognitive learning outcomes and attitudes instrument towards the environment.

The syntax model of Problem Based Learning combined with Group Investigation is elaborated in the learning devices developed in the environmental science course that is expected to be able to improve the critical thinking ability, the cognitive learning outcomes, and the attitudes towards the environment.

## 2. RESEARCH METHODS

This research is the development of the learning devices of Problem Based Learning model combined with Group Investigation used to improve the critical thinking ability, the cognitive learning outcomes, and the attitudes towards the environment for the biology students of Hamzanwadi STKIP of Selong. The development of the model refers to the model of Borg & Gall (1983) which is carried out through the Lesson Study activities. The procedural steps are described as follows.

### 2.1 Research & Information Collecting

The stage of needs analysis is set the subject related to the devices to be developed, the literature search, the initial observation, and the designing of research framework. Furthermore, the essential elements related to the product to be developed are collected and analyzed for the purposes of development.

### 2.2 Planning

The planning implemented covers: formulating the objectives to be achieved with the products developed, estimating the funds, manpower, time and capabilities, and arranging the work procedures which cover: (a) the formation of Lesson Study Team, (b) the determination of the place of the meeting, and (c) the planning of meeting schedule.

### 2.3 Developing

The developing of the initial product in the form of the learning devices which consist of: a syllabus, lesson plans, students worksheet, practicum instructions, handouts, and learning instrument. The results of the initial product development are in the form of the draft basic (prototype) of learning devices. Learning devices that were developed using the Problem Based Learning model combined with Group Investigation.

### 2.4 Field Trial

The field trials which were carried out cover: the beginning of field trials through the expert validation, the main field trials and operational field trials which were conducted through Lesson Study activities. The field trials which were conducted was aimed to get the product in the form of effective and acceptable learning devices and able to improve the critical thinking ability, the cognitive learning outcomes and the attitudes towards the environment. The main field trials and operational field trials were conducted through Lesson Study I and II. The design of the implementation of Lesson Study are shown as in Figure 1.

Figure 1. The model of the implementation design of lesson study in the environmental science courses.

The tried subject of the main field test through Lesson Study activities I was the second semester students of biology education program 2012/2013 consisted of 25 people. While, the tried subject of the operational field tests which were conducted through

Lesson Study II was the second semester students of biology education program 2013/2014, consisted of two parallel classes with 73 people. The research instruments were the questionnaires and observation sheet used to collect the information about the learning process that has been conducted and the learning devices that had been developed. The data analysis used was descriptive qualitative technique. The data obtained are the data of learning process that had been implemented through lesson study activities, questionnaire data from the students towards the learning process which had been implemented and learning devices that had been used and the description of the results of the product that had been developed.

**2.4.1 The Process of Development of Learning through the Stages of Lesson Study Activities**

The process of development of learning in Lesson Study activities I was performed 4 cycles. Cycle I discussed about the material of Global Environmental Issues, Cycle II discussed about the material of the Environmental Degradation in East Lombok region, cycle III discussed about the Environmental Pollution which was done through practicum activities, and the Environmental Health.

The process of devices development through Lesson Study activities II was conducted in 16 cycles on two parallel classes. Cycle I discussed about the material of the Ecosystem Components that was taught in class II B, Cycle II discussed about the material of Ecosystem Components that was taught in class II A, Cycle III discussed about the material of Relationships among Organisms that taught in class II B, Cycle IV discussed about the material of Relationships among Organisms that taught in class II A, Cycle V discussed about the material of Biogeochemistry cycles that taught in class II B, Cycle VI discussed about the material of Biogeochemistry cycles that taught in class II A, Cycle VII discussed about the material of Natural Resources that was taught in class II B, Cycle VIII discussed the material of Natural Resources that was taught in class II A, Cycle IX discussed about the material of Global Warming that was taught in class II B, Cycle X discussed about the material of Global Warming that was taught in class II A, Cycle XI discussed about the material of Environmental Degradation that was taught in class II A, Cycle XII discussed about the material of Environmental Degradation that was taught in class II B, Cycle XIII discussed about the material of Environmental Pollution that was taught in class II A, Cycle XIV discussed about the material of Environmental Pollution that was taught in class II B, Cycle XV discussed about the material of Environmental Health that was taught in class II A,

and Cycle XVI discussed about the material of Environmental Health that was taught in class II B.

**3. FINDINGS, DATA ANALYSIS AND PRODUCTS REVISION**

**3.1 Findings and Trial Data Analysis**

Based on the findings of Plan, Do and See which were conducted by a team of LS every cycle in Lesson Study activities I, there are some things found, namely: (1) Cycle I: the instruction on students worksheet number 7 that discussed about the material of Global Environmental Issues was not clear so that the students had not been able to analyze the issues displayed in the video, the time management was not in line with what was planned in lesson plan at the Plan time, (2) Cycle II: The students had not skilled in conducting the discussions, there were many students' misconceptions about the material of the Environmental Degradation, it still needs a technique in order to motivate the students to be active in the learning process, (3) Cycle III: the students' misconceptions still occur in the material of Environmental Health, Cycle IV: the equipments and the materials listed on the practicum instruction were adjusted with the equipments and the materials provided in the laboratory, the students had not been skilled in making the glass slide and doing observation through a microscope.

Based on the learning process that had been carried out, it was obtained the data of the students' questionnaire towards the learning process which had been conducted and learning devices that had been developed through the LS activities I as in Figure 2.

Figure 2. The students' response towards the learning process that had been conducted and learning devices that had been used in the activities of Lesson Study I

**Notes:**

- A = Learning which had been carried out was interesting.
- B = Learning was fun

- C = Learning was easy to understand
- D = Students were motivated to learn
- E = Learning encouraged the students to cooperate with other friends
- F = Learning encouraged the students in independent learning.
- G = Media used was interesting
- H = Media used can help the students to understand the material that learned
- I = Materials written in the students worksheet assisted in learning
- J = Materials written in the students worksheet were easy to understand
- K = Tasks in the students worksheet provided learning challenges.
- L = Assessment and evaluation were conducted transparently
- M = Assessment was appropriate with the material that learned.
- N = Assessment instrument was easy to understand its point.
- O = The questions in the test were appropriate with the competencies required.

The results of the questionnaire towards the learning process that had been implemented through a Problem Based Learning model combined with Group Investigation and learning devices that had been developed in the LS activities I showed that the interesting learning, challenging, motivating the students to learn, training the students to think, training the students to solve problems, training of critical thinking and encouraging the students to cooperate with thier friends when doing an investigation group. Through syntax found in PBL combined with Group Investigation, the students were trained ranging from planning investigation activities that will be carried out, doing an investigations to find out the environmental problems in the region, analyzing and finding the solutions to the problems encountered, as well as presenting what they had been done. This will train the ability to understand, apply, analyze, evaluate and even to create a product from the waste that causes environmental pollution (Supramono 2005, Paidi, 2008, Selcuk and Gahin, 2010). While, the task which was always done in a group would encourage the students to cooperate with the group's friends (Arnyana, 2004; Slavin, 2005). The results of the questionnaire towards the students worksheet which were less clear will be improved at a later stage.

Based on the results of Plan, Do and See which were conducted by a team of LS for each cycle, on the Lesson Study activities II, there were some things found, namely: (1) Cycle I: The learning indicators and learning objectives found in the students worksheet 1 should be adjusted to the lesson plan, the task written on the students worksheet number 4: based on the results of the group investigation, do you

find a balanced ecosystem? It should not be used since the indicator of "balanced" was not clear, it was necessary to determine the time allocation for each group which presented the results of its investigations for 10 minutes of each, (2) Cycle II: the use of time allocation was not in accordance with the plan because of that it was necessary to reduce the number of groups from the eight groups into six groups, there was a misconception on the students, (3) Cycle III: there were two groups who made mistake to report their investigatigation, namely group 3 and 4, they should report the Relationship among Organisms but they reported about the Relationship Between Components of Biotic and Abiotic, (4) Cycle IV: there was still a misconception on the students towards the material of Relationship among Organisms, (5) Cycles V: the distribution of the topics discussed for each group of the students was adjusted to students worksheet 4, namely: group I: Nitrogen-sulfur-water, group II: phosphorus-sulfur-water, group III: carbon-sulfur-water, group IV: carbon-sulfur-nitrogen, group V: phosphorus-nitrogen-water, and group VI: carbon-nitrogen-water, the students' mastery towards the materials was still lack, (6) Cycles VI: the students had not been able to associate three biogeochemical cycles requested, (7) Cycle VII: an indicator of competence and learning goals found in the students worksheet 5 were adjusted to lesson plan, time allocation was adjusted to the material discussed: 5 minutes of initial activities, 75 minutes of core activities and 10 minutes of final activities, the indicator of competence number 8 was repaired for its editorial, (8) Cycle VIII: there were still some students who were not active during the learning process, the solution was that the lecturer model approached the pasive students, the capability to argue, providing the solutions, asking the questions continuously trained to provide the opportunities to the students through discussions and presentations, (9) Cycle IX: a video about the Impact of Global Warming which was played at the beginning and at the end of the learning was seen to motivate the students, it was shown on the students concentration when they watched the video carefully, some students who previously did not dare to argue had begun to dare to give their opinion, (10) Cycle X: the direct appointment technique to the students who asked questions and gave opinions was aimed to provide the opportunities to the passive students to be more active, (11 ) Cycle XI: the students seemed motivated during the learning process since the materials discussed related to the issue that had been observed in East Lombok region, (12) Cycle XII: there was interaction among the students when discussing the environmental issues in East Lombok region, the students were motivated to give their opinion related to the issues encountered during the investigation, (13) Cycle XIII: asking and answering technique needed to be defined so that all students

involved in the discussion, it was used the term of questioner and compulsory responder, the overall students's sitting position was changed into "U" shape that looked more interactive, (14) Cycles XIV: some students who was never active become more active during the learning process because the material discussed covered the issues encountered in their environment although there were some students who still had low ability to ask, (15) Cycle XV: the indicator competency number 3 at Basic Compe-tetion 5: **feeling responsible** towards the environmental health which began from self, family environment to the society was changed to: **grow a sense of responsibility** for the environmental health which began from self, family environment to the society, presentation technique was implemented in two sessions, the first session by group 1, 2 and 3 and the second session followed by groups 4, 5 and 6. Each session was given time allocation for 35 minutes with question and answer process, (16) Cycle XVI: the students had been able to provide the solutions to the problems found in their surrounding environment, the students who was never active become more active with direct appointment technique, the learning which took the real problems encountered in the environment motivated the students to learn.

Based on the learning process which had been carried out, it was obtained the data from the students'questionnaire towards the learning process that had been carried out and the learning devices that had been developed through the LS activities II as shown in Figure 3.

Figure 3. The students' response towards the learning process that had been carried out and the learning devices that had been used in the Lesson Study activities II

**Notes:**

- A = Learning which had been carried out was interesting and challenging.
- B = Learning activities motivated to learn
- C = Process of learning trained oneself to think critically and solve problems
- D = Learning activities trained oneself to express opinions.
- E = Learning activities encouraged to cooperate with friends

- F = Process of learning made the students understand the environmental issues in their region.
- G = Media of learning used was interesting and eased to understand the material that learned
- H = Hand outs used helped in understanding the subject matter
- I = Students worksheet used was easy to understand
- J = The questions provided were related to the issues in East Lombok region (contextual).

The results of the questionnaire towards the learning process that had been carried out through a Problem Based Learning model combined with Group Investigation and learning devices that had been developed in the LS activities II showed the better results than before, as shown in Figure 2, that was the learning which had been conducted was interesting and challenging, motivating to learn, training to think critically and solving problems, training to express opinions, encouraging the cooperation with other friends, making the students understand about the environmental issues in their region, media of learning used was interesting and eased to understand the material learned, hand out helped in understanding the subject matter, the students' worksheet was easy to understand and the questions provided were related to the issues in of East Lombok.

**3.2 Products Revision**

Based on the development that had been carried out, it was presented a revised product that had been carried out, as shown in Table 1.

Table 1. The Learning Devices Before and After Revision.

No	Learning devices	Before revision	After revision
1	Syllabus	Indicator number 11 on Basic Competence 1, material: The Energy Transfer in Ecosystems, namely analyzing the forms of energy transfer in the ecosystem.	Indicator number 11 on Basic Competence 1, material: Energy Transfer in Ecosystems, namely analyzing forms of energy transfer in the ecosystem integrated to the material of Biogeochemistry Cycle with the indicators: describing the relationship between biogeochemistry

			cycle with energy transfer in the ecosystems.			Do you feel the heat lately? Then, the rainy season and the dry season often do not fit with the month estimated, do they? Do you also see the Darmawangi beach where the water has begun to rise? Motivating the students by saying: the earth's temperature that we life has begun to rise, you can imagine the impact, it is very terrible, isn' it?	students by playing a video about global warming.
		The learning experience in the indicator number 1, 2 and 3, Basic Competence 3, the material of the Global Environmental Issues is: finding a solution through group discussion to solve the environmental issues encountered, which were found both in their own environment and globally.	The learning experience in the indicator number 1, 2 and 3, Basic Competence 3, the material is a Global Environmental Issues: <ul style="list-style-type: none"> <li>• Conducting the investigations in the East Lombok region to discover the impact of global warming.</li> <li>• Discussing the results of the group investigation about the environmental issues encountered and discussing how to solve them.</li> </ul>				
2	Lesson Plan	The lesson plan of the third meeting with indicator: energy transfer in ecosystems	The lesson plan of the third meeting with indicator: energy transfer in ecosystem is integrated into the lesson plan 4 about the biogeochemical cycles material into the indicator: describing the relationship between biogeochemical cycle and energy transfer in the ecosystem.				
		Initial activities in the lesson plan for the indicator number 1 up to 4 are written: <ul style="list-style-type: none"> <li>• Brainstorming:</li> </ul>	Initial activities in the lesson plan for the indicator number 1 up to 4 are written: <ul style="list-style-type: none"> <li>• Motivating the</li> </ul>				
				3	Students Worksheet	Task number 4 on the the Students worksheet 1 is written: based on the results of the group investigation, do you find a balanced component?	Task number 4 on the Students worksheet 1 is removed
						The task number 4 on the Students Worksheet 4 is written: write the results of your group discussion and make it in the form of group papers.	The task number 4 on the Students Worksheet 4 is written: Make it in the form of pictures displayed with power point.
						The tasks number 1 and 2 on the Students Worksheet 7 are written: (1) find the information with your group from various sources about the environmental issues that are global, national, and local, (2)	The task number 1 and 2 on the Students Worksheet 7 are written: (1) Discuss with your group the relationship between global warming and coastal erosion in East Lombok region based on the results of

		discuss with your group about the environmental issues which are global, national and local by grouping each of them on a table.	your investigation. (2) Make an analysis about the causes of global warming that occurred at this time. (3) Describe the impact of global warming for life. (4) What solutions do you offer to solve the causes and impacts of global warming?
4	Practicum Instructions	The equipments used for practicum consist of: a light microscope, dry ice, tweezers, hand counter, water bath, glass objects and glass cover, and the pipette.	Alternative 1, The equipments used for practicum consist of: a light microscope, dry ice, tweezers, hand counter, water bath, glass objects and glass cover, and the pipettes. Alternative 2, the equipments used are: light microscope, tweezers, hand counters, glass objects and glass cover, pipettes, test tubes, graduated cylinder, tripco concentric ring, burner bunsen. Graduated cylinder, tripco concentric ring, and burner bunsen are as a substitute of water bath.

Through the Lesson Study activities I and II, it was generated the learning devices that can improve the quality of learning from conventional learning, lecturer-centered, teaching concepts into contextual learning, student-centered, learning to train the ability to argue, analyzing the environmental issues that exist in the students' environment surrounding. This is in line with the statement of Lewis (2002), Sadia (2008), Santyasa (2009), Yumiko and Johanna (2010), that the

Lesson Study is one of the activities aimed at improving the quality of learning and LS can be the basis of learning development.

#### 4. CONCLUSIONS AND RECOMMENDATIONS

Based on the research and development that had been carried out, it can be concluded:

- a. Through the Lesson Study activities, it was obtained the learning devices which based on the implementation of the learning process which was observed and discussed based on the issues encountered by the team of Lesson Study and preparation of the standard device that had been set by the government.
- b. The process of planning, observation and reflection of learning carried out during the activities of LS can be a means to train the lecturers who involved in this activities to review the learning process which was carried out in other subjects.
- c. The development of learning activities through Lesson Study can be done on other subjects in order to improve the quality of learning.

## Improving The Students' Ability In Critical Thinking At Mechanics Subject Through Lesson Study

Marnita, M.Pd

*Department of Physics, Teacher Training and Education Faculty, Almuslim University, Bireuen-Aceh, Indonesia  
nitaiswadi@gmail.com*

**Abstract:** Based on writer observation in learning teaching process in University Almuslim, shown that the majority of learning still use the conventional method and lecture's oriented. This made students felt bored in accepting lesson and did not give the chance for the students to generate the ideas such as critical thinking. The results of previous research shown that the learning model can improve the students' critical thinking. Therefore, through Lesson Study had been done in Physical Education Program, the writer had done the research to improve students' critical thinking with the aim of to know the improvement of students' critical thinking in studying mechanics through lesson study. In this research the writer used descriptive qualitative method by using Classroom Action Research Procedure. The data obtained by using instrument such as critical thinking test, observation sheet to the teachers and students activities and questionnaires. This research had done to the fifth semester 2013/2014, consists of 36 students. The result shown that the students can improve their skill in critical thinking after the implementation of lesson study. It can be shown of the result in the first cycle there are 7 students were succeed, while in the second cycle there are 33 students were succeed. The result of the lectures and the students' activity also shown that 87% succeed, it is mean that the lecture and the students' activity in criteria good level. Thus, the results concluded that physics learning through lesson study had improved the students' critical thinking in mechanics lesson.

**Keywords:** Critical thinking, Lesson study, Mechanics

### I. INTRODUCTION

Education is something that should be run by the human being from obstetrical until passed away. Long life Education can be gone through formal and non-formal Education. In formal and non-formal Education, such as Elementary School, Junior High School, Senior High School and University. Generally, will give the consequence of quantity form or percentage criterion for each the concepts and the students' ability. These matters make formal Education as a process management of study or Education which is very base on the way in teaching of a educator or teacher. One of the participants is the students. The students also should have the certain skill in expecting the work, so that will support them in working to be the professional worker. The students' ability can be in low or high level. All of depending on the students' skill it self that had learn from the Elementary school until University. In the principal the students always dealt with demand in high critical thinking level, while, in teaching and learning process the lecturer is not give the chance for the students to improve their ability in high critical thinking, so that by itself the ability of students can be low in thinking something. The ability in high critical thinking of the students can improve through the various kinds of the materials or instructions in the

curriculum at Physics Program Education by using the appropriate method or model of the instructions. The ability in high critical thinking of the students also can improve in science instructions. The creativities of the students and the lecturer in preparing the instruction that oriented in high critical thinking of the students are needed. According to Yerigan (2008) states that "the active students can improve their interaction between another student and had high critical thinking in learning the instructions". But, the writer found during teaching and learning process at Physics Program of Almuslim University, shown that many of the lecturers still used the conventional method, such as; speech method in teaching. Kristianingsih et al (2010) said that "caused by the teacher during teaching the instructions used the speech method, so, the students difficult in generating the ideas in improving the application of the concept in their life or in the reality of their life". This activity is different with the purpose of Physics Program in improving the students to master the concepts and can solve the problems in science in their daily life. In fact, the instruction of Physics easier to reach by the teacher or lecturer, as long as the lecturer should lead the students to be active in learning the instruction. The writer's experience during became the head Physics Program at Almuslim University Bireuen Aceh, shown that the lecturer was not care

about the inquiry or problem learning as the fundamental in teaching and learning process. The lecturer still used the conventional method in teaching and learning process as the solution in teaching. It caused the students got a good score “A” only 10% of 40 students as sample. This fact also caused the students’ low ability in high thinking level, which ought to as the students, they should improve their high thinking level such as critical thinking.

Based on the experience and also Lesson Study was accepted by Faculty of Teacher Training and Education of Almuslim University since 2011-2014, the writer and some lecturers work together in creating the new instructions and the writer hopes can improve the mind set of the lecturers and the students in teaching and learning process. The instruction is an instruction that forward the lecturer’s active in preparing the material and media of the instruction and also the students should be active to find out pedagogic concepts through the media had been prepared by the lecturer. The model of the instruction is “Lesson Study”. Lesson Study is one of the models that are active and collaborative in teaching the instruction to be better. Through Lesson Study the lecturer can find out the weakness during teaching and learning process, the lecturer can revised all the problems through the information of the observer. Lesson Study also can make the students more active in the activity in group. Therefore, Lesson Study is a good solution to apply in teaching the instructions at Physics Program which during the time the students were not active to generate ideas, especially in high critical thinking.

Considering to the mechanics is one of the lesson that contains the materials is integrated to other lessons at Physics Program. Hence, the mechanics is as choice in applying Lesson Study. In applying Lesson Study at Physics Program of Almuslim University become a research caused the following problems:

1. How Lesson Study model is used to improve the fifth semester students’ ability in Mechanics?
2. How is Lesson Study model can improve the lecturer and the fifth semester students’ activity in Mechanics?
3. How do the students’ respond toward the implementation of Lesson Study in Mechanics?

Based on the problem above, the writer has some purposes of the research as follows:

1. To know Lesson Study model improve the fifth semester students’ ability in Mechanics.

2. To know Lesson Study model improve the lecturer and the fifth semester students’ activity in Mechanics.
3. To know the students’ response toward the implementation of Lesson Study in Mechanics.

Lesson study is one of the models to make the teacher want to change the way in teaching. Historically Lesson Study is not a model in teaching from Indonesia, but come from Japan. For the first time Lesson Study implemented in Japan in 1990, and than lesson study had been implemented by another country, one of the country is Indonesia. Nevertheless, applying lesson study in Indonesia is not familiar yet, especially at Elementary School teacher, Junior High School teacher and Senior High School teacher. Even though, lesson study is not only the way how to teach the lesson by the teacher but also by the lecturer. According to Rustopo (2007), said that lesson study applied as model to guide the students in improving the students’ ability in applying strategy. So, lesson study can be a model to improve the students that will be the teacher through collaborative instruction and should be continued, depending on the principles of the collaborative in helping each others teacher in improving the teaching and learning process. The principles such as collaborative, continue, and teaching group. Teaching group is used in improving the students’ ability in learning the instruction by the lecturer. Various problems were faced by the lecturer in teaching. Those problems made most of the students had low ability in critical thinking. Based on the fact above, the writer used Lesson Study as a solution to solve the problems in teaching and learning process. Sudrajat (2008) states that “lesson study is one of the efforts in increasing the teaching and learning process through collaborates by a group of teacher”.

Based on the quotation above, the writer concluded that lesson study need teacher team work to reach the target of the study. Moreover, Sudrajat (2008) said explained the purpose of lesson study as follows:

1. To obtain a good comprehend about the students and the teacher in teaching and learning process.
2. To obtain a good result and can be beneficial for another teacher in teaching the instruction.
3. Can improve the instruction systematically through inquiry collaborative.
4. To develop the knowledge of pedagogic, a teacher can learn from another teacher.

Based on the quotation above, can conclude that lesson study model is suitable to be applied to improve teaching and learning process.

### 1. The purpose of Lesson Study

Based on the description of previous point had shown that there were some big purposes of lesson study. Sudrajat (2008) states the purposes of lesson study as follows:

- a. The teacher can evidence the progress of the job.
- b. The teacher can obtain the feed back from the other teachers.
- c. The teacher can expose the result of lesson study.

### 2. Steps of Lesson Study

Mustikasari (2008), states that lesson study is a model in creating the professional teacher through the activities or steps of lesson study and developing the quality of the teachers and students in teaching and learning process. The steps of lesson study are follows: Plan, Do, and See. According to Rahayu (2012) states that in doing lesson study there are three fundamental steps such as; the first, identification the theme of the research. The second, doing the research based on the research theme. And the last is reflecting after done the research. Explanation above shown that in implementing lesson study had three steps that should be followed by the teacher. These steps are integrated with other steps in implementing the lesson study. The process of implementing lesson study as illustrated in this following figure:

Figure 1 Cycle in lesson study

Where :

1. In stage *plan* the lecture or teacher and observer collaborate to discuss about the solution in solving the problems were faced by the students in the class.
2. In stage *do* the lecture or teacher perform the instruction focused on students centered, while another lecturer or teacher is the observer and should observe all of the activities of the students in learning.

3. In stage *see* the lecture or teacher and the observer formulate the reflecting after done the activity.

### 3. Definition of Critical Thinking

The ability of critical thinking is the ability that should have by the students in critical thinking. Without this ability students had difficult to analyze all of the material concepts in physics. Hassoubah (2002) states that the ability of critical thinking is the process to make the logic decision about something that can be trust. Moreover, Khanafiyah (2011) said that “the ability of critical thinking is the skill of a person in using critical thinking in analyzing the arguments and give the interpretation based on the truth apperception or logical reasoning”.

Based on definition above, states that all of the students had the ability of thinking, but in getting the knowledge the students should not have the appropriate way or method, subsequently, the students did not improve their ability in critical thinking and they did not become a good teacher and can not be professional in their job. According to Setyorini (2011) said that critical thinking can be classification in several skill such as; analysis, focus, observe, hypothesis, assumption, review, take the conclusion, and reflection. Moreover, Sarwi (2012) supposed that five skills in critical thinking, namely 1) giving simple explanation (elementary clarification). 2). Giving depth explanation (in-depth clarification), 3). Making the decision or assessing (judgement). 4). Making the conclusion (inference) 5).Strategic steps (strategies).

## II. RESEARCH METHODOLOGY

This research was conducted at semester III consisted of 40 students in physics program of Almuslim Universitas. There are some factors in this research, such as; firstly, the ability of students’ critical thinking was measured by giving test. Secondly, the activity of the lecturer and students was measured by giving the observation sheet. And lastly, the students’ respond was measured by giving questionnaire.

The design applied in this research was Classroom Action Research. Therefore, in conducting this research the steps as follows: planning, implementing, observing, and reflecting. This research was conducted in two cycles. The data obtain through observation sheet, test, and questionnaire. Test was giving in last meeting of each cycle.

The data from the result of the students' test was analyzed by using the formula proposed by Sudijono (2005).

1. The data the result of the improvement in critical thinking of the students by using the formula proposed by Sudijono to find out the percentage of the students :

$$P = \frac{f}{N} \times 100 \quad \% \quad (\text{Sudijono, 2005})$$

The criterion of success as follows:

75% < NR ≤ 100%	: very good
50% < NR ≤ 75%	: good
25% < NR ≤ 50%	: enough
0% < NR ≤ 25%	: poor

The data the result of the lecture and students' activity by using the formula proposed by Sudijono to find out the percentage as follows:

$$P = \frac{f}{N} \times 100 \quad \% \quad (\text{Sudijono, 2005})$$

### III. FINDING AND DISCUSSION

This research was conducted at physics program of Almuslim University. The research design applied was lesson study. This research focused on improving the students' critical thinking. Based on the steps of lesson study, the researcher was conducted in three steps were plan, do, and see.

#### III.I. analysis of cycle I, II, III, dan IV

##### 1. Plan

Before starting the research, the researcher and the observers discuss about the subject will implementing in open lesson. And then, the researcher and the observer decided mechanics was suitable subject to be research.

In this stage the researcher as acted the lecturer and observers made the plan in preparing lesson plan, students' worksheet, pre-test and media of the instruction. A giving pre-test is to know the basic knowledge of students' critical thinking at mechanics lesson. After prepared all of the instruments, the researcher discussed when the first open lesson is started.

##### 2. Do

In stage Do was focused on teaching and learning process. In this stage the researcher collaborate with 8 observers. Each consisted of two

lecturers of mechanics, two lecturers of basic physics, and three lecturers of thermodynamics. The observers should observe all of the students' activities in their groups and also observe the lecturer' activities. The researcher was a model in this research. For the first time the researcher gave the time among 40 minutes for the students in answering the pre-test was given by the researcher. The pre-test was given to know the basic of students' knowledge before implementing open lesson. After giving the pre-test in the first cycle, the writer started the open lesson activity by using students centered learning. The students were hoped can solve the problem in mechanics lesson had been taught by the lecturer. In the cycle II, III dan IV, the writer also did the same activities such as in the first cycle.

The writer asked to the students of each cycles, they should solved the problems and to find out the concepts that had been taught. After implemented the lesson study the students can solve the problems were they faced and gave the big impact of students' learning. It also had shown members of each group in finishing students' worksheet faster than the time given. The group that faster and correct answers than other groups was given the reward by the lecturer. The lecturer gave mentos and aplos peppermint. This is one way to make the students more interesting, enthusiasm in learning. This activity also did by the researcher in each cycle. In each cycle the researcher always prepared the lesson plan, students' worksheet and the different media of the instruction based on the materials given. In the last meeting of the fourth cycle, the researcher asked to the students to present in the class because the last meeting was gave post-test. Post-test was gave to obtain the students had improved their ability in critical thinking.

##### 3. See

In stage see the researcher and the observers analyzed and made the reflection about the weakness and the strange was found by the observers when open lesson of the first cycle. This activity was done outside the class. Disadvantages and advantages had been reviewed for the lecturer to be applied in the next cycles. At the first cycle the observers found the students were not self confident. This problem made the students had difficult to explore their ability, and then the lecturer should gave the students spirit and bravery for several times to solve the problem and to find out the new concept in their worksheet.

In open lesson activity in the second cycle, the students' confident better than in the first cycle, although was not all of the students. In this activity, the observers found several students were not come on time, so made the activity of groups annoyed.

And then the observers also found there are the instruction in the students’ worksheet had difficult to understand by the students. But another side the students can comprehend the materials given was good.

In open lesson action in the cycle III better than the first and second cycle, but the observers found a weakness, that was the students can not finished their worksheet on time. In this case the researcher explained the factor was media of equipments of electric useful had difficult for the students, but the teaching and learning process take place better than before. It also shown the students’ motivation had improve.

The last was the open lesson activity in the fourth cycle. This activity was conducted in perfect plan. The researcher was found the suitable media in teaching the materials in the fourth cycle. Observer said that there is no more the weakness in the fourth cycle. The observer only found there are one student was come. But teaching and learning process run perfectly, the students’ participation was improved and they enjoy in their activity.

**III.2. Analysis of the students’ ability in critical thinking**

As stated in the previous section this research was focused on students centered learning through lesson study. The activities of lesson study were bottom-up, collaborative, continue and mutual learning became lesson study as a good solution in improving the students’ ability in high critical thinking. This research was conducted at the third semester students at physics program of Almuslim University, shown that had improved the students’ ability in critical thinking. In the first cycle shown that there were some the weaknesses come from the lecturer and also the students. But the weaknesses can solve by the researcher.

In conducting the cycle II until IV, the researcher and 8 observers be able to improve the students in finding the new concepts of the materials, they be able to analyze and explore the ideas in groups. And then the lecturer asked to leader of groups to patch and explain the results were found by them in front of the class. That moment the discussion happened with other groups. The last activity was gave the reward by the lecturer for the groups that be able to finish on time and correct answer of the students’ worksheet.

The result of cycle I until cycle IV, had gave a good impact in improving the students’ ability in critical thinking. The result shown that was 87% students can answer correctly in the pre-test. The result also shown the activity of the lecturer and students had improved through lesson study. The

students’ enthusiastic in learning also had improved. The indicators of critical thinking such as; 1) gave simple explanation (*elementary clarification*), 2). Gave depth explanation (*in-depth clarification*), 3). Made the decision and assessment (*judgement*), 4). Made the conclusion (*inference*), 5). Made the strategic steps (*strategies*). The result of the improvement of the students’ ability in critical thinking, lecturer and students’ activity through lesson study at mechanics subject at the third semester students as follows:

Figure 2. Figure of the result

Based on the figure 1 shown that the mean score of the students’ ability in critical thinking in the cycle I was 22,66, in the cycle II was 50,04, in the cycle III was 71,23 and in the cycle IV was 89,89. The lecturer’ activity in the cycle I was 53%, in the cycle II was 66%, in the cycle III was 82%, and in the cycle IV was 93%. Meanwhile, the students’ activity in the cycle I was 59%, in the cycle II was 81%, in the cycle III was 87%, and in the cycle IV was 97%. The data of figure shown that had improved the students’ ability in critical thinking through the lesson study model activities in mechanics subject at physics program of Almuslim University.

Based on the result, the researcher’s analyze of each the indicators in improving students’ critical thinking. The analysis had shown the improvement of the students’ critical thinking better than before. This ability can made students professional. See the figure of the students’ improvement in critical thinking of each indicator.

Figure 3. Figure of Analysis students' critical thinking of each indicator

Based on the figure 2, conclude that the significant improvement between the first cycle until the fourth cycle through lesson study. The subject of the research was 40 students. From 40 students can improve the ability in critical thinking in the cycle I was 15%, in the cycle II was 35%, in the cycle III was 57%, and in the cycle IV was 87%. The percentage of the students' ability in answering the correct answer of each cycle were in the cycle I was 13%, in the cycle II was 30%, in the cycle III was 60%, and in the cycle IV was 93%. The percentage of the students' ability in analyzing the questions, in the cycle I was 11%, in the cycle II was 40%, in the cycle III was 55%, and in the cycle IV was 84%. The percentage of the students' ability in considering the truth source or not of each cycle were in the cycle I was 5%, in the cycle II was 49%, in the cycle III was 59%, and in the cycle IV was 88%. The percentage of the students' ability in reducing the question of each cycle were in the cycle I was 7%, in the cycle II was 48%, in the cycle III was 64%, and in the cycle IV was 96%. The last, percentage of the students' ability in asking the question of each cycle were in the cycle siklus I was 10%, in the cycle II was 42%, in the cycle III was 67%, and in the cycle IV was 98%.

The result of the improvement of the students' ability in critical thinking in several aspects such as: gave the description of the terms, answered the question, analyzed the question, considered the truth source or not, reduced and asked the questions of each cycle had shown that implementing lesson study model had been reached the successful.

In conducting the research, the researcher had prepared good Plan. In stage Do the researcher focused on improving the students' ability in learning process and to find out the concepts of the mechanics material. In this activity the researcher

guides the students in analyzing and exploring the ideas through the questions and they should discuss in groups. The last activity was giving reward to the students. Giving the reward for the students can made them more interested in improving their ability in critical thinking. And then the researcher made the reflection. According to Yuan (2008) states that "the instruction that depending on the problem will support the students in learning to improve their ability in critical thinking".

### III.3 Analysis of lecturer and students activity

The successful had explained in point IV.2 shown that the students and lecturer activity in teaching and learning was good. Although, there were some the weaknesses found in the first cycle until the third cycle. But, the weaknesses did not make the students and lecturer low down activity. The result of the students and lecturer activity was obtained from the observation sheet for the students and also the lecturer that had been observed by the observer. Observation sheet had discussed together in stage Plan before the lecture implemented in the stage Do. The result shown that the percentage of the lecturer and students activity in the first cycle was 59.72 % or in low level. While, the percentage of the lecturer and students activity in the second cycle was 81.94% or in good level. In the third and the fourth cycles the percentage of the lecturer and students activity was 87.5% and 97.22% or in very good level. As for, the result of analysis of lecturer and students activity from the cycle I until cycle IV in Figure 4 as follows:

Learning Activity	SM	Cycle 1			Cycle 1			Cycle 1			Cycle 1		
		SP	%	Ket.	SP	%	Ket.	SP	%	Ket.	SP	%	Ket.
Menyusun pengetahuan baru	12	8	66	good	11	91	very good	11	91	Very good	11	92	Very good
Keg. penemuan	12	6	50	enough	6	50	enough	8	67	good	12	100	Very good
Memancing mhs utk mengali sis & ber eksplorasi	12	4	33	enough	9	75	good	10	83	good	11	92	Very good

SP : Skor Perolehan  
SM : Skor Maksimum

Figure 4. Analysis of Lecturer and Students activity in Teaching and Learning Process

#### IV. CONCLUSION

Based on the result above, concluded that lesson study can improve the students' ability in critical thinking at the third semester students at physics program of Almuslim University. That was shown of the result in the percentage in improving the students' ability in critical thinking in the first cycle was 22.66%. In the second cycle was 50.04%. In the third cycle was 71.23% and the fourth cycle was 89.89%. The lecturer's activity in the first cycle was 53%, in the second cycle was sebesar 66%, in the third cycle was 82%, and in the fourth cycle was 93%.

## Implementation of Lesson Study to Increase Student’s Ability in Reading and High Level Thinking

Marwan

*Economic Education Department, Padang State University, Padang, Sumatera Barat, Indonesia*  
[marwan.unpdg@yahoo.co.id](mailto:marwan.unpdg@yahoo.co.id)

**Abstract:** The purpose of lesson study implementation in Introduction to Micro Economic lesson is increasing university student’s ability in reading and high level thinking. Besides of that, we hope lesson study activity can increase the lecturer professionalism in recite and solving learning problem in a collaboration manner. Lesson study activity is done in 3 cycles: plan, do, and see. Based on the result of plan activity, learning is designed using cooperative script learning model. The data is gathered through observation paper that filled in by the observer at open lesson moment. The data is analyzed in a qualitative manner with focus on increasing student’s ability in reading and high level thinking. From data analyze, we know that the university student’s ability in reading and high level thinking can increase through cooperative script learning model. The student must study and studied each other with other students in their group. The student must read the subject well. Then the students give the subject by turns and give their main idea each other in a critical and creative manner. Last, they perceive the question and solve the problem that submitted by lecturer and another students.

**Keywords:** reading ability, high level thinking, cooperative script

### 1 INTRODUCTION

Introduction to micro economic lesson is one of mandatory lesson in Economic Education Program in Economic Faculty, Padang State University. Through this lesson, we hope the university student can understand theory and practice about economic base concept, supply and demand, consumer and producer behavior, and how economic activity in various market structure. In an effort to get competence in this lesson, we hope student have an ability to read and understand the lesson subject in a good manner. Then the student should have a high level ability in thinking, so they could understand the implementation of micro economic science in the real practice. High level ability in thinking is using the intelligence in a wider manner to find new challenge, or someone ability in implementation new information or the knowledge before, and manipulation the information to get possibility answer in the new situation (Heong et.al., 2011).

High level ability in thinking can be measured from someone’s ability in critical and creative thinking, and their ability in solving the problem. Critical thinking is an organize process that enable the student to evaluate the evidence, assumption, logic, and language that based on other people thinking (Johnson, 2007). Creative in thinking ability can show by student’s ability in giving new idea, giving the question, brave in experiment and planning the new strategy. Creative thinking include create, find, imagination, estimate, design, giving alternative, make and produce something (Thomas et. al., 2000). Critical and creative thinking can be used

in solving the problem. Problem solving uses existing knowledge and skill to answer the question or the difficult situation (Ormrod, 2009).

Based on observation in teaching Introduction to Micro Economic lesson, we know that university student’s ability in reading and high level thinking relatively not enough. It was shown when lecturer asked student to read subject and cases in the text book. The student relatively could not understand the subject that they read well. The student also could not complete the problems that need high level ability in thinking. In discussion, not all of the student could make the question and give critical and creative answer. All of the phenomena shown that the student could not study well in getting expect competence.

There are many factors that influence student’s ability in reading and high level thinking. Besides internal factor, external factor also have important role to increase student’s ability in reading and high level thinking. Lecturer’s ability in managing the learning process also have important role to motivate the student to increase their ability in reading and high level thinking. Speech method in learning process and variation with question-answer method could not motivate student to increase their ability in reading and high level thinking. It needs an effort to expand and implement variation that could motivate them.

This problem must be solved together by the lecturers who teach Introduction to Micro Economic lesson. This problem can be solved through Lesson Study (LS) activity. Lesson Study is one of an effort to increase learning quality through learning

recitation in collaborative and continuous manner. Lesson Study implementation based on collegiality principles and mutual learning to build learning community. Lesson Study is a model of “teacher professional development”. Through lesson study activity, it is created learning process that could motivate university student to learn in active, creative, effective and pleasure manner through hands-on and mind-on activity, daily life, and local materials. Lewis (2002) said the idea that is contained in lesson study actually brief and simple. If a teacher wants to increase learning process, they have to collaborate with another teacher to design, watch closely, and make reflection to learning process. Sato, Masaaki (2014) said that lesson study is an activity system and philosophy. Activity system include arrange learning plan activity, make open class, make discussion forum and archive the record of learning activity.

Three important things in Lesson Study: plan, do, and see can increase learning quality absolutely. Sato, Masaaki (2014) exacerbate lesson study activity into Plan, Do, See, and Redesign. At Plan stage, teacher discuss and understand the lesson subject, learn the various media and model, and how to do the activity. At Do stage, teacher observe the learning to know whether student have learned through learning design that have been designed before. At See stage, teacher learns about learning activity that have been done and redesign the next learning plan.

Through Lesson Study lecturer can design learning process that makes the student learn each other. In Lesson Study, lecturer attention focuses on student behavior. A model lecturer in the reflection process will explains all of condition that he create to make the student learn, in accordance with the program that have been planned. This is important, because reflection is not aimed to the lecturer’s appearance, but how the lecturer manages learning and student’s activity. With Lesson Study implementation, we expect to change learning paradigm from lecturer centre learning model to student centre learning model. The learning process can increase ability in high level reading and thinking, to explore tendency, solve the problem, or build the concept, in cooperative manner or individual.

## 2 METHOD

The subject in this lesson study is university student at the first semester in Economic Education Program that follows Introduction to Micro Economic lesson. All of the students are 45 people. The lecturer consists of 1 model lecturer, 2 observers, 1 monitoring, and 1 people in documentation.

Lesson study activity is designed into 3 learning cycle. Every cycle consist of Plan, Do, and See

activity. Plan for the first cycle did on Wednesday, November 27th, 2013. Do for the first cycle did on Thursday, November 28th, 2013. Plan for the second cycle did on Wednesday, December 4th, 2013, and Do activity did on Thursday, December 5th, 2013. Last, for the third cycle, Plan activity did on Friday, December 6th, 2013, and Do activity did on Monday, December 9th, 2013. The reflection activity for every cycle did in the end of open lesson activity.

Collecting data are done by using observation technique. Data are collected through observation paper that is filled in by the observer as long as open lesson process. Technique for data analysis use qualitative analysis. Data from observation paper are discussed with the observer in reflection activity. With collaboration, model lecturer and observer collected data, classified them, analyzed, and interpreted the observation result. At the end, we get the conclusion from open lesson activity, suggestion and input for the next better lesson study activity.

## 3 RESULT AND DISCUSSION

Lesson study activity consist of Plan, Do (open lesson), and See (reflection). At the first cycle in Plan activity, model lecturer explained the problem in learning process at Introduction to Micro Economic lesson. Model lecturer explained the lesson design for that lesson, where model lecturer would use cooperative script learning model. Implementation this model absolutely would increase student ability in reading and high level thinking. Observer agreed that model lecturer could use that lesson design.

At the second and the third cycle in Plan activity, model lecturer and observer agreed to put into learning design what is the result of before reflection. The substantive things like making the group and the rule for interaction between groups are the focus in this learning process.

Open lesson activity at the first, the second, and the third cycle are attended by observers and documenter. Model lecturer started learning activity by explaining that open lesson is attended by other lecturer as an observer. After apperception activity, model lecturer asked student to make the group that consist of two persons. Next, students are asked to read the subject in the text book. After that, students are asked to make summary. Then, in every group will be determined who act as speaker and listener. The speaker in every group extended the resume and put main idea into their resume. The listener hear, corrected, and completed main idea if it still incomplete. Next, they changed the place. Implementation of cooperative script learning model would train the student to read precisely and have critical thinking about the subject that they read. In interaction process, student would give input each other. Last, lecturer asked the student to make

question that related to the subject. The question would be answer by the student from another group. Next, together lecturer and student made conclusion about that subject.

Reflection activity in every cycle would be done after open lesson activity. Observation results shown that the interaction will increase between student and student, student and lecturer, or student and text book. Interaction between student and student occur in the group or inter group. Interaction between student and the source of lesson occur when the student read the text book. Interaction between student and student occur when student have to explain the subject and complete each other subject. Interaction between student and lecturer go on learning process. Interaction between one group and another group occur when the group gave and answer the question.

From observation results, we can see that all of the students have learned the subject in every cycle. Small group in cooperative script learning model can motivate student to learn each other. All of the students read the subject although in quantitative manner their ability in understanding the reading not measurable well. Observation results also shown if the student could not read the subject at the time that agreed, lecturer will give the direction so they could read faster. The important thing that we get from this observation is ability in reading fast is needed for the student in learning.

From observation we also can explain student's ability in high level thinking. In a qualitative manner, increasing in student's ability can be measured from the question and the answer that they give. Based on the subject they read, student can submit various questions critically and creatively. Another student must answer this question well, and this question could be critical by the other student. This process could increase student's ability in solving the problem.

We can explain that not all of the students participate actively in discussion, so increasing in student's think ability could not seen individually. It was occur because the limitation of time, so we could not got the chance to discuss with every student. Student's ability in high level thinking to solve the problem also could not be measured well. We suggest the lecturer to prepare some case or problem that need high level thinking.

There are some important things from reflection result. First, making the group must think about heterogeneity of student's ability. There is student that has high interaction because these two groups personal have good academic ability. But there is student that has less interaction because these two groups have lower academic ability. Second, the interaction between the groups must plan precisely, so all of the groups have the same opportunity to

discuss. Third, timing for every stage in learning process must be arranged, for reading, for discussion in group or inter group. Fourth, about student's ability in reading, lecturer must give the direction how to read well. Fifth, about student's ability in high level thinking, lecturer must give explanation about high level thinking aspects that the students need. Last, we need to develop special instrument to measure student's ability in reading and high level thinking.

The implementation result of this lesson study show that collaborative learning especially in small group could increase student's ability in their study. But cooperative script learning model that is used in learning design must modify being collaborative learning. Sato (2014) said this as lesson reformation with collaborative learning. There are some reasons why it is important to implement collaborative learning (Sato, 2014), collaborative learning is a learning essential, create the right to study for every children, tool to improve academic ability, and to guarantee the student that have good academic ability to be better.

The implementation result of lesson study also show that cooperative script learning model create the interaction to teach each other between the students in the group. Actually, it creates the interaction to study each other. Sato (2014) said that the interaction to study each other better than the interaction to teach each other. The interaction to study each other is the mutual relationship that full of honesty. It starts from the student question that they can't understand. Students who understand will help them. The interaction to study each other is suitable with the andragogy learning in university. Pannen (1997) in Suprijanto (2011) said that study for adult correlate with how to direct themselves to ask the question and find the answer. Sato (2014) said the learning (manabi) is when every student meet and dialogue about lesson subject, and although they are not sure, but they start to understand the substance with their own way (dialogue with object), then through collaboration (dialogue with another people), every student build their understanding exactly.

Another discussion is about building the learning that could motivate student to study each other to solve the high and complex problem. Most of the problems arise from the class discussion have not challenge the student yet to solve them using high level thinking ability. Sato (2014) said that in that learning is needed the jumping, it is creative and challenge learning. In triangle model (Sato, 2014) the prerequisite to build learning is an authentic learning, study each other relationship, and jumping learning. It was agreed by Sato (2014) that 3 unsure that affect learning quality are task quality that is given, study in interaction and actively, then

motivation, cognition, and student’s emotional. In an effort to increase student’s thing ability in solving their problem, of course the lecturer needs to prepare the jumping task.

Another thing that must be change is discussion activity. Discussion in group or inter group must direct to hearing each other, not debate or discuss each other. Sato (2014) said that discus each other just express what we have understand. The class is seen very active but most of the learning is not happened. Sato (2014) added that the group who get the learning is the group where the exchange in opinion occurs calmly, and every student hears what their friend say and then think it deeply.

From monitoring result and internal evaluation, we know that lesson study give the big contribution to increase lecturer collaboration in growing up learning quality. The lecturer together can design and develop learning tool that will be used at open lesson. Model lecturer and observer discuss and prepare learning tool that is needed for every “do” activity or learning process. At do activity, model lecturer give learning subject well, related with the “plan” that have been prepared. Model lecturer try in their best way to prepare themselves in teaching, because they will be seen by the observer and recorded by using camera.

“See” activity is a pleasure activity for the lecturer, because they could give input and suggestion each other. Usually, lecturer solves the learning problem individually. Through “see” activity the lecturer give input each other to solve the problem or increase learning quality.

#### 4 CONCLUSIONS

Implementation of lesson study in Introduction to Micro Economic lesson could solve the problem about less ability of the student in reading and high level thinking. Through lesson study, the lecturer collaborates to design learning using cooperative script learning model. From three cycle lesson study activity, in a qualitative manner, based on the observation, we could see that there is an increasing in student’s ability in reading and high level thinking.

The student must read and understand the subject that they read. Student must explain what they know to another student. The other student must listen and add the idea if it is not enough yet. In discussion, the student must submit critical and creative question, and the other student must answer the question better. All of this process could increase student’s ability in solving the problem.

In an effort to increase student’s reading ability, better giving the student the direction about good reading technique. Then we need to explain the question formulation and the answer that can categorized as a high level thinking. In an effort to

increase student’s interaction, lecturer should make heterogeneous group based on student’s learning ability.

## Reflection of Lesson Study Approach by Pre-Services Science Teacher During Practicum at Selected School

Md Yusoff Daud<sup>1</sup>, Zanaton Iksan, Fariza Khalid<sup>2</sup> and Roslinda Rosli<sup>3</sup>

<sup>1</sup>Faculty of Education Universiti Kebangsaan Malaysia

<sup>2</sup>Faculty of Education Universiti Kebangsaan Malaysia

<sup>3</sup>Faculty of Education Universiti Kebangsaan Malaysia

**Abstract:** Lesson study is a model of teacher professional development in improving teaching and learning process. Advantages of this approach had been proven by the Ministry of Education. They had implemented it at the school level gradually. Science students teacher in the faculty of education are exposed to teach at school as their practicum. Hence, to enhance the development of teaching and learning, lesson study has been applied in the evaluation of learning experience. This study aims to get some response from the students who apply lesson study approach in their training. There were 5 students, 2 teacher, 5 colleagues and 4 lecturers involve in this study. The data consist of observation, structured question and interview. The focus of data is about the main step in lesson study which are preparation of lesson plan, open class and reflection. The finding shows that the students have some positive and negative comment on the application of lesson study. They are different feedback between the applying of the lesson study during micro teaching and practicum in term of certain principle.

**Keywords:** Lesson study, reflection, practicum, pre-service teacher.

### 1 PERKENALAN

Pembinaan tamadun sesebuah bangsa adalah berkait rapat dengan kualiti pendidikan negaranya. Negara yang maju sudah semestinya memiliki tahap pendidikan yang berkualiti untuk melahirkan masyarakat yang berkembang maju. Dalam konteks Negara Malaysia, dasar pendidikan seperti yang dihasratkan dalam Falsafah Pendidikan Negara adalah untuk melahirkan modal insan yang mempunyai minda kelas pertama dan bertaraf dunia. Untuk mencapai hasrat murni itu suatu Pelan Pembangunan Pendidikan (PPP) telah dirangka dan diterbitkan sebagai rujukan semua warga pendidik (KPM, 2013). Pelan tersebut adalah rancangan pembangunan jangka panjang bermula daripada 2013-2015. Ia menggariskan 5 teras utama dan salah satu terasnya ialah untuk meningkatkan keupayaan pengetahuan dan inovasi serta memupuk minda kelas pertama dalam mencapai hasrat negara untuk menjadi negara yang berpendapatan tinggi dan produktif menjelang tahun 2020. Justeru itu individu yang mempunyai ciri-ciri modal insan cemerlang seperti berkemahiran tinggi, boleh bertindak balas dengan pantas dan kreatif terhadap perubahan ekonomi, dan berpaksikan kepada penjana dan penggunaan pengetahuan mampu membangunkan negara dan ekonominya. Oleh yang demikian, satu pendekatan pengajaran yang bersifat holistik yang memenuhi semua keperluan tersebut diperlukan. Kerjasama antara kementerian dan pihak-pihak swasta digalakan bagi pembangunan modal insan ini

melalui transformasi pendidikan. Transformasi pendidikan telah digariskan secara jelas dalam salah satu Bidang Keberhasilan Utama Negara (NKRA). Satu pendekatan pengajaran berasaskan *Lesson Study* cuba diketengahkan kerana ianya diyakini berupaya menggalakkan pembelajaran secara kolaboratif dan berterusan bagi meningkatkan perkembangan ilmu guru, berkongsi pengalaman dan sekaligus dapat meningkatkan kecemerlangan pelajar (Stepanek et al., 2007).

*Lesson Study* merupakan kesinambungan daripada kaedah pengajaran secara kolaboratif dan mempunyai ciri-ciri yang tersendiri. *Lesson Study* yang dijalankan dalam kelas dapat meningkatkan pengalaman pembelajaran guru di samping memperbaiki pengajaran guru. Ianya juga tidak meminggirkan kepentingan pelajar di dalam proses pengajaran. Hal ini kerana penilaian dan refleksi bagi setiap pengajaran bukan sahaja berfokus kepada guru tetapi juga perkembangan pembelajaran pelajar. Selain daripada itu, kaedah pengajaran *lesson study* dapat meneroka idea para guru untuk meningkatkan pemikiran kreatif dan kritis, saling membantu mencari penyelesaian bagi sesuatu masalah serta meluaskan pemahaman, kemahiran dan keupayaan guru dan pelajar (Wiburg dan Brown, 2007).

Sorotan literature menunjukkan bahawa *Lesson Study* telah mula bertapak di Jepun semenjak tahun 1960-an (Fernandez & Yoshida 2004) tetapi menurut Takahashi (2000) mendapati bahawa *Lesson Study* sebenarnya telah bermula pada akhir kurun ke-19. Sungguhpun amalan *Lesson Study* sudah hampir

seabad lamanya di negara Jepun tetapi kurang dikenali di peringkat global sehingga akhir tahun 1990-an. Oleh sebab dianggap sebagai suatu amalan biasa, *Lesson Study* menjadi suatu budaya dalam kalangan guru-guru Jepun untuk memperkembangkan profesionalisme keguruan. Dari segi istilah, menurut Yoshida (1999) *Lesson study* diperolehi daripada perkataan Jepun iaitu *Jugyokenkyu* merupakan gabungan dari dua kata *jugyo* yang bererti *lesson* atau pembelajaran, dan *kenkyu* yang bererti *study* atau *research* atau penyelidikan. Oleh itu, *Lesson Study* boleh disimpulkan sebagai suatu kajian atau penelitian terhadap proses pengajaran guru dalam bilik darjah. Melalui aktiviti penelitian tersebut, guru-guru di Jepun mengkaji pembelajaran melalui perancangan dan pemerhatian bersama yang bertujuan untuk memotivasi pelajar untuk aktif belajar secara inkuiri. Dalam konteks dunia global, amalan *Lesson Study* bermula pada tahun 1995 dan menarik perhatian pendidik di Barat secara kebetulan semasa berlangsungnya *The Third International Mathematics and Science Study (TIMSS)* dan kemudiannya diikuti oleh 41 buah negara dan 21 di antaranya memperoleh skor matematik yang lebih tinggi dari Amerika Syarikat. Posisi tersebut membuat Amerika Syarikat melakukan kajian perbandingan pembelajaran matematik di Jepun dan Jerman. Di Jepun, dua penyelidik Amerika Syarikat, Catherine Lewis dan Richard Hiebert, memerhati amalan '*lesson study*' (*jugyoukenkyu*) yang diamalkan secara meluas dalam kalangan guru di sekolah. Daripada kajian perbandingan tersebut, kumpulan penyelidik Amerika Syarikat menyedari bahawa Amerika Syarikat tidak memiliki sistem untuk melakukan peningkatan mutu pembelajaran, sedangkan Jepun dan Jerman telah mengamalkan peningkatan mutu pembelajaran secara berterusan. Oleh kerana itu, para pendidik di Amerika Syarikat telah mula belajar dari Jepun tentang *Lesson Study* dan kemudian mengembangkannya pada beberapa negara lain. Dalam tempoh sembilan tahun yang lalu, *lesson study* telah dibangunkan di beberapa lokasi di Amerika Syarikat. Ia juga digunakan dalam projek Persatuan Kualiti Pendidikan Antarabangsa (IQEA) di England dan Hong Kong. Penyelidikan ini adalah pembangunan pertama penyelidikan dalam lesson study yang dibiayai di UK (Wiburg dan Brown, 2007).

## 2 MODEL LESSON STUDY

Secara umumnya, satu kitaran model *Lesson Study* mengandungi beberapa langkah yang mendorong guru-guru untuk bekerjasama melaksanakan langkah-langkah tersebut. Satu komuniti *lesson study* yang berjaya dibentuk dengan satu kesatuan cita-cita dan matlamat akan

memudahkan pelaksanaannya (Lewis dan Hurd, 2011; Fernandez dan Yoshida 2004). Rajah 1 menunjukkan model kitaran *Lesson Study*.

Rajah 1: Model Kitaran Lesson Study

Langkah pertama adalah menetapkan matlamat pengajaran iaitu dengan mengkaji matlamat jangka panjang untuk perkembangan pembelajaran murid dan kurikulum serta membuat pemerhatian terhadap sukatan pelajaran. Tiga aspek yang perlu diperhatikan iaitu, pertama pencapaian GPMP (Gred Purata Mata Pelajaran) matapelajaran, kedua sasaran ETR (*Expected Targeted Result*) matapelajaran, ketiga jurang antara GPMP pencapaian berbanding sasaran GPMP ETR matapelajaran. Jurang pencapaian tersebut akan dijadikan fokus penelitian dalam *Lesson Study*.

Langkah kedua adalah merancang rancangan pengajaran. Ini memerlukan kumpulan *Lesson Study* untuk memilih topik atau subtopik matapelajaran. Pemilihan mestilah mengambil kira tajuk yang penting, sukar difahami dan topik bukan kegemaran murid, membincangkan masalah pembelajaran murid dan merancang langkah-langkah pembelajaran murid sehingga menghasilkan rancangan pelajaran yang efektif dengan mengambil kira perubahan yang dijangka berlaku kepada murid semasa sesi pengajaran dan pembelajaran dalam kelas terbuka.

Langkah ketiga adalah melaksanakan pengajaran dan pemerhatian yang mana ia memerlukan seorang ahli kumpulan *Lesson Study* yang akan melaksanakan pembelajaran berdasarkan Rancangan Pengajaran yang dihasilkan bersama. Ahli *Lesson Study* yang lain bertindak sebagai pemerhati. Protokol Pencerapan *Lesson Study* semasa sesi pengajaran dan pembelajaran akan melibatkan para pencerap membuat pemerhatian dan mencatat dalam borang pencerapan yang disediakan. Fokus utama diberi kepada pembelajaran murid dan bukan kepada guru yang mengajar. Para pencerap boleh bergerak di dalam bilik darjah untuk meneliti murid membuat kerja latihan tetapi mereka tidak akan campur tangan dalam proses pengajaran dan pembelajaran tersebut. Sekiranya terdapat rakaman video dijalankan, para pencerap diingatkan supaya tidak menghalang rakaman video semasa mereka bergerak dalam bilik darjah manakala ahli *Lesson Study* hendaklah mengumpul data untuk refleksi dan perbincangan.

Langkah keempat adalah menilai refleksi pengajaran yang mana ia hendaklah dilaksanakan pada hari yang sama. Pembelajaran yang dilaksanakan merupakan milik pembelajaran ahli pasukan *Lesson Study* (pembelajaran 'kita' bukan pembelajaran 'saya'). Pengajar diberi kesempatan pertama mengemukakan refleksi. Pengajar hendaklah memberi refleksi sendiri berkenaan dengan pengajaran-pembelajaran berdasarkan apa yang telah berlaku dalam kelas daripada aspek kekuatan dan kelemahan. Para ahli pasukan berbincang dari aspek keberkesanan pengajaran-pembelajaran, termasuk penglibatan murid, tingkah laku, maklum balas, kerja latihan dan lain-lain aspek pembelajaran murid yang berkaitan. Ketua pasukan memainkan peranan sebagai moderator dalam perbincangan. Beliau memastikan penglibatan secara menyeluruh dalam kalangan semua ahli pasukan semasa perbincangan. Pakar rujuk tidak perlu terlalu menonjolkan diri semasa memberi input dan pandangan. Suasana seperti itu perlu bagi menggalakkan perbincangan yang terbuka dan mesra. Para ahli pasukan *Lesson Study* perlu membincangkan kelemahan, membuat dan penambahbaikan kerana dapatan tersebut akan dapat meningkatkan rancangan pengajaran yang efektif serta pembelajaran murid. Bagi langkah kaji semula pengajaran, rancangan mengajar berkenaan boleh diterima tanpa pembetulan, diterima dengan pembetulan atau pun ditolak. Sekiranya perlu, pasukan *Lesson Study* boleh mencadangkan supaya rancangan mengajar berkenaan dibuat semula dan diajarkan semula kepada kelas yang lain oleh ahli *Lesson Study* yang lain. Rancangan mengajar berkenaan disimpan sebagai rekod untuk dokumentasi (Lewis dan Hurd, 2011).

Komponen teras bagi kaedah *lesson study* menekankan untuk bekerja dalam mod penyelidikan secara bersama-sama. Tujuannya adalah untuk mengenal pasti apa yang mahu dipelajari, mengapa dan apa yang menjadi tumpuan penyelidikan atau siasatan. Pemerhatian dilakukan dalam satu kumpulan yang terdiri daripada beberapa orang guru dan data direkodkan. Kemudian, perbincangan, analisis dan rakaman dilakukan dari apa yang telah dipelajari oleh pelajar dan penyelidik. Mereka merekod dan menganalisis amalan dan atau data contohnya menggunakan video, audio atau imej pegun. Akhir sekali, laporan akan disediakan untuk menyampaikan kaedah ini sama ada dalam mesyuarat kakitangan, PowerPoint, video dan panduan kejurulatihan serta dapat menggunakan ia untuk pengajaran yang sebenar (Zanaton Iksan, 2014; Lewis dan Hurd, 2011; Lewis, 2002 & Lewis, & Tsuchida, 1997).

### 3 LATAR BELAKANG KAJIAN DAN PERNYATAAN MASALAH

Dalam kerangka untuk melahirkan guru yang terlatih dan kompeten, peranan universiti secara amnya dan peranan fakulti pendidikan masing-masing universiti secara khusus harus mempunyai suatu dasar dan kurikulum yang mantap yang diterapkan kepada guru-guru pelatih. Justeru itu segala bentuk pembaharuan, inovas dan pendekatan pengajaran semestinya diperkenalkan pada peringkat pengajian prasiswazah lagi. Dalam konteks yang lebih khusus, Fakulti Pendidikan Universiti Kebangsaan Malaysia (UKM) yang melatih bakal-bakal guru dalam bidang pengkhususan seperti TESL (*Teaching English as Second Language*), Pendidikan Khas, Pendidikan Sukan dan Rekreasi dan Pendidikan Sains telah cuba menerapkan pendekatan *Lesson Study* melalui subjek Kurikulum dan Pedagogi dan Latihan Mengajar. Bakal-bakal guru atau dikenali juga sebagai guru pelatih telah diberikan pengalaman pengajaran secara terus di sekolah-sekolah terpilih selama 16 minggu. Amalan pengajaran selama ini berasaskan kepada pendekatan *Peer Coaching and Mentoring* yang sedikit berbeza dengan pendekatan *Lesson Study*. Menurut Loucks-Horsley et al. (1997) pendekatan secara permentoran lebih kepada latihan dan bimbingan dari rakan yang lebih senior secara perseorangan berbanding dengan pendekatan secara *Lesson Study* yang menekankan kepada proses pengajaran. Satu komuniti *Lesson Study* perlu diwujudkan dalam sesebuah sekolah bagi menyokong pelaksanaan pendekatan ini. Dalam amalan pengajaran yang di amalkan sekarang, wujud jurang antara pendekatan secara bimbingan secara orang perseorangan dan pendekatan secara *Lesson Study*. Justeru itu kajian ini dijalankan bertujuan untuk mengenalpasti sejauhmana pendekatan secara *Lesson Study* ini memberi impak kepada guru pelatih tersebut.

### 4 OBJEKTIF KAJIAN

Objektif kajian ini adalah untuk mengenalpasti:

- a) Sejauhmana pendekatan *Lesson Study* ini memberi impak kepada guru pelatih dalam proses pengajaran.
- b) Sejauhmana pemerhatian kelas terbuka yang dilaksanakan memberi nilai tambah kepada proses pengajaran guru.
- c) Isu-isu penambahbaikan dalam memperbaiki latihan mengajar bagi guru pelatih.

### 5 METODOLOGI KAJIAN

Seramai lima orang guru pelatih telah terpilih dari dua sekolah yang berbeza, empat orang guru pembimbing, lima orang rakan sebaya dan empat

orang pensyarah. Kesemuanya mereka telah bersetuju untuk turut terlibat dalam proses pemerhatian pada sesi kelas terbuka. Sebelum kelas terbuka dijalankan guru pelatih telah berbincang bersama pensyarah, rakan sebaya dan guru pembimbing untuk menulis rancangan pengajaran harian. Elemen yang terkandung dalam rancangan harian tersebut ialah tarikh, tajuk, set induksi, perkembangan, penutup dan refleksi sendiri (Lihat Lampiran) (Zanaton Iksan dan Md Yusoff Daud, 2014). Semasa kelas berjalan, semua yang terlibat telah membuat pemerhatian sepanjang proses pengajaran guru tersebut. Disamping itu juga, rakaman video turut dijalankan. Selepas sesi pengajaran guru pelatih diminta untuk memberikan refleksi sendiri berkaitan dengan proses pengajaran yang telah berjalan. Huraian perlaksanaan pendekatan *lesson study* adalah seperti berikut:

Langkah 1

Guru yang mengajar di minta membuat refleksi berkaitan dengan proses pengajaran pada hari itu dengan menyatakan apa-apa sahaja perasaan, kekuatan dan kelemahan.

Langkah 2

Setiap pemerhati yang turut serta semasa sesi pengajaran diminta untuk memberikan ulasan dan refleksi berkaitan dengan proses pengajaran pada hari itu. Teguran atau cadangan penambahkan boleh dikemukakan dengan cara yang berhemah tanpa menyinggung perasaan guru pelatih tersebut

Langkah 3

Refleksi turut sama diberikan oleh rakan sebaya, guru pembimbing dan pensyarah yang terlibat. Beberapa idea penting samada pujian atau penambahkan diutarakan sebagai input penting yang berguna. Selepas mendengar refleksi dari rakan pemerhati, guru pembimbing dan pensyarah, guru pelatih diminta sekali lagi untuk memberikan ulasan dan justifikasi kepada komentar yang di berikan. Ketua projek akan merumuskan dapatan refleksi tersebut. Aspek yang ditekankan ialah berkaitan dengan

- i. Penyediaan rancangan pengajaran
- ii. Set Induksi
- iii. Kawalan kelas
- iv. Penyoalan
- v. Penggunaan Alat Bantu Mengajar (ABM) atau Media pengajaran
- vi. Rumusan dan penutup.

Data kajian dikumpul melalui laporan bertulis semasa pemerhatian proses pengajaran yang dilakukan dan juga refleksi di analisis. Temubual secara bersemuka diajukan kepada guru pelatih untuk mendapatkan input yang berkaitan secara lebih jelas dan mendalam. Rakaman video turut dianalisis bagi melengkapkan maklumat yang berkaitan. Analisis dijalankan menggunakan kaedah analisis bertema

atau *'thematic analysis'* (Miles dan Huberman, 1994).

## 6 DAPATAN KAJIAN DAN PERBINCANGAN

### a) Impak Pendekatan Lesson Study kepada Guru Pelatih dalam Proses Pengajaran

Proses pengajaran yang dijalankan oleh guru pelatih diperhatikan oleh rakan sejawat, rakan pelatih dari university yang berbeza, guru pembimbing, guru mata pelajaran dan pensyarah pembimbing. Pelbagai dimensi yang dilihat yang kemudiannya di cerakinkan dalam sesi refleksi. Analisis data daripada laporan bertulis dan refleksi guru pelatih menunjukkan beberapa aspek kekuatan dan kelemahan yang dikenalpasti. Aspek yang ingin ketengahkan adalah berkaitan dengan kesediaan guru pelatih dalam mengaplikasi pendekatan *lesson study*, kekuatan dan kelemahan guru pelatih dalam proses pengajaran. Data analisis menunjukkan persetujuan yang positif dari guru pelatih, menyatakan bahawa pendekatan *lesson study* ini memberi impak yang positif kepada proses pengajaran. Pada peringkat awal pendedahan ini sememangnya berlaku kelemahan sedikit sebanyak. Pendekatan *lesson study* ini memberikan satu lonjakan dalam diri untuk turut berubah. Guru pelatih pada mulanya merasa tertekan kerana pendekatan *lesson study* adalah satu pendekatan yang baru diperkenalkan. Ianya diikuti dengan proses pemerhatian yang dilakukan secara beramai-ramai semasa kelas terbuka. Ianya berbeza sekali dengan amalan pemerhatian sebelum ini yang hanya dijalankan oleh seorang pensyarah penyelia sahaja.

Kesemua guru bersetuju, pada awalnya mereka merasa gugup, lama kelamaan perasaan gugup itu hilang. Namun demikian satu perasaan puas hati, bangga dan teruja timbul apabila dijalankan sesi refleksi secara bersemuka beramai-ramai. Input dari sesi refleksi ini memberikan keyakinan baru untuk guru pelatih memperbaiki proses pengajaran selanjutnya. Sebagai contoh:

.....*"saya merasa sikit gugup....dan agak gementar pada permulaan pengajaran...tetapi setelah memulakan pengajaran perasaan itu semakin hilang.dan boleh teruskan pengajaran seperti yang dirancang"* (Liza)

.....*"Setelah diberitahu bahawa praktikum kali ini akan dilaksanakan melalui pendekatan lesson study...sedikit gementar, kerana selama ini saya belum pernah mendengar istilah lesson study....akan tetapi setelah selesai melalui proses ini, saya merasa sedikit teruja....."* (Yati)

### b) Impak kepada Proses Pengajaran

Impak kepada proses pengajaran berasaskan kepada pendekatan *lesson study* ini akan

dibincangkan berdasarkan aspek-aspek berikut, (i) persediaan rancangan pengajaran, (ii) set induksi (iii) kawalan kelas (iv) penyoalan, (v) alat bantu mengajar (ABM) dan (vi) sesi rumusan dan penutup.

i. Persediaan rancangan pengajaran

Gelungan kedua pendekatan proses pengajaran berasaskan *lesson study*, ialah merancang persediaan rancangan pengajaran. Semua guru pelatih yang terlibat bersetuju bahawa, pendekatan *lesson study* ini memberikan satu lonjakan kelainan dari amalan-amalan sebelumnya. Dimana rancangan pengajaran yang disediakan disemak dan dibincang bersama dengan rakan sejawat, guru pembimbing dan pensyarah penyelia. Kelpelbagaian pandangan dan cadangan sebenarnya telah bermula diperingkat awal persediaan rancangan pengajaran lagi.

*...”seronok dan teruja sekali..bila rakan-rakan dan guru pembimbing memberikan komen dan cadangan membina dalam penulisan rancangan pengajaran...(Guru Pelatih Ayu)”...*

ii. Set induksi

Set induksi dalam proses pengajaran merupakan satu elemen penting, dimana perkaitan dan hubungan diantara konsep yang hendak diajar pada hari itu boleh dikaitkan dengan suatu set yang dekat dengan pengalaman harian pelajar. Menurut Perrot (1982) set induksi ialah memberikan makna kepada sesuatu konsep yang hendak diajar dengan memberikan contoh-contoh tertentu. Sebaik-baiknya contoh yang diberikan itu berasaskan kepada pengalaman yang dekat dengan kehidupan seharian pelajar. Analisis refleksi berkaitan dengan aspek set induksi adalah seperti berikut. Sebagai contoh:

Menurut komen yang diberikan oleh Dr R berkaitan dengan elemen set induksi proses pengajaran oleh Guru Mala.

*...”inisiatif awak untuk memasukkan elemen set induksi dalam sesi permulaan pengajaran patut dipuji...tetapi..saya ingin mencadangkan agar set induksi yang dipilih biarlah sesuatu yang boleh memberikan perkaitan yang kuat dengan konsep yang hendak di ajar....(Komen Dr R)”...*

Dalam rumusan refleksi, guru pelatih bersetuju dengan cadangan pemerhati dan berjanji untuk mencarikan bahan yang berkaitan.

*...”pada permulaan pengajaran....agak susah bagi saya untuk mencari satu situasi atau bahan yang boleh menyokong set induksi dalam proses pengajaran....contoh set induksi yang saya gunakan agak tidak bersesuaian...namum cadangan set induksi yang diberikn sungguh teruja....dan saya berjanji untuk digunakan dalam sesi pengajaran akan datang”.....(Guru Pelatih Mala)*

iii. Kawalan kelas

Aspek kawalan kelas tidak kurang pentingnya dalam keseluruhan proses pengajaran. Melalui pendekatan *lesson study*, perancangan berkaitan kawalan kelas, telahpun dibincangkan dalam

persediaan rancangan pengajaran. Namun demikian apabila tiba pada waktu sesi pengajaran sebenar, realiti atau suasana pengajaran akan berubah. Faktor guru turut memainkan amat peranan penting dalam mengawal suasana kelas pada sesi tersebut. Menurut Buckler & Castle (2014) antara tip penting dalam kawalan kelas ialah faham tentang realiti semasa dan elemen kepelbagaian yang ada dalam kelas tersebut.

Kesemua guru pelatih mengakui bahawa aspek ini yang paling mencabar dari keseluruhan proses pengajarannya. Walaupun ianya telah dirancang awal, tetapi kebimbangan tetap wujud disudut hati sanubari, kerana pelbagai kemungkinan mungkin timbul semasa proses pengajaran yang sedang berjalan. Analisis refleksi berkaitan dengan kawalan kelas, antara lain mengatakan bahawa:

*...”elemen inilah yang paling sukar, kerana saya sedar dan faham dalam kelas saya ada pelajar yang sukar untuk di kawal..dan suka bermain-main dan bercakap-cakap di belakang...(Guru Pelatih Ayu)”...*

Sememangnya diakui bahawa, aspek kawalan kelas merupakan hati dan jantung dalam proses pengajaran dan pembelajaran. Jika aspek ini berjaya dikawal, keseluruhan proses pengajaran akan menjadi lebih mudah. Di antara refleksi ialah;

*....”sebenarnya elemen penegasan melalui intonasi suara, hukuman dan perhatian khusus..sedikit sebanyak boleh membantu...kawal kelas..(Dr Z)”..*

iv. Penyoalan

Penyoalan yang dibuat sepanjang prose pengajaran adalah penting bagi seseorang guru. Input dari jawapan pelajar boleh digunakan sebagai kayu ukur untuk menilai keberkesanan proses pengajaran pada hari itu. Guru boleh mengawal aras soalan yang dikemukakan, berasaskan kepada tahap pencapaian kelas masing-masing. Menurut Paul (1993) aras soalan dan teknik penyoalan yang baik boleh mendorong pelajar ke arah pemupukan berfikir secara kritis dan kreatif. Analisis refleksi menunjukkan guru pelatih berjaya menyesuaikan aras soalan dengan tahap pencapaian pelajarannya. Sebagai contoh:

*...”saya rasa amat lega..bila soalan yang saya kemukakan dapat dijawab oleh pelajar...saya risau juga takut apa kata pensyarah yang memerhati dibelakang”...(Guru Pelatih H)*

Namun demikian, komentar ringkas yang diberikan oleh pemerhati dibelakang dalam sesi refleksi. Antara lain:

*...”saya bersetuju dengan aras soalan yang diberikan. Namun teknik penyoalan boleh dipertingkatkan lagi. Berikan sedikit ruang masa untuk pelajar berfikir... sebelum jemput pelajar secara sukarela untuk menjawab soalan tersebut...berikan ruang juga kepada pelajar lain untuk tokoh tambah kepada jawapan tersebut..sebelum guru menjawab betul atau salah”...(Dr Z)*

v. Alat Bantu Mengajar (ABM)

Alat Bantu Mengajar, ABM tidak kurang pentingnya dalam menyokong keberkesanan proses pengajaran dan pembelajaran. Pemilihan ABM yang tepat akan memudahkan pelajar memahami sesuatu konsep yang di ajar. Menurut Heinich, Molenda dan Russell (1992), suatu garis panduan dan model yang khusus perlu dipelajari oleh guru sebelum menggunakan ABM dalam proses pengajaran dan pembelajaran. Model ASSURE adalah satu model yang baik dalam memilih ABM, kerana ia sangat bergantung kepada objektif pengajaran dan analisis keperluan pelajar. Analisis refleksi menunjukkan kesemua guru pelatih menggunakan ABM dalam sesi pengajaran masing-masing. Sebagai contoh:

*...”saya suka menggunakan ABM kerana saya yakin ia amat membantu saya mengajar dan membantu pelajar memahami apayang saya nak ajar...lebih-lebih lagi dalam dunia internet yang moden sekarang ini mudah bagi saya untuk mendapatkan imej yang menarik..Namun begitu banyak masa yang saya tumpukan untuk menyediakan ABM tersebut”....(Guru H)*

Komentar dari pemerhatian juga bersetuju, bahawa semua guru pelatih menggunakan ABM dalam sesi pengajaran. Sebagai contoh:

*.....”saya meyokong penuh dan memberikan kredit diatas usaha untuk menggunakan ABM dalam sesi pengajaran. Namun perlu diingat dan perlu diberi perhatian bahawa, jangan sekali-sekali ABM yang digunakan akan mengusutkan kefahaman pelajar tentang sesuatu konsep yang hendak di ajar...mudahnya seperti persembahan isi kandungan melalui penggunaan power point. Isi kandungan bahan perlu diringkaskan dalam pentuk poin-poin, kemudian awak sendiri akan huraikan dan elaborate dalam kelas”...Dr F*

vi. Rumusan dan penutup

Sesi rumusan dan penutup adalah sesi terakhir dalam proses pengajaran. Perancangan yang baik, membolehkan guru pelatih merumuskan keseluruhan pengajaran dalam minit-minit terakhir pengajaran. Pendekatan *lesson study* ini memberikan satu justifikasi yang baik, kerana perancangan pengajaran telah di selia bermula dari peringkat persediaan rancangan pengajaran lagi. Analisis refleksi menunjukkan kesemua bersetuju dan berpuashati dengan perjalanan proses pengajaran.

a) Isu-isu penambahbaikan pendekatan *lesson study* dalam latihan mengajar

Pendekatan *lesson study* dalam proses pengajaran dalam sistem persekolahan di Malaysia adalah sesuatu yang baru diperkenalkan. Rentetan isu-isu yang melingkari pendekatan *lesson study* perlu ditangani dengan berhemah supaya hasrat untuk menjadikan *lesson study* sebagai salah satu pendekatan yang digemari ramai menjadi realiti.

Antara isu-isu yang dirungkai bersama semasa sesi refleksi ialah:

- i. Peruntukan satu masa atau waktu khas disekolah, supaya guru boleh bersama berbincang dalam menyediakan rancangan pengajaran. Susunan jadual waktu perlu diselaraskan agar satu ruang untuk guru-guru, pentadbir dan ketua-ketua panitia boleh hadir bersama memerhati proses pengajaran yang dijalankan.
- ii. Paradigma berfikir juga perlu di ubah, dimana pendekatan *lesson study* bukan satu pendekatan untuk mencari salah guru yang mengajar. Tetapi pendekatan *lesson study* ialah untuk melihat proses dan perjalanan pengajaran. Naatijah akhirnya ialah keberkesanan pengajaran untuk manfaat bersama.

Guru perlu didedahkan dengan pendekatan *lesson study* melalui bengkel, seminar dan kursus. Bagi sekolah yang mempunyai peruntukkan yang besar, boleh melakukan lawatan sambil belajar ke negara-negara yang telah lama mempraktikkan pendekatan *lesson study* seperti Negara Jepun.

## 7 KESIMPULAN

Kajian ini memberi fokus kepada pendekatan *lesson study* dalam pelaksanaan Latihan Mengajar bagi Guru-guru pelatih di sekolah-sekolah terpilih. Kajian ini bersifat penerokaan awal dalam menjustifikasi pendekatan pelaksanaannya. Sebelum guru pelatih di hantar untuk menjalani latihan mengajar selama 14 minggu, guru pelatih tersebut telah didedahkan pendekatan *lesson study* melalui subjek Kurikulum dan Pedagogi serta subjek Pengajaran Mikro. Impak yang positif ditunjukkan oleh guru pelatih, guru pembimbing dan para pensyarah dalam mengaplikasi pendekatan *lesson study* ini. Isu keselarasan antara pihak berwajib perlu ditangani dalam usaha untuk mencari titik pertemuan dalam penentuan jadual waktu, masa dan kesediaan dalam merealisasikan pelaksanaan pendekatan *lesson study* dalam kerangka yang lebih besar dan menyeluruh. Kesediaan guru untuk dicerap dan bersedia untuk berkongsi pengalaman dalam sesi refleksi adalah satu petunjuk yang baik dalam membina kemahiran insaniah guru-guru pelatih tersebut. Adalah menjadi satu harapan dan impian agar suatu hari nanti pendekatan *lesson study* dalam proses pengajaran di Malaysia akan menjadi realiti, setanding dengan negara-negara maju lain yang telah mendahului kita. Saya yakin penuh impian ini akan menjadi realiti.

**Abstract:** Midwifery students receive the material lesson theoretically, practically and clinically. Yogyakarta Midwifery Academy is a vocational education. Vocational education educates more in capability as a tool to achieve nine midwife competencies. Yogyakarta Midwifery Academy innovate the learning process by watching video of clinical skills and using learning practice method in small groups with independent practice. The learning practice is the most important thing to achieve graduates competence. Students' independence and responsibility are important to be improved in the form of independent practicum in small group. The research aimed to determine that audio visual and the small groups could improve clinical capability of midwifery students. Students were separated into small groups. Students were given clinical capability practice material in small group independently. The samples of the research was 94 students. After get inform consent, students assess by using likert scale and will evaluate the practicum study result by OSCE method. The data was collected during one semester. The quantitative data analyzed by statistic software. From the evaluation result, the problem that was found will continue to process by using qualitative method.

**Keywords:** Midwifery students, study partner, small group

### 1 INTRODUCTION

Midwifery is one of health professionals who become a central pillar to decrease maternal death rank in Indonesia. Midwifery professional education, which is developing now, draws people's attention. Data from Directorate General of Higher Education said that in 2014 there is 697 major registered.<sup>1</sup> The number of the major should proportionately with the students therefore the right method is needed so that students can improve the skill to gain the midwife competencies.

Midwifery students receive the material lesson theoretically, practically and clinically. Midwifery Academy is a vocational education. Vocational education educates more in capability as a tool to achieve nine midwife competencies. Learning practice process gives a chance to students to feel directly so that they can go through the process, after that they can make the conclusion from a situation or a particular process.<sup>2</sup>

Method and media have an important role in the learning process. Lecturer should be able to choose the right one of the method and media. Method and media is a one unit that cannot be separated because it has function as an introduction material learning.<sup>10</sup>

Yogyakarta Midwifery Academy giving an innovation in the learning process by splitting students into small groups in practice method and let them to learn from each other. Learning in a small group can make each student more active.<sup>3</sup> Learning

practice in a small group can encourage the cooperation within the member.<sup>4</sup> Midwifery students doing the learning practice in a laboratory with lecturer guidance. To gain the maximum competence, learning practice is become the important thing. Being independent and having a responsibility are the important things to improve in learning practice through a small group independently.

A result from the previous research shows that in learning practice lecturer will doing a pre-conference in 20 minutes. Pre-conference is an explanation about the learning practice process including the tool preparation and the procedure requirements. After that a clinical capability learning practice demonstration will be doing by lecturer in 20 minutes then students will be given a chance to do the same thing in front of the lecturer. The interview result from 3 students shows that the time which is given is not enough so that they think they need more time to practice independently in front of the lecturer. Another interview result from 3 students shows that the explanation that they get from the lecturer is not always same from one lecturer to another lecturer so that it make them confused.

Based on that introduction, the aim of this research is to know that using clinical capability audio visual and making small groups are more effective to increase midwifery students' clinical capability.

## 2 THEORITICAL FRAMEWORK

### 2.1 Affectivity

Affectivity derives from the original word of affective which means successful. Affectivity is a measurement that gives a vision about how far our target is can be reach.<sup>5</sup> In this research, affectivity means that a success in using small groups method and partner study which is supported by using visual audio as a media.

### 2.2 Audiovisual

Using audiovisual as a media is a learning method that provides sound and visual that attracts students about how to put in IUD contraception tool. By using that media, we hope that students will become interested.

Students are more interested in learning by using audio visual method. Using VCD as a media has good influences in increasing study of normal birth capability learning.<sup>8</sup>

### 2.3 Small Group

Small group method is the right learning model in clinical capability practicum for midwifery students. This model can improve students' participation so that students can be more competence.

Small group is known as cooperative learning or collaborative or partner study that involves high level of interaction.<sup>9</sup>

### 2.4 Partner Study

Partner study means that a friend in the same group which has more capability. A help that comes from partner study can eliminate fear. Diction that is used by partner study is easier to understand so that students can explain the difficulties without feeling ashamed.<sup>6</sup>

The application of various model of learning along with a consistence evaluation system is an effective way to used in the learning process that can be seen in the increase of students learning outcomes. Using the same age tutor can help students in solving the problem such as in doing exercise questions.<sup>7</sup>

## 3 METHOD

This research is using experimental research method by using *randomized pre-test and post-test* with *control group* model. The location of this research is in Yogyakarta Midwifery Academy.

There are two groups in this research that is compared; control group and experimental group. The population of this research is all of the three grade students of Yogyakarta Midwifery Academy in year of 2014/2015 as many as 243 students. The technique that is used to take the sample is *simple random sampling* technique. The number of the sample in this research is 94 people. The instruments research is a questioner satisfaction method and media learning with likert scale.

The question is analyzed by using validity and reliability test. After that hardship index, distinguishing features, normality test and homogeneity tests are seen then analyze by using T-test is also been done.

### 3.1 Learning Process in Experimental Group

The process of research is done by dividing students into small groups. Each of group is consisting of 7-8. Lecturer use IUD insertion VCD as a media in teaching class. Learning practice begin by watching video about how to put in the contraception tool in womb. Students do practice independently in small groups twice for each clinical skill. Each of the small groups is lead by one person in charge to coordinate all of the members. All students who become a respondent fill the informed consent. Student asses the learning method by using likert scale and the outcome of learning practice will be evaluated by using OSCE method.

### 3.2 Learning Process in Control Group

In the beginning process, lecturer will give asperses to knowing about students knowledge about material study which will be given, that is about how to put in contraception installation tool in womb. Lecturer will doing pre-conference and demo about how to put in IUD.

After that, lecturer will give a chance to student to demonstrate about how to put in the IUD. Then lecturer and other students will evaluate the practice that has been doing by the student.

**Abstract:** Lesson Study was applied in Palembang since 2009. After dissemination in 2009, Lesson Study applied for Physical Chemistry II courses of major of Chemistry Education, Department of PMIPA FKIP Sriwijaya University. In 2010 contribute in the activities of Lesson Study in major of Chemistry Education. In 2012 Lesson study applied for Chemistry teachers at Musi Rawas regency and Lubuk Linggau City. In 2013 has been implementing Lesson Study with Chemistry teacher at the Schools of Muhammadiyah from Palembang Ilir zone. In 2014, we implement Lesson Study with Chemistry teacher of Muhammadiyah at Palembang city. This paper outlines the activities of lesson study that has been done and their results from each activity. Lesson Study activities were conducted in the Discussion Group forum (FGD). FGD is a activity cycle, each cycle consisting of three phases: Plan, Do, See. FGD conducted in the Plan, and the stage See. Each cycle produced agreements on the success and improvement of chemistry learning. See stage of FGD is a matter of FGD initial Plan phase of the next cycle. Success criteria, are to be identified various factors that have been reinforced, and the increasing satisfaction levels of student in learning chemistry.

**Keywords:** Lesson study, Chemistry, Higher school, Palembang

## 1 INTRODUCTION

Lesson Study in South Sumatra began to develop since 2009, indicated by Lesson Study dissemination in FKIP Sriwijaya University, conducted by Sumar Hendayana, Ph.D. in february 2009. Lesson Study activity in 2009 has been performed throughout the course of study within the Faculty of Teacher Education Department of Mathematics University of Sriwijaya. Furthermore FKIP Sriwijaya University disseminates Lesson Study to entire district in the province of South Sumatra. A Team disseminate Lesson Study in Musi Rawas and Lubuk Linggau City. Subsequently, in 2013 and 2014, disseminate Lesson study among chemistry teachers in Muhammadiyah High school in Palembang.

Preliminary Lesson Study developed in Japan state. In 1998 Lesson study spread to America and other Countries, including the spread in Indonesia. Lesson Study according Hendayana et al (Hendayana, 2006), is a model of coaching teachers / lecturers through joint activities assessing continuous learning process within a learning community. In Lesson study all active community members in the

assessment effort, resulting in a thorough lesson plans and can be realized in the classroom.

A Lesson Study is a form of collaborative activity in boost all things related to the teaching and learning process. Everything related to the teaching and learning process, among others (Sanjaya, 2011): knowledge about teaching materials, knowledge of learning, the ability to observe the activity of learning, improving collegiality relationships, improving the relationship between implementation of daily lessons with a long-term goal to be achieved, increase motivation to learn, both teachers and students to always evolve, and improve the quality of the learning plan.

Lesson Study activities carried out in the forum of Group Discussion (FGD). Activity in FGD activity cyclical, each cycle consisting of three phases: Plan, Do, See. FGD conducted on Plan stage, and the stage See. FGD in Plan stage are planning the implementation of the activities performed Do stage, and FGD in See stage are discuss about the data collected from Do stage. Each cycle produced agreements on the success and improvement of learning in chemistry learning learn the material. The FGD of See stage produced key word of FGD initial Plan phase of the next cycle. In FGD the teachers

together, with the help of educational experts (Research Team) conduct continuous assessment of learning. Having agreed on the form of activities that will be performed at the time of Do, the final of FGD Plan stage is one of the teachers agreed to be the model teacher in the Do stage will portray all agreed procedures; while other teachers who act as observers to collect data to be material FGD See stage. Success criteria, are to be identified various factors that have been reinforced in every stage of the lesson study, and the increasing levels of student satisfaction in learning chemistry. Outcome of this activity is to get the experience to implement teacher lesson study.

## 2 IMPLEMENTATION OF LESSON STUDY

### 2.1 Implementation In FKIP UNSRI at 2009 and 2010

In 2009 implementing Lesson Study in major of Physical Chemistry II Program Studi of Chemical Education FKIP Sriwijaya University (Sanjaya, 2009). In 2010 to participate actively in the activities of Lesson Study in Chemical Education Program (Sanjaya, 2011). Socialization and workshops of lesson study for level faculty was conducted on 24 - 26 February 2009. And then, on 17-18 March, 2009 an workshop internal Lecturer Chemistry, prepare teaching plan and teaching material. The results of the workshop include: observation instrument, SAP, teaching materials, teaching materials and evaluation instruments. Implementation of Lesson Study in Chemistry education Prodi held in the second semester of the 2008/2009 Physical Chemistry II course.

Lesson Plan on the first attended by a group of lecture physical Chemistry. Sanjaya as model lecturer of Physical Chemistry II course. Plan of study are: Initial activities, consisting of apperception is done frequently asked questions about physical chemistry II material to be discussed. The material will be discussed in colligative properties do 1 is the real solution. The group of students who have been determined are welcome preparing to lead a class discussion group. Core activities, comprised of a group of students who received an explanation task of explaining the course material, classroom discussions to deepen understanding of each student. Lecturers will direct the course of the discussion, or provide a way out if the discussions had deadlocked. Final activity, consists of preparing a summary and tests / exercises.

Do 1 meeting held on Tuesday March 18, 2009. Material discussed is finding a potential relationship between chemical components dissolved in the solvent and the real solution. The first meeting began with an explanation of the student group. After an

explanation of matter, opened the opportunity to ask other students. During the learning process of the interaction both among students and between students and lecturers. Interaction between students is quite good, it looks like the interaction and question and answer discussion, express ideas or opinions, as well as respond to questions or concerns another student either in a group or with other groups. Likewise with faculty interaction with students is quite good. At the end of the lesson, the group presenters gave examples of problem-solving and tasks to improve understanding and determine the level of students' understanding of the lecture material. The results of the examination of the tasks it is known that the level of student understanding is quite good.

See 1 based on observations at the confluence Do 1, it can be reflected as follows. Still there are students who are not actively involved in both the group discussion and class discussion this is because learning is done discussing a fairly dense material, so there are still some students who are less active. The learning process is still dominated by a group of student explanations. Class situation still looks stiff this is because faculty and students are not familiar with the presence of the observer.

Plan II meeting reflection models based on the results of 1 See. Initial activities, consisting of apperception about the dependence of the molar conductivity to concentration. Core activities, beginning with the delivery of material by a particular group of students, class discussion with the leadership of the head of the student group. Attention to the course lecturer class discussion. Lecturers will mediate if there is a debate between the presenters and students. The discussion concludes with examples of application of the concept and practice the application of concepts. Final activity, consisting of the preparation of the conception of the concentration dependence of the molar conductivity.

Implementation of Do second was held on Tuesday, April 8, 2009. The material presented is the concentration dependence of the molar conductivity. Starting with the delivery of material in class discussions by a particular group of students, with student leaders of the group leader. The discussion concludes with examples of application of the concept and practice the application of concepts. Observation results illustrate that more students and a question and answer discussion, expressed his or her opinion, as well as respond to questions or concerns of other students either in groups or with other groups. Implementation See 2 concludes there are still students who do not engage in group discussions, and class discussion.

Plan of the third cycle is meeting to plan the initial activity is to do a question and answer on the cell potential measurement applications. Core

activities, starting with an explanation by a group of students about the cell potential measurement applications. The student group gives a case related to the application of cell potential measurement to the other groups, presentation of the results of each group. Finally, drawing conclusions and testing.

Implementation Do third held on Tuesday, April 22, 2009. The observations illustrate that the interaction between the students already classified as better than previous meetings, it is seen more and more students and a question and answer discussion, express his or her opinion, as well as respond to questions or concerns students others both within the group or with other groups.

See 3 reflects that student activity is optimal and students involved in group discussions, and class discussions, better activities on faculty and students.

## 2.2 Implementation in Lubuk Linggau

FKIP Sriwijaya University in 2012 to send a team for each district / city in the province of South Sumatra (Sanjaya, 2012). The author with the rest of the team given the task of implementing Lesson study in Musi Rawas Regency and Lubuk Linggau city. Lesson Study Team tasked to accompany the FGD of 9 subjects in the UN. Lesson study initiated by the dissemination of Lesson Study to all teachers who are invited, and then form a group discussion of each subject, as well as hold implement the Plan, FGD preparation of lesson plans in the form of discussion that will be implemented in stages Do.

Lesson Study in Musi Rawas Regency and Lubuk Linggau City was conducted in two sessions and two meetings. The first meeting was held on Thursday, November 1, 2012 at SMAN 1 Tugumulyo Musi Rawas. At this meeting attended by seven Chemistry teachers. Model Teacher in Do stage is teacher of SMAN 1 Tugumulyo. Models teacher with other teachers, and supervisor planning activities of Do in XI Science class; learning tools used are lesson plans, instructional media, instructional models, student worksheets and evaluation tools and instruments of observation learning process. In the process of assisting the teacher was happy because so far they have never had the guidance and direction by the principal or superintendent of subjects. If they have difficulty, they not have consult the confusion of these difficulties. The principal can not always

Figure 1. Dissemination of Lesson Study at Lubuk Linggau

preoccupied with the problem of other problems, even if there is a chance the principal can not provide a solution. Supervisor difficult to find, in addition to the low frequency of visits to school also knowledge of learning are inadequate.

The second meeting was held on November 8, 2012, at SMAN 1 Tugumulyo Musi Rawas. At the second meeting was held Do and See stage activities. Before Do stages, the model and teacher observers gathered in advance to get a briefing from supervisor. Supervisor directs how teachers observers should take a position in the class to be able to observe students and teachers during the learning process. Teacher observers are directed to observe the activity, expression, posture, gestures takes place. The observation of teachers observers will be used as the material and data in activities See later. Do carried out for a two hour ( 2 x 45 minutes). Model teachers implement instructional models in accordance with the RPP and the teachers observers take a position in the rear, left side and right side in the classroom. Activities do begin at 10:00 am until 11:30 pm. The next activity is carry out See stage. Model teacher reveals the strengths and weaknesses of the model during implemented learning process. After that the teachers one by one observer reveals what observations of the learning process that has just been implemented.

Teachers model and teacher observers feel happy with implementing lesson study, but they have doubts whether this activity can be resumed. The first inter-school locations far from each other. Second, because this activity is not available for the fund. Supervisor to provide input that their distance from each other which can be overcome by providing a day of the week to be able to come together and put together a program that can be entered on the school budget plan.

In Lubuk Linggau city, the first meeting was held on Friday, November 2, 2012 at SMK 1 Lubuk Linggau. At this meeting attended by six subject teachers chemistry. In this plan the activities agreed upon model teacher is a teacher of SMAN 5 Lubuk Linggau. Do stage be implemented in class XI Science. The second meeting, do and see, held on November 9, 2012, at SMAN 5 Lubuk Linggau.

Figure 2. Plan Stage of Lesson study at Lubuk Linggau

Figure 3. Do stage of lesson study at lubuk linggau

Lesson study activities, overcoming problems associated with learning. Teachers share about a variety of approaches, strategies, methods and models of good teaching in teaching. Each teacher teaches the use of media as well as ICT and increase creativity.

## 2.3 Implementation in Palembang

### 2.3.1 Implementation Palembang 2013

In 2013 has been implementing Lesson Study with Chemistry teacher in Environmental of Muhammadiyah schools across the region Ilir Palembang (Sanjaya, 2013). In this service activities FGD formed through an invitation to high school chemistry teachers across the region Muhammadiyah Ilir in Palembang, to form the Group MGMP Chemistry teachers who teach in Muhammadiyah Palembang. In the following table is the chemistry teachers who attended the event this Service:

Table 1. Name of Chemistry teachers High school of Muhammadiyah.

No	Name of chemistry teacher	Name of High school
1	Rosita, S.Pd.	M A M 1 Palembang
2	Dessy Zulmi, S.Pd.	SMA 'Aisyiyah 1

The team consists of five people, which consists of one chairman, two members who are experts in the learning process and Chemistry 2 students final project; together teachers determine priority issues agreed to be solved during the implementation of service programs.

Figure 4 Opening Event Lesson study

The result of the discussion stage Plan is as follows: Taking into account the implementation of the new curriculum, Curriculum 2013, then selected as the class class X Do. Chemistry subject matter to stage Lewis Coat Do is, for a time of 1 hour meeting. The topic was chosen because it is a material that has been planned to be taught on the day of Do, so that learning is not disturbed. Designed together preliminary activities, core activities, and closing activities. Of the various proposals, it was agreed to apperception activity, students are invited to engage in dialogue about the solar orbit. Then the sequence of questions that challenge and engage students about the solar system. It ends with a series of questions that teachers convey the material to be learned is that the outermost electrons orbit around the nucleus of an atom. Students are grouped into several groups with the group name is taken from the name of an existing group in the periodic system. Each student brings cardboard worn around the neck of each. Carton has been painted emblem of the elements in the same group with the group name. Elements in the chain each, will be used to exercise determine lewis emblem. In core activities, planned teacher invites students to know the number of electrons of an element, grouping the number of electrons by electron charging rules, invite students to determine the number of outer electrons of each element, and tell the students the rules of making emblem Lewis. Then together describe lewis emblem necklace elements in each. Plan covers activities agreed to invite students study summarizes the results, giving the task to present the material enrichment and associate with the meeting materials chemistry lesson observation sheet preparation. Planned position of students and teachers observers at Do stage. As a model teacher is teacher of chemistry SMA Muhammadiyah 1 Palembang, Pasilati, S.Pd. With a model teacher is a local teacher, it is not necessary anymore for teacher adaptation models.

Activities performed on stage Do is as follows: Before the hour lesson begins, the teacher will be a teacher observer, studying guidelines for observation, while teachers prepare learning tool models. After the turn of the clock tolled sign learning, teacher models, and the observer entered the classroom. Teacher models prepare students to study chemistry, while teachers observer occupies a predetermined position. During the teacher in the role of teacher models, observers continued to make observations of the nearby students who are experiencing learning process. Results of student activities known observation that students experience the learning process. Some students were very enthusiastic in learning. Students closely follow the learning process directed by the Master Model. The learning process has been designed turns on the stage Do has successfully enabled students to learn. Students are excited and delighted in studying chemistry.

Figure 5. Students are very involved in the learning process

See satge is the activities carried out after carrying out stage Do, day after school students. FGD see the stage led by senior teachers, attended by a model teacher, teacher observer, and a team of experts. FGD began to hear reports observations by each observer. Furthermore, listening to your comments/impressions of the model teacher. The next comment from a team of experts as well as analyzing the learning process that takes place on stage Do. FGD See stage, generate conclusions about what has worked and what learn constraints that hinder the process of learning in students.

Figure 6. See stage. are discussing the learning process that occurs in stages Do.

Lesson Study lasted for 2 months in 2 cycles, where each cycle produced agreements on the

improvement of learning chemistry, namely an increase in the role of teachers in lesson study partners, both quantity and quality, the relationship between teachers Chemistry in Palembang, Chemistry Teacher professionalism and increased confidence in the teachers can teach chemistry to chemical subjects with fun.

### 2.3.2 Implementation in Palembang 2014

In 2014 was implemented a Lesson Study for teachers of high school Chemistry teacher of Muhammadiyah in Palembang City (Hadeli, Sanjaya, Desi, 2014). Lesson Study starts from the formation of FGD (Focus Group Discussion), which is conducted through PDM notice to the Head of SMA Muhammadiyah Palembang. Teachers of chemistry of High school Muhammadiyah Palembang were divided into 2 groups: group A, Region Partner Kemuning and group B, Bukit Kecil Regional Partners. In the implementation of Lesson study, it turns out to be ineffective division. Teachers of Kemuning fewer than the group Bukit Kecil region. Kemuning group is a teachers group of school entered the afternoon; so as not to interfere with the activities of teaching, the teachers gathered in the morning. Bukit Kecil Group is a school teacher who entered the morning; so gathered at the school in the afternoon. The number of schools that entered the afternoon less than the incoming school in the morning, which is 4 : 11.

At this stage of the Plan, teachers together, with the research team, conducting learning assessments of chemical material that is considered difficult, and plan how learn students. Discussion of learning steps to incorporate things that specified in the implementation of the curriculum of 2013. At the end of the meeting, agreed Mrs. Nopi, S. Pd, a teacher models on stage Do.

Figure 7. Opening and Plan stage in Palembang 2014

In the Do stage, Mrs. Nopi, S.Pd. teaching activities, applying FGD Plan stage, and while the other teachers and the research team became an observer of student learning activities. Each group of students around the observer observing the observer, the observed data are used as an ingredient FGD See stage.

At the stage See, first Teacher models convey the experience of being as models. Then followed other teachers present the results of observations and to provide comments on the students' learning process. The research team with the teachers - teachers discuss the observations, to find what has been produced and what does not work, what are the factors that hinder success.

Figure 8. Do stage of lesson study in Palembang 2014

Lesson Study takes place in two cycles for 2 months. In the second cycle, started with a PLAN. During the meeting, discussed the subject matter of other chemicals that is felt hard. In the second cycle is planned to be taught is a matter of determining the location of the elements in the periodic system using electron configuration information.

Figure 9. Do stage of the second cycle of lesson study at Palembang 2014

After the completion of phase Please Do immediately followed, which held a discussion on the students' learning process during stage Do. It was agreed that there has been a good learning process in most students. The learning process occurs with the

application of scientific learning as a form of curriculum 2013. Students experience learning through observing teachers' instructions and tried stages of learning from worksheets, ask each other, reasoning in group discussions, and try to do the work and workout is in LKS.

In addition to seeing the success of the learning process, teachers are motivated to create articles based on the results of the results of the lesson study. At the end of the meeting, teachers agreed will drafting the articles, which will be assisted by a team of researchers improved the article, and the article will be sent to the Research Journal Of Chemistry Education PMIPA FKIP Sriwijaya University.

Figure 10. See stage and closing of lesson study at Palembang.

### 3 CONCLUSIONS

Lesson Study has been conducted of the following results, Lesson study in education study program Chemistry Department PMIPA increased relationship scientist group, and Increasing the quality of the lecture.

Lesson study in Lubuk Linggau Increased awareness of teachers to hold regular meetings of teachers, Increased relationship silaturahmi teachers throughout the field of study. And then the emergence of a commitment to mutually benefit from the facilities and infrastructure owned by each school.

Lesson study in Palembang Increase the quality of learning of chemistry teacher in SMA Muhammadiyah. Generates LKPD ( sheet activities of Students ), which refers to the curriculum in 2013, Increased social relationships teachers Chemistry in Palembang professionally. With this activity, especially the activity MGMPs Chemistry teacher becomes intense and sustained. And the top is scientific articles produced by each of the participating teachers of lesson study.

## 4 ACKNOWLEDGEMENTS

Acknowledgements presented to the leadership of Sriwijaya University, Palembang City Government, District MURA, Lubuk Linggau city, and the Director General of Higher Kemendikbud RI, who have participated in the implementation of Lesson Study research and activities of these.

## The Improvement of Students' Critical Thinking On Embryology and Animal Reproduction Course Through Lesson Study In Biology Education Department of Faculty of Teacher Training and Education University Of Muhammadiyah Malang

Rr. Eko Susetyarini<sup>1</sup>, Sri Wahyuni, Siti Zaenab<sup>2</sup>, Roimil Latifa<sup>3</sup>, Nur Widodo<sup>4</sup>, Ainur Rofieq<sup>5</sup>

<sup>1</sup>Biology Education Department – University of Muhammadiyah Malang  
ninie08@gmail.com

**Abstract:** The skills and capabilities of students need to be improved so that they have the awareness to seek information, knowledge, and equip themselves with a high scientific capacity and the ability to think critically. The approach used was a lesson study. Lesson study is a coaching model for educators through a collaborative and sustainable learning assessment. This research aimed at describing the results of lesson study implementation to improve thinking ability of the sixth semester students at University of Muhammadiyah Malang on Animal Reproduction and Embryology course. The research subjects were 40 students of Biology Education Department class 2010 who attended Reproduction and Embryology course. The lesson study was conducted within four cycles. The learning model chosen was cooperative learning model with jigsaw method for cycle I. Meanwhile, the method for cycle II, III, and IV was two stay two stray. The indicators of critical thinking skills observed were clarity, the level of accuracy, precision, relevance, logical thinking used, the breadth of viewpoints, the depth of thought, honesty, the completeness of the information, and the implications of the proposed solution. The results of lesson study implementation to improve the students' critical thinking were as follows: the critical thinking skills cycle I showed 50% of clarity, 75% of level of accuracy, 50% of precision level, 60% of relevance, 50% of logical thinking used, 50% of the breadth of viewpoint, 50% of depth of thought, honesty of 87.5%, 62.5% of completeness of information, and 50% of implementation of the proposed solution. The thinking capability data from cycle I to cycle IV showed an increase, with the data shown as follows: 90% of clarity, 87.5% of accuracy rate, 80% of the precision rate, 87.5% of relevance, 80% of logical thinking used, 87.5% of the breadth of viewpoint, 80% of depth of thought, 87.5% of honesty, 87.5% of completeness of information, and 80% of the implementation of the proposed solutions.

**Keywords:** Critical Thinking, Lesson Study, Animal Reproduction and Embryology

### 1. INTRODUCTION

Students are part of the youth who contribute to the progress of the nation. Students, as human beings, must have the sensitivity and awareness towards the condition around them. These sensitive and caring attitudes need to be grown. Furthermore, the skills and capabilities of students should also be improved so that they have the awareness to seek information, knowledge, and equip themselves with a high scientific capacity and the ability to think critically (Fitri, 2011).

According to Paul and Elder (2005), critical thinking is a way for someone to improve the quality of ideas by using intellection systematic techniques and to generate intellectual thought. The criteria in critical thinking process are clarity, the level of accuracy, precision, relevance, logical thinking used, the breadth of viewpoints, the depth of thought, honesty, the completeness of the information, and the implications of the proposed solution. Therefore, a method is needed to teach a course in order to improve the students' critical thinking skills.

A learning process that can foster the students' critical thinking is the cooperative learning model

by using jigsaw method and *two stay two stray* method. In *two stay two stray* method, students learn to solve problems together with members of the group; then two students from the group exchange information to two members of another group who stay (Lie, 2002). Students are required to have responsibility and be active in each learning activity. The delivery of material is associated with daily life or results of a research so that the students may easily understand since it is familiar and foster the character values corresponding to their personality.

Students who attend Animal Reproduction and Embryology course in the Biology Education Department of University of Muhammadiyah Malang are supposed to be the sixth semester students who have taken various pre-requisite courses. However, several students who are still in the fourth semester and have not taken the prerequisite courses are found. The problem that arises was the teaching learning process which was only limited to memorizing, understanding and the application of the understanding, and less emphasis on higher cognitive aspects such as the sharpness of analysis and evaluation, and the development of creativity. During the lecturing, students were

passive; they come to the class without learning the material in advance. In addition, the students were said to have high achievement if they had a lot of memory and understanding of the knowledge given by the lecturers. In fact, the lecturers were supposed to only facilitate the students by giving a problem, and motivating them to solve it. Furthermore, the material given was less oriented to the application of the lecturers' field of study, research, and long-term needs. The lecturers have been patterned by the knowledge that they have been mastered and teaching is considered only as a field of work. Moreover, most of the competences/purposes of lecturing were limited only to low-level cognition, whereas the physical subject was limited merely to psychometric domains. The high-level cognition and affective domain were still neglected, although plans with other lecturers observing them, and reflecting, whether the students have achieved the desired competencies by following the plans or not. The approach used is a lesson study (LS). Lesson study is a coaching model for educators through a collaborative and sustainable learning assessment based on the collegiality and mutual learning principles to build a learning community. (Hendayana in Wahyu, et al, 2011)

Lesson Study is a learning society that consistently and systematically performs self-improvements on the individual as well as managerial level. In addition, it is a collaborative and continuous learning that involves planning, implementing, observing, and reporting learning outcomes (Supriatna, 2012).

The implementation of LS includes several stages, namely planning (plan), implementation (do), and reflection (see). This activity is carried out by a group of lecturers. LS can be taught to students (prospective teachers) because LS is conducted periodically and continuously in order to enhance the competence and professionalism of teachers.

In learning activity, LS not only functions as an attempt to enable students to be active, but also as a review of the lecturers' performance and the development of students' academic abilities as well as to foster caution and responsibility in learning. LS will be observed and reflected together by students, observers, or by faculty observers.

## 2. METHODS

This research was a descriptive research by implementing a lesson study. The research subjects were the sixth-semester B class students of Biology Education Department class 2010 who were attending Animal Reproduction and Embryology course. The total number of the research subjects was 30 people. Implementation of the lesson study was conducted within 4 cycles. The phase of LS

those aspects are important in the scientific community for students' life and the world of work. Problems perceived by the lecturers were solved by themselves or discussed among the lecturers who taught the same course, however; rarely did they involve other colleagues who might help provide input and suggestions for the improvement, e.g. other lecturers who had different field of study or come from other departments.

In addition, most lecturers did not really know each other. Accordingly, the improvement of learning process needs to be done by all lecturers. In groups, they discuss competencies (cognitive, affective and psychometric) that must be possessed by the students, the course material to be learned to achieve the competencies, how to plan the delivery of material to the students, practicing their consisted three stages, namely: (1) planning stages (plan), (2) the implementation stage (do), and (3) the stage of reflection (see).

The critical thinking skills observed were clarity, the level of accuracy, precision, relevance, logical thinking used, the breadth of viewpoints, the depth of thought, honesty, the completeness of the information, and the implications of the proposed solution.

## 3. FINDINGS AND DISCUSSION

### 3.1 Cycle I

#### a. Plan

LS team planned the lesson plan with direct learning model, formulated the Student Worksheet, prepared the instructional media, learning materials and assessment instruments, and learning activity observation sheet. The student grouping on cycle I was based on numbers. The material was given to the captain of class a few days before the implementation phase (Do). This was intended that other students can ask/copy the material from the captain. The method used was jigsaw method.

#### b. Do

Lecturer entered classroom with the observers. Each observer was equipped with observation sheet to be filled as a reflection after the implementation phase (Do). The stages of implementation in this cycle I included: (1) students formed groups according to animal anatomy observations that had been assigned (there were core and origin group corresponding animal names that would be observed). The core group consisted white mice, rabbits, pigs, goats, cows, and humans. The origin group consisted of the male/female fish,

male/female reptiles, male/ female aves, and male/female mammals. (2) This classification was based on the method used, the jigsaw method. (3) The students conducted observations in accordance with the predetermined task, (4) filling the provided observation sheet, and (5) discussing the proposed problems. (6) the lecturer appointed two groups to present the results of the discussion, (7) observing the critical thinking skills namely clarity, the level of accuracy, precision, relevance, logical thinking used, the breadth of viewpoints, the depth of thought, honesty, the completeness of the information, and the implications of the proposed solution, (8) strengthening the results of the discussion presented by the students, (9) concluding the results of students’ work, and (10) delivering a follow-up to the next meeting.

### c. Implementation (Open class) and Observation

Activities that demonstrate the students’ critical thinking skills in cycle I can be seen in Table 1.

Table 1. Critical Thinking Skills in Cycle I

No	Indicator of Critical Thinking Skill	No of Students	%
1	Clarity	20	50
2	Accuracy Level	30	75
3	Precision	20	50
4	Relevance	24	60
5	Logical thinking used	20	50
6	Breadth of viewpoints	32	50
7	Depth of thought	20	50
8	Honesty	35	87.5
9	Completeness of the information	25	62.5
10	Implications of the proposed solution	20	50

### d. Reflection

After the implementation of LS in cycle I, reflection was conducted after the learning process was completed. Reflection aimed at reviewing the implementation of learning that had been carried out. Reflection was done by lecturers and all observers. One of the observers was appointed as the moderator and the other one as a note taker. The results of this reflection were used for the improvement of learning at the next cycle. Here are the results of the cycle I reflection.

- (1) Some students did not have the materials that had been copied to the captain of the class; this

has resulted in the implementation of learning which was not optimal. Supposedly, all students were required to have material that had been given by the lecturer.

- (2) There was no identification used by the students so that the observers found it difficult to observe the student activities.
- (3) During the observation, the students looked confused and the junior students did not understand the activities or material to be observed. Consequently, the time available became inefficient.
- (4) Time taken for observation was inefficient.

The efforts to improve the learning process in the next cycle (cycle II) were as follows.

- (1) Grouping might be done based on the high to low ability of students which could be seen from the students’ participation in the cycle I.
- (2) The softcopy of material could be given to the captain of each group according to the distribution of materials that had been defined previously.
- (3) To make the time to be more efficient, the ways of working should be described beforehand by the lecturers before the activity began.
- (4) All students were required to bring a uniform identification.
- (5) For more efficient time, the media used for observation was adapted to fit the method.

## 3.2 Cycle II

### a. Plan

Based on the results of cycle I reflection, in order to anticipate the excess time and the lack of students’ understanding towards the material, the LS team planned to make the material in the form of handouts. The instructional media used were PowerPoint and pregnancy or fertility test. The taught material was the hormonal control systems. The method used was Two Stray-Tree Stray. In addition, the LS team also prepared an evaluation sheet at the end of the lesson.

### b. Implementation (do)

The stages of implementation in this cycle II included: (1) studying the material to be learned independently, (2) forming a group with varied members, from the class of 2010 and 2011, (3) setting up equipment/materials assigned as a group, that are the urine of pregnant women and fertile women as well as pregnancy and fertility test pack, (4) finding literatures other than the given

literatures, (5) observing hormone in the urine, (6) discussing with the group, (7) writing the results of group discussion on a large sheets of paper, (8) displaying the results of the discussion in the provided space, (9) responding and asking questions during a visit to other groups, (10) discussing the observation results during the visit, (11) appointing the group with the most and the least favorable comments, (12) observing the critical thinking skills, (12) strengthening the discussion results submitted by the students, (13) giving an award to the group receiving the highest good points, (14) administering a quiz, and (15) giving a task for further material.

### c. Implementation (Open class) and Observation

Activities that demonstrate the students’ critical thinking skills in cycle II can be seen in Table 2.

Table 2. Critical Thinking Skills in Cycle II

No	Indicator of Critical Thinking Skill	No of Students	%
1	Clarity	32	55
2	Accuracy Level	30	52
3	Precision	20	35
4	Relevance	37	63
5	Logical thinking used	20	35
6	Breadth of view points	32	55
7	Depth of thought	20	35
8	Honesty	35	60
9	Completeness of the information	20	35
10	Implications of the proposed solution	25	42

Lie (2002) stated that cooperative learning with two stay two stray method is a method with stages of preparation and assessment systems, instructional design, students’ assignment preparation, the division of student groups in which each group consists 3, 4, and 5 students and each member of the group should be heterogeneous in terms of student’s academic achievement and gender, lecturers’ explanation, group work by students, and evaluation of learning.

The advantages of this method are as follows:

- (1) The students’ learning becomes more meaningful, more oriented to students’ active learning. Furthermore, it may also increase the students’ motivation and learning outcomes, provide an opportunity to the students to define their own concepts to solve a problem, give students the opportunity to create creativity in communicating with their group members, familiarize the students to be open to their friends, and increase students’ motivation to learn. (Anonymous, 2013)
- (2) The Lecturers use interactive lecturing method to give motivation to the students, deliver the

important concepts learned so that there is a clear link between the described materials and the observations conducted by the students.

- (3) Lecturer distributes observation tasks to each group as material to be discussed. Each group has similar discussion task.

### d. Reflection

The reflection results of the cycle II showed an increase in students’ learning activity in terms of critical thinking about the conducted observations. However, there were some members of the group who did not actively join the discussion especially the group whose members were mainly from the class of 2011. Accordingly, for the further planning, it was needed to pay special attention to students who were less active in the discussion and confused in doing the observations.

The students’ thinking skills, indicated on their activities during the learning process lasting for two cycles, was increasing. This was seen from the number of students who performed various activities with indicators of clarity, honesty, completeness of information, and the implications of the proposed solutions.

The efforts of improvement for the next cycle (cycle III) were: randomizing the group seating and the lecturers monitor the readiness of students to bring the materials for the next meeting. The seating was arranged in such a way to facilitate the lecturers in giving attention to all students so that there was no group domination.

## 3.3 Cycle III

### a. Plan

Based on the results of cycle II reflection, the LS team drafted a seating arrangement for students so that the lecturers and the observers would be easy to get around observing the group activities. In cycle III, the students’ seating was shifted, the group which at the previous meeting sat at the back would be in the front seat. In addition, the team also prepared critical thinking skill observation sheet.

### b. Do

The lecturer entered classroom with the observers. The observer stood beside or behind the class. The stages of implementation in this cycle III included: (1) Explaining the scenario to be implemented in the study, (2) Dividing the students into nine groups with four members in each group as agreement before the meeting. The group seating formed U shape, (3) Describing the animals used for the

ovum and sperm observation, that were mice, (4) Assigning each group to watch a video about the journey of sperm, ovum photos and motility mass of cow and mice sperm, motility, concentration, and mice sperm viability on their laptop with an honest, disciplined and thorough attitude. (5) Discussing the observation results (the journey and quality of sperm) that had been performed by using the Student Worksheet and working together to write it on large sheets of paper, (6) Assigning each group to work together to display their work/discussion in the provided space. (7) Appointing two members to stay in their group to explain their work to the guests, whereas the two others would visit another group to carefully observe the work of other groups, (8) Assigning the guests to return to their group and to match the work of other groups with their group, (9) Appointing the best and the worst group based on other groups' comment to inform the results of the discussion with other groups, and (10) strengthening the students' work/discussions.

### c. Implementation (Open class) and Observation

Activities that demonstrate the students' critical thinking skills in the cycle III can be seen in Table 3.

Table 3. Critical Thinking Skills in Cycle III

No	Indicator of Critical Thinking Skill	No of Students	%
1	Clarity	25	62.5
2	Accuracy Level	35	87.5
3	Precision	25	62.5
4	Relevance	30	75
5	Logical thinking used	25	67.5
6	Breadth of viewpoints	35	87.5
7	Depth of thought	27	67.5
8	Honesty	35	87.5
9	Completeness of the information	30	75
10	Implications of the proposed solution	25	62.5

Based on Table 3, there was a significant increase of students' critical thinking compared to the cycle II. This was because the students were already familiar with the open class, a class which was viewed by other lecturers as the observers; therefore, the students were more confident to inquire material that had not been understood.

### d. Reflection

The results of cycle III reflection were as follows:

- (1) Lecturers seemed to merely dominate some groups.
- (2) Lecturers could not monitor all groups.
- (3) References owned by students were lacking because some students only had the materials provided by the lecturers, they did not search references from other sources.

The efforts to optimize the next cycle (cycle IV) were:

- (1) Moving the room to conduct the LS implementation to a laboratory room with consideration that desks which supported the group work were available in the laboratory, and thus the lecturers and observers might freely observe the student activities.
- (2) Requiring the students to bring additional references as the source of learning, not just references provided by the lecturers.

## 3.4 Cycle IV

### a. Plan

Based on the results of cycle III reflection, to improve the implementation of cycle IV, the LS team prepared a learning observation sheet. The room to do the implementation of LS was at the laboratory.

### b. Implementation (Do)

The lecturer entered classroom with the observers. The observers stood beside or behind the class. The stages of implementation in this cycle IV included: (1) Explaining the scenario to be implemented in the study, (2) Dividing the students into six groups with four members in each group as agreement before the meeting. The names of the groups were 1). Spermatozoa, 2) ovum, 3) vas deferent, 4) oviduct, 5) uterus, and 6) epididymis. The group seating formed U shape, each group sat according to the plans and group members sat in a circle. (3) Delivering the information about animals used for external fertilization mechanism observation such as picture of sea urchin, fish fertilization videos, internal fertilization video (humans), and mice in vitro fertilization. The pictures and videos had been assigned at the previous meeting, (4) Assigning each group to observe the mechanism of sea urchin fertilization (picture), fish video, video of mice in vitro fertilization and humans' internal fertilization on their laptop with an honest, disciplined and meticulous attitude, as well as discussing the

observation results (external and internal fertilization mechanism) which had been performed by using the Student Worksheet fertilization and working together to write it on large sheets of paper, (5) Assigning each group to work together to display their work/discussion on the provided space, (6) Appointing two members to stay in their group to explain their work to the guests, whereas the other two would visit another group to carefully observe the work of other groups. The guests must visit the six groups alternately. This alteration was marked by a whistle sound. In addition, the guests would give pink sticker if they agreed with the group's work or green sticker if they gave suggestions/comments to the group. (7) Assigning the guests to return to their group and to match the work of other groups with their group, (8) Appointing the best and the worst group based on other groups' comment to inform the results of the discussion with other groups. The best group is the group with the most pink stickers, while the worst group is the group with the most green stickers/the lowest pink stickers. (9) Giving an award to the group who received the most pink stickers and the most green stickers accompanied by the song "Champion" before the group presentation, and (10) strengthening the students' work/discussion about the mechanism of fertilization.

### c. Implementation (Open Class) and Observation

Activities that demonstrate the students' critical thinking skills in the cycle IV can be seen in Table 4.

Table 4. Critical Thinking Skills in Cycle IV

No	Indicator of Critical Thinking Skill	No of Students	%
1	Clarity	36	90
2	Accuracy Level	35	87.5
3	Precision	30	80
4	Relevance	35	87.5
5	Logical thinking used	30	80
6	Breadth of viewpoints	35	87.5
7	Depth of thought	30	80
8	Honesty	35	87.5
9	Completeness of the information	35	87.5
10	Implications of the proposed solution	30	80

Based on Table 4, all indicators of critical thinking skills had increased, especially for the first indicator, that was clarity which increased by 27.5% from the implementation of cycle III.

### d. Reflection

The implementation of cycle IV was running as expected. All indicators of critical thinking skills had been achieved according to the initial target of LS implementation. The percentage of critical thinking skill improvement of cycle I, II, III, and IV can be seen in Table 5.

Table 5. The Improvement of Students' Critical Thinking Skill on Embryology and Animal Reproduction Course of the Fourth Semester of Biology Education Department Class 2010

No	Indicator of Critical Thinking Skill	% Cycle I	% Cycle II	% Cycle III	% Cycle IV
1	Clarity	50	55	62.5	90
2	Accuracy Level	75	75	87.5	87.5
3	Precision	50	50	62.5	80
4	Relevance	60	67.5	75	87.5
5	Logical thinking used	50	50	67.5	80
6	Breadth of viewpoints	50	50	87.5	87.5
7	Depth of thought	50	50	67.5	80
8	Honesty	87.5	87.5	87.5	87.5
9	Completeness of the information	62.5	75	75	87.5
10	Implications of the proposed solution	50	62.5	62.5	80

## 4. CONCLUSION

The critical thinking skills of Biology Education Department Students can be improved through the implementation of learning with LS on Animal Reproduction and Embryology course which is taught in the sixth semester. The improvement is seen from the observations of various students' activities during the course which includes: clarity, the level of accuracy, precision, relevance, logical thinking used, the breadth of viewpoints, the depth of thought, honesty, the completeness of the information, and the implications of the proposed solution.

## Empowering Metacognitive Knowledge through Biology Learning Based on Lesson Study

Suratno

*Biology Education Department, The University of Jember, Jalan Kalimantan No 37 Kampus Bumi Tegalboto, Jember, Indonesia  
suratnofkip@gmail.com*

**Abstract:** This study aims to empower the students' metacognitive knowledge in biology learning especially evaluation for biological learning achievement through lesson study. Metacognitive knowledge is one of the higher-order thinking (HOT) skills that are important to develop based on the evaluation for biological learning achievement demands. In the evaluation for biological learning achievement, the students are able to understand evaluations' and assessments' concept, apply it concepts to design the assessments' instrument, and develop the higher-order thinking skills such that the students' metacognitive knowledge will be formed automatically. However, there are 12 students from 17 students who take the evaluation for biological learning achievement have difficulty and not realize how to resolve it difficulty when asked to develop the questions. The students was focused on example problems that was the given. To solve that students' problem, then in the evaluation learning using the stages' lesson study. In this research, the stages' lesson study will be apply for two cycles in the evaluation for biological learning achievement class consisting 17 students, one lecture and three observer. In the first cycle, the research was focused on how the students make example problems and rubrics based on cognitive domain, psychomotor domain and affective domain. In the second cycle, the research was focused on the cognitive process and cognitive knowledge dimension consisting of factual, conceptual, procedural, and metacognitive. First observation was focused on the declarative knowledge, and the second observation was focused on the activities that related to procedural and conditional knowledge. The result of this study showed that in the first cycle, there are 8 students have the declarative knowledge. However, in the second cycle, there are 12 students have the procedural and the conditional knowledge. Therefore, it can be concluded that there was a development in the students' knowledge especially metacognitive knowledge.

**Keywords:** metacognitive knowledge, lesson study, biology learning

### 1 INTRODUCTION

The general types of knowledge are factual, conceptual, procedural and metacognitive. Factual knowledge is knowledge of discrete, isolated content element bits of information. In contrast, conceptual knowledge is knowledge of more complex, organized knowledge form. Procedural knowledge is knowledge of how to do something. It includes knowledge of skills, techniques and methods, as well as knowledge of criteria used to determine and justify when some one to do what within specific domain and disciplines. Metacognitive knowledge is knowledge about cognition in general as well as awareness and knowledge about one's own cognition (Anderson and Krathwohl, 2001).

Metacognitive knowledge is one of the higher-order thinking skills that are important to develop based on the evaluation for biological learning achievement demands.

In the evaluation for biological learning achievement, the students are able to understand evaluations and assessments concept apply it concepts to design the assessments' instrument, and develop the higher-order thinking skills such that the

students metacognitive knowledge will be formed automatically.

However, there are 12 students from 17 students who take the evaluation for biological learning achievement have difficulty and not realize how to resolve it difficulty when asked to develop the questions.

The students was focused on example problems that was the given. To solve that students' problem, then in the evaluation learning using the stages' lesson study. This study aims to empower the students' metacognitive knowledge in biology learning especially evaluation for biological learning achievement through lesson study.

Lesson study provides a professional knowledge base for teaching. Lesson study is describes as a model for professional development rather than a research approach (Carlgren, 2012). The application of self-regulation to learning is a complicated process involving not only the awareness and application of learning strategies but also extensive reflection and self-awareness. Students who are skillful at academic self-regulation understand their strengths and weaknesses as learners as well as the demands of the specific tasks (Isaacson and Fujita, 2006).

## 2. METHOD

In this research, the stages’ lesson study will be apply for two cycles in the evaluation for biological learning achievement class consisting 17 students, one lecture and three observer.

In the first cycle, the research was focused on how the students make example problems and rubrics based on cognitive domain, psychomotor domain and affective domain. In the second cycle, the research was focused on the cognitive process dimension and cognitive knowledge dimension consisting of factual, conceptual, procedural, and metacognitive.

The observation was focused on the activities that reflect the metacognitive knowledge consisting of the declarative knowledge, the procedural knowledge and the conditional knowledge.

First observation was focused on the declarative knowledge, and the second observation was focused on the activities that related to procedural knowledge and conditional knowledge. Data analysis by descriptive analysis.

## 3. RESULT AND DISCUSS

### 3.1 RESULT

The metacognitive knowledge is knowledge of cognition in general as well as awareness and knowledge of one’s own cognition. The result of this study showed that in the first cycle, there are 8 students have the declarative knowledge. However, in the second cycle, there are 12 students have the procedural and the conditional knowledge.

The knowledge dimension, major types and subtypes and the examples (Anderson and Krathwohl, 2001) Table 1:

Table 1. The knowledge dimension, major types and the examples

Metacognitive knowledge	Examples
Strategic knowledge	Knowledge of outlining as a means of capturing the structure of a unit of subject matter in the text-book knowledge of the use of heuristic
Knowledge about cognitive tasks including appropriate contextual and conditional	Knowledge of the types of test particular teachers. Knowledge

knowledge	of the cognitive demand of different tasks.
Self-knowledge	Knowledge that critiquing essays is a personal strength whereas writing essays is a personal weakness, awareness of one’s own knowledge level

The examples of strategic knowledge

- Knowledge that rehearsal of information is one way to retain the information.
- Knowledge of various mnemonic strategies for memory.
- Knowledge of various elaboration strategies such as paraphrasing and summarizing biology aspect.
- Knowledge of various organizational strategies such as outlining and diagramming biology concept mapping.
- Knowledge of planning strategies such as setting goals for reading biology topic.
- Knowledge of comprehension-monitoring strategies such as self-questioning on discussing.
- Knowledge of means-ends analysis as heuristic for solving problem on biology topics.

The examples of knowledge about cognitive task including contextual and conditional knowledge:

- Knowledge that recall tasks (such as short-answer questioning in biology problems) generally make more demands on the individual’s memory system than recognition task (such as multiple-choice answer).
- Knowledge that a primary biology source book more difficult to understand than a general biology textbook or biology popular book.
- Knowledge that a simple biology memorization task such as the term of biology topics may require only rehearsal.
- Knowledge that elaboration strategies like summarizing and paraphrasing on biology topics can result in deeper levels of comprehension.
- Knowledge that general problem-solving heuristics on biology case most useful when the individual lacks relevant subject or task specific knowledge or in the absence of spesific procedural knowledge.

- Knowledge of the local and general social, conventional, and cultural norms of the local and general social, conventional, and cultural norms for how, when, and why for how, when, and why to use different strategies.

The examples of self-knowledge

- Knowledge that one is knowledgeable in some areas but not in others.
- Knowledge that one tend to rely on one type of cognitive tool (strategy) in certain situations.
- Knowledge of one’s capabilities to perform a particular task that are accurate not inflated such as overconfident.
- Knowledge of one’s goals for performing a task.
- Knowledge of one’s personal interest in a task.
- Knowledge of one’s judgments about the relative utility value of a task.

### 3.2 DISCUSS

The term metacognition has been used in many different ways, but an important general distinction concerns two aspects of metacognition: (1) knowledge about cognition and (2) control, monitoring, and regulation of cognitive processes. The latter is also called metacognitive control and regulation as well as more generally, self-regulation. Metacognitive knowledge to knowledge about cognition. The aspect of metacognition that involves metacognitive control and self-regulation reflects different types of cognitive processes and therefore fits into the cognitive process dimension (Anderson and Krathwohl, 2001).

Strategic knowledge is knowledge of the general strategies for learning, thinking, and problem solving. The strategies in this subtype can be used across many different tasks and subject matters, rather than being most useful for one particular type of task in one specific subject area. This subtype strategic knowledge includes knowledge of the variety of strategies that students might use to memorize material, extract meaning from biology text.

The large number of different learning strategies can be grouped into three general categories: rehearsal, elaboration, and organizational. Rehearsal strategies involve repeating words or term to be recalled over and over to oneself. They are generally not the most effective strategies for deeper levels of learning and comprehension. Elaboration strategies include the use of various mnemonics for

memory tasks as well as techniques such as summarizing, paraphrasing, and selecting the main idea from biology text. Elaboration strategies foster deeper processing of the material to be learned and result in better comprehension and learning than do rehearsal strategies. Organizational strategies include various form of outlining, drawing cognitive maps or concept mapping. Organizational strategies usually result in better comprehension and learning than do rehearsal strategies.

General learning strategies, students can have knowledge of various metacognitive strategies that are useful in planning, monitoring, and regulating their cognition. Students can eventually use these strategies to plan their cognition (set subgoals), monitor their cognition (ask themselves questions as they read a piece of text, check their answer to biology problems), and regulate their cognition (re-read some thing they don’t understand go back and repair their mistake in biology problems).

Knowledge about various strategies, individuals accumulate knowledge about cognitive tasks. Metacognitive knowledge, knowledge that different cognitive tasks can be more or less difficult may make differential demand on the cognitive system, and may require different cognitive strategies. A recall task is more difficult than recognition task. The recall tasks requires the person to search memory actively and retrieve the relevant information. The recognition task requires only that the person discriminate among alternatives and select the correct or most appropriate answer.

Self-knowledge was an important component of metacognition. In self-knowledge includes knowledge of one’s strengths and weaknesses in relation to cognition and learning. Self-knowledge is an important aspect of metacognitive knowledge but the accuracy of self-knowledge seems to be most crucial for learning.

Metacognitive knowledge includes knowledge of general strategies that may be used for different tasks, the conditions under which these strategies may be used, the extent to which the the strategies are effective and self-knowledge (Anderson and Krathwohl, 2001).

An important distinction is between knowledge of cognition and the monitoring, control, and regulation of cognition. Recognizing the distinction only students’ knowledge of various aspects of cognition, not the actual monitoring, control, and regulation of their cognition. In the way that the other type of knowledge are acted upon in some way by the cognitive processes the same is true of metacognitive knowledge (Anderson and Krathwohl, 2001).

The development of metacognition proficiency is the valuable purpose of education. It is because

this proficiency can help them to be self-regulated learner. Self-regulated learner has responsibility toward the ability of self learning (Suratno, 2011).

Lesson study has helped to construct shared knowledge about how to teach (Elliott, 2012). Lewis (2012), lesson study give it power to inform policy and transform practice, (1) attention to variation, (2) a mechanism for scale-up, (3) a window on instruction for policy makers, (4) creating demand for research.

#### 4.CONCLUSIONS

Metacognitive knowledge to knowledge about cognition. First cycle, there are 8 students have the declarative knowledge. However, in the second cycle, there are 12 students have the procedural and the conditional knowledge. Therefore, it can be concluded that there was a development in the students' knowledge especially metacognitive knowledge.

#### 5. ACKNOWLEDGEMENT

Many people provided support as we prepared this article. A very special acknowledgement goes to lesson study project.

## Increasing The Activity of Learning and Creativity of Teaching

Uus Kusdinar<sup>1</sup>

<sup>1</sup>Department of Education Mathematics, University of Ahmad Dahlan, Jl. Prof. Soepomo, Janturan, Yogyakarta, Indonesia  
kusdinar@uad.ac.id

**Abstract :** Learning problems in private colleges is the lack of activity of college students in learning, while Lecturer still find it difficult to make improvements in teaching. This is because the input of students in private colleges are relatively less than compared with the input of students in universities. State. Departement of Education Mathematics at the University of Ahmad Dahlan was one of those who experienced the problem. Lesson study conducted at the Departement of Education Mathematics in University of Ahmad Dahlan was conducted by lecturers who are members of the same group or field, in this case the LS is done for courses "graph theory". Learning using approaches the Group and student activity sheets. As one of the benchmarks of success implementation of learning activities using a sheet of questions form activity. The results, the implementation of the Lesson study in Departement of Mathematics Education at University of Ahmad Dahlan was (1). An increase in the activity of college students in learning, (2). the growing creativity of lecturers in teaching, and (3). Cultural interactions between students, lecturers and students as well as the interaction and cooperation between the lecturers for improved quality of learning can be realized.

**Keywords :** activity of learning, creativity of teaching, lesson studies.

### 1. INTRODUCTION

This paper presented the results of a case study of the implementation of lesson study in higher education: which is carried out in Department of mathematics education at the University of Ahmad Dahlan in Yogyakarta. Lesson study in department of mathematics education at University Ahmad Dahlan was intended to improve the quality of learning as students prospective mathematics teacher through increased competence of pedagogic lecturer. From the series of activities of the lesson study is expected to be developed for effective learning models that can be used in the study.

### 2. MANUSCRIPT FORMAT

#### Lesson study in higher education

Students in the College are generally required to have a high independence in learning. This means that students have a high activity in their learning, initiative and independence is high. So did Lecture are required to have a breadth of understanding either the material or his pedagogic abilities, grows his creativity in the face of the student. At private colleges is very different, that expectations become barriers when its student input relative less well than with universities.

Lesson study is one of the coaching model is based on the principle of solidarity among

colleagues that aimed at creating a good learning community. LS is also one way to assist educators in making the plan a quality learning while gaining a better understanding. In Lesson study, teachers or lectures make the planning of learning collaboratively, observing the operations of the learning process and analyse the learning process going on in the classroom.(Lewis, et. Al., 2006). Therefore, it is expected that educators can produce a result that is good for the overall learning process.

The fundamental issues raised through LS are the low activity of college students in learning "graph theory". And how lecturer to efforts in enhancing student activities in learning. This means, how creativity is lecturer in teaching to improve its student activities.

One of the methods used in addressing the above issue by using problem-based learning. Problem-based learning is an approach to learning by making the confrontation to the students with practical problems, shaped ill-structured or open ended through stimulus in learning (Fogarty, 1977).

The underlying implementation of the LS is the first, the LS is a way that is effective for improving the quality of learning and teaching being done may improve student learning activities.. This is because (1) the development of LS is done and based on the results of professional knowledge sharing based on learning outcomes and practices conducted by the lecturer, (2). The emphasis is to make the students have a LS quality a high learning, (3). The purpose of the study was the focus point of main attention,

and (4). Based on the experiences in class, the LS was able to become the Foundation for development in the classroom, and (5). LS puts the role of teachers as researchers learning. Second, the LS is designed properly will result in a professional and innovative lecturer.. With LS lecturer may (1). Define learning objectives that match the requirements of students, (2). Reviewing and improving the learning that is beneficial to the students, (3). Deepen the knowledge about the learning material, (4). Specify long-term goals be accomplished students, (5). Collaboratively, learning plan (6). Do a reflection of learning that is conducted based on the development of students and colleagues.

### Methodology

Implementation of LS in department of mathematical education for courses "graph theory" involves the grouping of the lecturer. A lecturer as a lecturer models, the other as an observer. The implementation is done every Tuesday. LS is activities of 3 cycles, each cycle includes the activities of plan, do, and see. In the framework of the attainment of learning outcomes used observation tests given at the end of each cycle, as well as the observation sheet. Data were analyzed by descriptive analysis.

### Results and Discussion

The results of observation activities conducted observer noted in an observation sheet the result as follows:

Table 1 Activity of Students

No	Activity	Average Activity (percent)		
		Cycle 1	Cycle 2	Cycle 3
1	Enthusiastic students in learning	52.02	90.63	92.54
2	Student interaction with lecturers	48.51	81.25	88.12
3	Interactions between students	39.29	64.06	78.34
4	The cooperation group	45.09	75.03	80.56
5	Student activities within the Group	40.71	62.65	74.34
6	Student participation in the concluded result	25.05	31.25	56.05
	<b>Average</b>	41.78	67.47	78.33

From table 1 it appears that an increase in the percentage of students in the learning activity is fairly high in almost all aspects.

An increase in the activity of college students in learning is caused by the presence of learning activity that requires every student to be able to actively learn both individually and group. Similarly, the demands of the activity between groups. An observer in the classroom becomes one of the motivators for students to be able to perform learning activities optimally. The Observer has become a tool of control for their learning activities.

Creativity of lecturer also appears increasingly growing. This is due to the presence of other lecturers that the grouping that is able to evoke confidence models lecturer and other Lecturers. The activities of "plan" to be a means of intercultural lecturer prepared of learning plan becomes a shared responsibility. During the events of "do" Lecturer model showed a good effort in carrying out the learning in the classroom. Efforts to make innovation in the approach to students, the use of teaching methods, as well as media usage study. Other lecturers as observer objectively give attention and important notes the implementation study done, whether in accordance with a plan or not, as well as provide another note on the development of events over the learning process. The activity ends with "see" on the basis of observations that have been done giving positive feedback openly required to repair together. These activities became the basis for improvements to the "plan" for the next cycle so that the learning innovations appear to be done.

### 3. CONCLUSION

The results, the implementation of the Lesson study in Departement of Mathematics Education at University of Ahmad Dahlan was (1). An increase in the activity of college students in learning, (2). the growing creativity of lecturers in teaching, and (3). Cultural interactions between students, lecturers and students as well as the interaction and cooperation between the lecturers for improved quality of learning can be realized.

## Implementation of Lesson Study In Enhancing of Student Learning Activeness On The Discreet Mathematics Subject In Mathematics Education Study Program of Ahmad Dahlan University

Harina Fitriyani<sup>1</sup>, Uswatun Khasanah<sup>2</sup>

*Mathematics Education Study Program, Faculty of Teacher Training and Education, Ahmad Dahlan University, Jalan Prof. Dr. Soepomo Warungboto, Yogyakarta, Indonesia*

<sup>1</sup>*rin\_najmi@yahoo.co.id*

<sup>2</sup>*uswatun.khasanah2@yahoo.co.id*

**Abstract:** The learning that implemented by lecturers tend to use conventional method so that the result is student activeness be less. The aim of this article is to know the enhancing of student learning activeness on discreet mathematics subject through lesson study. In the observation of student learning activeness, technique of collecting data used observation technique and the instrument was observation sheet of students' activeness. The participants of lesson study were students of mathematics education study program at class D of semester 7 amount 56 students. This lesson study was implemented for 4 cycles with 4 meetings. The implementation of lesson study engaged all lecturers in mathematics education study program as model lecturer and the others as observers. Based on analysis of observation sheet of student learning activeness was obtained that lesson study with problem based-learning (PBL) implementation can enhance the student learning activeness. It can be seen from the percentage of activeness on 1<sup>st</sup> cycle was 57.35 %, 2<sup>nd</sup> cycle was 61.67%, 3<sup>rd</sup> cycle was 59.92 % and the last cycle was 67.75%. This shown that the criteria of student learning activeness on each cycle were in good criteria.

**Keywords:** Lesson study, Problem based learning, learning activeness

### 1 INTRODUCTION
